THE DIAMOND MOUNTAIN MINES.—John B. Winter has returned from a visit to the Diamond Mountain placer mines, situated in the vicinity of Susanville, in the lower hills of the Sierra Nevada Mountains. The snow was not yet sufficiently melted to allow of mining on the higher hills. Mr. Winters obtained some excellent prospects in coarse gold in places

SINGLE-ACTING HINGE.

DOUBLE-ACTING HINGE.

garden gates, while the double hinge is peculiarly adapted for use on farm gates, or enclosures where it is desired to have the gate open either way with equal facility. On both classes the principle of an incline is employed by an ingenious mechanical application, so that an arrangement is effected by which the gate shall close by its own gravity. The hinge is constructed with double inclines of unequal base upon each leaf, the apex of the widest inclines being cut off at an angle so that when the gate is opened wide it is held in that position without being locked. If the gate is opened so that it is at a right angle from the post, the construction is such that it will remain so, and can be closed by a gentle touch; but if it is only opened half way it will close by its own gravity. There is no strain on the pintles as they only serve as guides to hold the inclines against each other; while by the employment of inclines of unequal base, the whole weight of the gate is supported by the single-bearing surface of the wide inclines, and is held open without being locked; consequently the necessity of lifting it preparatory to closing is avoided.

It will be seen that the hinge is a very simple and practical one, there being no springs or other contrivance to get out of order. In opening or closing a farm gate no lifting is necessary, the hinge performing the operation itself by the gate being pushed in the required direction. There is no danger of its dragging on the ground if the gate post is properly set, and when closed is securely locked by itself.

where the snow had disappeared. He made several cuts through the gravel deposits and succeeded in finding bed-rock, a thing which had not been done before. He found upon the bed-rock a considerable quantity of very hard cement. The weather was so cold that he did not dig through this cement nor make more than a very rough test of it. It is supposed that in following the bed-rock into the hill the cement will be left above it in a horizontal stratum. Susanville is full of prospectors from California, who are waiting for the disappearance of the snow in order to commence operations. At the time Mr. Winters left it was thought that the snow would be gone in a couple of weeks, at least from the range where the gravel is found. The late snow-storm, however, have doubtless given the hills in that region a fresh coating.—*Alta*.

UTAH MINING INCORPORATIONS.—Two new mining companies were incorporated in Salt Lake last week, each with a capital of \$1,000,000. The companies are called respectively the Utah Belcher and the Rocky Mountain smelting company. On the 10th, the Otsego mining company was incorporated with a capital of \$3,000,000. This latter company was organized at Otsego, New York, to operate in Utah mines.

SUTRO TUNNEL.—The Terrestrial Enterprise of the 11th says: It was yesterday reported that Adolph Sutro had succeeded in negotiating in Europe a loan of \$3,000,000 for the Sutro Tunnel Company. What foundation there may be for the report we are unable to say.

COAL.—The yearly consumption of coal in Great Britain is 118,000,000 tons.

PATENTS & INVENTIONS.

Telegraphic List of U. S. Patents Issued to Pacific Coast Inventors.

(REPORTED OFFICIALLY FOR THE MINING AND SCIENTIFIC PRESS, DEWEY & CO., PUBLISHERS AND U. S. AND FOREIGN PATENT AGENTS.)

By Special Dispatch, Dated Washington, D. C., April 15th, 1873.

FOR WEEK ENDING APRIL 1st, 1873.

MACHINE FOR INSERTING SCREW-PIES IN BOOTS AND SHOES.—Andrew Cavall, assignor one-half interest to Victor Noly, S. F., Cal.
PROCESS OF SEPARATING GOLD AND SILVER FROM BASE METALS.—Erick Lundquist, Grass Valley, Cal.
TRACK CLEANER FOR HARVESTERS.—Orrin Du Bois, San José, Cal.
PRESSER BLOCK FOR PANTS.—Lewis Cohen and John C. Waller, S. F., Cal.
PROCESS FOR REMOVING PAPER FROM WALLS.—Catherine F. Ware, S. F., Cal.
MAGAZINE GUN.—Alfred Swingle and Frank A. Huntington, S. F., Cal.
CHIMNEY.—Jeremiah Browell, S. F., Cal.
CHANNELING AND ENGINING TOOL.—Louis Baur, S. F., Cal.
FRUIT KNIFE.—George W. Stevens, S. F., Cal.
FRAT FOR DAYING FACIT.—George W. Stevens, S. F., Cal.
DIAMOND POINTED DRILL FOR DENTAL USE.—James P. Gillispie, S. F., Cal.
METALLIC CASES FOR TURBINE WHEELS.—Abraham Myers, Salem, Oregon.

TRADE MARK.

MEDICINE.—D. D. Tomlinson, San José, Cal.
—The patents are not ready for delivery by the Patent Office until some 14 days after the date of issue. NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with greater security and in much less time than by any other agency.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s Scientific Press American and Foreign Patent Agency, the following are worthy of mention:

TOP.—N. D. Clark, S. F., Cal. It is seldom that we are able to chronicle the discovery of a new principle in mechanics and its practical application in a toy for the amusement of the rising generation. Mr. Clark has discovered that if we take a tube, one end of which is a flat disk through which the hole in the tube also passes, and make a groove from the center to its outer rim on the under side, and place against this grooved underside an oppositely grooved flat surface, say the upper portion of a common spinning top flattened, and then blow strongly through the tube, the top will be caused to spin or revolve with great rapidity as long as the air passes forcibly through the tube. As soon as the breath is exhausted the top can be allowed to drop upon an even surface when it will spin like any ordinary top. An important feature of this discovery is that as long as the air is passing through the tube under pressure the top will not leave the disk, no difference how it is held, but will remain as it were, suspended in the air and in swift motion very close to the disk. Water, air, or steam can be used to drive the top. Mr. Clark has also applied this principle to a motive power and various other uses.

CONVERTING BUTTER INTO CYLINDRICAL ROLLS. Chas. H. Fancher, S. F., Cal. When our California butter was first introduced into the Eastern market, it was likened by the Eastern people to the bright and shining rolls of \$20 gold pieces so common to our State. This was owing more, perhaps, to the neat and modest manner in which it was put up than to any great superiority in the quality of the butter. Mr. Fancher is a practical butter-man; he saw that the California plan of putting up butter in rolls was to succeed the present plan, practiced in other parts of the United States, of making flat, stamped rolls, or balls. Mr. Fancher's invention consists of a number of mechanical devices by which he is enabled to convert a keg or barrel of packed butter into beautiful rolls in a very short time, so that it cannot be distinguished (by its looks, at least) from freshly-put up butter. One great advantage of his process is that the grain of the butter is not disturbed in converting it into rolls, thus preserving its quality to the last.

STEVEN'S FURNACE.—The White Pine News says it is asserted that great impetus has been imparted to mining operations at Mineral Hill, by the success of the new oxy-hydrogen furnace recently described in our columns. There are large quantities of base metal ore in that vicinity which will pay with economical working.

NICKEL.—It is stated that an extensive nickel mine has been discovered somewhere in Lake County, in this State. The precise locality of the mine has not been divulged, nor have any details connected with it.

The Disilverization of Lead.

The details of this important and essential process in the metallurgical operations connected with lead-mining are fully set forth in Mr. G. H. Makins' *Manual of Metallurgy* (2d edition) recently published, as follows:

As all lead, after reducing, retains the amount of silver originally present in the ore, this has now to be removed, which is done by first concentrating the silver into a reduced quantity of lead and afterwards cupelling this. Formerly, for want of a good and effective process, the lead of commerce always retained a considerable amount of silver, so much as to render its separation a very profitable operation since Mr. Pattinson's process has been in use. That gentleman discovered that if we fuse lead containing any notable amount of silver, and then cool slowly, carefully stirring at the same time, crystals will form in the bath and subside to the bottom; and, moreover, these will be much less rich in silver than the original metal was. Upon this discovery he founded the following operation for removing the poorer lead and concentrating this silver. A series of iron pots, from nine to eleven to twelve in number is employed. These are hemispherical, of about five feet in diameter, and calculated to hold a charge of about nine tons of metal each. They are set in brick furnaces adjacent to each other, but with quite distinct flues, furnaces, dampers, etc. Suppose the series of pots to be numbered consecutively from one to eleven, then each will have a certain place and value in the series, according to the estimated richness of the lead in silver, as usually found resulting in the ordinary course of working the operation. Thus:

Pots Numbers.....	1	2	3	4	5	6	7	8	9	10	11
Ozs. of silver per ton.....	36	24	22½	5	10	20	40	60	160	220	640

Soms 10-oz. lead, that is to say, lead containing 10 ozs. of silver per ton, having been worked, nine tons of it would be placed in the fifth pot and melted, after complete fusion it is skimmed with a perforated ladle; thus the fluid lead runs through into the pot, and the dry oxides are reserved for after reduction. The fire is drawn, and the men stir the metal continually; if, however, it is much too hot, they will throw water upon it, which sets the top lead; this they push down with their slices, but the plan is objectionable for two reasons; first, on account of the danger, as frequently, under some part of the hardened top a certain quantity of water becomes enclosed, and an explosion thence follows; and secondly, because too much water causes an improper formation of crystals, which retain silver (such crystals are, however, easily distinguished).

When the pot begins to thicken from stirring and cooling, one workman takes a crystallizing ladle. These are large iron ladles of 18 inches diameter by about 5 inches deep; they are perforated at the bottom with half-inch holes, and furnished with very long handles. This handle he raises above his head, sinking the bowl down vertically into the lead until it reaches the bottom; then, by bringing the handle down as far as he is able, he holds it for a companion workman to place a hook, which is attached to a chain over it, and thus, by means of a crab and crane, draws up the ladle full of crystals; the first operator then slides the ladle handle under a shoulder of the crane, and it is left to drain; the second resumes the stirring of the pot, while the fluid lead drains out from the holes of the ladle, which is accelerated from time to time by a man in charge of the ladle, who, by shaking the shank, so displaces the crystals as to cause all the fluid lead to run more completely out.

This effected, the crane is turned, so as to bring the ladle over pot No. 4, for these crystals are to be turned into it, and will be found to contain only 5 ozs. silver. These operations are continued until two-thirds of the lead in the pot No. 5 has been passed over in crystals to pot No. 4, that is to say, six tons out of the nine. Now, under pot No. 4 a fire is made up, so that the crystals, as they are thrown in, may be melted. This done, the men, with a large plain ladle, turn the remaining one-third, or three tons, of molten lead in pot No. 5, and which now contains the remainder of the silver, equalling 20 ozs. per ton, into pot No. 6.

Now in produce the operation is thus:—In pot No. 5 nine tons of 10-oz. lead equals 90 ozs. of silver, of which six tons of 5-oz., or 30 ozs., works into pot No. 4; and three tons of 20-oz., or 60 ozs., is ladled into pot No. 6.

Now, providing there is lead of these two assays in the works, that is, three tons of 5-oz to add to the six tons passed into the pot No. 4, and also six tons of 20-oz. in the same way, to fill pot No. 6, this would be done, and both these pots may be worked at the same time with two different sets of men. Six tons from No. 6 in crystals will work into No. 5, and three tons in bottom will be put back into the same pot from No. 4, and thus again fill it without any addition of pig-lead.

The rich lead is now finally submitted to cupellation to separate the silver, and as there is generally a loss of about 5 per cent. of lead in this operation, it is found better to employ less of this high silver value for it.

During the whole operation much oxidation of the lead is going on, and it is estimated that leads averaging 20 ozs. to the ton will produce a quarter of their weight in "dross," or oxide, to reduce; leads of 30 ozs. about one-third; thus 1,000 tons a year of 20 ozs. will give 250

tons to reduce, and the same quantity of 30 ozs. about 330 tons.

Although this lead of commerce is very nearly pure, it is never entirely so; consequently, if it be required chemically pure, the best quality of commercial lead must be taken and dissolved in nitric acid, and the resulting nitrate crystallized repeatedly to purify it. This is then heated to redness in a crucible, whereby the nitric acid being decomposed and driven off, a pure oxide of lead remains, which may be reduced to metal by heating with black flux. But it may thus even retain traces of silver. If, therefore, it is to be freed entirely from silver, lead should be dissolved in nitric acid, purified by recrystallization, and precipitated as sulphate from a dilute solution by sulphuric acid. Thus diluted the silver remains untouched. The washed plumbic sulphates is reduced by heating with sodic carbonate and resin in a lined crucible. Or eight parts of plumbic sulphate may be mixed with four of potash and one of charcoal, and then reduced at a moderate temperature.

Parkes' patented process was for the fusion of argenteiferous lead with zinc, which, on cooling, removes and retains a small portion of the lead, and at the same time abstracts nearly the whole of the silver, the zinc being finally separated by distillation with lime and carbonaceous matter, the lead and silver being divided by cupellation.

Condurifé has patented an improvement thereon by passing superheated steam for two or three hours through the molten lead.—*Iron.*

Diamonds in the Hydraulic Washings of California.

Professor B. Silliman, at a recent meeting of the American Institute of Mining Engineers, read the following paper, "On the Probable Existence of Microscopic Diamonds, Zircons and Topaz in the Sand of Hydraulic Washings in California," which has been published in the *Engineering and Mining Journal*:

The occurrences of diamonds of some size in the gold fields of California is by no means uncommon, and was noticed by me in a communication to the California Academy of Science in 1867, when specimens of this gem, from at least five different localities, were exhibited. I then suggested that a more attentive examination of the heavy sands left in the sluices of hydraulic washings would in all probability detect diamonds, mingled with other rare species not commonly believed to occur in these sands.

Mr. George A. Treadwell, of San Francisco, has lately sent me a small package of these sands, collected by him from the sluices of the "Spring Valley Gravel Mining Claim," Cherokee, Butte County, California. A microscopic examination shows these sands to abound in beautiful colorless zircons (hyacinths), of the form well-known in the hyacinths of Expailly (France), associated with crystals of topaz, quartz in fragments, rounded grains of chromic and titanite iron, and a few small, almost globular, masses of very high refracting power which appeared to be diamonds. To determine this chemically, a portion of the sands was treated with acid for the removal of any carbonates which might be present. There was no effervescence from this treatment. The same sample was then digested in strong sulphuric acid of a high temperature to destroy any particles of organic matter which might be present, washed out in pure water without contact with organic matter, dried and ignited in a vessel of platinum out of contact with air. This sample of the sands thus freed from anything which could afford carbonic acid, but the diamond, was then ignited in a platinum nacelle (boat) in a tube of hard glass, and in a current of pure dry oxygen gas, which, for precaution, was passed over soda lime, and then, after passing the ignited assay, was delivered through a solution of baryta water. The transparency of this delicate test was soon disturbed, and by continuing the experiment for about an hour, a notable quantity of baryta carbonate was obtained. This experiment seems to prove that diamond powder was present in small quantity.

It will be remembered that Prof. Wöhler, some years since, found diamonds by a similar method in the platinum sands from Oregon, associated with the rare species *Laurite*—sulphide of osmium and ruthenium. His paper will be found in the *American Supplement* to the *Chemical News* for November, 1869, p. 317.

The black grains, which contribute fully one-half the bulk of the Butte County sands, are about equally chromic iron, which the magnet removes, and titanite iron, which is unaffected by the magnet. The chromic iron was so proved by the blowpipe, and no magnetite could be detected. No metallic grains of any of the platinum or iridosmium metals, or gold, could be found.

Under polarized light, these crystalline sands form a splendid microscopic object.

When I am provided with a larger quantity of these sands, I propose to determine the amount of diamond dust quantitatively.

In his letter to me, accompanying the sample sent, Mr. Treadwell says: "I have examined much of the sand under the microscope, and think there are a few fragments of broken diamonds. These sands were taken from the tailings after passing through a long flume paved with stone. You know what sharp and hard pounding the gravel gets, mixed with boulders, in a hydraulic flume. No doubt, some diamonds are ground, or rather broken, by hard knocks to powder."

A more attentive observation, by a mineralogical eye, of the sands accumulating in the

sluices of hydraulic washings will, no doubt, be rewarded by the discovery of many rare species, which have thus far escaped notice for want of scientific skill. To show how much may be learned from an attentive study of such sands, Dr. John Torrey has informed me that in a sample of sands from gold washings in Nicaragua, he has found not less than twenty distinct mineral species, many of them of rare occurrences. No doubt, a careful examination of the sands of Oregon, where Dr. Trask found the platinum minerals, would reveal many unsuspected species.

The Gold Placers of the Plains.

When labor, living and supplies are as cheap in Colorado as in the older eastern communities, and its mining population becomes satisfied with a smaller margin of profit, it is probable that the ancient water-courses and bars of that portion of the great Plains lying along the foothills of the Range will become valuable property as placer diggings. The extent of the auriferous deposits outside of the mountains is much greater than is generally supposed, and of considerable interest, on account of the changes that have evidently occurred both in the topography of the valley, and in the courses of the streams, some of which are entirely innocent of any presences to water, or flow now in beds miles away from their ancient channels. How far towards the east gold may be found, it is impossible to say. Probably a belt of country 20 miles in width would include all the land that could be worked with any profit without the introduction of super labor which would barely be compensated for by any amount of billion produced.

From its head to a point some miles north of Denver the Platte is known to be auriferous, while Cherry, Clear, Ralston, Cache-la-Poudre, North and South Boulder, and other of its tributaries yielded the first gold that was found by Americans in Colorado. From the sands of Dry Creek about 8 miles south of Denver, from \$5 to \$10 per day to the man was made as early as 1858, and only on account of the richer discoveries in 1859 of Gregory and his followers in this gulch of Gilpin County, were the deposits on the Plains neglected. The immense yield of those at first, and the subsequent discovery of the network of gold and silver veins that are exclusively found in the mountains, have drawn attention from the deposits on the plains, so entirely, that all these lands are now considered as agricultural when in reality they are in every sense of the word mineral.

The bed-rock under the city of Denver is unusually shallow. At almost any portion of the town it can be reached by a 15 ft. shaft, and in many places it is not necessary to sink more than five feet. The strata of soil are very evenly laid and consist of three separate kinds, namely, gravel with coarse and large boulders intermixed, clay and sand. An examination of any of the excavations being made daily in the city for cellars, etc., will show very plainly these strata are always in the same relative position. The farther away from what is now the bed of the Platte sections of the soil are examined, the larger will be found the layers of sand and gravel, and the smaller the clay. On Capitol hill on one side and the Table lands beyond what is called North Denver on the other, bed-rock approaches the surface very closely and often crops out, indicating the limit of the forces that have produced the ground upon which the city stands. Between these boundary lines it can hardly be doubted that the Platte River once ran, a stream from one to five miles broad and several hundred feet in depth, narrowed at times to perhaps half a mile, and again expanding into huge lakes with shallow and far reaching shores. Such a formation is one in all probability in which Denver now stands, while farther to the south the river was narrower and more rapid.

It has been found and curiously enough, that the swifter the current and more rocky the channel, the larger the deposit of gold. It is a notable fact that the soil which now forms the banks of the Platte for half a mile back from its present channel will yield a color in almost every case, and little pockets have been found that richly repay the prospector even at the present value of time and labor. To the south of Denver its banks are torn up with prospect holes and in its more rapid courses, nearer or under the foot hills, it has yielded largely. The gold found on the plains is very fine grained and thin, and needs the most careful washing to save a fair per cent. Nuggets are seldom if ever found. On the other hand the metal is remarkably pure, and more so than the best obtained from quartz mining. Both these conditions would be naturally expected from the abrasion and rubbing that the metal would naturally have undergone in its long travel from its first place of deposition.

We believe no deep bed rock mining has been attempted on the plains, with the exception of the working of some of the creeks close by the foothills. Should the auriferous deposits in Colorado prove at all similar to those now being worked in California, there yet remains unprospected and untouched a large part of this Territory which may fairly be expected at no distant day to yield its share to the balloon produce of the country. Judging from the character of the ancient bars and creek beds of the Pacific Slope, nothing but deep bed-rock mining will successfully develop the placers of the Plains. And this will need to be backed by large capital and the most approved machinery.—*Colorado Mining Review.*

The California Powder Works

No. 314 CALIFORNIA STREET,
SAN FRANCISCO.

Manufacturers and have constantly on hand

**SPORTING,
MINING,
And BLASTING
POWDER,**

OF SUPERIOR QUALITY, FRESH FROM THE MILLS. It being constantly received and transported into the interior, is delivered to the consumer within a few days of the time of its manufacture, and is in every way superior to any other Powder in Market.

We have been awarded successively

Three Gold Medals

By the MECHANICS' INSTITUTE and the STATE AGRICULTURAL SOCIETY for the superiority of our products over all others.

We also call attention to our

HERCULES POWDER.

Which combines all the force of other strong explosive now in use, and the lifting force of the BEST BLASTING POWDER, thus making it vastly superior to any other compound now in use.

A circular containing a full description of this Powder can be obtained on application to our Office.

1670-3m

JOHN F. LOHSE, Secretary.

The Most Popular Medicine Extant.

1840. OVER THIRTY YEARS 1873.

Since the introduction of

PERRY DAVIS'

PAIN-KILLER.

THE PAIN-KILLER

Is equally applicable and efficacious to young and old.

THE PAIN-KILLER

Is both an internal and external remedy.

THE PAIN-KILLER

Will cure Fever and Ague when other remedies have failed.

THE PAIN-KILLER

Should be used at the first manifestations of Cough or Cold.

THE PAIN-KILLER

Is the Great Family Medicine of the Age.

THE PAIN-KILLER

Will Cure Painter's Colic.

THE PAIN-KILLER

Is good for Scalds and Burns.

THE PAIN-KILLER

Has the verdict of the people in its favor.

THE PAIN-KILLER

Gives universal Satisfaction.

THE PAIN-KILLER

Beware of IMITATIONS and COUNTERFEITS.

THE PAIN-KILLER

Is almost a certain cure for CHOLERA, and has, without doubt, been more successful in curing this terrible disease than any other known remedy, or the most eminent and skillful Physician. In India, Africa and China, where this dreadful disease is ever more or less prevalent, the PAIN-KILLER is considered by the natives, as well as European residents in those climates, a SURE REMEDY.

THE PAIN-KILLER

Each bottle is wrapped with full directions for use.

THE PAIN-KILLER

Is sold by all Druggists and Dealers in Family Medicines.

AXLE GREASE.

To Millmen, Teamsters and Others.

Your attention is called to the very superior AXLE GREASE manufactured by us for over 15 years. Recent improvements in the chemical arrangement of the lubricant need in its manufacture render its use as serviceable on the lightest huggy as on the heaviest team.

The extensive demand for the H. & L. Axle Grease has enabled the proprietors to reduce its price to as low a rate as any of the inferior compounds, which are continually being forced upon the market.

See that the trade-mark (H. & L.) is on the red cover of the package, and take no other.

—AND—
Chemical Apparatus,
Having been engaged in furnishing these supplies since
the first discovery of mines on the Pacific Coast,
Our Gold and Silver Tables, showing the value
per ounce Troy at different degrees of fineness, and val-
uable tables for computation of assays in Grains
Grammes, will be sent free upon application.
7v25-1f **JOHN TAYLOR & CO.**

Important to Miners and Mill Men.
Silver-Plated Copper Amalgamating Plates,
for Saving Gold.

Of all sizes and in any quantity, furnished to
order. Full instructions sent for operating.
Particular attention given to plating goods for
Builders, Plumbers, etc. Hotel and Restaurant
work replated.
SAN FRANCISCO GOLD AND SILVER PLATING WORKS,
655 Mission street, San Francisco.
2v25-3m **E. G. DENNISTON,** Proprietor.

Varney's Patent Amalgamator.
These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they
have no equal. No effort has been, or will be spared
to have them constructed in the most perfect manner
and of the great number now in operation, not one has
ever required repairs. The constant and increasing de-
mand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly
into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows.

The pan being filled, the motion of the muller forces
the pulp to the center, where it is drawn down through
the aperture and between the grinding surfaces. Then-
ce it is thrown to the periphery into the quicksilver.
The curved plates again draw it to the center, where it
passes down, and to the circumference as before. Thus
it is constantly passing a regular flow between the grind-
ing surfaces and into the quicksilver, until the ore is
reduced to an impalpable powder, and the metal amal-
gamated.

Settlers made on the same principle excel all others
They bring the pulp so constantly and perfectly in con-
tact with quicksilver, that the particles are rapidly and
completely absorbed.

Mill-men are invited to examine these pans and settlers
for themselves, at the office, 229 Fremont Street,
San Francisco.

Richardson & Co., Copper Ore Wharves,
SWANSEA.

RICHARDSON & CO. have been for thirty years established
in Swansea as Agents for the preparation, Sampling, Assay-
ing, and Sale of Copper, Silver, Gold, Lead, Zinc, and all
other Ores and Metals, for which they have extensive Ware-
houses and Wharves under cover, 1,600 feet of Quay Front-
age within the Floating Dock, and the most complete Ma-
chinery and Appliances. They are also prepared to make
advance against Ores in anticipation of realization, and to
guarantee all payments when required. 17v24-1y

PLATINUM
Vessels, Apparatus, Sheet, Wire, Etc., Etc.
For all Laboratory and Manufacturing Purposes
H. M. RAYNOB,

LEA & PERRINS'
CELEBRATED
Worcestershire Sauce.

Declared by Connois-
seurs to be the only good
SAUCE
Caution Against Fraud.
The success of this most
delicious and unrivaled
Condiment having caused certain dealers to
apply the name of "Worcestershire Sauce"
to their own inferior compounds, the public
is hereby informed that the only way to
secure the genuine is to ask for LEA &
PERRINS' SAUCE, and see that their names
are upon the wrapper, labels, stopper and
bottle.
Some of the foreign markets having been
supplied with a spurious Worcestershire
sauce, upon the wrapper and labels of which the names
of Lea and Perrins have been forged, L. and P. give
notice that they have furnished their correspondents
with power of attorney to take instant proceedings
against manufacturers and vendors of such, or any
other imitations by which their right may be infringed.
Ask for LEA & PERRINS' Sauce, and see name on
wrapper, label, bottle and stopper.
Wholesale and for export by the Proprietors, Worces-
ter; Crosse & Blackwell, London, &c., &c., and by
Grocers and Oilmen universally. 15v24-1f

EUCALYPTUS.
The attention of the Medical profession is respectfully
called to the following preparation of this new reme-
dial agent. Eucalyptus and its preparations have been
found useful in obstinate cases of Intermittent and Malar
Fever, often supplanting the use of Quinine. The paroxysms
of Asthma and Catarrh are greatly controlled, and in various
Kidney diseases and Catarrh of the Bladder
it seems to act like a specific.

FLUID EXTRACT EUCALYPTUS.
This extract represents in a concentrated form the
medicinal effects of the leaves of Eucalyptus Globulus
THE ELIXIR OF EUCALYPTUS.

This compound presents the properties of the leaves
in a palatable form and elegant appearance. Dose—
One tablespoonful, to be repeated as often as the case
demands.

Cigarettes of Eucalyptus Globulus, useful in
Asthma, Difficulty of Breathing, Incipient Pleurisy, etc.
Prepared and sold by **JAMES G. STEELE & CO.,**
Chemists and Apothecaries,
No. 521 Montgomery St., between Clay and Commercial,
San Francisco. nc28

SHEET IRON PIPE.
THE

Risdon Iron and Locomotive Works
Corner Howard and Beale Streets,

Are prepared to make SHEET IRON AND ASPHALTUM
PIPE, of any size and for any pressure, and contract to
lay the same where wanted, guaranteeing a perfect
working pipe with the least amount of material.

Standard sizes of railroad Car Wheels, with special
patterns for Mining Cars. These small wheels are made
of the best Car Wheel Iron, properly chilled, and can be
fitted up with the improved axle and box—introduced by
this company, and guaranteed to outlast any other
wheels made in this State.

All kinds of Machinery made and repaired.

Important Patent Decision.

The suit of David McKay vs. John B. Wooster et al. was brought to restrain defendants from shipping egg cases from territory owned by defendants into the territory owned by plaintiff, both being assignees of different territory under the same patent. The decision in this case is the most important to patentees and assignees ever delivered on this Coast, as it settles a question but once heretofore directly adjudicated upon by the United States Courts, and one concerning which Patent Attorneys, and in fact the patent world, has heretofore been in doubt.

The patent covering the egg case in controversy was obtained through the Scientific Press Patent Agency, by J. L. and G. W. Stevens, of this city, in February, 1867.

In August, 1872, the patentees sold and assigned to F. H. Billings, of Chicago, Ill., all their right, title and interest in the States and Territories East of the Rocky Mountains, and in October, 1872, sold and transferred the patent right in and to the States and Territories west of the Rocky Mountains to this complainant, said McKay.

Billings made and sold the patent egg cases inside of this Territory, and, in the course of business, some of the cases were shipped, filled with eggs, to the defendants at San Francisco.

After citing the single decision upon the points in this case, mentioned above, Judge Sawyer continues as follows:

In the absence of an authoritative injunction, I should hesitate long, before venturing to dissent from a well-considered decision of so learned, experienced and eminent a jurist as Judge Shapley. But, in this instance, I can perceive no good ground for doubting the soundness of the proposition laid down in the guarded form in which it is stated in the case cited.

An important question, not discussed by the learned Judge, may, however, arise, as to when, or under what state of facts, a patented machine may be regarded as "lawfully" sold without restriction, or condition, within his territory, by the territorial assignee of a patent right.

In the case now under consideration, it will be seen by reference to the stipulated facts, that the assignment to Billings was made in August, 1872, while that to complainant was not made till October following. If there is any conflict, therefore, in the rights claimed by the parties, the complainant's assignment so far as the conflict is concerned, being subsequent in time, was taken in subordination to the prior grant to Billings—that is to say, he could only take by his assignment what was left after Billings' interest had been carved out. At the date of the assignment to Billings, the patentees were still the holders of the entire interest under the patent. Had they, at that time, at Chicago, sold one of the patented articles in question, without restriction or condition, that, undoubtedly, would have been a lawful sale without restriction or condition, and the article so sold would have been taken out of the monopoly, and the purchaser, or any one deriving title through him, would have been entitled to use it till worn out in any part of the United States. The patentee, himself, could not by a subsequent assignment of his patent have limited the right of the purchaser already vested. The vendor, being at that entitled to the whole monopoly for the entire jurisdiction of the United States, it was competent for him to wholly emancipate the article sold by taking the entire royalty for the use in any part of the territory. And a sale, without restriction or limitation would work such emancipation.

In such case any party subsequently purchasing thereto to any specific portion of territory, would take that right subject to the use of the machine so sold at any point within the territory purchased. What the patentees could do with respect to one machine, they could do as to any number of machines in existence, or to be brought into existence. What they could do themselves they could by contract authorize, or convey the right to any other party to do. As the patentees themselves could lawfully sell these patented articles at Chicago without restriction or condition, so as to authorize the purchaser, or those claiming under them, to use the machine anywhere in the United States, they could convey the right to Billings to lawfully do the same.

This authority to emancipate from the monopoly by an unrestricted sale was a part of their "right, title and interest in the invention secured by the patent," that could be exercised and enjoyed at Chicago, or other place east of the Rocky Mountains, as well as elsewhere. The assignment to Billings is in the broadest terms. It is of "all the right, title and interest which the said John L. and George W. Stevens had, in and to the said Letters Patent, and the invention as secured to them by said Letters Patent, and all their rights, liberties, privileges and franchises, which they had, or might acquire by or under said Letters Patent." "for, to and in all the States and Territories of the United States east of the Rocky Mountains."

There is no limitation of the power to vend in the territory. The patentees could lawfully make without restriction or condition,

could use without restriction or condition, or could vend without restriction or condition any where within the specified territory, and all their rights they conveyed to Billings without restriction or condition, who, thereupon, stepped into the shoes of the patentees, as to the territory sold. Had they intended to limit the right of vending, "to vending to be used" by the purchasers within the territory sold only, they should, at least, have so specified the intention, and by some apt words restricted the right of use in the deed of assignment. This unrestricted assignment of the right to vend put it in the power of Billings to lawfully vend the patented article within his territory without restriction or condition, and, thereby, wholly emancipated from the monopoly the articles so sold. The complainant subsequently purchased his territory, and whatever the terms of his grant, he could, of course, only obtain what was left of the franchise, or monopoly.

As the patentees, after their sale to Billings, could not object to sales by him without restriction or conditions, their subsequent assignees cannot object. The latter's right is subject to the right of Billings and those who have lawfully purchased without restriction or condition from him. This is as far as it is necessary to go in this. It is unnecessary, now, to consider the effect of an express limitation in the deed of assignment of the right to vend for the purpose of use only within the purchased territory; or how far the complainant, being a subsequent purchaser of territory, can lawfully vend without restriction or condition, so as to wholly emancipate the article sold from the monopoly, and enable the purchaser of the patented articles of his manufacture to use it in the territory of Billings.

If there is any practical hardship in the construction adopted of the law and contract under it, and it should turn out to be the correct construction, then the patentee, when he desires to assign, must consider whether he can afford to do so without restriction, and the subsequent purchaser, when he wishes to buy, must determine whether he can afford to do so with the burden entailed upon his territory by a prior grant unlimited in the particular indicated. There must be a decree for defendants.

Asbestos.

This remarkable mineral is totally indistructible by fire notwithstanding it consists of fibres as fine as the finest linen. Its name has been taken from a Greek root meaning incombustible. Several varieties of this mineral have different names; amongst them, byssolite, mountain-wood, mountain-cork, mountain-leather, etc. They are all silicates, that means compounds of silica (silicic acid) with an earthy base. The greater number of them are hydrated silicates, but all varieties are distinguished by a crystalline fibrous structure possessing a certain amount of flexibility and elasticity of which usually the whole mass partakes as well as the single fibre. In former years, deceived by the idea that this property belonged exclusively to certain chemical combination, the different varieties of asphalium were supposed to be identical in elementary composition; but we know at present that the asbestos form belongs to no exclusive mineral, but is only a peculiar condition under which many minerals may present themselves. It has been agreed to apply the name "asbestos" only to those fibrous minerals possessing the chemical composition of the augit or amphibolite. The ordinary German asbestos at Tyrol is of this class; also the mountain-cork of Tillerthal, and the fibrous travertine. The fibrous amphibolite forms a kind of asbestos, to which belongs the fibrous tale of St. Gothard, the fibrous Krokodyolith. In all these minerals a portion of the magnesia is displaced by basic water, and it is exactly the presence of this water which appears to give to these minerals the fibrous structure, and in general causes the crystalline structure to be found with one long axis, obliterating all outward aggregations of molecules. The term by which this is expressed scientifically is that those minerals are the result of a homoaxial paramorphose.

Other minerals adopting sometimes the arbut-like structure, are the serpentine and tourmaline. To this class belong the mountain-wood, which are found on Staten Island, United States, and the mountain-leather of the Tillerthal, Germany.

The ancients used the asbestos fibres for the manufacture of incombustible woven products, which they chiefly used to wrap up the corpses previous to burning them, so as to keep all the ashes together, which were then placed in an urn, and this in the burial vault. In this way they hastened the decomposition of the bodies in ashes, which in our present method of burials is the result of a during many years continued chemical decomposition. Most kinds of asbestos can not be spun or woven without intermixture of cotton or linen fibre, as the asbestos fibres are not quite long enough. The intermixture of longer fibre makes the operation quite easy, and when the fabric is entirely ready, it is simply placed in the fire, when the combustible linen or cotton is burned out and the incombustible asphalt texture remains.

It is an excellent material for the chemist as a filter. Being a silicate, it will filter acids which would destroy the ordinary filters. It is also used to dry air by placing the asphaltum loose in a tube like a sponge, moistening it with sulphuric acid, and passing the air through in a gentle current. Other properties and uses of this material we will mention later.—*Manufacturer and Builder.*

Our Iron Mines.

The Calaveras Mountaineer of the 2d inst., referring to an article in the Stockton Independent touching upon the iron mining interests of the State, has the following pertinent remarks:

The Independent is probably not aware that in the vicinity of Murphys there is known to exist one of the richest iron mines in the world. Ore from it has yielded as high as seventy per cent., while the poorest yielded fifty per cent. In addition to this, in the immediate neighborhood there are immense quantities of soapstone of the finest quality known in commerce. This is extensively used in the erection of furnaces. As far as timber is concerned, from which to get the charcoal necessary for use in the manufacture of iron, there is enough in the immediate neighborhood to keep a hundred furnaces running day and night for the next three generations. That paper well remarks "that it seems strange that an effort has not been made to work some of the valuable iron mines which are known to exist in this State." The answer to this is simple: Our capitalists have been encouraged by the press and the easy manner of making and losing money through stock speculation, to invest their money in mines abroad. In most of these cases it has been a losing game, and this has made them cautious when a known meritorious enterprise is offered for their consideration. The Independent further remarks that the "consumption of iron on this coast is rapidly increasing." This is so.—Calaveras, we predict, will have—before another decade has passed—used millions of tons of iron dug from her own mines. People may say we are sanguine on this point, but time, which at last sets all things even, will prove the assertion to be true. The known richness and vast extent of these mines will sooner or later cause their development. Their comparatively easy access and nearness to point of shipment is also another advantage in favor of development. We hope to hear more upon this subject from the daily press of the State.—*Calaveras Mountaineer.*

Ore Sampling.

A Mechanical device for sampling ores is much needed to replace the tedious and unsatisfactory operation of hand sampling now in use. Equal accuracy in results can be obtained by machinery in this as in every other kind of work, while treble the amount of labor can be performed in the same time. This is of course self-evident and it can only be by reason of the imperfections existing in such machines as have come under the notice of our mill-men, that they are not extensively in use.

Ores in this and adjoining counties are generally sampled after passing through the crusher where they are broken to the size of coarse gravel. In this state the ore proper (galena, zinc blende, and pyrites) is in a finer condition than the gangue; whatever dust there is, is valuable, while the larger pieces are mainly quartz. It can fairly be questioned whether any of the methods of hand sampling succeed in yielding a perfect specimen of the value of a small lot, though variations are as likely to occur on the side of the purchaser as on that of the owner, and while a fair result would be obtained in the long run, individual lots might be under or over valued, owing evidently to the different classes of ore submitted to the same kind of handling.

Again the different methods used by our mill-men and purchasers is proving a source of trouble. Discrepancies in assays such as have occurred at times between them, and which can only be laid to the varying results obtained in sampling, often appear on the surface as carelessness, or worse, on the part of the assayer. Either the adoption by all who buy ore of a uniform system of hand sampling or the use of good machines would bring about more satisfactory results for those whose living depends upon a correct determination of the value of their produce.—*Col. Mining Review.*

MINING IN MEXICO.—Mining in Mexico seems to have been improving for the past three or four years. The annual coinage is now \$22,000,000, and the production is probably about the same, for the smuggling of silver bars has been very slight lately. The yield of the country just before the revolt against Spain had risen to \$25,000,000, and was still, as it had been for two centuries before, steadily increasing; but the civil war was followed, immediately, by a great decline, and the standard of 1808 has never been reached. Sometimes the yield has not been more than \$10,000,000, and the average for the last sixty-five years has probably not been over \$16,000,000.

ARIZONA MINES.—On general principles, says the Prescott, Arizona Miner, we wish to brag of the mineral resources of this Territory, and on behalf of our miners and prospectors extend a cordial invitation to capitalists to come and look at our mines. We need Stetefeldt furnaces, good mills and millmen, and are willing to do everything in our power to secure them.

The Coos Bay News says, "There are four separate companies now organized for the construction of either railroads or canals, to connect the waters of the Coos Bay with the Coquille."

An Act Authorizing Joint Entry by Pre-emption Settlers, Etc.

The subjoined act is to go into effect at once, and orders have been given for the immediate preparation and issuance of circulars from the Land Office for the purpose.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, that when settlements have been made upon agricultural public lands of the United States, prior to the survey thereof, and it has been or shall be ascertained, after the public surveys have been extended over such lands, that two or more settlers have improvements upon the same legal subdivision, it shall be lawful for such settlers to make joint entry of their lands at the local land office, or for either of said settlers to enter into contract with his co-settlers to convey to them their portion of said land after a patent is issued to him, and, after making such contract, to file a declaratory statement in his own name, and prove up and pay for said land, and proof of joint occupation by himself and others, and of such contract with them made, shall be equivalent of sole occupation and pre-emption by the applicant. Provided that in no case shall the amount patented under this Act exceed one hundred and sixty acres, nor shall this Act apply to lands not subjected to homestead or pre-emption entry.

Sec. 2. That effect shall be given to this Act by regulations to be prescribed by the Commissioner of the General Land Office.

Approved March 3, 1873.

Scaling and Foaming Prevented and Fuel Saved.

Enquirers are respectfully informed that

WARSOP'S AERO STEAM SYSTEM

Has been well tested, during three years, in England. Besides the above advantages, it greatly prolongs the life of Boilers, Tubes and Fire-boxes.

It is a cheap contrivance, and easily applied to any engine.

Illustrated Circulars, showing the appliances and describing its advantages, are sent to all applicants.

All who are troubled with Scale and Foaming may rely on this system of prevention—also on saving at least 20 per cent. of fuel.

RIGHS for States and for individuals will be sold on liberal terms.

J. L. SANFORD,

General Agent for United States,

420 Montgomery street, San Francisco,

And Box 989, P. O.

Information Required to Give an Estimate of Warsop's Apparatus:

- 1.—Diameter of Cylinder.
 - 2.—Length of Stroke.
 - 3.—Number and Length of Boilers—Tubes or Flues.
 - 4.—Distance of Boilers from Engine.
 - 5.—Can Pump Piston be attached to Cross-head of Engine?
- It can, however, be driven by any of the usual appliances that work the Water-feed Pump. These items will enable us to give a near estimate of the cost.

L. SANFORD, General Agent,

Machinery.

N. Seibert's Eureka Lubricators.

THE HIGHEST PREMIUM

Awarded by the Mechanics' Institute Fair, San Francisco, and State Fair, Sacramento, 1871.

These Lubricators are acknowledged by all engineers to be superior to any they have ever used; feed constantly by pressure of condensed water supplied by pipe A, regulated under this oil by valve J, and forced out through check valve and pipe B into the steam pipe C; it then becomes greasy steam, passes to all the valves and cylinder at every stroke of the engine; glass tube I indicates amount used per hour. Packing on rod and stems lasts longer, and the rings on the piston will not corrode. One pint of oil will last from three to six days, according to speed and size of engine; I, adding gauge; K, valve to shut off when engine stops; H, F, valves to shut off in case of frost; steam does not enter the cup; it is always cool; warranted to give satisfaction. Patented February 14, 1871. Manufactured by California Brass Works, 125 First street, S. F. 24v23ti

IMPORTANT TO Quartz Mining Companies. IMPROVED PATENTED Hardened Cast Steel Shoes & Dies.

The undersigned are prepared, at short notice, to furnish IMPROVED PATENTED HARDENED CAST STEEL SHOES AND DIES, for Quartz Mills of every pattern. This improvement supplies a want long needed by persons engaged in Mining enterprises. They are more economical and cheaper than cast iron shoes, as they wear from four to six times as long, and crush a greater quantity, as they retain their full diameter, never chipping from the edges. This, with the time saved in replacing worn and broken iron shoes and dies, and the great saving of freight to remote mills and mines, makes a vast difference in the cost of reduction of ores.

WE ALSO FURNISH Cast Steel Tappets, Cams, Picks and Hammers,

Which possess the same advantage of Economy and Durability, and deserve the special attention of Miners and others engaged in quartz crushing.

The Superior Strength of these steel castings—the fact that they can be forged and welded as easily as bar steel—their cheapness and great accuracy, as compared with forged iron—cannot fail to make them desirable for many purposes, where forged iron and steel have heretofore been used. Among such articles we mention:

ROLLING MILL CASTINGS.
Bevel and Spur Wheels, Guides, Spindles, Dies, etc.
AGRICULTURAL CASTINGS.
Reaper Guards, Plow Shares, Mold Boards, Plow Joints, etc.

Anvils, Sledges, Vices, Masons' Hammers, Blacksmith Hammers, Mattocks, R. R. Frogs, etc.
And other articles requiring solidity and great strength.

DONKEY ENGINES FOR HOISTING, Mining Machinery, Etc. Persons giving orders will send diagrams and measurements of Shoes and Dies, etc., as above.

J. G. KITTREDGE & CO.,
No. 515 California street, San Francisco.
12v2b-4f

Notice is hereby given, that the copartnership heretofore existing between A. J. Severance, Charles W. Randall and J. Gus. Burt, under the firm name of "Severance, Holt & Co." is this day dissolved by mutual consent. A. J. Severance, having purchased all the interest of his late partners, will continue the business of manufacturing and selling Diamond Drills as before, under the style of A. J. Severance & Co. Dated San Francisco, Nov. 24, 1871.

STEVENSON'S PATENT MOULD BOARD AMALGAMATING PAN.

This Pan is far superior to all others in several important particulars. The grinding rollers are near the center, requiring less power. The plow-shaped grooves raise the quicksilver with the pulp regularly, with less power, without violence, and with better amalgamating effect, besides admitting of a larger charge. The inclined-shaped housings of the muller-plate openings efficiently force the pulp directly under the rollers.

Manufactured at the Golden State Iron Works (Co-operative), 19 First street, S. F.

Where it can be examined and further particulars be learned; or persons may apply to the inventor and patentee, Mr. O. O. STEVENSON, at the Douglas Mine, Gold Hill, State of Nevada, where the Pan has long been in constant operation. 15v20-1mr, lamtf

KNOWLES' PATENT STEAM PUMP.

It has no Cranks or Fly Wheel, and has no dead points where it will stop, consequently it is always ready to start without using a starting-bar, and does not require hand-work to get it past the center. Will always start when the steam cylinder is filled with cold water of condensation.

CENTRAL PACIFIC R. R. OFFICE OF THE GEN'L MASTER MECHANIC, SACRAMENTO, CAL., January 14, 1871.
A. L. FISH, Esq., Agent of the Knowles Steam Pump, San Francisco—Dear Sir: In reply to your inquiry as to the merits of the Knowles Steam Pump, in use upon this road, I will say that it gives me great pleasure to report that they have performed their work well whenever called upon. In no instance have they failed. We have now over 30 of them in use on this road as fire engines, and pumping water for shop and station use. I consider the Knowles Steam Pump the best in use, and prefer it to any other. Yours truly,
A. J. STEVENS, General Master Mechanic.

Messrs. KNOWLES & SIBLEY, 32 and 34 Liberty street, New York—Gentlemen: In reply to your note of 31st, requesting my opinion of your Steam Pump, etc., as suggested from my experience with them in a coal service, I have to state that I have used your pump, and entertain the most favorable opinion of their great merit and usefulness, and for every purpose well, we them to be superior to any others, and have so recommended and adopted them. They have given complete satisfaction in all cases that have come under my observation. Yours very respectfully,
WM. W. WOOD.

A. L. FISH, Agent Knowles' Steam Pump—Dear Sir: In answer to your inquiries, we state that the highest award for Steam Pumps at the Eighth or last Mechanics' Fair in San Francisco, was a First Premium and Diploma, awarded to the Knowles Patent Steam Pump, as published in the Official List September 23d, 1871.

BROWN'S PATENT LAMP.

One of these Lamps, when placed at a distance of 200 feet from the bank, will light up a bank surface 250 feet in length and 150 feet high, and to a much better advantage than any other light heretofore tried, and at an expense not to exceed five cents per hour. Lamps furnished at short notice.

Letter of Recommendation.

MR. C. B. BROWN—Sir: Your Patent Lamp for lighting hydraulic mines, which you sold to me in December last, has given entire satisfaction, and far exceeds my expectations, and I think it the best and cheapest light ever used to light mining claims by night, and am satisfied that I have saved three hundred dollars by the use of it in the last mining season over pitch or any other light of the same brilliancy; and I will also say that if I could not get another lamp, five hundred dollars would not buy it. Yours,
W. D. APLIN.

Little York, Nov. 5, 1872.

For further particulars, address,

BURLEIGH ROCK DRILLS —AND— Air Compressors.

The Burleigh Rock Drills, which have stood the test of five years' constant use at the Hoosac Tunnel, and which are now in use in nearly every State in the Union, as well as in Europe and South America, are unequalled in efficiency and economy by any other Drilling Machine. They are of various sizes, and equally well adapted to Tunneling, Shafting, Open Cut or Quarrying, and will drill six to ten inches per minute in granite. They are driven by steam above ground. The Burleigh Air Compressor is the best engine yet devised for furnishing the "air motor" for the many purposes to which it is now being used.
They are to be used on the St. Gothard Tunnel, Switzerland; Tunnel 13 miles long. We refer to the following gentlemen and works:

Gen. Newton, U. S. A. Hell Gate Tunnel, L. I.
Messrs. Shanley Hoosac Tunnel, Mass.
J. Dutton Steele Nesquehoning Tunnel, Pa.
Sidney Dillon Fourth Avenue Work, N. Y.
Col. Roehling East River Bridge Company, N. Y.

DEWEY & CO.,
American and Foreign
Patent Agents.
No. 338 Montgomery St.,
SAN FRANCISCO.

Established in 1860. Inventors can rely upon the
surety and dispatch of all important and confidential
business entrusted in our hands. Long familiarity with
Mining, Farming, and all other classes of inventions on
this coast, enables us to give the most intelligent ad-
vice to PACIFIC COAST INVENTORS of any Agency in the
Union, and oftentimes saves unnecessary delay and ex-
pense. Every branch of the patent soliciting business
attended to. All worthy inventions patented by us
will be liberally noticed, free, at the most desirable
time for the patentee, in both the MINING AND SCIENTIFIC
PRESS and the PACIFIC RURAL PRESS.

HINTS FOR INVENTORS.
We will send on receipt of stamp for
postage, FREE, our 32-page Circular,
containing 112 Illustrated Mechanical
Movements; a digest of PATENT
LAWS; information how to obtain patents, and about the
rights and privileges of inventors and patentees; list of
Government fees, practical hints etc., etc. Address DEWEY

RECOMMENDATION.
St. Patrick Mill, Placer Co.,
Feb. 10, 1873.
JOSHUA HENDY, ESQ., SAN FRANCISCO:

Dear Sir: We, the undersigned, take pleasure in giving
you the following testimonial as to the merits of the Hendy
Governor, which we ordered from you about four months
ago. Though more than pleased with its workings at first,
we deferred writing until we had tested it thoroughly.

Our engine is 12x36 (carrying 70 lbs. of steam), driving 15
stamps, 725 lbs. each; 1 Wheel r Pan, 1 Knox Pan, 6 H. ndy
Conc. ntra ors. The discarded Governor was the common
"Arm and Ball Governor" it giving but poor satisfaction,
we decided to try the "HENDY," and are pleased to report
in its favor for the following reasons:

1st. It SAVES US FUEL. Previous to attaching your Gov-
ernor we were burning 3 1/2 cords of wood per 24 hours. We
now consume but 2 1/2 cords doing the same work.

2d. FOR SAFETY. The "trip" saved us from an expensive
smash up but a few days ago, during the temporary ab-
sence of our engineer. The Governor kept the Pul-
leys. Your little automatic trip worked like a charm, and
but one or two revolutions was the result, and no damage.
Had we been using any other Governor, the probability is
that we would not have had a whole cam in the mill.

3d. It is A PERFECT GOVERNOR. We can turn off the
Wheelser Pan and hang up one-third of our stamp, without
any perceptible change in speed.

4th. THE ADJUSTMENT for regulating the speed without
increasing or reducing the size of our Governor pulley, is
admirable, and as easily managed as setting a clock.

5th. It is SIMPLE and not liable to get out of order, or
requiring more than ordinary care.

Yours respectfully,
JAS. H. CROSSMAN, Supt.
(Signed by request.) GEO. H. BARNEY, Chief Eng'r.

The system of transporting material, such as Ores,
from the mine to the mill, Earths for embankments,
Rock from quarries, etc., by means of steel wire rope,
has been well tested and found more economical,
advantageous and reliable than any other method
of transportation; and to the annexed certificates in con-
nection therewith I beg to call the attention of those in-
terested:

EUREKA, Nevada, July 10, 1872.
T. M. MARTIN - My dear Sir: On your leaving for San
Francisco, it gives me great pleasure to hand you my
written acceptance of the HALLIDIE TRAMWAY put
up by you upon our mine in Freiburg.

It is a perfect success, discharging ten tons of ore per
hour with two men's labor. It is perfectly simple in
construction, and, as far as I can judge, there is nothing
about it to ever get out of order—nothing to wear out.
While ours requires but about two thousand five hun-
dred feet of wire rope, I can see no reason why the line
could not be extended almost indefinitely with equally
happy results. Again, the carrying capacity might be
doubled or quadrupled if desired. After several weeks
trial upon our mine, the unanimous verdict of all who
have seen it is a complete, unquestioned success. If
this can be of any service to you, use it in any way you
think proper. Very respectfully, O. C. GOODWIN.

EXUMA HILL CONSOLIDATED MINING CO.,
Little Cottonwood, Utah.
Superintendent's Office, Sept. 28, 1872.

T. M. MARTIN, Esq.—Sir: The Ropeway constructed by
you (HALLIDIE'S PATENT) for the Exuma Hill Consoli-
dated Mining Company, has been built in a most substan-
tial and workmanlike manner, and is at this time in splendid
working condition. I most cheerfully accept the work for
the Company, and recommend it to others wishing a safe
and speedy transit for ore over places impracticable for
wagon roads, etc. Respectfully,
L. W. COLBATH, Superintendent.

"The Vallejo works smoothly with the elevated wire
tramway, which carries its load of ore as quietly and easily
as if there was no winter or snow in the world."
"Whatever the objections to wire tramways may be on
account of their cost, I have seen nothing yet that even
approaches them in the facilities they afford for moving
ore at all seasons of the year."—Correspondent Utah Mining
Journal, Alta, Jan. 8, 1873.

The Vallejo Ropeway.
The Vallejo Tunnel Company's Tramway in Little Cot-
tonwood, built on the HALLIDIE PATENTED PLAN, is a
complete success. It is between 2,400 and 2,600 feet in
length, and is supported by thirteen stations. The fall in
this distance is about 600 feet, and the wire rope, which is
three-fourths of an inch in diameter, will safely and easily
deliver one hundred tons in six hours. The machinery is
automatic, loading and unloading the sacks or buckets.
About one ton and a half can be sent down at one time.
The stations are about two hundred feet apart, and the entire
apparatus is strong and safe. As the wire rope is elevated
about forty feet above the surface of the hill, the Tramway
can be worked all winter long, without the slightest trou-
ble.—Utah Mining Journal, Salt Lake, Sept. 22, 1872.
Mining Companies and others desiring to negotiate for
the erection of this system of Ropeway, can communicate
with me personally, or through Postoffice Box 264.

A. S. HALLIDIE, Patenteo,
112 and 114 California Street, SAN FRANCISCO.

WIRE ROPE
For hoisting from mines, transmitting power, ship rigging,
etc., of all kinds and sizes, on hand and made to order.
Wire of all kinds and descriptions, furnished at lowest
rates. A. S. HALLIDIE, 112 and 114 California St.

Number 17.

Important to Smelters—A Patent Section Slag Pot.

Prior to the White Pine excitement of four years ago, the only gold and silver-bearing ores of the Pacific Coast that received any attention from our prospectors and capitalists, were those that could be reduced by mill process. The milling process consists of reducing the ore by means of heavy stamps, to a fine state of mechanical division, and subsequently extracting the precious metals by amalgamation. Certain milling ores, however, require to be roasted, in suitably constructed furnaces, in order to set the precious metals free, so that the quicksilver can amalgamate with them. Soon after the discovery of the White Pine and surrounding districts, it was proven by experiment, that although some of their gold and silver-bearing ores could be easily worked by the ordinary mill process, the ores of the base metal range, owing to the presence of more or less lead, could not be profitably reduced by any known milling process. Attention was therefore turned to smelting, and the discovery in California, Nevada and Utah of vast bodies of lead ore, containing gold and silver in paying quantity, has created a new era in the metallurgy of the Pacific Coast. The smelting furnace thus far principally used in reducing these "base metal ores" is a modification of the ordinary iron blast furnace. The charcoal and ore alone, or else ore mixed with the proper fluxes (if these be required), are fed into the furnace in alternate layers, at a distance of ten to twelve feet above the level where the jets of air are forced into the furnace. As the charge of charcoal and ore moves downward, it becomes heated, first to redness, and subsequently to the smelting point. This temperature attained, the lead, gold and silver are separated in the metallic condition, while the iron, lime and other constituents of the ore are converted into slag. The metal finds its way to the bottom of the furnace—the slag, being lighter, floats upon the melted metal. The metal is drawn off at intervals from the bottom of the furnace and the slag runs off as fast as formed, over a slag spout, into a slag pot. A great improvement has recently been made in the construction of these slag pots, an illustration of which is shown on the accompanying page.

Figure 1 shows the form of the ordinary slag pot, which is simply a conical cast iron pot, with three legs upon which it stands, and four trunnions by which the pot is handled. These slag pots are about two feet high, and weigh four to five hundred pounds, according to their thickness. Foundrymen are familiar with the fact that iron castings of irregular form and unequal thickness in their different parts, are often very fragile. Sometimes it even happens that such castings will remain apparently perfect for some days, and then suddenly crack and fall apart spontaneously. But commonly, such fracture requires a disturbing cause.

The ordinary slag pot, when cast with the usual precautions, will bear transportation and a certain amount of rough handling without cracking. But the effect of running into them a slag heated sometimes to whiteness, is the same in kind though less in degree, as pouring boiling water into a thick glass tumbler. The ultimate consequence is a crack, and the "skin" of the casting being broken, the forces opposed to cohesion (produced during the first cooling of the pot in the "flask"), held in check before breaking of the "skin," now overcome the cohesive force, and the crack rapidly opens into a V shape, as shown in Fig. 1, and sometimes extends half way down the pot. In this condition, a pot is quite useless—the iron of an old slag pot being too much "burned" to be fit for recasting. Fig. 3 shows the section slag pot invented by Prof. R. H. Fisher of this city, the patent for which was obtained through the SCIENTIFIC PRESS agency. The illustration speaks

for itself. As shown in the figure, the slag pot is cast in sections. The edges of the sections are turned in a lathe, then washed with a strong solution of Sal Ammoniac, (to produce a perfectly tight "rust joint"), and after being put together are firmly held in place by iron bolts, passing through the four ears or lugs on the edges of the sections. The value of the patent section slag pot has been fully tested, and is now used almost exclusively at the Richmond furnaces at Enreka, Nevada.

A crack commencing at the top of one of these slag pots, is of course limited to the section, and experience has proven that a crack does not open, as in Fig. 1., but remains sufficiently closed, as represented in Fig. 4., to permit the pot to be filled to the usual height with slag.

Should the top section crack in more than one place and become useless, the sections being "interchangeable," a new top section (costing only one-third of the price of a whole pot), puts the old pot into a thoroughly renovated condition.

It sometimes happens with the ordinary slag pot, that the bottom is cracked by hot slag the first time it is used. When slag pots are cast in sections, there does not exist the same strain upon the different parts of the pot as if it be

cast in a single piece. The bottom section of the new slag pot seldom cracks, but in case of such mishap, it is renovated by replacing the broken bottom section.

Some idea of the importance to smelters of this simple invention will be conceived upon considering that the ordinary slag pot weighs four hundred pounds or upwards, and if transported from San Francisco to any considerable distance from a railroad station, they cannot be laid down at a cost (including freight) of less than fifty dollars. Beside the "Patent Section Slag Pot," Prof. Fisher has invented a new "slag spout," a "tweezer tester," by which a leaky water tweezer can be detected almost immediately; and a means of preventing the formation in tweezers of the incrustation (from the use of impure water) that is so frequent a cause of "burning out" the tweezer. Patents for all these inventions have been secured through the agency connected with this office. The "slag pot" is manufactured by Messrs. Hawkins & Cantrell, No. 210 Beale street, San Francisco, who may be addressed for further information.

ACADEMY OF SCIENCES.—The rooms of the California Academy of Sciences on Clay street between Montgomery and Kearny are open on Mondays, Wednesdays and Fridays, from 9 A. M. to 4 P. M., when visitors may inspect the curiosities. The collection of the Academy is large and varied and while but a small proportion of it is in a position to be examined as yet, it will repay a visit to those who have an interest in natural history. Most of the specimens to be seen are of Pacific Coast origin and as no entrance fee is required a good chance is given for every one to see them.

The Dangers of Coal Oil and How to Avoid Them.

During the year 1872, fifty-nine fires—the largest number from any one cause—originated in Philadelphia, from the explosion of coal oil and lamps, and about 100 deaths were caused from these fires and from coal oil explosions, not attended by fires. This is an enormous loss of life and property to be charged to a single cause, in a single city.

The number of deaths from similar causes in the entire Union, during 1871, was about 3,500; and probably three times that number were more or less severely burned or maimed. These facts have carefully been collected by insurance companies, whose interest and business it is to collect such statistics. This is a terrible record indeed; and when the fact is borne in mind that nearly nine-tenths of the casualties are the results of sheer carelessness, which the most trifling caution or forethought

accidents will certainly be avoided; for the more volatile the oil the cheaper can it be afforded, and the more dangerous is the compound.

Accidents often occur from the evaporation of cheap oils so filling a room as to render the gas explosive, as is the case when ordinary gas escapes from a burner, and a light is brought into the room—the gas is fired more surely and suddenly than gunpowder would be under such circumstances. When the mixture of gas reaches an extent of four parts of gas to one of common air, the compound is highly explosive. No family can be safe with a can or lamp of kerosene standing near a hot stove.

A burning wick turned down becomes a live coal. It consumes but little oil and gives but little light; but it always heats the tube to a dangerous extent, thereby raising the temperature of the oil in the lamp, causing rapid evaporation, which is liable to find its way, in company with the right proportion of atmospheric air, to the small blaze, and an instantaneous explosion takes place. Never turn the wick of a kerosene lamp down very low, except when you do so to extinguish it.

Coal oil, when first introduced for general illuminating purposes, had a burning point of 125°, and was used with great timidity and care. The accepted standard has since been reduced to 110°, and familiarity has led to its more careless use. Dealers often mix light oils with that of the 110° degrees of that standard, thus reducing it still lower, because the lighter oil is also cheaper; and moreover such a mixture gives a better light. Many customers will have the best light, careless or ignorant that the danger increases with the brilliancy of the light.

Dealers in light oils, to show the safety of their oils, make vain attempts to set it on fire in an open vessel. Let them fill a lamp half full with it, and allow it to reach the warmth that always exists in a lamp after it has been burning an hour, so that the vacant space may be partially filled with the oil vapor, and then try to set it on fire, and our word for it, they will accomplish the thing most effectually.

All the light forms of petroleum, when not closely confined, are constantly though slowly generating vapor, even when the temperature is not more than 10 or 12 degrees above the freezing point; and any oil that generates vapor, rapidly, below two degrees, should be considered very unsafe.

A good and simple way of testing oil is as follows:—Take a small four-inch test tube, which can be obtained at the druggist's for ten cents; fill with oil, place it in the ordinary temperature of a room in summer, and if the evaporation exceeds one-fourth of an inch in 24 hours, the oil is not safe. The best oil will thus remain for days without any perceptible diminution. In the absence of a test tube, a two ounce vial will answer, but the evaporation will be much less, owing to the contraction of the neck of the vial. We recommend to every one to try some simple test before using any new lot of oil.

SATURN SMELTING WORKS.—A dispatch from Salt Lake states that the fire reported at Sandy on the 22d was at Saturn Smelting Works, and not at the Germania. During the absence of the Salt Lake steam fire-engine, two small fires occurred in that city. The engine returned to Salt Lake, leaving the charcoal burning, it being impossible to extinguish it. A terrible wind storm prevailed at the time of the fire; 15,000 bushels of charcoal, four freight cars and 350 feet of the Utah Southern track were destroyed.

might have avoided, the problem becomes still more perplexing.

The use of petroleum is still in its infancy. It is less than fifteen years since its introduction became general; yet the great cause of civilization cannot do without it. Like gunpowder and steam, it has become indispensable. Like those agents, also, in the hands of knowledge, it is a faithful servant; but in the hands of ignorance a terrible master.

The authorities of this city have been and still are very much exercised over this matter. The necessities of the day will not permit its disuse, and beyond certain rules in regard to its sale our authorities cannot go.

The press is continually repeating its words of caution, and almost daily giving the particulars of such accidents, and often pointing out the particular phase of carelessness from which they originated. As we write, we call to mind several instances of gross carelessness, which did not find their way "into the papers," but which have recently occurred almost, and in part, directly under our own observation, and in most intelligent families, where utterly, inexcusable carelessness came near resulting in serious casualties.

What is to be done? The first thing is to restrict the sale of illuminating fluids to the very best article the market affords, even if it cost double what the cheapest can be bought for. The price of the article is low enough, even at the highest figure—by observing this as the chief and first rule, a great number of

Coin and Bullion.

This actual coin supply in San Francisco is a matter of interest. There is probably not over \$15,000,000, and possibly not more than \$12,000,000 in coin in the vaults of the city. It is well known, says the *Bulletin*, that the drain hence for the past two months has been very heavy. Our sources of supply are the Mint and the Express Company. The coinage at the Mint for the first quarter of the year, together with the receipts through the Express, have been as follows:

Coinage at Mint.....	\$3,259,400
Receipts by Express.....	2,404,328

Total supply.....\$5,663,728

Against this amount there have been demands for the payment of duties, for remittances to the interior, and for shipment to New York and other distant markets as follows:

Demands for duties.....	\$1,940,959
Remitted to interior by Express.....	3,559,695
Gold coin exported.....	3,469,043
Silver coin exported.....	15,940

Total withdrawn.....\$8,985,637

To this sum must be added the shipments through the mails, the aggregate of which is not known, but variously estimated at from \$2,000,000 to \$3,000,000. This money will work back again in time, though for the present there will be inconvenience.

The descriptions of treasure shipped from San Francisco during the first quarter of the year, through regular mercantile channels, have been as follows:

	Jan.	Feb.	March.
Gold Bars.....	\$198,681	\$69,954	\$129,237
Silver Bars.....	745,766	393,162	393,080
Gold Coin.....	227,412	1,465,349	1,776,302
Silver Coin.....	10,000	5,940
Gold Dust.....	1,630	3,230	2,500
Mexican Dollars.....	443,280	315,448	249,255
Totals.....	\$1,026,742	\$2,247,123	\$2,554,111

The aggregates for the quarter compare as follows with the same quarter last year:

	1872.	1873.
Gold Bars.....	\$2,225,346	\$397,875
Silver Bars.....	1,834,799	1,634,028
Gold Coin.....	1,511,169	3,469,043
Silver Coin.....	64,773	15,940
Gold Dust.....	2,375	5,110
Mexican Dollars.....	353,573	1,607,983
Totals.....	\$5,030,035	\$6,427,979

The comparison shows an increase for this year of \$400,000. It is probable that as much has gone through the mails since January 1st as for the same time last year. The amount thus shipped is not definitely known, but will probably approximate \$4,000,000, mostly in gold coin. The results of the above table are interesting. It will be seen that there has been an increase of over 100 per cent. in the gold coin shipments. The amount of fine gold sent is quite small compared with last year, while there has also been \$350,000 less of fine silver and \$650,000 more in Mexican coin. Of the \$4,236,000 in treasure shipped hence in the first quarter of 1871, \$2,201,000 was in fine silver, \$1,161,000 in fine gold, \$429,000 in American gold coin, and \$443,000 in Mexican silver coin. Two-thirds of the treasure shipped this year went to New York.

It is a difficult matter to determine the bullion product of the Coast, since it is diverted into various channels. Formerly, nearly all came to San Francisco for a market. Now, large sums go direct from the mines to New York and London. The bulk of that brought to the city comes through the Express Company. The amount reported through that channel for the first quarter of the year, was \$951,300 in fine silver and \$2,081,700 in fine gold and dust, making a total of \$3,033,000. Another way of ascertaining the product is to take the amounts sent to the Mint for coinage and add to them the bullion exports. During the first quarter of the year the San Francisco Assaying and Refining Works sent the following sums to the Mint in this city for coinage purposes:

	Gold		Silver	
	Ounces.	Value.	Ounces.	Value.
January.....	61,063	\$1,252,473	3,391	\$4,549
February.....	48,292	983,780	3,747	5,027
March.....	47,684	977,112	2,630	3,393
Totals.....	157,039	\$3,213,365	9,668	\$12,969

We will now add the bullion exports for the quarter through regular mercantile channels, as follows:

Fine gold deposited at Mint.....	\$3,213,365
Fine silver deposited at Mint.....	12,969
Fine gold exported.....	397,875
Gold dust exported.....	5,110
Fine silver exported.....	1,532,028

Total from January 1st to March 31st.....\$5,166,347

Bullion receipts by Express for same time....\$3,033,030

Discrepancy.....\$2,133,317

There are two explanations for this discrepancy. One is found in the fact that there was some bullion carried over from 1872, and the other is that some bullion has been received through private channels. We believe the receipts for the quarter were much nearer \$5,000,000 than \$3,000,000.

NEW ZEALAND COAL.—The subject of coal is attracting attention in New Zealand. There were imported into that colony last year 93,867 tons of coal, the total value of which was \$121,151. There were exported 1,698 tons valued at \$1,612.

COOMBS & TAYLOR, of 109 Market street, advertise for 150 ship carpenters, to work four months, at \$5 per day—nine hours to constitute the working day.

Mineral Resources of Amador.

Notwithstanding the vast and exceedingly valuable agricultural resources of Amador county, says the *Stockton Independent*: Its greatest wealth has not yet been referred to. As a mineral county it must be considered the leading one in this State. Every old Californian has heard of her rich placer mines, now, however, mostly exhausted, and the fabulous richness of the Hayward quartz mine at Sutter Creek, from which one of California's noted millionaires gained his great wealth, has been so frequently written about that every person in the State is familiar with its story. The quartz mines of the county are still yielding their treasure to the persevering miners, and several mines besides the Hayward mine are still being

Worked at Immense Profit.

Fortunately for this county, these mines are worked for profit at the mine rather than upon California and Montgomery streets, and the owners make their profits therefrom in the shape of dividends, rather than by hawking and bearing the stock in the Board of Brokers of San Francisco. Several hundred men are constantly employed in these mines, and the supplies for them and the machinery for the mills (excepting such as is made at a foundry at Sutter Creek) is transported from the line of the Western Pacific Railroad at great expense. Stockton has none of this trade, and it is today within her grasp, provided her people will but put forth their hands to control it.

Valuable Copper Mines

Also exist in this county, which were worked with profit several years ago, and large amounts of ore shipped therefrom to market. Work was stopped, however, on account of the decline in the price of copper, and the great expense of shipping the ores to market, and for several years nothing was done to develop these important interests. The suspension of the work, however, has probably been a very fortunate circumstance for the present owners of the mines. At the time the work was stopped, some of the tools used were left in the pits, which in time became partially filled with water. When this was pumped out after the lapse of two or three years.

A Remarkable Discovery

Was made. Every piece of Iron and steel that had been left in the mine, where it had been covered with water, was found to be completely decomposed, while around it had formed deposits of crystallized copper, nearly pure. Shovels, hammers, drills and iron bars were completely eaten up by the action of the water, but in their place deposits of copper were found, generally resembling in shape the pieces of iron which had thus so singularly disappeared. Drills and iron bars had, in that singular laboratory, been mysteriously changed into irregular copper tubes. The iron car wheels and the iron fastenings of the car had all passed through this transmutation. The ring and hook attached to the manilla rope used for hauling out the car was covered by the water in the pit, every sign of the iron ring and hook was gone, but in their place a large copper ring and hook were perfectly formed, with the exception of a cavity of the exact size and shape of the iron ring and hook, around which the copper had been precipitated, while the manilla rope retained its original appearance and was still firmly attached to the copper ring which had so singularly taken the place of the original iron one. The owners of this mine have taken advantage of the knowledge thus obtained, and this mine is now

Being Successfully Worked

By a process of which the above was the first example. It is found that the mine contains quantities of sulphurets of copper which, on being exposed to the atmosphere, rapidly oxidize and change to sulphate of copper, a salt that is soluble in water. The ores are now taken from the mine and exposed to the air so that they may become completely oxidized when water is turned over them to dissolve the sulphate of copper, and then run through vats filled with scraps of iron. The sulphuric acid which holds the copper in solution having a stronger affinity for iron than for copper, unites with it, and the copper held in solution is precipitated in these vats, and can be gathered in large quantities. The copper thus obtained is nearly pure, assaying ninety-two per cent., and hundreds of tons are being obtained from ores which by any other process would not pay for working. The owners of this mine—Messrs. Glidden and Williams, of Boston, Mass.—are much encouraged by their present prospects, and consider it a very valuable piece of property.

The Same Vein of Copper

Passes through Amador county from north to south, and has been opened at several points, at all of which the same character of ores are obtained. This will soon be a valuable interest in that county, and would afford a large amount of business for a railroad.

PLACER MINES NEAR OROVILLE.—A dispatch from Marysville states that great excitement prevails in the vicinity of McConnell's Ferry, near Oroville, over the discovery of rich placer diggings. One claim was sold for \$2,500, and as high as \$6,000 offered for others, but declined. The new district covers a space of about four square miles.

"Wage-Laborers" in Massachusetts.

Wishing to find out the number and average earnings of the "wage-laborers" in Massachusetts, General Oliver and his deputy have made a thorough study of the United States census report of 1870, and have based elaborate calculations upon the figures therein given. It seems that there were then reported in Massachusetts about 550,000 male persons above the age of 10, and that about 450,100 of these had specified occupations. More than 320,000 of these are included in the tables of wages given by the Labor Bureau; besides about 90,000 women and girls, out of 123,000 put down in the census report as having some occupation. There are, therefore, more than 400,000 employed persons, whose wages and earnings are averaged in the volume before us. The general result is that, of skilled laborers, the men get, 280 working days in the year, average earnings of \$536½; the women earn, in the same time, \$237 each; and the children earn \$151; the average annual earnings for all persons being somewhat more than \$308. The unskilled laborers fall below this rate, and earn (the men) only \$422 a year—no figures being given for women in these employments. It must be remembered that these sums are all estimates of the result of computation. Whenever the actual earnings are returned, they are generally higher than these figures. For example, carpenters are set down as earning less than \$600, but one in Fitchburg, who returns his exact wages, gives \$962.50 for 275 days—the table showing only 262 days as the average working time. Laborers are set down as earning less than \$400, but one who returns his wages gives \$360 besides board—equal to at least \$460. In the same family one boy is plumber's apprentice, and earns \$260 a year, almost twice what the table allows him, which is \$135 only; and a second boy whose occupation is not specified, earns \$182, though the average of the table would give him but \$151. From these instances, and for other reasons that might be given, we conclude that the average earnings as computed by the Bureau are at least twenty per cent. too low.—*Christian Union*.

What Becomes of the Quicksilver?

What becomes of all the quicksilver brought to this State and used in our reduction works is a matter worthy of receiving the critical attention of some of our scientists. Quicksilver in large quantities is constantly being brought to the State and not an ounce is ever sent away. After it has been used in amalgamating the precious metals contained in the ores operated upon, it is separated from the metals with which it is combined by retorting and is again used in the amalgamating pans. Thus it is used over and over until it has disappeared. Whether it floats away with the water used in amalgamating or is lost by evaporation, there must be vast quantities of it collecting somewhere, as it is a metal not easily destroyed. In case it is lost by evaporation it must condense and fall to the ground somewhere near the works in which it was used, and if it floats away in the water it must eventually find a resting place on the bottom of the stream in which it was floated away. It is an axiom among millmen that "wherever quicksilver is lost, silver is lost;" therefore there must be a great amount of silver lost, as we shall presently see. The amount of quicksilver furnished mills in this section of the State alone by the Bank of California averages 800 flasks of 76½ pounds each, or 61,200 pounds per month. This in one year would amount to 734,400 pounds of quicksilver, that goes somewhere, and counting backwards for ten years shows 7,344,000 pounds that has gone somewhere, either up the flue or down the flume. The quantity of quicksilver distributed monthly among the mills shows just how much is lost. None is sold or sent out of the country with the bullion; therefore, if there was no loss, the mills would never want any more quicksilver than enough to give them a start at first, as the same lot could be used over and over, ad infinitum. But there is a loss and a very large one, as is exactly shown by the demand for quicksilver, as it all goes to supply the place of that lost.—*Virginia Enterprise*.

COAL AT LANCHA PLANA.—The Amador Ledger hears the most flattering reports from the coal discoveries at Lancha Plana and near Buena Vista. Samples of the coal have been sent to Sacramento and Stockton and other places, and experts have reported very favorably upon the quality. It appears that the top strata is a little hard and dull, yet makes a very hot fire. That taken from the third and fourth strata improves and works admirably in plain blacksmiths' fires. We feel highly gratified to think that little Amador county contains such promising evidence of future wealth, for when these coal deposits are properly opened and an easy mode of approaching a ready market obtained, the owners will become rich, a large number of workmen will have employment, and all the county be benefited. The Stockton and Lone Narrow Gauge Railroad will pass along the line of these valuable coal deposits and will furnish easy and cheap transportation to market. We understand that a contract has already been taken to supply one hundred tons of coal each to Sacramento and Stockton for trial.

Hydraulic in Plumas County.

The Hungarian Mining Company purchased the claims on which they are now operating a little less than a year ago, for the sum of \$50,000. They at once commenced the work of introducing all the modern improvements in hydraulic mining, and are now only getting into fair running order. The company have already laid out over \$40,000 in improvements, and are still under heavy expense. Thousands of feet of huge iron pipe have been laid, large flumes have been built, reservoirs constructed, miles of ditch dug, and still the work goes on. The company are now piping in what is known as Quigley's ravine, on the west end of the diggings, where they are opening a new claim. The flume here is in four sections, making a length of 1,800 ft. The flume is very substantially built, is four ft. eight inches wide inside the blocks, and on six inches grade works well with 1,000 inches of water. Two large undercurrents catch all the fine dirt, and it seems impossible for the gold to escape. Between the sections of flume are ground sluices, so arranged as to break up the dirt, which might otherwise pass off in "chunks." The bank of gravel at this place is from 100 to 200 feet deep, and contains gold from the surface to the bed-rock. Two large "giants" are worked against the bank, throwing some 900 or 1,000 inches of water. With a pressure of 300 feet these pipes keep the flume constantly filled to its full running capacity, and the bank seems fairly to melt before their almost irresistible power. Rocks weighing hundreds of pounds are tossed about the flume to land in the cañon below.

In the old workings on the north side of the claim the company have constructed a new flume three feet wide through the whole length of the tunnel, and at the lower end have placed undercurrents sufficient, it seems, to render the escape of gold impossible. The main pipe is finished to this point also, and two or three days work will place the remainder of the machinery in position to commence piping. Here the former owners did all their work on these claims, and from their noted richness, the yield under the present appliances must be immense. The company own some one hundred and fifty acres of ground, and from what we see and know of its richness, we believe it to be the most valuable gravel claims in the State.

THE MECHANIC.—Popularly the mechanic is considered to be a little more than a skillful handler of the tools of his specific trade, rarely or never being called upon to exercise the higher intellectual powers, such as reflection, reason and judgment. Very little thought, however, will convince any one that such a notion is far from being a correct or complete one. Correct, it may be, as far as it goes, but very incomplete. To dexterously use the hammer, the plane or the file requires long and tedious practice, and exact an extensive acquaintance with the nature of the material operated upon; the many mechanical and physical laws which govern the same, in numerous varied conditions and circumstances. The mechanic to be truly worthy of the name, should thoroughly understand the groundwork of the mathematics. At least, he should be an adept in the use of fractions, decimals, and the calculations of common ratios. Then again, sketching and practical drawing with the laws of light and shade are indispensable to a workman of even ordinary ability. These are a few of the many qualifications requisite to constitute a worthy competitor for the name of mechanic in the latter days of the celebrated Nineteenth Century. *Manufacturers Bulletin*.

LOCOMOTIVE CONSTRUCTION AT SACRAMENTO.—The new enterprise of constructing locomotives at the railroad shops in this city is no longer a doubtful one. The original order was to build ten freight locomotives. Lately this order was amended by adding, "and two passenger locomotives." Thus, twelve in all are to be built. Two-thirds of the iron work for these is already completed. The passenger engines will have 18-inch cylinders, the others being 17 inch. All the wrought iron work is being made out of scrap-iron, and in this respect, as in others, the locomotives will be superior to any made by Eastern manufacturers. The whole work is being done better than is usual in shops where locomotives are made for sale. Norway iron is used largely, which is an item of superiority. More general care is taken in the whole work than is usual. Exceeding strength and durability are the essentials aimed at. The heaviest of these iron horses will reach thirty-five tons, while none will fall below thirty tons. One hundred and fifty-four men in the iron works are now bending their energies to accomplish the rapid building of these locomotives, besides carrying on the general business of the shop. The whole is under the supervision, so far as the iron work is concerned, of one of the most methodical and careful of foremen, Lashella.—*Sac. Rec.*

DIABLO COAL.—The Antioch Ledger of April 12th has the annexed: "The vast amount of coal which has been taken from the Diablo range of mountains has given our county somewhat of celebrity as a coal-producing region, and there is no doubt that greater developments will yet be made. One writer has asserted, and substantiated with sound argument, that the coal veins of Diablo are but the outcroppings or upheavals of the great bed of coal which underlies this immediate section of the valley. The dip of the veins would indicate this, and the same is substantiated by the outcroppings found on the Montezuma hills opposite, in Solano county."

MECHANICAL PROGRESS.

Hints on Forging Iron.

An interesting book was published some time since, in England, containing much valuable information given to Government by the most eminent firms in that country, upon the subject of forging iron. A brief summary thereof may not be devoid of interest and value, as these sources of information are not often applied to by, or accessible to, the general public.

With respect to the best mode of securing from deterioration the store of raw iron, the opinion is expressed that it should be kept under cover, and exposed as little as possible to the influence of moisture. The best iron is that which is most frequently worked, or which in the manufacture undergoes the greatest number of processes at a welding heat; such as iron produced from re-manufactured scrap and old iron.

The cleaning of the scrap iron previous to manufacture is recommended to be done in the chainable cleaning machine as far as possible. By this means, not only will the scrap iron be perfectly cleaned, but the cleaning of the chainable will be facilitated by the increased attrition thus produced.

With reference to the means of producing sound smith's work, the most fertile sources of defects which from time to time have been experienced are:—(1) The original inferior quality of the iron; (2) Improper treatment in the forging; (3) Improper treatment of articles of smith's work in actual service. With respect to the quality of iron, that employed in the dockyards is generally of good quality, and only requires due care in its treatment to render the work produced therefrom equal to any legitimate duty required of it. With respect to the second cause of defects, namely, improper treatment in the forging; as this head refers to a very extensive class of defects, it may be proper to regard it, first, with reference to the nature of the forging; and, secondly, to the kind of coal used in the operation.

It being most important that every condition necessary for the operation of welding should be in the highest state of perfection, this requires that the iron should be at the right welding heat, rather than over or under it; so that, if any slight delay or impediment arise in bringing the parts together, there may be, as it were, a surplus of heat to work upon; and next in importance to this is, that as little scoria, or oxide, or other foreign material as possible should cling to, or interpose between the surfaces about to be welded. As the welding of iron is accompanied by its combustion, and by the production of an oxide in a melting state, we must altogether get quit of this interposing material, as, ere the two pieces are laid together, it has a tendency to form as rapidly as it is wiped off. But very fortunately, in almost every case, if due care be paid to the form and manner in which the surfaces are presented together, the instant the blows are given to the parts in question, the interposing scoria is forced off it, and the two perfectly pure surfaces of the weld ing-hot iron are so brought into intimate contact as to unite together and form one mass. There is no department of the art of forging more important than this, inasmuch as, in the majority of cases of defective welding, it is observed that the defect in question has arisen either from the scoria being shut up by means of improper forms of the surfaces, or that it has been inefficiently expressed from between the surfaces, for want of due energy and judgment in the blows of the hammer.

Secondly.—On the subject of forging it may be proper to refer to the kind of coal used in that operation. Much evil arises in this process from the risk of viscid and sulphurous scoria clinging to the surface of the iron, owing to the use of raw or impure coal as the material for the smith's fire. If the coal were of a pure quality, namely, such as contain nothing but carbon and its ordinary bituminous accompaniments, the evil alluded to would be less felt; but as all coal contains, besides earthy matter, more or less of sulphur, a class of evils arises which is of a very serious nature. When we attempt to weld together two pieces of iron which have been heated in a fire formed of very sulphurous coal, not only is the quality of the iron damaged by being rendered brittle, but also its surface becomes covered with a certain substance which in a very remarkable degree, destroys that adhesive quality which accompanies iron when at a welding heat. When this evil exists to excess, the parts will not unite, however much they may be hammered. But although such an extreme case as this is not frequent, yet it is a question of degree, and not of existence, so long as raw coal is used.

It is therefore advisable for those shops which admit of it, slightly to carbonize the coal previous to use. This is the practice in most private establishments where the quality of the smith's work is a prime object. The practice should be discontinued of making notches in the scarp of two pieces of iron about to be welded together, as such notches afford a lodgment for scoria, etc. Another extremely bad practice should be discontinued, namely, that of throwing a few fresh coals into a hollow fire on the hot iron, just before the heat is coming out.

It is recommended also to abolish cold

hammering, unless the articles can afterwards be annealed.

No Injury From Straining or Testing Iron.

The committee appointed to investigate the several matters relating to iron, etc., report that the result of their experiments clearly shows that very heavy testing strains even to the extent of the breaking strain (that is equal to the strength of the iron itself) and this even several times repeated, were found not only not to weaken the iron, but actually to increase its strength by every application.

"This fact," the committee says, "appeared so important, and so much opposed to the opinion of the best informed persons upon the subject, that in order to prove beyond all question, that the increased strength was due to the repeated previous strains, and not to the diminished length of the bars, we considered it proper to make experiments upon this point; we therefore took several bars of the same kind of iron, and of the same diameter, but varying in length from ten inches to ten feet, and found they were all equally strong. It may be proper to state the circumstances which usually attend the fracture of iron bars; namely, that considerable heat is evolved at the breaking place, and that the diameter of the bar is everywhere reduced, but particularly so at the place of fracture; but it is worthy of remark, that at the second and subsequent fractures of the bars, it generally happened that little or no heat was given out at the place of fracture, and that the general diameter of the bar was not again sensibly reduced, except in some instances, at the place of fracture."

Some of the results announced by the committee are somewhat remarkable. If they are right as to increase of strength resulting from the continued application of the breaking strain, what becomes of the modern doctrine of the "fatigue" of metals, and how are we to reconcile therewith the admitted action of the testing machine submitted to the Institute of Naval Architects in 1872?

Compounding Common Steam Engines.

A correspondent of *The Engineer*, asks, in view of the manifest saving in the use of the compound engines:—"What shall we do with our old engines?" After alluding to some proposed modifications brought forward by the engineers, in answer to this query, he gives his own as follows:

"My idea would be rather to attach a very small cylinder to each side of the large one, and connect them to the large one by a cross-head, let the steam into both of them at once, and the exhaust into the large one; proportion them so that with steam, say, at 50 lb. below them both and the exhaust in the large one, the same strain, and no more than what was before, for no more is needed, would be on the beam and connecting rod. Have no cut off for small cylinder, but follow the steam to the end of the stroke. By this means the old cylinder would be left as it is; perhaps an extra eccentric would be required to move the small valves. By this means I see no limit to the pressure that could be used. The greater the pressure the smaller the cylinders would require to be; the regularity of the engine would not be affected, the power would be applied exactly as before. No doubt the pressure would fail in the large cylinder as the piston neared the end of the stroke, but the steam following at full pressure in the small ones would help to balance the loss.

I have given my idea roughly it may be, and I will conclude by stating this: I have a cylinder 14in. which will drive the machinery at the proper speed with 25lb., but at this pressure the stroke ratio requires to be pretty open. I am of opinion a 10in. cylinder with 50lb. would do the same work with a third less coal, or by fitting a slide to cut off in the 14in. cylinder, say at a third off the stroke, would come to the same purpose. Were I using to put up the same machinery I would be inclined to put in a small cylinder, and use high pressure; the only thing I would lose would be I would be unable to increase the power of the small cylinder."

CAR AXLES AND JOURNALS.—A committee appointed by the Master Car Builders' Association to determine the most suitable form and size of railway axes, oil boxes and journal bearings, in order that a uniform standard may be adopted, state that larger axes, longer and larger journals and larger oil boxes than are now in use are desirable. A large axle, it is considered, would tend to lessen its liability to break; an increase in the length and diameter of journals would distribute the friction over a larger surface, facilitate lubrication and avoid delays by hot boxes.

A NEW CAR-SPRING.—The chief locomotive engineer of the Berlin and Gorlitz railroad has obtained a patent for a car spring which depends upon torsion instead of flexion, as in the ordinary plate springs, and which, it is claimed, is less liable to break, gives greater security, with twenty per cent. heavier load, is cheaper, and is easily attached to the car.

NEW USE FOR SULPHATE OF SODA.—Mr. W. Dingley, of England, has lately patented the use of sulphate of soda in the crude state of salt cake, for the purification of iron. A small quantity of the salt is thrown on the surface of the molten iron during the operation of the puddling—about 12 ounces being recommended for each heat of 4 or 4½ cwt. of metal.

SCIENTIFIC PROGRESS.

The Origin of Life.

Professor Haeckel of the University of Jena, who has won a name for himself during the past ten years as the author of several remarkable works in various departments of natural history gives the following facts in relation to the origin of life in mammals:

At the outset of his existence, man, like every other animal organism, is only an egg, a simple little cell, whose diameter is only one fourth of a millimeter—the one hundredth part of an inch—at the most. It differs from the primordial cellule of the other mammalia only in its chemical constitution and the molecular composition of the albuminous matter of which the egg essentially consists. And yet these differences cannot be directly perceived by any means at our disposal; but we are compelled by indirect conclusions to suppose their existence as the prime cause of the difference in individuals. The human egg incloses all the essential elements of a simple organic cellule; a protoplasm which bears the name *vitelus* and a nucleus or germinal vesicle. This nucleus is a small sphere itself, inclosing another nucleus much smaller still, the *nucleolus*; exteriorly the protoplasm is enveloped by a membrane which is known by the name of *zona pellucida*. The eggs of many of the lower animals, as the greater part of the mollusca, are, on the contrary, naked cells which do not possess this envelope.

As soon as the egg of the mammal is completely developed, it leaves the ovary and descends, by the narrow canal of the oviduct, into the uterus, where, after fecundation, it becomes an embryo. This transformation is thus brought about: The original cellule becomes divided into two cellules: on the primitive nucleolus are formed two new specks, and the nucleus becomes separated into two vesicles, each of which takes with it half of the protoplasm. The result of this process is that, in the heart of the vitelline membrane, which alone is not divided, two cellules are found in juxtaposition differing from the original only in being unenveloped. Each of these new cellules in its turn divided into two others, so as to form four, which in the same way become eight, these eight, sixteen, and so on; these successive segmentations producing an agglomeration of cellules, in outward appearance resembling a mulberry.

The further development consists in the cells assuming the shape of a sac, in the interior of which a liquid collects; shortly, on a point of the wall which is composed of these cells is produced a disk-like coagulation; their number rapidly increases, and this particular condensation becomes the embryo strictly so called while the remainder of the sack serves only for its nourishment. The embryo soon begins to broaden into the form of a biscuit. Three leaves or layers of cellules can be distinguished, superposed like envelopes upon each other, and each having its particular place in construction of the living being; from the exterior leaf is formed the epidermis and the central parts of the nervous system, the spinal marrow and the brain; from the central layers is formed the interior membrane which lines the digestive canal from the mouth to the anus, with all the glands that are attached to it (the lungs, the liver, the salivary glands, etc.); the intermediate layer is the source of all the other organs.

The processes by which the three layers of cellules give birth to the most complicated organs all be reduced: (1.) To new segmentations, and consequently to an increase in the number of the cells; (2.) To the divisions of labor or the differentiation of these cellules; (3.) To the combination of these cellules, differently developed.

Until the brain begins to show itself distinctly it is scarcely possible to recognize any difference between the embryos of the different vertebrata, or least of the three superior classes—reptiles, birds, and mammals.

THE COLOR OF MARINE WATERS.—Many local causes influence the colors of marine waters, and give them certain decided and constant shades. A bottom of white sand will communicate a grayish or apple-green color to the water, if not very deep; when the sand is yellow, the green appears more sombre; the presence of rocks is often announced by the deep color which the sea takes in their vicinity. In the Bay of Loango the waters appear of a deep red, because the bottom is there naturally red. It appears white in the Gulf of Guinea, yellow on the coast of Japan, green to the west of the Canaries, and black round the Maldivian group of Islands. The Mediterranean, toward the Grecian Archipelago, sometimes becomes more or less red. The White and Black Seas appear to be named after the ice of the one and the tempests to which the other is subjected.

SULPHURIC ACID BY SYNTHESIS.—M. Boillot announces that, by passing the electric current through a vessel containing a mixture of sulphur vapor and oxygen gas, he has effected a combination of the two, thus producing sulphuric acid by synthesis.

LIFE IN THE OCEAN DEPTHS.—The unscientific man is generally startled a little, when Agassiz tells him that "the ocean is the true home of animal life." He is so accustomed to think of the sea as barren and desert, that he "makes great eyes," as the Germans say, when the naturalist assures him that it is rather the land which is comparatively bare of animal life. The land, to be sure, is the habitation of the most perfect of animals, and, as it is besides the home of our own species, we naturally connect the idea of life with it rather than with the ocean. The land, moreover, affords more favorable conditions for the development of a greater variety of functions, among which is the faculty of uttering sounds, while almost all marine animals are dumb. The latter have such a quiet way, that we are apt to overlook them—the fate of quiet people generally.

But it is quite sure that in the number both of species and of individuals, the ocean far exceeds the land. We begin to realize this when we look down into a shallow, waveless sea, and observe the variety of creatures of all sorts—crabs, snails, worms, starfishes, polyps—each have their home among the sea-weed; and yet these animals which we are able to see in their submarine abodes, are nothing in comparison to the hosts of smaller creatures, imperceptible to our eyes—the infusoria, myriads of which the microscope brings to our view, and which are all, without exception, aquatic.—*Journal of Chemistry.*

THE AURORA AND THE ALL-PERVADING ETHER—COMETS TAILS.—A correspondent of the *Journal of Science* for April, suggests the possibility that the electric currents which give rise to auroras are propagated in the ethereal medium which is supposed to pervade all space, and that the spectrum of the aurora is, in reality, the spectrum of that ethereal medium.

The same writer suggests that it is not improbable that the tails of all large comets will be found to give spectra similar to that of the aurora, although additional lines may be present. This hypothesis is certainly a very interesting one, and one the solution of which will be looked for with much interest on the appearance of the next comet, which presents any very considerable caudal appendage. The tail of a comet, we believe, has never yet been observed by means of the spectroscope.

OZO-BENZINE—A NEW EXPLOSIVE.—M. Houzeau and Renard state, in *Les Mondes*, that by causing concentrated ozone to react upon pure benzene boiling at 178° Fahr., a solid body is formed of gelatinous appearance to which the name of ozo-benzine has been given. The formula is $C_6H_8O_3$ ($C_6H_6O_3$). Dried *in vacuo*, the substance becomes solid, white, amorphous and highly explosive. It detonates with violence under the influence of shocks or heat. A few grains exploded in the laboratory shattered the glass in the windows. It is very unstable, and when left either in air, carbonic acid, or even in a vacuum, it changes rapidly.

It has also been noted that a mixture of bicarbonated hydrogen and ozone detonates violently without the action of light, heat or electricity. The ozone must be strongly concentrated.

EXTENT OF METEOR STREAMS.—Astronomers now very generally accept the theory that the November and other periodical meteors consist of a vast number of those small bodies moving like comets, around the sun, and in orbits so eccentric as to cross that of the earth. They may move in vast aggregated numbers, or in streams more or less elongative. Some idea of the vast number of some of these meteoric streams, or aggregations may be inferred from the fact that it required six hours for the earth to cross the meteoric stream which was encountered on the 27th of November last. As the earth moves at the rate of 68,000 miles an hour, we must therefore infer that stream to be upwards of 400,000 miles in breadth and of unknown length.

NEW DETERMINATION OF THE VELOCITY OF LIGHT.—M. Fizeau communicates to *Les Mondes* the results of a series of very elaborate experiments made with a view of the most accurate determination of the velocity of light. The source of the ray was a jet of oxyhydrogen gas, and the distance between the two stations, as found by triangulation, was 33829.1 feet (about 6 miles,) with a probable error of 0.001.

Six hundred and fifty satisfactory observations were made, the mean of which, gave 185,368 miles per second as the velocity of light. This result agrees with that determined previously by Foucault. M. Fizeau considers that, with stations separated a distance of 12 miles, the velocity of light could be determined to an approximation of 0.001.

STABILITY OF BLUE COLORS.—Professor Chevreul, a French chemist, who is high authority on such subjects, in a recent paper mentions that while the blue colors obtained from indigo are permanent, those from Prussian blue will not resist the action of soap, though equally unaffected by light and air.

PLATINUM BRONZE.—H. Helouin proposes the introduction of a platinum bronze for the manufacture of cooking utensils. It is said to be entirely inoxidizable. The proportions are; nickel, 100; tin, 10; platinum, 1.

PHOSPHORESCENCE OF ORRIS ROOT.—Landerer has discovered this phenomena repeatedly while digging for the root at night. The phosphorescence occurs in the form of luminous spots.

barren quartz and in much better working ground. Air pumps are now working in the incline. Expect to get the water out to commence sinking to-night or to-morrow.

Golden Chariot.

Letter of the 15th says the sixth level drift south has passed through the crosscourse and now has an 18 inch vein of very rich ore. It is fine development. The eighth level drift also shows some fine ore. No change in winze or fifth and ninth levels.

Hale & Norcross.

The weekly report for the week ending on the 19th gives the following summary of operations: Ore extracted from the lower mine—second station level, 223 tons; twelfth station level, 92 tons; ninth station level, 45 feet; tenth station level, 29 tons—total, 399 tons. Delivered to mills, 363 tons 1030 pounds. On hand, 604 tons 980 pounds.

Imperial.

The accident to the hoover was caused by a portion of the woodwork on the inside breaking loose, slipping the gear and smashing things generally. It has been repaired temporarily, and will try and keep it going until the arrival of another. But little has been done during the week in the mine.

Letter of the 21st says there is no material change in the appearance of the mine. Are getting along finely with the machinery, and will, without doubt, start the perpendicular shaft this week.

Julia.

Letter of the 17th says the south drift continues to improve. The ore is looking well—not very large but will pay for milling. There is nothing new in the north drift, pushing ahead, and making excellent progress. The rock is very soft, and considerable water is coming in the face of the drift. Everything looks well and very favorably.

Justice.

Letter of the 20th says they have made average progress during the past week, as follows: North works, main south drift 315 feet in hard quartz, with an increase of water from the west side. Crosscut number two, last 35 feet in quartz and porphyry. In the former the strata became more regular as they approached the Cedar chimney. In South works, main drift south, 211 feet have been made, and it is looking better, all ore, one-half good for milling. Winze in main south drift, 74 feet below the second station, in low-grade ore, with rich pockets. Crosscut east in the main south drift 43 feet with streaks of ore. Main incline 54 feet below second station in west wall, and ground sinking. The work is pushed with all energy to gain the depth for the station to run north for the 100-foot level in north works.

Lady Esten Tunnel.

Letter of the 14th says the track iron arrived on Friday, and was laid on Saturday last. The rock is rather hard, and is of a grayish lime, containing a large amount of pyrite of iron. A soft streak has made its appearance in the face, near the floor of the tunnel, of red oxide of iron, about six inches in width, and carries with it a small amount of silver, the same as the pyrite. The indications are rather encouraging.

Mammoth.

Superintendent's letter of the 17th says the mine continues the same as last reported. Looks like a large body of ore coming in. The snow is disappearing fast, and I think we will be ready to haul ore to the mill soon.

Overman.

Letter of the 19th says this week they started to put in a plunger pump at the bottom of the shaft, but owing to the strong head of water were compelled to stop until the head of water becomes further reduced. Have made during the past week 30 feet in our west drift and 25 feet each in north and south drifts, making a total of 85 feet of drifts for the week.

Pioche.

Letter of the 20th says the east drift on the bottom proved so hard and discouraging that they concluded to stop it. Will let contract to sink the incline 50 feet deeper. Will start sinking to-morrow. Are getting out some very good ore.

Raymond & Ely.

Dispatch from the Superintendent dated the 21st says: "I shipped on the 19th, \$35,323." This makes the total amount for the month, so far, \$135,942. Dispatch of the 21st from the Superintendent says: "I shipped yesterday, \$40,348." This makes the total amount of shipments for the month, so far, \$176,290.

Silver Peak.

Letter of the 17th says they are now shipping ore to the Meadow Valley mill regularly, and expect to begin crushing next week. The ore-breasts continue to look well, and the mine gives fair promise. The average samples for the 14th were \$100.53 per ton; for the 15th, \$109.95. These assays, from the manner in which they are taken, should show very well what the ore will pulp at the mill.

Letter of the 19th says there is no particular change in the mine. The east drift still continues hard, but the ore is good and maintains its full width. The west drift looks about the same. Average samples for the 17th were \$100.53 per ton. Have hauled about 33 tons of ore to the mill, and will get the haulage as soon as possible, and it will be crushed as soon as hauled.

Savage.

The weekly report for the week ending on the 19th gives the following summary of operations: Ore extracted, 474 tons; forwarded to the mills, 1,224 tons; assay value of the ore, \$31.38. The ore came from the second station of the north mine.

Silver Hill.

On the 17th shipped to the Bacon mill 72 tons 350 pounds of ore. Letter of the 19th says they are making fair progress in the north drift, second station, but find the rock is very hard. The ore in both the north and south drifts is looking well. Everything is running smoothly. Ore shipped to the Bacon mill on the 18th, 63 tons 300 pounds; on the 19th, 48 tons 400 pounds.

On the 21st inst. shipped to the Bacon mill 78 tons 1,750 pounds of ore. On the 22d they shipped to the Bacon mill 63 tons 500 pounds. An assay on that day gave a value in silver of \$14.92, and in gold, \$18.85—total value per ton, \$33.75.

Sierra Nevada.

Letter of the 19th says they cleaned up the batteries of the mill on the 15th and shipped to the Mint on the 17th 250 pounds of bullion. We worked 993 tons of ore. The returns have not come as yet. The mill is in an excellent condition. The mine is looking fully as well as at former period. We are getting some low-grade ore, in north workings from up-rails. Expect it will improve. The northwest streak holds about five feet wide, and prospects are about as usual; have put the same streak 50 feet above, four feet wide, and prospects good. The main tops about the same.

Wellington.

Letter of the 17th says the total shipments for the last month have been about 160 tons of ore. Are not taking out much ore at present, as it can be done cheaper soon. Indications are good for another strike of ore within the next three or four days in the third west level.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned:

BUTTE COUNTY.

MINING EXCITEMENT.—Butte Record, April 19: Considerable excitement has been created by the discovery of rich diggings in the valley below Oroville. Ten and twenty dollars per day have been made with a rocker, and from 50 cts. to \$2 have been found in a bucketful of dirt. Everybody is locating claims, and the valley on which Oroville stands and for miles beyond, seems to have established its character as mineral ground.

CALAVERAS COUNTY.

OWIN.—Calaveras Chronicle, April 19: The work of sinking the south shaft in the Owin mine 100 ft. deeper—making 700 in all—is progressing rapidly. About 20 ft. of the distance has already been sunk, and the contractors are pushing the shaft down as rapidly as a constant application of muske, picks, drills and giant powder will permit. A very pleasing feature connected with the sinking is the fact that the ledge is improving in thickness and quality of rock as the shaft deepens. At the 600-ft. level, the initial point of the present sinking, the ledge is about 6 ft. wide, and is as solid, well-bedded and rich body of ore as any yet uncovered on the coast. Meanwhile there is no falling off in the yield from the batteries, the average production of the mine amounting to fully \$1,000 per day. Since the above was in type we have been shown some of the richest specimens of quartz, taken from the bottom of the shaft, that we ever saw. The ore was covered and filled with free gold that it was almost impossible to break it up in mortar.

WEST POINT DISTRICT.—The Bald Mountain Gravel Company, at West Point, resume work on their tunnel this week.

Zacatoro putting up hoisting works on main shaft. Shaft 242 ft. deep; sinking and running levels will be resumed as soon as the hoisting works are completed. The Harding and rich body of ore as any yet uncovered on the coast. Meanwhile there is no falling off in the yield from the batteries, the average production of the mine amounting to fully \$1,000 per day. Since the above was in type we have been shown some of the richest specimens of quartz, taken from the bottom of the shaft, that we ever saw. The ore was covered and filled with free gold that it was almost impossible to break it up in mortar.

LONG STAR CRUSHING NO. 1. Ore at Carlton's mill. Working level.

Pancho mine improving. The ore on the dump is rich in free gold. Handsome returns to the parties who contracted to work the mine on shares.

The Woodhouse is still adding good milling ore to the large quantities already on the dumps. Several mines are expected to change hands in a short time to parties who are able to work them as they ought to be.

RAILROAD FLAT DISTRICT.—Anderson mine stopping, and crushing ore at Clark's mill.

Book & Co. have discovered a valuable mine near the Chapman, south of the Negro ranch.

Many are prospecting near the Esperanza creek, with very promising results.

MOQUOQUE DISTRICT.—Work is being pushed forward on the Good Hope.

Cheney is sinking winze in tunnel. Plenty of fair milling ore in sight.

DOLLY VARNEN extending levels, which contain some very rich ore.

THE VALENTINE is being re-opened for legitimate purposes.

BLUE MOUNTAIN.—We learn that the snow has nearly all disappeared in the vicinity of Blue Mountain, and that work will speedily be resumed upon the Heckerford, Imperatrice Eugenie and other silver mines located at that point. The Heckerford mine was considerably damaged by the great fall of snow in that altitudinous region. The roof was crushed in and the building otherwise injured. As soon as the damages can be repaired active operations will be pushed vigorously forward.

MINES.—Cor. from Angels: Our mines, as a general thing, are looking well. They have commenced to sink on the Sticks claim. The shaft is now down 273 ft., and I understand that it is the intention of the Company to sink to depth of 300 ft.

The adjoining claim to the Sticks, owned by Robert Leeper, is being rapidly re-opened. The mine has just completed his mill, containing 3 stamps and 6 arrastras.

PLACER COUNTY.

ST. PATRICK.—Placer Augus: This Co. cleaned up on Wednesday, giving as the result of a ten days run on rock from the Crest Mine, the sum of \$8,350. They crushed 173 tons of rock, and the mill and mining expenses were \$3,750, giving as a net yield for the ten days the sum of \$4,600, or an average of \$450 per day.

The Bellevue Company are taking out some splendid looking rock.

The Yolo Company's mine is said to be furnishing an abundance of good rock and some very rich specimens.

The Dardanelles claim at Forest Hill cleaned up last week, after a run of three weeks, about \$7,000, having employed during that time from eight to ten men.

Work is progressing on the Jersey claim which is yielding fine usual good pay.

The Big Spring have completed their tunnel, to connect with the Dardanelles tunnel, which gives them good air and drainage. They have struck good pay.

MINING NEWS.—Placer Herald, April 19: The Rising Sun mine lately cleaned up from a five stamp mill, on a run equal to fifteen days, \$5,200 in gold. They are down on this mine over 300 ft. and have a ledge nearly 2 ft. thick, and will now run the mill night and day.

The Yolo mine, in the same vicinity, is again at work with good prospects. The new Quartz mill of the St. Lawrence company is approaching completion, and the company has a number of fine ledges prospected so as to insure good pay as soon as the mill starts.

The Butcher Boy company have again commenced work on their ledge. They have been on extremely hard rock in going down 85 ft., and will now drift on the ledge to a better position. This ledge prospects well. On the Yolo claim, 3 miles northwest of here, work is progressing rapidly. The ledge is now stripped and broken down 3 or 4 ft. deep, for some 60 ft. on each side of the shaft, which is now down 70 ft. on a good ledge which dips nearly at an angle of 45 degrees. In tracing and breaking down the ledge last Saturday, the boys picked up about \$300 worth of specimens, one piece being about the size of the crown of a hat, containing fully \$300 in gold.

The Auburn mine is working ahead with great energy. In this mine, 180 ft. deep, they have in sight plenty of very rich rock, but are endeavoring to fully prospect the mine before arranging to build a mill.

TUOLUMNE COUNTY.

EUREKA.—Tuolumne Independent, April 19: It is rumored that this mine at Summerville is soon to be opened. This mine was last worked, we believe, in 1868. For a trifling sum a new shaft can be put down from the end of the old works, to strike the chute at the 500-ft. level, where, no doubt, the pay-ore would be found as rich as before. It is estimated that a clear profit of \$70,000 was realized during the time this mine was worked.

LOUISEVILLE.—In this claim, the water is out and the miners have commenced taking out ore. This company are also about to commence on another ledge, owned by Lombardo, which is on the Mastodon, or mother lode of Orochero, owned by the Smith Brothers. They will tunnel in from the creek on the lode, and take out ore. This will be crushed at the Grizzly mill, which the Co. have leased for 12 months. The lode here runs 7 to 15 ft. in width, and will pay a good profit, even at \$7 per ton; but it is expected to go largely in excess of this figure, and it can be obtained in unlimited quantities and is easy of access.

RISING SUN.—Messrs. Hill & Crahtie inform us that

they have changed the name of their claim from the Hill or Wildcat, to the Rising Sun, in which name it is recorded. The rock grows richer the further they go, and now pays \$45 per ton, with good prospects of its keeping up increasing.

SOUTHERN.—Work in this celebrated mine, at Southleyville, is being rapidly pushed forward. The contract for sinking the Davidson shaft 40 ft. is finished. This takes the shaft 420 ft. below the surface, on the vein all the way, and sinking still continues. The south shaft, known as the old Southley shaft, 1,200 ft. south of the Davidson, has been thoroughly repaired and shored out, and sinking is again working in new ground. This shaft is about 100 ft. deep. Old practical miners who have before worked at this point, are satisfied that this part of the mine will prove as rich as in the past. The claim embraces 2,400 ft. of the vein, and the middle shaft, between those named above, is 400 ft. deep. In two tunnels above the bottom, or at a point 220 ft. beneath the surface, the miners are now working in new ground, and taking out rock which is estimated will pay \$40 per ton.

Nevada.

BELMONT.

MONITOR MINING CO.—Reese River Review, April 19: Work in the Monitor is progressing steadily and successfully. The mine is producing large quantities of fine ore. Good developments are being made 100 ft. below the lower tunnel level.

BELMONT CO.—This Co. is taking out splendid ore from the big chimney north of the Canfield incline and shipping the same to the Monitor-Belmont mill. Their new hoisting works over the Highridge mine will soon be ready for work.

EL DONADO SOUTH CON. CO.—The greatest feature in this wonderful mine at present is the immense body of sulphuric acid, which is the 300-ft. level north of the main incline. This same chimney has been cut into in the 400-ft. level, said level being already 30 ft. in the body of the ore. A winze sunk from the 340-ft. to the 400-ft. level is all in this immense ore body. Stopping has commenced 140 ft. from the incline on the 30-ft. level, raising in the chimney of ore, the character of which astonishes the oldest ore shapers. The ore is black sulphuric, very friable in its nature, and is thoroughly impregnated with native silver; break it where you will and the face of the pieces are completely coated over with quite thick leaves of the native stuff. The ore averages over \$2,000 per ton by assay. The whole ore stratum will work in the mill \$250 per ton. It is hard to estimate the vast amount of ore lying in this chimney between the two lower levels. There is certainly sufficient to run the Co.'s 20-stamp mill for months to come. The south slope is looking finely. The breast of ore in this slope has measured 6 ft. and will average at least \$125 per ton as it comes out. The south body of chlorides still looks well and is producing splendid ore. Although they have had some delays, this Co. has shipped on April account so far some \$50,000, and will ship \$100,000 more yet this month.

WHITE PINE.

EBERHARDT & AUBURN.—White Pine News, April 19: Since our last report we visited Treasurer Hill, and made an examination of a portion of the workings in the North Aurora, above the level of the Peers Chamber. The drift running from the Ladies' Chamber, south, 154 ft. strikes a body of ore 30 ft. below the Central Shaft, which runs across the main channel, or east and west. The vein has been followed east a distance of some 30 ft., discovering a fine body of high grade mineral. The body of ore found, will more than pay the expenses of running the drift through hard limestone. Returning along this drift, the Ladies' chamber is reached, from which a drift is being run east. Here another and convincing proof of the downthrow which has occurred on the Hill, is manifested by a wall as smooth as paper, plainly showing the immense friction which at some period of the past, has ground the solid wall to its present condition. It is neither a foot or hanging wall, simply the dividing line between the solid mountain and the broken masses which abound on the north. A piece of ore taken from this drift, which looked rich, prompted us to have an assay made by our friend Towne, of the Manhattan mill. The result was \$2,351.62; and quite a respectable "butter" was returned to the City of New York. We did not endeavor to pick out choice pieces, but knocked it out at random from a vein 12 ft. wide. Teams are constantly at work hauling the ore from all the workings of the company, and the Stanford mill is pounding away with its 30 stamps, down at Eberhardt. There are now 250 men on the payroll of this company, and more being added every day.

HAULING COMMENCED.—At last the roads are opened to the Hill, and the accumulated ore on the various dumps will soon be at the mill. On Wednesday last the first load of the season was hauled from the Ward Beecher mine to the Manhattan mill. It is with gratification we record the commencement of active milling operations, and Captain Turner, the Superintendent, assures us that he means to keep the mills of the district running the entire summer. The recent discoveries in the Edgar and Hidden Treasure shafts are guarantees of a sufficient quantity of ore to furnish the Big Smoky, Manhattan and Dayton mills with all the work they can do.

WASHOE.

ARIZONA AND UTAH.—Gold Hill News, April 19: Sinking the shaft is making good progress, the rock in the bottom blasting and working well. The flow of water continues much the same as in former reports, but gives very little trouble, the pumps handling it with perfect ease.

ALAMO.—Sinking the shaft is making good progress, although the ledge requires steady, hard blasting. The quality of the ore continues excellent.

BELCHER.—Daily yield over 500 tons. About 110 tons comes from the 1,300-ft. level and the rest from the levels above. The stopes and breasts are all looking nicely, with the prospect of a long continued yield ahead. The south drift at the 1,500-ft. level is being timbered, and when this is completed, drifting farther south will be resumed. The main incline is down 110 ft. below the 1,200-ft. level, the bottom in very hard rock. The drift south from it into the 1,200-ft. level is in 232 ft., and the drift south to connect with it is in 382 ft. from the Crown Point. About 160 ft. of drift remains to be done in order to make the connection.

BUCKEYE.—The daily yield of the mine continues about the same as per last report, keeping the mill steadily running. There is but little change in the ore producing sections of the mine, which continue to look well and yield finely.

BALTIMORE CO.—The main west drift at the first station is still driven ahead in very favorable looking quartz and vein matter, portions of the quartz showing ore of a low grade, with a steady improvement in both looks and quality as the ledge is penetrated.

OWNON POINT.—Daily yield, 550 tons, the best portion of which comes from the 1,300-ft. level. The other levels above are also yielding well, and everything in and about the mine is running very smoothly. Excellent progress is made with the incline, which is nearly low enough for the 1,500. Some little water is coming in, but not enough to seriously interfere with the work. The 1,500-ft. level will probably be reached without pumping. The drift south at the 1,400-ft. level is also progressing well, with the face in dry, hard, barren quartz. The cross-cut east from the 5th floor above the 1,300-ft. level, 100 ft. from the Belcher lino, has run out of ore into porphyry, but still shows indications of more ore.

CHOLLAR-POHOSH.—Daily yield 150 tons of ore, the assay value of which is \$33 per ton. The ore breaste in different parts of the mine are all looking well, and yielding well. The prospecting drift at the 4th station affords no change of interest for the week.

CON. VIRGINIA.—The shaft is down 340 ft. below the 500 ft. level, in good working ground, the sinking

making excellent progress. The main north drift on the 1,167 ft. level from the Gould & Curry shaft is making excellent headway, notwithstanding the intense heat attendant in so long a drift at so great a depth.

CALCROSS.—There is little or no change whatever in the ore producing sections of the mine at the first station. The main west drift at the second station is making excellent headway, the rock in the face continuing to blast and work finely.

DANEX.—Sinking the shaft is making excellent progress, the rock in the bottom working well. It is now down 45 ft.

EMPIRE.—The prospecting work on the lower levels progresses as usual, with but little change during the week, the developments continuing to increase the prospect of soon affording a dividend paying mine.

GOULD & CUR Y. The new pump in the incline are nearly completed, and will be ready to commence the work of draining the water in 2 or 3 days more. The north drift from the main east drift along the line of the ledge on the 1,500 ft. level, has developed a large body of fine appearing quartz, which contains but very little ore. The main drift south on the 1,600 ft. level, in connection with the north drift from the Savage, is still driven ahead, making fair headway, and nothing new to report.

GRAND.—The up-rails from the main tunnel, to connect with the old upper works is progressing at the rate of about 5 ft. per day, still raising through good ore.

HALE & NORCROSS.—There has been but little improvement in either the daily yield or the quality of the ore extracted since our last report. The ore-breasts between the 1,400 and 1,500 ft. levels, if anything continue to show less favorable. Prospecting the 1,700 ft. level is still continued with good results, but no change of material value to report.

JUSTICE.—The main south drift on the 400-ft. level is making excellent progress, showing some fine ore and giving promise of still better developments ahead.

KENTUCK.—Prospecting the 1,300-ft. level, with no change of material value to report.

KICKERPOCKER.—The main west drift on the 480-ft. level is still being driven steadily ahead, the face of the drift in clay and quartz, showing occasional streaks of low grade ore.

NEW YORK CON.—Sinking the shaft is making excellent progress, the rock working much softer. The quantity of water is about the same as at last report, and still considerably impedes the progress of the work.

NEVADA.—Still sinking in the ledge in milling ore the full size of the shaft. Fine prospects ahead for a good mine.

OVERMAN.—Cleaning out and preparing to again commence sinking the shaft was begun yesterday morning. The main west drift on the 1,000-ft. level is still pressed vigorously ahead, with no change of interest to note.

PILVER HILL.—Extracting ore from the first station has been steadily running during the week. It was found necessary to stop work in the north drift at the first station to connect with the south drift from the Justice on account of bad air.

SAVAGE.—The ore is nothing new to report of the developments in the west crosscut, from the main south drift on the 1,000-ft. level, down to the 1,500-ft. level, to connect with the south drift from the Gould & Curry 1 making fair progress, considering the great heat encountered, and difficulties of ventilating at so great a distance from the main shaft. The main south drift on the 1,700-ft. level is still pressed vigorously ahead, with some favorable indications of ore, but nothing of material value to report as yet.

SIERRA NEVADA.—There is no material change in either the looks or daily yield of the ore-producing sections of this mine during the week. The mill is kept steadily running, crushing ore from the mine at the rate of 60 tons per day.

SUCCESS.—The mill was again started up during the week, and ore from the mine. The developments in both the shaft and drift of the ledge, in the new shaft east of the mill in the canon, continue favorable, showing considerable quantities of fine ore.

UNION CON.—The north drift from main west tunnel is in 210 ft., running the whole distance through solid quartz; 200 ft. in from the mouth of the drift a crosscut has been run, showing the ledge to be 18 to 20 ft. in thickness and containing low-grade ore that assays from \$10 to \$15 per ton.

WOONVILLE.—The Ramsdell mill started up on ore from this mine about the first of the week, and the lone mill will also start in a day or two more, when some good returns may be looked for. The mine is looking well throughout, the levels both north and south showing large quantities of good material ore. Superintendent Curtis is getting the mine into the best possible working shape, with a view to taking out plenty of ore to keep both mills constantly running. About 30 tons per day are being required to supply them. Other mills will also be set to work as fast as procurable, it being the intention of the company to mill 40 or 50 tons per day. This ore will pay over \$50 per ton under the stamps.

Arizona.

MINING ITEMS.—Arizona Miner, April 5: Messrs. Lount & Allyn, on their gulch diggings near Hassayampa creek, last week took out \$250.

Cole & Johnson, on Lynx creek, in the class they bought from Wm. Crawford, took out up to last Sunday, \$700.

Lovejoy & Co. were averaging \$20 per day to the man, in their hydraulic claim.

Jesse Jackson arrived Thursday evening and reports that his company had crushed 40 tons of War Eagle ore at the Dol Pasco mill, which had paid very well, and they have some 50 tons of selected ore on the dump, estimated to be worth \$50 per ton.

A silver bar from the Mineral Park mill, weighing 15 lbs. 4 ozs. had just been received at Cerbat by Cory & Potts.

Montana.

BIGH STRIKE.—Herald, April 10: We learn that at a depth of 96 ft. on the Fry Agate mine, on Ten-Mile, the vein is three and a half feet thick, and assays \$2,897 in silver, per ton.

Washington Territory.

TIN MINES.—Walla Walla Union, April 5: During the week we have been shown samples of what is claimed to be tin ore. The substance is reddish in color, entirely free from grit, and is about as hard as a piece of castile soap. Persons have been tried burning it, and brought out blisters and drops of metal that look like lead or leaded tin. Samples of it have been sent below to be tested, and we may expect to soon hear what it really is. The mine is situated at the foot of the Blue mountains in Mr. Orley Hull's neighborhood. It is easy of access to the Valley, and is not far from timber, while the ore—whatever it is—seems inexhaustible in quantity. A number of our citizens have staked off claims of the ledge, but as yet do not seem to know exactly what value to place on "feet" in the new tin mine.

New Incorporations.

PIONEER GRAVEL M. CO.—April 14. Object: to mine at Iowa Hill, Placer county. Capital stock, \$2,000,000 in shares of \$100 each. Trustees—R. H. Rodgers, H. O. Macy, A. A. Jennings, C. W. Keeney and H. M. Lund.

SAN LUIS OBISPO RAILROAD CO.—April 19. Certificate of incorporation filed in Secretary of State's office, in Sacramento. Object: the construction and maintenance of a narrow-gauge railroad from the town of San Luis Obispo to deep water on the Bay of San Luis Obispo. Estimated length of road, 10 miles; ten miles; capital stock, \$100,000; principal place of business, San Luis Obispo. Directors—W. S. Chapman, William M. Stowe, Henry B. Tichenor, David Norcross, Charles W. Dany, Edgar W. Steele, William L. Beebe: \$14,000 of the capital stock has been actually subscribed.

Agricultural Progress.

The Agricultural Department at Washington.

No department within the whole range of Governmental business has been able to make so good a showing, for the money expended, as has that devoted to the great interest of agriculture. We herewith present our readers a faithful and beautifully executed engraving of the Agricultural Department Buildings and grounds at Washington. The main structure, a fine specimen of architecture, substantially built and well calculated for the purpose to which it is devoted, and the extensive and elegant conservatories connected therewith have cost the country less than \$200,000. The appropriations for carrying it on have also been expended with the same regard for economy; and although quite inadequate to the importance of the enterprise, they have nevertheless been made to accomplish an incalculable amount of good.

For many years the labor of the Department was purely one of love, it having been initiated and carried on for several years in the basement of the Patent Office, by Hon. H. L. Ellsworth, as an extra official duty to that of Commissioner of Patents. The first appropriation was only \$1,000; but that small sum was made to do the most it could, under the enthusiastic industry of that excellent officer. Happily, his successors in office continued the work with an almost equal interest and zeal, until May, 1862, when it was formally organized as an independent Department.

It is most singular that the leading men of the nation, many of whom are more or less connected with the farming interest, should, even now, be so strangely neglectful of the claims of agriculture—an industry far overtopping any other in importance and magnitude, and in the number of people directly engaged in it. If the Department of Agriculture had done nothing more than to arouse the dormant spirit of our farmers into the fact of the importance of their calling and of the possibility of its indefinite improvement, it would have already achieved a great work. It has not only done that, but in addition, it has spread abroad an amount of practical information, which has already returned to the country millions of dollars where only thousands have been expended; it has elevated the farmers' calling, and placed it on a level with the most favored industry in the land. It is to the influence which has gone out from this department, more than to any other single cause, that agriculture within the last twenty years, has been raised from a species of drudgery to the dignity of a science, calling to its aid not only the best inventive talent of the country, but the highest order of intellect to enable the farmer to pry into the very arcana of nature, and bring forth its inmost secrets, to the end that he may not only rightly appreciate them, but so order his labor and his appliances that they shall strictly conform to the requirements of the work he has in hand.

This new phase of the industry has introduced into its ranks men of superior intelligence, men of comprehensive and executive minds, who are fast elevating it to a power in the land—a power which will soon overshadow all other interests, one which will be felt not only in our State Legislatures, but in the halls of our National Congress as well—the one only power which will be found able to cope with and control the great evils of monopoly and corruption, before which the people now stand helpless and dismayed.

The very occupation of the farmers has a tendency to elevate and purify his mind. His dealings with Nature must, per force, be honest and true—nature cannot be cheated, she will not yield to wiles and subterfuge. The farmer, in this respect, ranks where he belongs—with the scientist, who also deals with nature. Search the world over; go among all the callings in which men are engaged, and where shall we find more uprightness, more true love of country than among farmers and scientists?

It is one of the most encouraging signs of the times that this class of our population is coming to the front not only in social, but also in political life; and it is the duty of every honest citizen to encourage and give his aid and support to the Department at Washington, which is laboring so faithfully and so zealously to elevate and render still more powerful and useful this great conservative element in our social and productive economy.

HOW TO IMPROVE CONVERSATIONAL POWERS.—In the first place have ideas and information as stock in trade, then impart those ideas and that information in the most felicitous style you can command to some appreciative listener, who will send you back as good as you give. Monologue and conversation are quite unlike. A conversationalist will divide the time with his interlocutors, and continually say something to elicit their ideas while giving expression to his own. Copious readings in Macaulay, Addison and our best American essayists will give fluency and elegance of diction. In this art practice is all important.

THE AGRICULTURAL DEPARTMENT AT WASHINGTON, D. C.

USEFUL INFORMATION.

House Furnishing as an Art.

We have plenty of elegant houses in all our large cities and their surroundings, but few homes; plenty of furniture, but few comforts; plenty of food, but poor service; plenty of dress, but small comfort in wearing it. Why is all this? With all the means of elegant, and comfortable, and healthy living, why this universal unrest? We cannot answer our own questions in detail, but will add a few words on the uses of furniture in promoting the health and happiness of a family.

First, let all furniture be selected, primarily for use, secondarily for decoration. To furnish your front hall so elegantly as to feel obliged to take your company in at the basement door, would be no greater folly, than to furnish your parlor so expensively that you stand in mortal fear the moment you open its doors for use, or throw open its windows for light and air. The country "Anut," whose "best room" was too nice for "ordinary company" made so many enemies by her invidious distinctions, that her best room, small as it was, was ample to hold all the friends she had left, by the end of the first years experiment. A good rule in furniture, as in dress, is, never to buy an article which your means will not allow you to use on all proper occasions, and replace, when, by reason of use, its utility or beauty has been destroyed. Second. Harmonize the different articles in each room, or suit of rooms, and balance the whole household around one central thought, so that you can exhibit your house as a whole, without shaming the meagerness of one department, by the richness and display in another. Let comfort guide you in every selection, your own, rather than your neighbors, your children's rather than your own, if either must yield, and you will have a home, where good taste will never be offended, and where earthly happiness may reign undisturbed.—*Cabinet Maker.*

Names of Various Sorts of Tea.

The designations by which the various sorts of tea are known in the market may be worth notice, as coming under the more immediate observation of dwellers at home. Congo is a corruption of Kangfu, signifying labor, and the Morning Congo advertised by tea dealers is simply a sort of the same tea grown at Wuning, a district and city the name of which, being interpreted, means "military rest." Souchong signifies "little sprouts;" Pekoa, "white down;" Bohea is derived from the Wukie Hills on which it is produced; Oolong means "black dragon;" Huangmoy, "red plum;" Campti, "selected firing;" Hyson, "fair spring;" Twankay, taken from Tunkee, or "Beacon Brook;" what is called "Young Hyson" is in Chinese termed Yutseun, or "Before the rains;" Gunpowder the Chinese call Yuen Choo, or "Round Pearls." There are a number of other names given to tea, but these will be recognized as those most familiar to the European ear. What are termed "chop names," are the fancy designations given by Chinese dealers to their teas, after having been made up into parcels of many hundred chests each. The tea is grown in the first instance by small farmers, who carry the produce of their respective gardens to the nearest depot, where it is collected by brokers, and by them made up into chests for delivery to the dealers, who convey it for sale to the foreign mart. These dealers are very particular in the selection of high-sounding and felicitous titles for their several parcels or chops, and very often a particular chop acquires such a fame as to be eagerly sought after for each successive season.

A Singular Cause of Fire.

The Cleveland (O.) *Ledger* publishes the following: A hard wood plug had been put into a hole in a gas pipe that ran along the ceiling in our job rooms, several feet from any burner, and in a position where no one could ever suppose it would catch fire. About six inches below it, passed a batt running from one pulley to another, and in operation during the day. About four days after the plug had been driven into the pipe, it was noticed to be on fire, and a bright jet of light, as if from a burner, burst forth from the side of the plug, which was already charred and being rapidly burned up. How the plug caught fire, how a steady flame of light could suddenly burst out from the side of it, was of course a subject of anxious inquiry. No one had lighted it and no fire had been used near it. The only conclusion possible was that it was caused by electricity from the belt, and a full investigation confirmed this conclusion. Had it happened in the night time, it might have ended in an extensive conflagration, and its origin would never have been known. Many destructive fires may have started in this manner, their causes remaining forever unknown. It is an incident worth hearing in mind, and proves that too much care can not be taken in guarding against fire.

LADIES AS INSURANCE AGENTS.—A project is on foot among numerous New York ladies for forming an insurance company, having only women for officers, agents and policy holders.

SCRAP IRON.—Manufacturers should look well to their scrap iron; do not waste a piece, no matter how small; gather all together—assort, have different receptacles for steel wrought, cast, and malleable iron. The wrought iron from the carriage shop is the most valuable of scrap iron, but to bring the highest price there must be no malleable or cast iron mixed with it; every pound of scrap has a market value, and it should be placed in barrels or boxes and sent to market. If there be any considerable quantity, it will pay to send it to the mills and have it worked up into bars. It is the small manufacturers who do not take care of their scrap, but allow year after year to pass without paying any attention to it, and scraps of iron can be found all over their factories, while boxes and out-of-the-way corners are filled with it, and hundreds of dollars worth of what would make the best of bar iron is allowed to go to waste.—*Scientific American.*

SILK MANUFACTURE.—Ten years ago, silk manufacturing, in the Atlantic States, was in its infancy, and partly an experiment; now it has attained vast proportions, employing a capital of not less than thirty millions of dollars, and giving employment to over sixteen thousand operatives. The value of its products is about forty millions annually. Californians should bear this fact in mind, and reflect that we may here produce the raw materials, for all this immense business, besides manufacturing many millions in value of goods which we now pay for in Europe with the products of our mines of gold and silver, and our broad acres of wheat.

GOOD HEALTH.

Airing Bed-Roms.

The most desolate-looking, sick-smelling, and every way repulsive room in most houses in cold weather, is the cold, unventilated bedroom. The prevalent notion is, that if it is cold, it does not need ventilation; and the next thing is to cork up the windows, so that they do not get opened by any chance. That is all wrong.

Other things being equal, cold air is more invigorating than warm air because more condensed, and therefore cold air in the bedroom is to be preferred during the night. It is also true that cold air may be impure; and rooms need ventilating even in winter. If a room is warm, the air, being colder than in warmer weather, rushes in more eagerly, and we feel it more keenly, and that misleads us to think that we need not take pains to ventilate bedrooms in cold weather. All this being true, a fire in a room helps ventilation, especially an open fire, and it is well to have fire enough to take the chill off the air and the bedding every evening. It may even be kept going all night provided you have a window or ventilator open. If you have not been accustomed to sleep with the window open, begin with a very small opening, and then gradually increase it, but do not let the wind blow directly upon you. If you feel it and cannot avoid it, turn your face to it. In the morning, just as you are vacating the room, throw it open, and all the merrit if there has been no fire in it.

As for the bedding, hang that out of the window. It will air three times as fast as it can in the room. Try it, and then smell of it, if you would know the difference. Let your bed and room air thus an hour or two, according to wind and weather—and in the summer months longer. Do not fear that this will make you appear untidy. The best housekeeper is the one who knows how best to make the house and its work serve the health and the comfort, as well as the taste of its inmates, not the one who makes up her bed as soon as she is out of it, covering up all the foul exhalations of the night previous, and then sleeping in them the next night. Some of the chamber work cannot well be done too early, but the beds may be left until ten o'clock. Then protect yourself with head and shoulders and gloves, and make them up and tidy the room, but do not allow yourself to become chilled. The latter result will not happen so readily as you might expect. With a room well ventilated and sunned, you can work comfortably with the thermometer eight or ten degrees lower than in a room where these two items are lacking. This is the direct advantage of fresh air and sunshine. The indirect, but still greater economy, is found in the fine spirits and the elastic vigor that increase your ability to wash, and in diminishing the doctor's bills.—*Science of Health*

PREVENTING SMALL-POX.—The *Atlantic Medical and Surgical Journal* publishes the following: Dr. G. D. Norris, at a recent meeting of the Alabama State Medical Association stated that during the prevalence of small-pox in Huntsville certain families at the instance of some one unknown, had resorted to the free use of the tea of the *Cimicifuga racemosa*, or black snake root of the United States Pharmacopoeia (black cohosh) as a preventive of small-pox. In the families using the *cimicifuga* there occurred no case of small-pox; though some were exposed to the disease. In the same families, Dr. Norris vaccinated the members but without effect so long as they continued the use of the cohosh; after ceasing to use the tea as a prophylactic, he again vaccinated them, when the specific effects of the vaccine virus were produced. He submitted the results in these cases as new, and not without interest to the profession.

Broadcloth and Exercise.

Professor Hamilton, in an able address on hygiene to the graduates of the Buffalo Medical College, denounces broadcloth as an enemy to exercise, and therefore to health. He says:

"American gentlemen have adopted, as a national costume, broadcloth—a thin, tight-fitting black suit of broadcloth. To foreigners we seem always to be in mourning; we travel in black. The priest, the lawyer, the doctor, the literary man, the mechanic, and even the day-laborer, choose always the same black broadcloth—a style that never ought to have been adopted out of the drawing-room or the pulpit, because it is a feeble and expensive fabric, because it is at the north no protection against the cold, nor is it any more suitable at the south. It is too thin to be warm in winter, and too black to be cold in summer; but especially do we object to it because the wearer is always soiling it by exposure. Young gentlemen will not play ball, pitch quoits, or wrestle, or tumble or any other similar thing, lest their broadcloth should be offended. They will not go into the storm, because their broadcloth will lose its luster if rain falls upon it; they will not run, because they have no confidence in the strength of their broadcloth; they dare not mount a horse or leap a fence, because broadcloth as everybody knows, is so faithless. So these young men and these older men, these merchants, mechanics and all, learn to walk, talk and think soberly and carefully; they seldom venture to laugh to the full extent of their sides."

PERFUME AND HEALTH.—An Italian Professor has made some very agreeable medical researches, resulting in the discovery that vegetable perfumes exercise a positively healthful influence on the atmosphere, converting its oxygen into ozone, and thus increasing its oxidizing influence. The essences found to develop the largest quantity of ozone are those of cherry, laurel, cloves, lavender, mint, juniper, lemons, fennel, bergamot; those that give it in smaller quantity are anise, nutmeg and thyma. The flowers of the narcissus, hyacinth, nignonetta, heliotrope and lily of the valley, develop ozone in closed vessels. Flowers destitute of perfume do not develop it, and those which have but slight perfume develop it only in small quantities. Reasoning from these facts the professor recommends the cultivation of flowers in marshy districts, and in places infested with animal emanations, on account of the powerful oxygen influence of ozone. The inhabitants of such regions should surround their dwellings with beds of the most odoriferous flowers.

SINGULAR DISEASE.—The papers have discovered a curious disease out in Cache county, Utah. They say that the patient is attacked with a pain in the left knee, the leg below the knee, down to the toes, becomes much swollen, hardened and red. The pain then abates. Then the swelling recommences above the knee and extends up to the body, when inflammation seizes the bowels and the patient dies. A medical man out there, who says he has had forty years practice, says he has never known anything like it before.

ENTERTAINING COMPANY.—"Do you ever thoroughly enjoy receiving company?" said a lady to us not long ago. For my part, I am so occupied with the fear that my guests will not be sufficiently entertained that I have no time to enjoy them." Most American housekeepers will confess something of this feeling. Even in our best appointed households there is not that absence of care in the department of the lady of the house which is seen in French or English drawing-rooms. Her thoughts cannot help wandering to the kitchen, even in the midst of the most animated conversation. She knows full well that all these endeavors which have made her somewhat too weary to be quite at her best in looks or manner, there may be a failure in serving the repast. It is curious to see what a different woman she is after supper, if all has gone well. For the time she is safe, and exuberant with a sense of relief.

FORCE OF GUNPOWDER.—A most remarkable instance of the force of gunpowder was observed in the blowing-up of a Confederate iron-clad, at the time of the evacuation of Charleston by the Southern troops, in 1865. It was considered very remarkable that search, in the immediate vicinity, some months afterwards, failed to discover anything more than small pieces of the wreck. It was only a few months since, in fact, that any considerable portion was discovered. At the time referred to, a ripple was observed at an unusually low stage of water and in a most unexpected locality. Search for the cause revealed the bow and one entire broad-side of the iron-clad, forming a mass of iron weighing about 100 tons; which must have been thrown, by the force of the powder, more than a quarter of a mile! The finding of the balance of the hull has not even yet been reported.

SELLING ILLUMINATING OILS BY WEIGHT.—The better quality of illuminating oils are the heavier, and if retailers were compelled to sell by weight, as the refiners are, the small purchaser would have in the weight and color of his oil a ready and correct test of its value as an illuminator.

MISCELLANEOUS.

The "Why" in Vegetable Cookery.

Why should soda be boiled with greens, cab-bages, Brocoli and turnip-tops? Because the oil which all these vegetables contain more or less, the soda extracts, and leaves the greens sweet and wholesome; but the water is, after boiling the greens with soda, most unwholesome, perhaps poisonous. A piece of soda, filbert size, is sufficient for a large saucepan of boiling water. Turnip greens have scarcely any oil in them, but are nevertheless much more wholesome for eating when cooked with a little soda.

Why should vegetables be washed in rather warm water first, then in cold, to cleanse them from sand and insects? The hot water, which must be better than tepid, cause the insects and sand to fall out at once. Insects do not always dislike cold water and salt, but the hot water kills them. It must be understood that only a small handful of greens or one head of cabbage at a time must be washed, and then instantly thrown into the cold water, which crisps and thoroughly cleanses them. Spinach, leeks, celery and sealake, are thus rendered very clean, and, moreover, are very rapidly cleansed. It is worse than useless to attempt to cleanse vegetables in salt and water. The hardness which salt creates in the water prevents all cleansing properties. The salt may kill the insects (it does not always do this), but they stick on hard and fast; the hot water makes them fall out at once, and the cold water crisps and also blanches them.

Why should turnips be cut across the fibre in rings of less than half an inch in thickness? For three reasons: first the turnip need only be peeled very thin, instead of in the usual manner, thickly and wastefully; secondly, by so cutting them the fibres are cut across, so that however old the turnip is, it is never stringy; thirdly, they require only fourteen minutes to boil in plenty of boiling water and salt, and thus the delicate flavor of the turnip is preserved, also they can be more easily mashed. The thinner the circles of turnip are cut, the quicker they cook and the less fibre they will have.

SALT ON CARPETS—PROTEST.—A Minnesota lady writes to her local journal, as follows: As you insert a paragraph recommending sprinkling salt on the carpets before sweeping to prevent dust rising, please insert my protest, lest some thoughtless housekeeper injure both her carpet and her health. As the salt cannot all be swept off, that remaining will collect moisture, keep the carpet damp, and the feet treading it, damp and cold. As tea-grounds cannot always be obtained, I recommend cotton or woolen rugs, cut by the children or house-maid at their leisure, into bits the size of the finger-nail, and put it into a thin bag—the little bags that table salt is put up in. Before sweeping, plunge the bag and its contents into water, (warm is best, it wets more thoroughly) wring out and use as tea-leaves. If desired, the bag can be taken up and washed either in an open tub, collander, or even in the bag, and used again and again.

BEST METHOD FOR KEEPING BEEF.—"Cut up the meat in pieces as large as you desire. Pack it in a barrel, or cask. Then make a brine as follows: one and one-half pounds salt to one gallon water, one ounce saltpetre to 100 pounds of beef, one tablespoonful of ground pepper to 100 pounds of beef. Put in the salt and saltpetre and heat it boiling hot, skim it, then add the pepper. Pour it on the beef boiling hot and cover closely. Your meat will be good and fresh any time. The philosophy is this: the hot brine closes the pores on the surface, preventing decay and meat from getting too salt. Try it. If necessary scald the brine over in the spring, or put on a new brine. Farmers can in this way have fresh meat nearly all the time. The meat should be taken as soon as it is cold, before it has acquired any old taste by exposure to the atmosphere.

AN ECONOMICAL DISH.—Steam or broil some small potatoes; mash them with some butter or cream, season them, and place a layer at the bottom of a pie dish; upon this place a layer of finely chopped cold meat or fish of any kind, well seasoned; then add another layer of potatoes, and continue alternating these with those until the dish is filled. Smooth down the top, strew bread crumbs upon it, and bake until well-browned. A small quantity of meat serves in this manner to make a nice presentable little dish.

NEW WAY TO COOK EGGS.—We see in a western exchange a hint in regard to cooking eggs, which we think well worthy of being more extensively known. The difficulty is, that eggs cooked sufficiently to fix the yolk, are, so far as the white is concerned, almost indigestible. To better this, do not boil your eggs over the fire at all, but put them into water near the boiling point and let them stay there ten or fifteen minutes, adding hot water enough to keep the temperature uniform. Do this, and both white and yolk will be digestible.

CUSTARD SQUASH is a very profitable and valuable variety. It grows to a large size, has a very hard shell and is a great keeper. It has a high reputation in market.

The Epizooty and Its Remedies.

The epizooty is upon us. As a sanitary
measure, rigid cleanliness and a full and per-
fect ventilation in any place where horses are
kept in buildings or stables, but never exposing
them to drafts of cold air.

Feed warm bran mash twice a day and take
the liquor of boiled flaxseed to mix the mash
with.

A little pure whisky daily, say half a pint, to
stimulate. Liniment for external application
on throat, composed of hartshorn and sweet
oil.

Sponge the nostrils with a solution of salt
and hot vinegar; also wash the mouth with a
weak solution of the same. Wet the hay
slightly with vinegar. Blanket thoroughly, and
give a little exercise daily.

In Pennsylvania, horses kept warm and
clean, not worked or exposed, with light feed,
such as bran and boiled oats, with little hay,
were successfully treated without medicines.

In Tennessee, a warm dry bed, mild food,
avoiding exposure to wind and rain, constituted
the remedy.

In New Jersey, those did best who kept their
horses in stables, without giving any medicines
or resorted to any other treatment than a due
regard to cleanliness.

CHINESE MINERS.—We stated recently that
the California Reed or Quicksilver mines, in
Napa county, had discharged its white miners
and employed Chinese in their stead. One of
the discharged miners has since informed us
that the mine is in Yolo county, not Napa, and
that some seventy-five Chinese have been em-
ployed. He says that it took six Chinamen
two and a-half days to put in two sets of tim-
bers, which two white men on one shift ought
to do in a day. The tunnel is six feet high
and five feet wide at bottom, and the timbers
are six by eight.

THE NEW DOLLAR.—A dispatch from Wash-
ington states that the Mint has fixed the charge
for coining the new trade dollar at one-half
cent a piece, the lowest possible rate under the
law. Great expectations are entertained of the
trade dollar, as a means of creating a home de-
mand for parting bullion, and keeping gold in
the country.

The Stevens Furnace.

The Use of Coal or Wood, Instead of Coal Tar.

One of the most interesting topics of the day
to the mining community, is the working of the
newly-invented Oxy-hydrogen Furnace, com-
monly called Stevens' Furnace. In our issue
of December 7th, 1872, we gave an illustration
and a detailed description of the construction
and operation of this furnace, and those of our
readers who feel interested in the matter can
send for that number of the Press. The experi-
mental furnace which has been erected in this
city differs, however, in some important par-
ticulars from the one shown in the cut referred
to. The principle of economizing fuel is the
same, the only difference being the application
of the best and construction of the furnace.
It has been running for some little time with
coal-tar as fuel, but has recently been fitted up
so as to consume coal instead.

We saw it in operation one day this week at
the corner of Main and Harrison Streets in this
city, where a number of mining men were as-
sembled to see it run. The front end of the
furnace has been made higher than it was when
coal tar was used, in order to afford a chamber
to burn the coal. The coal is fed into this
chamber from the side and a pipe from the
front of the furnace leads the smoke and pro-
ducts of combustion into the furnace proper.
The apparatus for the introduction of super-
heated steam is the same as usual except that
the orifice by which it and the gases produced
from the combustion of the coal, are intro-
duced into the furnace is somewhat larger.
The ore is fed into the hole in the stack about
half way up, food falls on an inclined plane,
where as it is gradually melted by the flame, it
runs slowly down into the body of the furnace.
The chamber now used to burn the coal needs
only to be enlarged in order to use wood. No
smoke, gas or heat passes out of this chamber
except through the pipe that leads it into the
furnace and just as the gases, etc. enter they are
forced in by the jet of the superheated steam.
The heat thus generated by the gas produced
by the union of the superheated steam with
the gas produced by the combustion of the coal
is very intense. The patentee claims that the
superheated steam coming in contact with the
carbon vapor under pressure combine with it,
and forms the highly combustible gas which
produces the requisite heat.

It is claimed that a most intense heat is ob-
tained by this arrangement, and it would ap-
pear that the only question to be determined
is that of economy and applicability to smelt-
ing ores. When these questions are solved
practically and it is proven a success, its general
introduction is only a matter of time.

A furnace to be run by this process has
been erected at Eureka Nevada and was to
have started up on Thursday last. It is
of the capacity of 50 tons in 24
hours and is 100 feet long. This length
probably includes the long incline upon which
the ore slides to the furnace. Dr. McKinney
who has put up the furnace at Eureka, adver-
tises to smelt ore at \$15 per ton, a reduction of
about 50 per cent. on former rates. The price
of smelting at Eureka is from \$25 to \$30 per
ton for free carbonate ores, and for other
classes of ore from \$30 to \$35 per ton, with a
guarantee of 75 per cent. on ores that run
over \$100 per ton.

These figures will show the confidence with
which the parties owning the furnace, take
hold of it. We hope that a correct and accu-
rate record will be kept of the operations of
the furnace, such as cost of steam and fuel,
time consumed in smelting certain classes of
ore, degrees of heat etc., etc.; the subject is of
much interest to the mining community, and
if these furnace men can prove an actual sav-
ing of even ten per cent. a revolution in our
method of working ore will be made. This offer
at the first furnace of any size erected on
this coast, to reduce ore at 50 per cent. less
than customary in a particular district is a sur-
prising one, and may well set our mining com-
munity thinking of the sums they have paid
out for smelting ores and the benefit a new sys-
tem will be to them. The furnace can burn
petroleum, coal-tar, coal or wood equally well.
The one at Eureka will use wood.

THE CHICAGO SILVER MINING COMPANY is the
name of a new organization incorporated in
London last month. The company propose to
acquire and work the property so called in
Dry Cañon, Utah, with a capital of £150,000
in shares of £10 each. The purchase money
is £110,000—£10,000 in cash and £100,000 in
fully paid shares.

Corporations Under the New California Code.

[Written at the request of the publishers, by J. M.
HAVEN, Esq., of S. F.]

We call the attention of the readers of this
journal to the provisions of the Code relating
to the formation of Corporations. There are
few subjects of more interest to business men
than that of Corporations. Scarcely a day
passes that some new corporation is not formed
for the prosecution of manufacturing, mining,
or trading. The tendency of the times is to an
increase in the number of, and in extension of
the objects to be secured by corporations; and
it is almost a necessity for every business man
to acquaint himself with the laws controlling
the birth and life of these artificial members of
society.

The object of the Code is to provide for the
formation of corporations for every conceivable
business, and also to more clearly define their
procedure, powers, rights and responsibilities.
Section 286 enumerates twenty-seven different
specific objects and classes of objects for which
corporations may be organized. One of these
subdivisions—No. 13—is sufficiently compre-
hensive to embrace any business not specifi-
cally provided for in some other subdivision.
It provides for: "Manufacturing, mining,
mercantile, mechanical, wharfing, docking, or
chemical purposes, or for engaging in any
other species of trade, business or commerce."
Under the former law a corporation was formed
by the signing and acknowledgment of a
"Certificate of Incorporation," by at least a
certain number of persons which varied ac-
cording to the purpose designated, from three
to twenty, and the filing of this certificate with
the clerk of the county in which was located
the principal place of business of the corpora-
tion, and a certified copy with the Secretary of
State.

Under the Code, "Articles of Incorporation"
must be prepared, setting forth: The name of
the corporation; the purposes for which it is
formed; the place where its principal business
is to be transacted; the term for which it is to
exist, not exceeding fifty years; the number of
its Directors or Trustees, and the names and
residences of those who are appointed for the
first year; the amount of capital stock and the
number of shares into which it is divided; the
amount actually subscribed, and by whom.
The articles must be subscribed by five or more
persons, three of whom must be citizens of this
State, and must be acknowledged by the sub-
scribers before some officer authorized to take
and certify acknowledgments of grants of real
property.

Upon the filing of the articles of incorpora-
tion in the office of the County Clerk of the
county in which the business of the company
is to be transacted, and a copy thereof with
the Secretary of State, the Secretary of State
must issue to the corporation over the great
seal of the State, a certificate that such articles,
containing the required statement of facts,
have been filed in his office; and thereafter the
persons signing the same, and their associates
and assigns, are a body politic and corporate,
by the name stated in the certificate, and for
the term of fifty years, unless it is in the ar-
ticles of incorporation otherwise stated.

Every corporation must hold a meeting
within one month after the articles of incorpo-
ration are filed, at which shall be adopted a
code of by-laws for its government, which
shall not be inconsistent with the Constitution
and laws of this State. The by-laws when
adopted, must be certified by the officers of the
corporation, and filed and recorded in the Re-
corder's office of the county where the princi-
pal place of business of the corporation is lo-
cated. Amendments to the by-laws can only
be adopted by a two-thirds vote of the stock-
holders; and the amendments must be certified
and recorded in the same manner as the origi-
nal by-laws.

THE KEYSTONE AND AMADOR CASE.—A dis-
patch from Washington to the Call states that
the decision of the Secretary of the Interior
in the case of the Keystone mine and Amador
town site case referred to at length in our last
issue, has been deferred by the application of
the Rose party for a further hearing, but it is
expected next week. In the mean time, As-
sistant-Attorney-General Smith has given the
Secretary an official opinion strongly adverse
to the Rose claim and sustaining the decision
of Commissioner Drummond, in favor of the
Keystone Company and the Amador town
site. Senator Sargent has written and filed
with Secretary Delano a letter strongly oppos-
ing the effort of Rose and others to gain posses-
sion of these properties, by reason of the pre-
tended passage of a title to the lands, or in
which they are situated as school lands as be-
fore mentioned. Mr. Sargent has argued the
legal points of the case fully, and points out
the danger to the mining interests of the
country, which the efforts to establish the prin-
ciple involved will occur.

A GOLD NOTE BANK will shortly be es-
tablished at Santa Barbara with a capital of
\$100,000.

The Steetken River Mines.

A party of some 15 miners left this city this
week for the Steetken River, in British Colum-
bia. "Another party will leave here on the
next steamer among whom will be Mr. Peter
Osergovitch, who was in that section of country
some years since and gives evidence of its exceed-
ing richness. The majority of the men will
engage in placer mining on the river but Mr.
Cargovitch is after silver and will prospect
further up the river than he has been before.
He exhibits some specimens of silver which
were found in a bar in the river and states that
the Indians had ornaments and tools of the
same material. The party that left this week
intend remaining at Victoria until the others
arrive on the next steamer when they will all
proceed together. They are very sanguine in
their expectations both as to getting "49
placers" and "Washoe silver diggings." Pro-
visions for a year have been obtained and all
the appliances necessary for a long stay in an
isolated country. A number of men died of
scurvy at the time of the last expedition, which
caused it to be abandoned so those who now
return thither intend going well prepared for
such an emergency.

While the bars on the river are said to be
rich in the yellow dust large hanks partaking of
the character of our California hydraulic dig-
gings are also reported to exist in various lo-
calities. If this be the case a new field for our
enterprising prospectors is opened and one
which many will like to try, although quartz
excitements lure many on to toil and hardship,
the idea that rich placer diggings, lying idle
and waiting only to be located and worked, will
make most any miner "take up stakes" and
seek the New El Dorado. The fact that the
locality in which these mines are situated is
an inhospitable and distant one, where in-
clement weather and hard fare is the rule and
the season is short, will only be an additional
argument for many to go. Without doubting
the statements made by the parties who have
visited the mining region of the Steetken River,
or evincing any desire to throw cold water on
their project, we would nevertheless caution
those who have steady employment that it is
much better to let these men depart and bring
us back practical proof of their assertions in
the shape of gold dust or rich ore, than take the
chances of a than trip to an unknown region.

The men who are going on the expedition are
most of them experienced prospectors and
miners, all hard working men, and just the
right sort to test the country. If they find what
they seek, their friends will soon hear of their
success, and if they do not they will return
here and make the fact public. In case rich
diggings and rich quartz mines are found, there
is plenty of time to go there, for 25 men can't
take up all there is in the country, and it will
be recollected that in quartz camps particularly
the richest mines are not always the first ones
located. We expect to hear from some mem-
bers of the expedition as soon as practicable
after their arrival at the scene of operations,
and will then lay the information before our
readers. We heartily wish success to the mem-
bers of the expedition, and hope that all of their
anticipations will be realized.

TEXAS PACIFIC RAILROAD.—After long and
patient waiting the citizens of San Diego, on
the 21st inst., had the pleasure of assisting at
the ceremony of breaking ground on the Texas
Pacific Railroad. Mr. Harris, one of the Di-
rectors of the road who assisted at the cere-
monies of breaking ground, declares that the road
will be pushed through vigorously, and will
probably be completed in time to carry pas-
sengers to the centennial celebration in 1876.
The company is required to finish ten miles of
road from the western terminus within one
year from the first of May next. This western
section will be constructed by the California
Texas Railway Construction Company, of
which General Brieton is President. The force
of men now at work is small, but if the com-
pany performs its promise it will probably be
greatly increased. The benefits which this
road will confer upon San Diego will be large,
and will make it a prominent town of our
Southern Coast. The inhabitants are, how-
ever, just at present, in all the excitement inci-
dent to a quiet place when railroad construc-
tion is first begun, and they have already—on
paper—placed their city as the Queen of the
Pacific. They are talking about taking the
China line away from San Francisco, and mak-
ing San Diego its point of departure. These
speculations are rather amusing, and show the
tendency of mankind to exaggerate the possi-
ble benefits of railroads. There has, however,
been so much "railroad talk" at San Diego for
the past few years, that it must be refreshing
to the people to have something tangible in
sight in relation to it.

The Vienna Exposition.

The Vienna Exposition now about being inaugurated, promises to be not only a grand success but will differ in many important particulars from any of the great national exhibitions which have preceded it.

1st. One of its characteristic features will be its direct connection by branch roads brought to the very door of the building, with the entire railway system of Europe. The main track where it enters the grounds, spread out into eleven branches or sidings running to every part of all the various exhibition buildings, so that merchandise can be carried directly to the very door where it is wanted, all along the lines of the buildings, which, if projected in a straight line and counting both sides, would measure about three miles.

2d. The machine department with its clatter and noise; its smoke, steam and hot oil, will be placed in an entirely distinct building separate from the general exhibition; an arrangement which will add greatly to the convenience and comfort of visitors.

3d. The fine art department, always heretofore associated and sometimes indeed, even mixed up with the general exhibition, will be entirely by itself, where it can be scanned and studied, in quiet and without the disturbing surrounding noise and stir of the general exhibition.

4th. More pains will be taken to isolate different nationalities in the general exhibition room, so that visitors may know at all times just where they are, and readily find their way from the allotment of one country to another.

5th. The system of lighting from the roof, always involving loss and damage from rain, will be obviated. We have been furnished with some notes by our correspondent, from which we are enabled to give the following facts:

The buildings consist of four main groups, a ground plan of the principal one—the general exhibition building—is given herewith, having been engraved from a drawing forwarded to us by our special correspondent, Mr. G. Kustel. The shading is so made as to show the relative amount of space and the position thereof assigned to each nationality.

Directly beyond this (north) is, first the Agricultural Hall or Halls, Covering, in all, about one-third as much ground as the main building, and running parallel to its whole length. Still beyond this are the machinery halls, occupying about the same space as the agricultural buildings, and running parallel therewith.

Just to the right of our diagram, or beyond the eastern entrance of the main building, is the Gallery of Fine Arts, separated therefrom by an open area, embellished with flowers and fountains, but connected by galleries, reaching out from both the north and southeast corners. The admirers of Art may here study and contemplate the works of the "masters" apart from the din of the general exhibition. The building is a handsome structure of brick, cased with cement and richly adorned.

Each of these buildings are separate and distinct—the one from the other. This novel plan of the general arrangement of the exhibition will, it is confidently expected, form a most pleasing and commendable improvement over previous exhibitions.

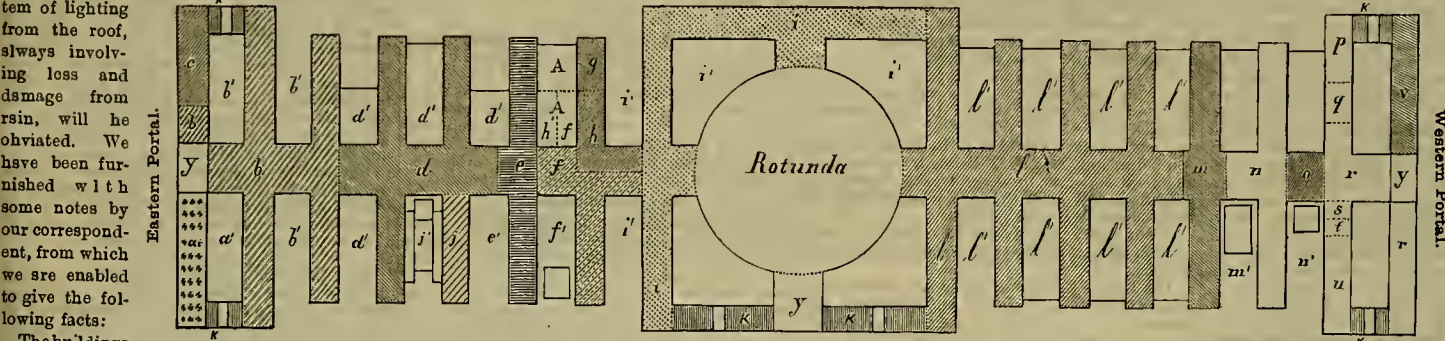

Plan of the Main Building.

The first of this group of buildings, the ground plan of which is given herewith, consists of a nave or central hall, running from the Eastern to the Western portal, a distance of 2,953 feet or more than half a mile long, by 83 feet in width and 74 feet high. The nave, where it meets the grand rotunda,—the dome of which is 348 feet span—branches off either way, forming a quadrangle 676 feet square, surrounding the rotunda, and opening

into it at four opposite points. Colossal triumphal arches ornament the approaches to the rotunda at its entrances from the northern and southern sides, or from front and rear; while right and left, as far as to the nearest of the small transepts, stretch handsome colonnades, which form a very fine facade to and along the central portion of the main quadrangular portion of the principal building. The nave, it will be observed, is intersected by 16 transepts, each 572 feet in length by 51 in width and 41 feet high. The two transepts at either end are bound together by buildings thrown across from one to the other and occupied as offices. These connecting buildings add about 100 feet to the length of each of the four outer transepts giving them the same length with the sides of the central quadrangle.

The spaces between the five center transepts, on either side of the quadrangle were originally left open, and intended for ornamental grounds; but such of the nationalities as were allowed space in the transepts and adjacent portion of the nave, who found their room deficient have been allowed to enclose and roof over such extra room as they might need in the open spaces. The spaces thus enclosed, up to the date of the letter of our correspondent, Mr. Guido Kustel, are shown on the diagram.

The Allotment of Space. The allotment of space to the different nations—its relative proportion and order of arrangement—is shown in the diagram by the different character of shadings and by references. The different nationalities have also been assigned space in the agricultural and mechanical

Front Portal. DIVISION OF SPACE AT THE VIENNA EXPOSITION.

halls, as nearly as possible opposite and corresponding to the space assigned in the main exhibition building. The central circular area is devoted to a general exposition.

It will be remembered, that at the Paris Exposition of 1867, nearly half the space was reserved for French contributors, while at present less than one-quarter of the gallery and yard space is claimed by Austria, although Austro-Hungarian applications at present exceed that of the French of 1867. Not counting the rotunda, the exhibition area of the galleries counts about 640,200 square feet, and is divided in the following proportion:

Austria.....	158,314 sq. ft.	Egypt & Mid-Germany.....	10,708 sq. ft.
France.....	72,904 "	Holland.....	9,396 "
England.....	57,146 "	Greece.....	9,258 "
Russia.....	35,402 "	Sweden & Norway.....	9,226 "
Italy.....	32,000 "	Roumania.....	9,162 "
Hungary.....	31,700 "	Spain.....	6,464 "
Turkey.....	31,348 "	Portugal.....	5,536 "
Belgium.....	27,882 "	Persia & Mid-China & Japan.....	3,626 "
United States.....	14,400 "	Tunis.....	2,773 "
Switzerland.....	12,000 "	Morocco.....	928 "
8th America.....	11,626 "		

Since the above table was prepared the State Department has received information that 6,000 additional square feet of space has been allotted to the American Department. Articles from the United States, intended for exhibition will be received until June 10.

General Reference.

The quadrangular portion of the main building 676 feet square, together with the cruciform portion of the nave and grand transept, its lofty and colossal dome, its grand colonnade, etc., has been designed as a permanent structure, and national palace of industry, after the balance of the main and the centre of the associated buildings are removed.

Unexpended Demand for Space.

The demand for space has been altogether beyond what was anticipated, and to accommodate, in addition to the taking in of the open areas alluded to, most of the offices and all the restaurants were removed to special buildings which have been erected here and there about

the ornamental grounds surrounding the building.

The Emperor has had a pavilion constructed on the outside grounds, which will form one of the great sights; for all the principle decorators and upholsters have fitted it up in the most costly and elaborate style, as an exhibition of their various trades.

The Viceroy of Egypt and the Sultan of Turkey have also each erected pavilions or palaces, as representative and emblematic of the peculiar forms of architecture, adornment and furnishing of their respective nationalities.

Our correspondent writes under date of March 20th, as follows:—"The United States machinery department will be well represented by new and interesting machines, several large steam engines, fire engines, sewing machines, stereotype and printing machines, and those for tools, horse shoes, for shoes, threshing etc. Mining and metallurgy, (in which California might have won much reputation, if something in that line had been done as urged in the SCIENTIFIC PRESS of June 15th 1872) will be represented principally by the American iron industry, exhibiting also Bessemer and Silico steel machines; of minerals, a collection from Nevada and one from Utah will be shown; of Agricultural products—wines from California and some of the Eastern states, tobacco, flour, sugar etc, is under way. An American school house fitted out with a collection of American school books and other means connected with our systems of education will be erected and exhibited by Mr. H. Heiger. There is also a considerable contribution to

The Woman's Co-operative Union.

The Woman's Co-operative Union, an association organized some five years since for the purpose of furnishing sewing to poor women, has failed to carry out the plans for which it was started. It was intended to give sewing women employment at remunerative wages or enabling them to obtain a controlling interest in the business, and thus afford them all the profits made on their work by dealing directly with the consumer. The report of the trustees states that the causes of failure are that in cheap needle-work they could not compete with Chinese labor nor with imported work. Moreover, the ladies, after the novelty of the thing wore off, took their sewing wherever it was most convenient instead of supporting the institution.

Although there was a loss of \$637 during the five years, the sum of \$46,000 has been distributed among a class much in need of it, so the Union has not been without good effects. The stockholders wish now to devise if possible, some better method by which the seamstresses of this city can be protected and their interests advanced. This class of people are, on the whole, much better off in this community than elsewhere. Although their pay is no better in proportion to the price of living than it is in the Eastern States, they are in a milder climate where the severity of winter is not felt to such an extent and where the hardships incident thereto are unknown. Nevertheless, these seamstresses are as numerous here as in other cities of like population, and distress is sometimes felt amongst them, so it is much to

be deplored that the efforts of the Woman's Co-operative Union have been futile in the attempt to ameliorate the condition of those whose only reason for not working was, want of opportunity. It seems strange, but is none the less human nature, that ladies in circumstances to be able to pay for their

sewing should give so little attention to the possible necessities of the needy of their own sex, as to let an institution of this character become a failure for want of patronage. They only wanted work to do and fair remuneration for their services—not charity. It is to be hoped that the philanthropic wishes of the members of the society will be carried out in this direction and that some plan may be devised by which the needy sewing women of our city may be relieved.

THE GOLD QUARTZ DISCOVERIES.—The reports from the gold quartz discoveries in north-eastern Nye county continue very flattering. We have been shown specimens from the ledges spangled all over with gold. They are owned by practical miners, of limited means, the deepest shaft only being 70 or 75 feet deep. Our advice to the owners is to keep on developing until they get their mines thoroughly opened before inviting capitalists; a failure at the outset in working such property usually damns it for years in the public estimation, and sometimes beyond the hope of restoring confidence. Have a dump-pile ready for the first run, boys. If you have a good thing—and we think you have—don't make a failure in your first attempt to prove the fact to the world.—Pioche Record.

BRISTOL DISTRICT.—Ten tons of hullion were shipped from Bristol District on the 21st, the freight being \$50 per ton. The mines are turning out well, and it is stated that the district bids fair to rival Eureka as a hullion producing section. The smelting works are turning out about \$4,000 a day.

RICH.—The Queen of the West mine, in the Camp Floyd District, is yielding ore assaying from \$100 to \$16,000 to the ton. This mine was sold last Fall for \$175,000. It stocked at \$500,000. It bids fair to rival the Emma.

THE EMMA mine shipped one hundred and seventy-five tons of ore the past week.

Coal in Southern Italy.

A Naples correspondent of the London *Mining World* writing under the date of 4th March, says,—"At a time when the question of coal supply is so much agitated the following reports, just published by one of the Naples journals will have an unusual interest:—"A correspondent from Villa San Giovanni, Calabria, says that as a land surveyor was forming the plan of a property near San Agata he came on some fragments of lignite. On asking the peasantry if they had ever found coal of that kind they replied that they had long used it for cooking, and in many places had found large pieces of real coal (*proprio dei pezzi carbone*), which they imagined had been purposely concealed under the ground, who knows for what object? These facts having been communicated to the Sub-Economato of San Giovanni, he interrogated a blacksmith, and ascertained that he had been in the habit of using this combustible in his forge. The *Economato* then visited the spot indicated, accompanied by an English railway engineer who happened to be at Melito, by the *Snydie*, and some peasants carrying picks and spades. On arriving at the summit of a mountain they found a black sparkling mass, which was recognized as coal. After considerable labor a quarter of a quintal was collected and carried off to the establishment of Signor Hallam, an Englishman, which is in our Commune. On being tested it was found that intermixed with lignite there was a large quantity of coal, in no respects differing from that which the same establishment imports from England. On the opposite side of the mountain there appears, almost laid open as it were, a large sparkling vein, and on the north as well, extending through the whole length of the mountain, vertical strata of this coal. I have thought it better to send you the report of the correspondent in his own words, and you will take it for what it is worth; but you will not fail to perceive that the names of localities and persons, two being Englishmen, are given. It is well known that Calabria possesses great mineral wealth, though there is much difficulty in working it—often followed by great disappointment. Four or five years only have elapsed since a Neapolitan, since deceased, made great efforts to induce the proprietors of land to discover coal. An establishment was opened in the *Largo du Municipio*, where I have seen numerous specimens of lignite and of something very like coal, but, in spite of the sanguine belief of the speculator, it may be doubted whether the real article was found. How, then, is the present discovery to be explained? From want of roads and from brigandage, and the absence of a spirit of enterprise, Calabria has been almost closed to the world, and it is possible, therefore, that wealth may be discovered there which has not been dreamt of. As regards the 'fiad' which I now announce much more information is desirable, but it is worthy of attention."

LOCOMOTIVE CONSTRUCTION.—The Sacramento *Record* of the 15th says: The new enterprise of "constructing locomotives at the railroad shops in this city is no longer a doubtful one. The original order was to build ten freight locomotives. Lately this order was amended by adding, "and two passenger locomotives." Thus twelve in all are to be built. Two-thirds of the iron work for these is already completed. The passenger engines will have 18-inch cylinders, the others being 17-inch. All the wrought iron is being made out of scrap iron, and in this respect, as in others, the locomotives will be superior to any made by Eastern manufacturers. The whole work is being done better than is usual in shops where locomotives are made for sale. Norway iron is used largely, which is an item of superiority. More general care is taken than is usual. Exceeding strength and durability are the essentials aimed at. The heaviest of these iron horses will reach thirty-five tons, while none will fall below thirty tons. One hundred and fifty-four men in the iron works are now bending their energies to accommodate the rapid building of these locomotives, besides carrying on the general business of the shop. The whole is under the supervision, so far as iron work is concerned, of one of the most methodical and careful of foremen, Laehells.

NEVADA BORAX.—The Carson Mint, and nearly all of our assay offices and mills and mining companies are now using borax manufactured at the borax fields of Columbus District, in this State. The Nevada borax is said to be superior, for all mechanical purposes, to the best English article. A large quantity is used monthly at the Mint, and our mining companies use on an average from 150 to 200 pounds per month each. All our assayers and all the smelting furnace companies use considerable quantities. It is sold here from 26 to 28 cents per pound by the case, each case holding 100 pounds. The Pioneer Borax Company, at Columbus, are now engaged in putting up new works for evaporating, refining and crystallizing, and when these are completed will be able to turn out four tons of the pure article per day, which would be worth \$2,000, counting it at but 25 cents per pound. Besides the company named there are several others that are now at work and the supply of the raw material in the borax fields is said to be inexhaustible.—*Gold Hill News.*

Pacific Cordage Company's Works.

The Alameda *Enclinal* of the 12th says: This new and important enterprise, located just upon the outskirts of our town, will to-day start into practical existence. We visited the colossal establishment on Thursday, and learned that all its intricate machinery had been put in place, and that every essential detail was in complete order for the commencement of work. The engines and hoiler were being tested by competent mechanics, and the first whistle of the steam gauge was sounded, perhaps for our delectation.

The stockholders in the company are all men of wealth, and generally known as gentlemen of excellent business qualifications. They are: Messrs. John Parrott, Peter Donahue, Oliver Eldridge, Wm. Norris, W. F. Bahcock, Tiburcio Parrott, George Howea & Co., Benjamin Hartshorn, Mr. Wilcox, J. D. Farwell, and a Spanish gentleman of means, from Valparaiso.

Owing to the magnitude of the undertaking, the managers found it necessary to draw upon two hemispheres for supplies.

The working capital of the company may be safely set down, in round numbers, at a quarter of a million dollars.

All the machinery is of the latest improved patents, from the noted establishment of Messrs. Todd & Raftery, Paterson, New Jersey. The extreme length of the rope-walk—1,800 feet—affords facilities for manufacturing a longer unbroken coil of rope than has ever yet been made in the world without "doubling," viz.: 230 fathoms, or 1,380 feet.

The capacity of the works will be about 4,000,000 pounds of rope per annum, embracing manilla and tarred cordage—the latter never having before been manufactured in the United States.

The company has been fortunate in the selection of a Superintendent, in the person of Mr. George W. Pitman, a thoroughly practical rope-maker, the inventor of several of the most important improvements known in the business, and a man of ripe experience in Eastern and European rope factories.

The standard which the company will maintain with their manufactures will be that of the best rope manufactured in the Eastern States.

Captain Oliver Eldridge is President of the company; and Capt. J. D. Farwell, who has had a general supervision of the works since their inception, will have the agency for the sale of its products in San Francisco.

About eighty persons will be constantly employed, the majority of them boys and girls—not Asiatics.

The Pacific Cordage company has our earnest wishes for a long-continued and profitable existence.

California Rate of Wages.

The following is a schedule of the daily pay of workmen in the Department of Construction and Repair, Mare Island Navy Yard, established for the months of April, May and June, 1873:

RATINGS.	CLASSES.
Shipwrights.....	1st, \$5 00 2d, 4 00

PLATINUM.—The idea of platinum coinage continues to be a subject of discussion among the scientists of Europe. No other metal, not even gold or silver, possesses so many inherent qualities for such use. It would be proof against forgery on account of its high specific gravity; its scarcity gives it an intrinsic value, and its indestructible nature admirably fits it for standing the wear of constant use. It has already been largely used for medals in France, and successful experiments have been made for converting it into coin. In Russia it was actually used for coin previous to 1845, when it was demonetized by imperial ukase. That step was taken at the time because the ready methods of working and refining the metal were not well understood. That objection is now, however, fully removed.

BORAX discoveries of considerable extent are reported in the Colorado Desert, San Bernardino county. The Borax field near Desert Springs, on the Owens river road, is attracting numbers of prospectors from the surrounding country.

Rich Quartz Discovery.

We have recently learned the particulars concerning the discovery of a rich lode of quartz, near Jesus Maria, in this county, which, taking all the circumstances together, seems more like romance than reality.

Fifteen or Sixteen Years Ago,

Prior to the excitement in quartz mining, an Australian named Peter Carairech lived in Jesus Maria. Subsequently he removed to Alameda county where, engrossed in agricultural pursuits, the recollection of his experience in earlier days among the rugged mountains of Calaveras gradually faded from his memory. Recently, however, the attention of Mr. Carairech having been drawn to the very favorable reports concerning the quartz mines of this county, he became interested in the matter, and in reverting to the scenes of his labor years before recollected having seen an immense quartz vein in the vicinity of Jesus Maria. Precisely where it was located he could not remember—only that it was but a short distance from the mining camp where he formerly resided. The more Mr. Carairech thought about the matter the more strongly became his impression that the ledge might be a valuable one, and

His Increasing Desire

To return and prospect the vein finally led him to communicate the facts narrated above to other parties. The upshot of the matter was the formation of a company who furnished Mr. Carairech with a comfortable outfit and dispatched him to search for the ledge. Arriving in Jesus Maria the prospector found all the old landmarks obliterated, and with nothing but the vague recollections of sixteen years to guide him, commenced this seemingly hopeless exploration. He made his business known to no one, but day after day continued his unavailing quest among the almost inaccessible gorges and impenetrable jungles of chaparral with which that section of the county abounds. Finally, after two months of incessant search his labors were rewarded with success—he discovered the long lost lead!

The Vein,

A very wide one, cropped out in a craggy defile, and the weary prospector was gladdened by the sight of surface ore that sparkled with gold. Mr. Carairech went quietly at work and sunk a hole ten feet in depth upon the ledge, uncovering a vein of uncommon size and richness. Taking a quantity of the ore with him he returned to Alameda to report the favorable intelligence to those interested in the venture.

An Assay of the Rock

Proved it to be rich beyond comparison. The company immediately dispatched Mr. Carairech to the mine again for the purpose of locating the claim in due form and holding it in accordance with the laws of the district. More recently a corps of engineers were sent up, and they are now engaged in surveying the ground preparatory to making an application for a Government title. We understand that the shaft is now about twenty feet in depth and that the ledge shows even better than it did on top. We also learn that the company are possessed of abundant means and are determined to thoroughly prospect the ledge that came into their hands in such a singular manner. We are not apprised of the exact locality of the claim, but hear that it is situated about a mile and a half from the celebrated Horae-thief mine, in the Jesus Maria district. Such, in brief, are the particulars of one of the strangest episodes in the history of quartz mining with which we ever became acquainted.—*Calaveras Chronicle.*

A NEW INDUSTRY IN FLORIDA.—Since my first visit to Florida a new branch of industry has been introduced, the credit of which is given to a lady with a Spanish name, Mrs. Olivarez. Thousands of acres in Florida are overgrown with the dwarf palmetto, a plant which has a shaggy stem lying flat on the ground and rooting itself by fibres from the under side, while its summit is crowned with a tuft of fan-like leaves of a tough fibre. These leaves, dried and bleached in the sun and shredded into strips, are formed into braids, and the braid into hats and bonnets of a texture as flexible, and I should think nearly as durable, as that of the well-known Panama hat. In this way a plant which the settler has regarded as a pest is made to give bread to thousands, and becomes so valuable that its disappearance would be regarded as a misfortune. The names of Mrs. Pucetti, Mrs. Carrano, Mrs. Canova and Miss Usina, over the shop doors in St. Augustine, show how generally the original population of the town have concerned themselves in this branch of industry.—*Cor. New York Post.*

THE PRE-EMPTION LAWS.—It turns out that the bill which passed both houses of the last Congress repealing the pre-emption laws and restricting the acquisition of Government lands to the method of homestead entry, failed to become a law through a technicality. By the neglect of somebody having the bill in charge, it was sent from the Senate to the House without having received the signature of the President of the Senate. The House passed the bill in the last moments of the session. Before the defect was discovered the Forty-second Congress had expired, and with it the term of Vice-President Colfax, who does not appear to have felt authorized to affix his signature to the bill *nunc pro tunc*. And so the measure, which was one of the genuine reform in the land laws, and would have done away with many of the abuses which have grown up under them, fails for another year.

The Riches of the Chilean Deserts.

To the discovery of nitrate succeeded that of borax, and after this the metalliferous deposits, especially in the form of numerous silver lead ores, and lately, the silver mines of Caracoles. Rich and numerous veins of copper are reported within some leagues of Salinas, as well as stratified layers of pebbles of different colors and arranged parallel, and suitable for the manufacture of cameos. A kind of alabaster is also found near Caracoles, capable of taking on high polish, and forming drawing-room ornaments. Lately a stone has been extracted from a depth of thirty yards in the Merceditas mine, containing embedded in it a shell, perfectly formed, in a matrix of chloride of silver. Other veins give petrified impressions of ammonites and hivalves, called technically *evomphalus petangulatus* and *cardium porulosum*. From the Blanco Torre mine more wonderful relics yet of a former world have been brought to light. At a depth of 70 metres shells have been met with, preserving all the lustre of a recent pearl shell. Some round balls, about the size of a hilliard ball, abound, and have been decided to be the eggs of antediluvian birds, of winged reptiles and toad-like monsters that came to that locality to lay their eggs when the bottom of the mines formed the surface of the earth. These round balls in fact, are the eggs of the *plesiosauros* and *ichthyosauros* of geologists, or perhaps the colossal tooth of Professor Owen, called by him the *Labyrinthodon Pachignatus*.—*Panama Star and Herald.*

MINING MACHINERY.—There is building at the Delamater Iron Works, in this city, a system of hoisting machines for the Calumet & Hecla Copper Mines of Lake Superior, which are designed to hoist from four shafts at a time, and from the enormous depth of 2,880 feet, or more than half a mile. There are four drums, each capable of taking out 2,880 feet, of 1½ inch wire-rope, without winding the turns over each other, and each drum will be able to raise 10,000 lbs. at the rate of 350 feet per minute. All four of the machines are driven by a pair of horizontal "Rider Engines" of 300 H. P. Steam will be furnished from six boilers, of 54 feet diameter and 27 feet long. This machinery is to be ready for shipment on the opening of lake navigation in the spring. A fire-proof building will cover the whole plant when erected at the mines. The work is from the designs and superintendence of George H. Reynolds. These works have constructed and are constructing a large number of similar machines, but of less power, for the iron mines in various parts of the country.—*Coal and Iron Record.*

THE LARGEST COMPOUND ENGINE.—It is said that the largest compound engine ever made in this country is now building by John Roach & Son, at the Morgan Iron Works, in New York, for the United States frigate "Tennessee." The vessel ranks second-rate, is 335 feet long, 45 feet beam and has a mean draft of 21 feet, with an immersed midships section of 725.47 square feet. Her displacement is 4,105 tons. The new engine is intended to take the place of the machinery known as the vibration lever engine.

Polishing and Fluting Iron.

This new invention takes the place of two articles needed in nearly every house. As a **POLISHING IRON** it has no superior. The part used for fluting is made of brass, and highly polished. A receipt for making **FAUX GLASS STAIN**, that gives a superior polish, goes with each iron. The Polishing Iron and Fluter, being in one, are both heated at the same time. We are now prepared to furnish them in quantities to suit. Price, \$3.

Something New for the Kitchen.

THE AERATING Egg Beater.

Various devices have been presented to the public for beating eggs, but none, we think, equal to the one herein shown. This, in fact, is the only aerating device ever made, and is very properly called the "Aerating Egg Beater." This Beater, as will be seen by reference to the engraving, is simply a tin can with a cone bottom and a cone dasher, the lower portion of the dasher being perforated with very small holes, as shown. Under this arrangement the upper portion, when forced down, fills with air which is forced through the eggs, thereby finely dividing and thoroughly aerating the mass. It beats one egg as well as half a dozen. For further particulars address

Varney's Patent Amalgamator.
These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they
have no equal. No effort has been, or will be spared
to have them constructed in the most perfect manner
and of the great number now in operation, not one has
ever required repairs. The constant and increasing de-
mand for them is sufficient evidence of their merit.
They are constructed so as to apply steam directly
into the pulp, or with steam bottom, as desired.
This Amalgamator Operates as Follows.
The pan being filled, the motion of the miller forces
the pulp to the center, where it is drawn down through
the aperture and between the grinding surfaces.
Thence it is thrown to the periphery into the quicksilver.
The curved plates again draw it to the center, where it
passes down, and to the circumference as before. Thus
it is constantly passing a regular row between the grind-
ing surfaces and into the quicksilver, until the ore is
reduced to an impalpable powder, and the metal amal-
gamated.
Settled made on the same principle excel all others.
They bring the pulp so constantly and perfectly in
contact with quicksilver, that the particles are rapidly and
completely absorbed.
Mill-men are invited to examine these pans and settlers
for themselves, at the office, 229 Fremont Street,
San Francisco.

The Most Popular Medicine Extant.
1840. OVER THIRTY YEARS 1873.
Since the introduction of
PERRY DAVIS'
PAIN-KILLER.

THE PAIN-KILLER
Is equally applicable and efficacious to young and
old.

THE PAIN-KILLER
Is both an internal and external remedy.

THE PAIN-KILLER
Will cure Fever and Ague when other remedies have
failed.

THE PAIN-KILLER
Should be used at the first manifestations of Cough
or Cold.

THE PAIN-KILLER
Is the Great Family Medicine of the Age.

THE PAIN-KILLER
Will Cure Painter's Colic.

THE PAIN-KILLER
Is good for Scalds and Burns.

THE PAIN-KILLER
Has the verdict of the people in its favor.

THE PAIN-KILLER
Gives universal Satisfaction.

THE PAIN-KILLER
Beware of IMITATIONS and COUNTERFEITS.

THE PAIN-KILLER
Is almost a certain cure for CHOLERA, and has,
without doubt, been more successful in curing this
terrible disease than any other known remedy, or
the most eminent and skillful Physician. In India,
Africa and China, where this dreadful disease is
ever more or less prevalent, the PAIN-KILLER is
considered by the natives, as well as European resi-
dents in those climates, a SURE REMEDY.

THE PAIN-KILLER
Each bottle is wrapped with full directions for use.

THE PAIN-KILLER
Is sold by all Druggists and Dealers in Family Med-
icine. ap8-1m

EUCALYPTUS.
The attention of the Medical profession to respect-
fully called to the following preparation of this new re-
medial agent. Eucalyptus and its preparations have been
found useful in obstinate cases of intermittent and Marsh
Fever, often supplanting the use of Quinine. The
poisonous effects of Asthma and Catarrh are greatly controlled,
and in various Kidney diseases and Catarrh of the Blad-
der it seems to act like a specific.

FLUID EXTRACT EUCALYPTUS.
This extract represents in a concentrated form the
medicinal effects of the leaves of Eucalyptus Globulus
THE ELIXIR OF EUCALYPTUS.
This compound presents the properties of the leaves
in a palatable form and elegant appearance. Does
One tablespoonful, to be repeated as often as the case
demands.

Cigarettes of Eucalyptus Globulus, useful in
Asthma, Difficulty of Breathing, Incipient Pleurisy, etc.
Prepared and sold by **JAMES G. STEELE & CO.,**
Chemists and Apothecaries,
No. 521 Montgomery St., between Clay and Commercial,
San Francisco. no28

LEA & PERRINS'
CELEBRATED
Worcestershire Sauce.

Declared by Connois-
seurs to be the only good
SAUCE
Caution Against Fraud.
The success of this most
delicious and unrivaled
Condiment having caused certain dealers to
apply the name of "Worcestershire Sauce"
to their own inferior compounds, the public
is hereby informed that the only way to
secure the genuine is to ask for LEA &
PERRINS' Sauce, and see that their names
are upon the wrapper, label, stopper and
bottle.
Some of the foreign markets have been
supplied with a spurious Worcestershire
sauce, upon the wrapper and label of which the names
of Lea and Perrins have been forged. L. & P. give
notice that they have furnished their correspondents
with power of attorney to take instant proceedings
against manufacturers and vendors of such, or any
other imitations by which their right may be infringed.
Ask for LEA & PERRINS' Sauce, and see name on
wrapper, label, bottle and stopper.
Wholesale and for export by the Proprietors, Worces-
ter; Crosbie & Blackwell, London, &c., &c., and by
Grocers and Oilmen universally. 15v24-1y

PATENTS & INVENTIONS.

Telegraphic List of U. S. Patents Issued to Pacific Coast Inventors.

[REPORTED OFFICIALLY FOR THE MINING AND SCIENTIFIC PRESS, DEWEY & CO., PUBLISHERS AND U. S. AND FOREIGN PATENT AGENTS.]

By Special Dispatch, Dated Washington, D. C., April 22d, 1873.

FOR WEEK ENDING APRIL 8th, 1873.*

SPRING MATRESSES.—Henry A. Geeton, San José, Cal.

GANG PLOW.—George W. Mannel, Napa, Cal.

VEHICLE.—Coffee & Bernard, Dixon, Cal.

*The patents are not ready for delivery by the Patent Office until some 14 days after the date of issue. NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with greater security and in much less time than by any other agency.

COPPER.—We see by James Lewis & Son's Liverpool, copper report for April, that business during the past month has been on a very extensive scale. A considerable quantity of ore and regline has been taken by the smelters, who are reported to have made extensive sales of English copper, while the delivery of Chili Bare and Ingote to manufacturers and consumers have been much larger than of late. The statistics of this metal are beginning to assume a more satisfactory position. About 10,000 tons of bare have changed hands at \$84 np to \$90 for Urmenta and good ordinary brands on the spot, and corresponding prices for other brands on arrival. The transactions in Australia also amount to some 6,000 tons at \$92 and \$96 1/2c. per ton. The sales of Chili regline have been 1630 tons at 17 c.; 1150 tons at 17c. 3d. and 750 tons at 17c. 6d.; 1722 tons of ore sold at the Swansea Ticketing at an average price of 16s. 1 1/2d. per ton average produce of 17 per cent., the Cape ore of 33 1/2 per cent. realizing 16s. 9 1/2d. per unit.

The latest quotations were—Bars, Good Brands and Urmenta £90; Lota £89 1/2s. J. Edwards and special brand £91 on the spot, £1 to £1 10c. extra being paid for distant arrival. Ore, 17s. 3d. to 17s. 9d.; Regline, 17s. 9d. 18s. per unit. The Chili exports to March 1st amounted to 9,902 tons in 1871 and 21,022 in 1870. Stocks of West Coast produce are estimated at 21,251 tons, Fine, against 23,056 on the first of March.

SANTA CRUZ POWDER.—The removal of the paper mill from Santa Cruz to Stockton was a matter of much dissatisfaction to the people of the former town but as far as the manufacturing interests of the place are concerned it has turned out just as well in the end. The Santa Cruz Powder Company have purchased the land lately occupied by the paper mill, and will construct works of ten times the value of the paper mill, and give work to more hands. The only question is, like placer or quartz mining, will dust or pulp pay best to those engaged in it. The workmen probably prefer the pulp operation.

MINING MACHINERY IN JAPAN.—H. J. Booth & Co., of the Union Iron Works in this city, shipped to Japan, in the steamer of the 22d inst., a complete quartz mill, with pans and four of Hendy's concentrator. It is probable that as the mineral resources of that country, which are represented extensive, are developed, our foundry man will receive considerable orders for machinery from that quarter.

MCGARRAHAN, the irrepressible, will again appear before the public as contestant in the case of the application of the New Idria Mining Company for a patent to the mine which is claimed by him. He will shortly visit this city to enterintend his adjustment suite, brought in the courts of this State.

THE MILLER platform is to be substituted for those in use on the passenger cars of the Central Pacific Railroad Company. The shops at Sacramento are all busy in constructing them; 600 having been ordered at once.

THE RANDOLPH Gold mines at Coos Bay are now attracting considerable attention; they were discovered in 1853 and have been worked to some extent ever since.

THE machinery for the Holly Water Works of Sacramento has been shipped from the East.

IMPROVED WAGON BRAKE.—The address of Oliver Fish, inventor of the self-acting wagon brake, recently illustrated in this paper, is at Coulterville, Mariposa Co., Cal.; not Centerville.

BORAX.—In our issue of the 12th inst., we gave a description of Mr. Gretzkow's process for the extraction of boric acid, and stated that we understood that work would soon be erected in Nevada, to be run by this process. A subscriber wants to know in what locality they are to be erected. We are informed by the parties interested in the claims that these works would be erected at Deed Horse Wells, in Churchill county, Nevada. We do not know how soon they will be put up or what their capacity will be.

THE Pioche Record says: Probably as many as a hundred miners have left here in the last week or ten days for the White Pine mines, it being understood in Pioche that mining labor is in demand up that way.

NARROW GAUGE.—It is stated that L. L. Robinson and others are about to commence the survey of a route for a narrow gauge railroad from Colfax to Grass Valley and Nevada City.

THE RAILROAD BRIDGE crossing the Kenebe River, at Kendalls Mill, Me., and belonging to the Portland and Kennebec Railroad Company was burned down this week. The loss was over \$100,000.

LEAD IN LIVERPOOL is very active and some manufacturers are asking an advance upon the quotations of the 1st of April of £22 17s. 6d. to £23 5s. for good brand of English.

THE RISON IRON WORKS of this city have sold upwards of 200,000 worth of mining machinery to various companies on the Comstock lode during the past year.

THE MENDOTA MILL.—The last load of machinery for the Nevada Company at Highland, has arrived at its destination and the mill will now be running.

ANOTHER FLYING MACHINE is being constructed in this city by J. C. Feirview, who will test his invention on the 1st of May.

SILVER.—Rich silver discoveries are reported forty miles southeast of Bridger, in Wyoming Territory, at the head of Uintah Valley.

THE CURVES on the Pioche and Bullionville Railroad are being strengthened and changed to ensure safety.

ANTIMONY is quoted in Liverpool at £60 per ton for French Star.

QUICKSILVER is quoted in England at £13 15s. per flask.

The offices of the SAN FRANCISCO NEWS LETTER, CAL. CHINA MAIL, CAL. MAIL BOX, and other publications issued at the News Letter Office, have been removed to the New and Spacious Building of the CALIFORNIA PLACARD EXCHANGE, Nos. 605 to 615 Merchant street, above Montgomery.

San Francisco Metal Market.

Frear Stone Company of California—Location

of principal place of business and works, City and County of San Francisco, State of California. Notice is hereby given, that at a meeting of the Directors, held on the 1st day of April, 1873, an assessment of two dollars per share was levied upon the capital stock of the Corporation, payable immediately in United States gold and silver coin, to the Secretary, at the office of the Company, No. 414 California street, San Francisco, California. Any stock upon which this assessment shall remain unpaid on the 15th day of May, 1873, will be delinquent and advertised for sale at public auction, and unless payment is made before, will be sold on Monday, the 28th day of May, 1873, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

E. WEGENER, Secretary.

Office, 414 California street, San Francisco, Cal.

Hardy Coal Mining Company—Principal

place of business, San Francisco, California. Notice is hereby given, that at a meeting of the Board of Directors, held on the 26th day of March, 1873, an assessment of one dollar per share was levied upon the capital stock of the Corporation, payable immediately in United States gold and silver coin, to the Secretary, Room 5, No. 333 Montgomery street, San Francisco, California. Any stock upon which this assessment shall remain unpaid on the 1st day of May, 1873, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Monday, the 28th day of May, 1873, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

JACOB HARDY, Secretary pro tem.

Office, Room 5, No. 333 Montgomery street, San Francisco, Cal. m2-4t

Ida and Rhoda Lewis Consolidated

Mining Company. There will be a meeting of the stockholders of the Ida and Rhoda Lewis Consolidated Mining Co., at the office of the Company, No. 10 Webb street on Saturday, May 3d, 1873, at 1 o'clock P. M. for the purpose of adopting a code of By-Laws for the company.

A. W. MONSE, Secretary.

San Francisco April 19th 1873. a12w

Lady Esten Tunnel and Mining Company.

Location of principal place of business, No. 35 New Merchants' Exchange, California Street, San Francisco, California. Location of works, Little Cottonwood District, Utah Territory. Notice is hereby given, that at a meeting of the Directors, held on the 17th day of March, 1873, an assessment (No. 2) of five cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the Company, No. 35 New Merchants' Exchange, California Street, San Francisco, California. Any stock upon which this assessment shall remain unpaid on the 17th day of April, 1873, will be delinquent and advertised for sale at public auction, and unless payment is made before, will be sold on Tuesday, the 6th day of May, 1873, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

CHAS. S. HEALY, Secretary.

Office, No. 35 New Merchants' Exchange, California Street, San Francisco, California. m2-2

POSTPONEMENT.—The day for deeming shares delinquent on the above assessment is hereby postponed until Wednesday, April 20th, 1873, and the sale thereof until Tuesday, May 20th, 1873, at the same hour and place. By order of the Board of Directors.

ap19 CHAS. S. HEALY, Secretary.

Machinery.

IMPORTANT TO Quartz Mining Companies.

IMPROVED PATENTED

Hardened Cast Steel Shoes & Dies.

The undersigned are prepared, at short notice, to furnish IMPROVED PATENTED HARDENED CAST STEEL SHOES AND DIES, for Quartz Mills of every pattern. This improvement supplies a want long needed by persons engaged in Mining enterprises.

They are more economical and cheaper than cast iron shoes, as they wear from four to six times as long, and crush a greater quantity, as they retain their full diameter, never chipping from the edges. This, with the time saved in replacing worn and broken iron shoes and Dies, and the great saving of freight to remote mills and mines, makes a vast difference in the cost of reduction of ores.

WE ALSO FURNISH

Cast Steel Tappets, Cams, Picks and Hammers,

Which possess the same advantage of Economy and Durability, and deserve the special attention of Miners and others engaged in quartz crushing.

The Superior Strength of these steel castings—the fact that they can be FORGED and WELDED as easily as bar steel—their cheapness and great accuracy, as compared with forged iron—cannot fail to make them desirable for many purposes, where forged iron and steel have heretofore been used. Among such articles we mention:

ROLLING MILL CASTINGS.

Bevel and Spur Wheels, Guides, Spindles, Dies, etc.

AGRICULTURAL CASTINGS.

Resper Guards, Plow Shares, Mold Boards, Plow Jointers, etc.

Anvils, Sledges, Vices, Masons' Hammers, Blacksmith Hammers, Mattocks, R. R. Frogs, etc.

And other articles requiring solidity and great strength.

DONKEY ENGINES FOR HOISTING,

Mining Machinery, Etc.

Persons giving orders will send diagrams and measurements of Shoes and Dies, etc., as above.

J. G. KITREDGE & CO.,

No. 515 California street, San Francisco.

12723-41

Notice is hereby given, that the copartnership heretofore existing between A. J. Severance, Charles W. Rendall and J. Gus. Burt, under the firm name of "Severance, Holt & Co." is this day dissolved by mutual consent. A. J. Severance, having purchased all the interest of his late partners, will continue the business of manufacturing and selling Diamond Drills as before, under the style of A. J. Severance & Co.

Dated San Francisco, Nov. 24, 1871.

Office, 315 California street.

Scaling and Foaming Prevented and Fuel Saved.

Engineers are respectfully informed that

WARSON'S AERO STEAM SYSTEM

Has been well tested, during three years, in England. Besides the above advantages, it greatly prolongs the life of Boilers, Tubes and Fire-boxes. It is a cheap contrivance, and easily applied to any engine. Illustrated Circulars, showing the appliance and describing its advantages, are sent to all applicants. All who are troubled with Scale and Foaming may rely on this system of prevention—also on saving at least 24 percent. of fuel. RHO'S for States and for Individuals will be sold on liberal terms.

J. L. SANFORD,
General Agent for United States,
420 Montgomery street, San Francisco,
And Box 969, P. O.

Information Required to Give an Estimate of Warson's Apparatus:

- 1.—Diameter of Cylinder.
 - 2.—Length of Stroke.
 - 3.—Number and Length of Boilers—Tubes or Flues.
 - 4.—Distance of Boilers from Engine.
 - 5.—Can Pump Piston be attached to Cross-head of Engine?
- It can, however, be driven by any of the usual appliances that work the Water-Feed Pump. These items will enable me to give a near estimate of the cost.

L. SANFORD, General Agent.

The California Powder Works

No. 314 CALIFORNIA STREET,
SAN FRANCISCO.

Manufacturers and have constantly on hand

SPORTING,

MINING,

And BLASTING

POWDER,

OF SUPERIOR QUALITY, FRESH FROM THE MILLS. It being constantly received and transported into the interior, is delivered to the consumer within a few days of the time of its manufacture, and is in every way superior to any other Powder in Market. We have been awarded successively

Three Gold Medals

By the MECHANICS' INSTITUTE and the STATE AGRICULTURAL SOCIETY for the superiority of our products over all others.

We also call attention to our

HERCULES POWDER.

Which combines all the force of other strong explosive now in use, and the lifting force of the BEST BLASTING POWDER, thus making it vastly superior to any other compound now in use.

A circular containing a full description of this Powder can be obtained on application to our Office.

16720-3m JOHN F. LOHSE, Secretary.

BURLEIGH

ROCK DRILLS

—AND—

Air Compressors.

—

The Burleigh Rock Drills, which have stood the test of five years' constant use at the Hoosac Tunnel, and which are now in use in nearly every State in the Union, as well as in Europe and South America, are unequalled in efficiency and economy by any other Drilling Machine. They are of various sizes, and equally well adapted to Tunneling, Shafting, Open Cut or Quarrying, and will drill six to ten inches per minute in granite. They are driven by steam above ground. The Burleigh Air Compressor is the best engine yet devised for furnishing the "air motor" for the many purposes to which it is now being used.

They are to be used on the St. Gothard Tunnel, Switzerland, Tunnel 13 miles long. We refer to the following gentlemen and works:

- Gen. Newton, U. S. A. Hell Gate Tunnel, L. I.
Mess. Shanley Hoosac Tunnel, Mass.
J. Dutton Steele Nequahoning Tunnel, Pa.
Sidney Dillon Fourth Avenue Work, N. Y.
Col. Roebbing East River Bridge Company, N. Y.

PACIFIC BRIDGE COMPANY.

WORKS NEAR SOUTH POINT MILL, BERRY STREET, SAN FRANCISCO, CAL.

Are Prepared, with Superior Machinery, to Manufacture and Build all kinds of Bridges on Smith's, Howe's, and other Improved Plans. Framing of all kinds done by Machinery.

The Smith Bridges have been thoroughly tested in the East for Three Years, and wherever tried have proved superior to any other Bridge in the following points:

- Being built of wood entirely, they are not affected by change of temperature.
- The timber used is placed so directly in the line of strain, that less material is required to support the same load.
- It is not perceptibly affected by shrinkage. It is the most Economical Bridge built. It is adapted to any practicable LENGTH OF SPAN.
- Plans, Specifications and Terms will be sent to any County, Township or Person wishing to build a Bridge, and no charge made unless the Plan is used.
- For all Public Bridges the Plan will always be open to competition.

Smith's celebrated CAST IRON PIER, economical, and adapted to heavy currents, built at low rates.

HALLIDIE'S
Patent Endless Wire Ropeway.
Covered by Numerous U. S. Patents.

IMPORTANT TO

Mining Companies, Civil Engineers, Contractors, Etc.

The system of transporting material, such as Ores, from the mine to the mill, Earths for embankments, Rock from quarries, etc., by means of steel wire rope, has been well tested and found more economical, advantageous and reliable than any other method of transportation; and to the annexed certificates in connection therewith I beg to call the attention of those interested:

EUREKA, Nevada, July 10, 1872.

T. M. MARTIN My dear sir: On your leaving for San Francisco, it gives me great pleasure to hand you my written acceptance of the HALLIDIE TRAMWAY put up by you upon our mine in Freireburg.

It is a perfect success, discharging ten tons of ore per hour with two men's labor. It is perfectly simple in construction, and, as far as I can judge, there is nothing about it to ever get out of order—nothing to wear out. While ours requires but about two thousand five hundred feet of wire rope, I can see no reason why the line could not be extended almost indefinitely with equally happy results. Again, the carrying capacity might be doubled or quadrupled if desired. After several weeks trial upon our mine, the unanimous verdict of all who have seen it is a complete, unquestioned success. If this can be of any service to you, use it in any way you think proper. Very respectfully, O. O. GOODWIN.

EMMA HILL CONSOLIDATED MINING CO.,

Little Cottonwood, Utah.

T. M. MARTIN, Esq.,—Sir: The Ropeway constructed by you (HALLIDIE'S PATENT) for the Emma Hill Consolidated Mining Company, has been built in a most substantial and workmanlike manner, and is at this time in splendid working condition. I most cheerfully accept the work for the Company, and recommend it to others wishing a sure and speedy transit for ores over places impracticable for wagon roads, etc. Respectfully,

L. W. COLBATH, Superintendent.

"The Vallejo works smoothly with the elevated wire tramway, which carries its load of ore as quietly and easily as if there were no winter or snow."

"Whatever the objections to wire tramways may be on account of their cost, I have seen nothing yet that even approaches them in the facilities they afford for moving ore at all seasons of the year."—Correspondent Utah Mining Journal, Alta, Jan. 8, 1873.

The Vallejo Ropeway.

The Vallejo Tunnel Company's Tramway in Little Cottonwood, built on the HALLIDIE PLAN, is a complete success. It is between 2,300 and 2,400 feet in length, and is supported by thirteen stations. The fall in this distance is about 200 feet, and the wire rope, which is three-fourths of an inch in diameter, will safely and easily deliver one hundred tons in six hours. The machinery is automatic, loading and unloading the sacks or buckets. About one ton and a half can be sent down at one time. The stations are about two hundred feet apart, and the entire apparatus is strong and safe. As the wire rope is elevated about forty feet above the surface of the hill, the Tramway can be worked all winter long, without the slightest trouble.—Utah Mining Journal, Salt Lake, Sept. 23, 1872.

Mining Companies and others desiring to negotiate for the erection of this system of Ropeway, can communicate with me personally, or through Postoffice Box 944.

A. S. HALLIDIE, Patentee,
112 and 114 California Street, San Francisco.

WIRE ROPE

For hoisting from mines, transmitting power, ship rigging, etc., of all kinds and sizes, on hand and made to order.
Wire of all kinds and descriptions, furnished at lowest rates.
A. S. HALLIDIE, 112 and 114 California St.

THE GIANT POWDER COMPANY

Are now manufacturing besides the famous regular

GIANT POWDER, A NO. 2 GIANT POWDER,

Somewhat slower in its Explosion, which we recommend for

BANK BLASTING, COAL MINES,

AND FOR ALL SUCH WORK WHERE THE ROCK IS NOT VERY HARD

It is fully as safe as the other and evolves neither smoke nor noxious fumes when exploded.
Price. 50 Cents per Pound.

The sales of both grades increase very fast, which is the best proof of their superiority over other explosives.

Number 18.

An Unusual Mining Accident.

We see by a dispatch from Nevada City that an accident occurred this week at the Manzanita hydraulic claims near that town, which resulted in the injury of three men—William Wolf, David Anderson and Thomas Bell. The accident is said to have been caused by the explosion of gas in a tunnel in which a blast had been shot off or rather blown out. Gun cotton and Giant powder were used in the blast, but it had only the effect of blowing the tamping out of the hole without breaking up any ground. An hour after the blast had been shot off, the three men named entered the tunnel with a lighted candle to examine the effect, and, when about 40 feet from the mouth, an explosion of gas occurred blowing the men back, injuring them severely. Anderson was the most hurt, though none of them are considered as fatally injured.

Instances of this kind occur frequently in coal mines but they seldom happen in mines of the character of the one referred to. The uncertainty of the causes of many fatal explosions in collieries has led to investigation of the subject in all its phases, of which "explosions from blown out blasts" is one. The Midland Institute of Mining Engineers in England is now engaged in discussing the important question, according to the London Mining Journal and a well known English Mining Engineer has published a paper on the subject.

It was formerly contended and is by some now, that before an explosion can take place there must be another important contributory—the presence of gas, fire damp or "light carburetted hydrogen gas." Yet many explosions have taken place in coal mines where this gas did not previously exist, and the causes are still shrouded in mystery. The causes of a number of fatal explosions are, however, accounted for by the peculiarity of "blown out shots," hereinafter explained.

The exhaustive paper to which we refer seems to intimate that the explosion took place almost immediately after the shot was blown out, but in the case of the Manzanita claim, according to the dispatch, it was a full hour before the men entered the claim, and a light was brought in. In a number of cases cited by Mr. Warburton in his paper it was clearly proven that explosions occurred in the mine after "blown out shots," in places where there was previously no gas.

In one instance mentioned, when the shot was blown out, it was at a great distance from where there was any explosive gas, but in about the space of time necessary to count two, the explosion occurred. Of course the powder exerted its force somewhere, and Mr. Warburton explains the matter as follows: The powder put in the hole was considerable; the amount of force it would exert is difficult of calculation. Of one thing there was no doubt, from the loud report and its consequences, a very small proportion of the energy of the powder was spent in the rock. Some idea of the force of powder may be gathered from recent experiments. When under pressure it was found to be equal to a force of nearly 16 tons on the square inch of the hole containing the charge. As this force was not spent in the hole, where was it spent? On the atmosphere of the mine. When the ignition of a pound of powder in a cannon will send a ball of seven pounds weight, say 1,800 yards, and at the mouth of the cannon at the rate of 1,467 feet per second, what must be the force of this powder striking the atmosphere? It would strike with the force of many tons.

What would be the force on the atmosphere of the mine in the vicinity of this blown out shot. Suppose we consider it pretty nearly good atmosphere, composed of a due proportion of oxygen and nitrogen, with a small proportion of carburetted hydrogen. This strong, quick blow would set at naught the law of the diffusion of gases. The atoms of each separate gas would set off at different velocities according to its specific gravity—the lighter at a speed far quicker than

those of greater gravity. Another law might increase the velocity of the carburetted hydrogen—that of absorption as it is very high in this gas, being per 100—air 1; carburetted hydrogen about 400; so it is more than possible the velocity of the atoms of this gas would be greatly augmented by the heat absorbed from the flame of the powder. The atomic velocities according to gravities at atmospheric pressure at a temperature of 32° F. have been ascertained to be nearly as follows:

Oxygen	1513 feet per second.
Nitrogen	1316 " "
Carbon	1885 " "
Hydrogen	4050 " "

This is the difference of velocity at a pressure of 15 lbs, and would be much greater under the pressure given by the force of the exploded powder, enough perhaps to account for the aggregation of sufficient atoms of carbon and hydrogen to bring the atmosphere up to an explosive point, where previous to the sudden transmission of the atoms of carbon and hydrogen it was not so.

These are the very interesting points argued by Mr. Warburton on the question of "Explosion from blown-out shots." He concludes that if these impressions be confirmed by investigation, it will be dangerous to use powder ever in collieries not supposed to give off large quantities of gas, and in all collieries a power to be used with care and in the hands of com-

Nugget of Crystallized Gold.

Pieces of crystallized gold, are so seldom found that they are highly prized, aside from their mere intrinsic value and great beauty. When they occur in large pieces they are still more scarce and proportionately valuable. The accompanying cut shows one of the most beautiful specimens of dendritic crystallized gold, which has, perhaps, ever been found in the world, of its size. It was found in a seam of decomposed quartz, between the slate, at a depth of about 60 feet from the surface, in August 1865, at what is known as the "Grit" Mining Claim, in Spanish Dry Digging, El Dorado county, California. It weighs about 16 pounds and is valued at \$3,500. Although much larger nuggets than the one described have been found in this State and in Australia, so far as ascertained none has been found presenting such a remarkably beautiful appearance. As will be seen from the cut, the gold branches out in the form of offshoots like the branches of trees.

Strange to say, this beautiful specimen was not

NUGGET OF CRYSTALLIZED GOLD—201 40-100 OZ. IN WEIGHT.

petent men. If this difference in the velocity of the different gases agitated by the explosion would account for the aggregation of sufficient atoms of carbon and hydrogen, to bring the atmosphere up to an explosive point, which previous to the sudden transmission of the atoms of carbon and hydrogen it was not so, as Mr. Warburton argues, could this be the case in the instance of the Manzanita claim?

It would appear that there could not have been any considerable quantity of carburetted hydrogen in the mine previous to the explosion; for if there had been, according to Mr. Warburton's theory, the scattered particles of that gas diffused through the atmosphere of the mine would have been forced together, by reason of the difference between their specific gravity and that of the ordinary atmosphere, until the explosive degree of combination had been reached, when it would have been fired at that point by the mere force of the condensation.

From the fact then that no explosion took place immediately after the firing of the shot, we must infer that the shot liberated, from some chamber in the gravel, a sufficient quantity of carburetted hydrogen to produce an explosion when the flame of the candle was introduced. No explosive gases could have been generated from the burning of either the powder or gun cotton employed in the blast. It is well known that explosive gases—light or heavy carburetted hydrogen—may be formed by the decay of organic matter, such as is often met with in gravel deposits; but it is not often that such gas occurs in quantities sufficient to be dangerous.

N. P. R. R.—On the new 40-mile section of the Northern Pacific Railroad, 160 whites and 300 Chinese are employed.

The Industrial School Movement.

A meeting of the Mechanics' Deliberative Assembly was held at the 12th District Court-room on Wednesday evening, at which there were present 58 members. Gen. A. M. Winn presided.

The report of the Committee on Rules and Regulations was received, discussed and accepted. The most important rule adopted, and that which sets forth the object of the Association was section 2 of Article 1, which reads as follows:

Section 2.—Its object is to discuss a system of labor schools, to enable boys and girls to learn a trade, as part of their education in the common schools, and to provide for the education and employment of all classes of children; prepare bills to be presented to the Legislature of the State for adoption, and to take such steps as may be necessary to secure their passage.

In discussing this article it was remarked that an apprentice system was contemplated in the terms of the article as a matter for legislation.

Efforts are being made to secure a lecture upon the objects of the Association from Hon. Amasa Walker.

The Lady Morehead and Elmer Mine.

In our issue of April 19th 1873, we made reference to the decision of the Commissioner of the General Land Office with reference to the Lady Morehead mine, in Little Cottonwood District, Utah. The title of the case is A. G. Paddock vs. J. P. Taggart. We stated that Paddock's adverse claim to the mine as a continuation of the Elmer lode was rejected by the Commissioner on the ground that no survey had been made of the Elmer lode within the 60 days required by law. This week we received a letter from Mr. A. G. Paddock asking us to make the statement that the above mentioned survey was made within the limits of the prescribed 60 days. Mr. Paddock says: "The parties applying for a patent on the Lady Morehead mine advertised December 5th, 1872. The survey of the Elmer mine was completed January 25th, 1873, and the protest filed on the 31st of the same month. The survey was made by Thomas Davie, Assistant United States Mineral Land Surveyor. The only possible ground for the rejection of my claim lay in the fact that the Surveyor neglected to file his field notes and make affidavit with regard to the amount of work done on the Elmer mine."

Raymond & Ely vs. Hermes.

The hotly-contested and important suit of the Raymond & Ely mine vs. the Hermes mine has been decided by the jury in favor of the Hermes. As we understand it, the effect is only to deny the right of the Raymond & Ely mine to 150 feet of ground on the west of the claim, which was the disputed territory. The case has excited much interest from the magnitude of the interests involved, and the decision has affected the prices of both stocks to a considerable extent, as will be seen by reference to our stock sales.

ASSYRIAN ANTIQUITIES.—A dispatch from London states that the Daily Telegraph's explorer in Assyria has met with great success. He has found eighty inscriptions, including histories known and hitherto unknown, of Assyrian kings. Among his discoveries is a highly important tablet containing a collection of proverbs in two languages, which will aid in the further elucidation of the whole class of inscriptions. Many of the inscriptions have definite dates.

STOCK COMPANIES IN ENGLAND.—An illustration of the mania for joint stock companies in England may be found in the statistics for February relating to the subject. During that month 76 companies were formed in London with a combined nominal capital of £9,777,280. Of these 76 companies 15 had a capital of over £25,000 and under £50,000, sixteen companies were organized for the purpose of mining with a capital of £1,431,700; 23 companies for manufacturing various things and working patents, with a capital of £1,351,580; two tramway companies with a combined capital of £140,000; and one railroad company with a capital of £500,000.

A GOLD NOTE BANK will shortly be established at Santa Barbara with a capital of \$100,000.

CORRESPONDENCE.

Climate of San Joaquin Valley.

EDITORS PRESS:—A farmers steady work and busy thoughts in laying the foundation for another crop, have delayed the preparation of a report in full for 1872 of the temperature and rainfall of our inland climate. But here it is at last, made out for twelve months on the plan adopted for the past year.

It is offered to the readers of the PRESS with some degree of that pleasure which we all experience in a work completed, even though such work be in itself but small and unimportant. It enables us to approximate for the first time, from actual observations for this part of San Joaquin Valley, the

Average and Range

Of temperature for the year, as well as for our Spring, Summer, Autumn and Winter. I say, to approximate, for we must remember that to arrive exactly at such general averages for any climate, requires similar observations to be accurately made, recorded, and calculated for at least ten years; indeed, it is almost the work of a life-time.

Such as it is, however, permit the hope, that it will not be a needless contribution to aid some future worker in making out the meteorology of our State.

We have tried, by careful calculations, from at least a thousand observations made in the course of the year, at or near the hours indicated, to form an accurate and trustworthy

TABLE OF TEMPERATURE AND RAIN ALL.

1872.	Average Temperature.	Monthly Highst.	Lowst.	Rain.
	7 A.M.	2 P.M.	9 P.M.	Mean.
Jan.	40.20	52.30	46.15	46.21
Feb.	44.83	59.11	49.69	51.16
March.	46.16	63.69	50.49	53.28
April.	49.21	66.40	50.80	55.12
May.	56.45	73.39	59.65	61.49
June.	64.57	86.86	65.23	72.23
July.	68.23	92.48	71.15	77.28
August.	69.88	91.72	71.85	77.73
Sept.	63.69	88.25	69.37	73.74
Oct.	59.57	77.19	57.25	61.67
Nov.	59.68	65.66	47.46	50.21
Dec.	56.74	66.71	41.57	45.02
Annual.	52.39	73.04	56.64	60.69

Our locality, as has already been mentioned in the PRESS, is on the plains of Stanislaus County, midway between the Sierra and Coast Range mountains, and about half way between the Tuolumne and Merced rivers. As we are not far from the center of the great grain-producing region of the San Joaquin Valley, our climate may be correctly taken as a type of the climate of the entire valley.

Let us briefly discuss the observations, and record results. It is seen that the table gives, 1st. The average temperature for each month at 7, 2 and 9 o'clock; also the monthly average.

2d. The average temperature for the year at the same hours, as well as the annual average. 3d. The highest and lowest temperature the thermometer indicated each month and for the year.

4th. The amount of rain in inches and hundredths for each month and for the year.

A Few Words of Explanation

About the manner in which these averages were obtained.

For each month, all the observations at 7 A. M., were added and divided by the number of days on which the temperature at that hour was noted. The same was done for all the observations at 2 and 9 P. M. To obtain the monthly mean, these average temperatures for 7, 2 and 9 were added and divided by 3. For the year all the monthly means were added and divided by 12.

The rainfall for 1872, 12.42 inches, must not be confounded with that of the wet season of '71 and '72, which was about 16 inches; nor that of '72 and '73, which to date of writing is about 10 inches. Also, our having no rain in May should be remembered as a very uncommon occurrence. Eight miles east of us on the Merced, and forty miles southeast along the Chowchilla, more than half an inch fell that month. We generally have as much or more. But in dry Springs, like the last, it is usual for our rains to come in spots and streaks throughout the valley.

Two Points of Special Interest

In such a table to which we wish to call attention, are the average and range of temperature for the year. As was mentioned in a previous article, the decimals of temperature are needed only for accuracy in calculations and comparisons. For practical purposes they may be dropped, and if over one-half, the preceding degrees should be called one greater.

1. The average temperature at 7 A. M. is seen to be 52 degrees; at 2 P. M. 73; at 9 P. M. 57; and the

Annual Average, 61 Degrees.

The latter is the most important item in the entire table, as it gives the means of correct comparison with other climates throughout the world.

By adding the averages for the months composing each season, and dividing by 3, we obtain the following average temperatures: for Spring 53, or one degree above the average at 9 P. M. for the year; for Summer 76, or three degrees above the average at 5 P. M.; for Autumn 62, or one degree above the general average for the year; for Winter 47, or five degrees below the average at 7 A. M.

2. By range of temperature is meant the difference between extremes of heat and cold.

From the table, this can be obtained for each month and for the year. At present, we shall call attention only to the

Annual Range, 100 Degrees.

The highest temperature recorded is 110 in June and August; the lowest, 10 in December. This makes the range for the year 100 degrees, which is exactly the same as the range of temperature found to exist in the central portion of the cotton States.

We had the coldest weather by six degrees last December that has been experienced on our plains for five winters past. The lowest previously observed was 16 degrees in Dec. '69. Last winter we had ice an inch thick. In one instance within the knowledge of the writer, the ice was so thick on a deep slough along the Merced river, as to enable a man of over 150 pounds weight to walk across it without difficulty. The like has not been known in this part of California for many years. More than once the Coast Range Mountains were white with snow for several days at a time.

Even in portions of San Joaquin Valley during one storm a few flakes of snow fell. This is a great rarity. Occasionally we have had a small amount of fine hail. As 1872 has been rather a cool year, its average temperature of 60.69, or 61 degrees, will probably be proved by future observations to be somewhat lower than the general annual temperature of our climate. It is, however, such a medium temperature as we would reasonably expect between the mean temperature at Sacramento to the northward which is given as 59.90 and San Diego toward the south, which is 62 degrees. By comparing our California temperatures with remote localities in various parts of the world, we arrive at the following

General Results.

While the mean temperature of San Francisco is nearest to that of Bordeaux, France, Pekin, China, and New York, that of our inland valleys, and Southern California is almost identical with that of Southern France, Central Italy and Southern Japan. To the latter we might also add the Holy Land and that portion of the Southern States along the valley of the Tennessee, in North Alabama, around Huntsville and Tusculuma, when the average annual temperature is not far from 61 degrees.

The following table will show more plainly wherein these climates agree, and how they differ.

TEMPERATURE OF VARIOUS LOCALITIES.

PLACES.	MEAN TEMPERATURE	Range	Latitude
	Of yr.	bet. W. and S.	North.
San Francisco.	55.83	50.59	37 deg. 47 m.
Bordeaux.	56.48	42.08	44 deg. 50 m.
Pekin.	54.86	25.42	39 deg. 54 m.
New York.	53.78	29.34	40 deg. 40 m.
Sacramento.	59.30	48.46	38 deg. 32 m.
San Joaquin Valley.	60.69	47.46	37 (about)
San Diego.	62.00	—	33 (about)
Rome.	60.44	45.69	41 deg. 47 m.
Marseilles.	59.00	45.50	43 deg. 37 m.
Nagasaki.	60.80	39.38	32 deg. 45 m.

The column for range, or difference, between the summer and winter of respective climates has been estimated in the table to show, that though the annual temperature of various places may agree closely, their differences between extremes of heat and cold may vary greatly. Indeed, this is the chief mark of distinction between climates. The range between summer and winter averages in San Francisco is

Only Eight Degrees.

Which makes it as an equable climate, one of the most wonderful in the world. In our inland valleys, in Bordeaux and in Rome, the range is three times as great; in Japan five times, in New York six times, and in Pekin seven times as great.

The most striking agreement we find is between our temperature in San Joaquin Valley and that of Rome. Both the averages and range are almost identical. The remarkable similarity between the climates of parts of California and Italy, which has been so often asserted, is not then a dream, but is proved to mathematical certainty by the stubborn logic of facts.

J. W. A. WRIGHT.

Turlock, Stanislaus Co.

THE GOLD PRODUCT OF AUSTRALIA.—The Melbourne *Argus* states that the product of the Australian gold fields was less during the year 1872 than any previous year since the gold discoveries, because the mines were fewer. Still, the pay per man was better in proportion than it has been in any of the previous years. According to the estimates of that paper, the largest yield of gold in Victoria during the past seven years was in 1866, when the product amounted to 1,536,581 ounces, and the smallest in 1870, amounting to 1,281,841 ounces. Last year the estimated yield was 1,317,102 ounces; but to produce this amount the labor of only 54,651 miners was required, against 73,749 miners, the average number employed in 1866, when the product was 219,479 ounces greater. The *Argus* estimates the average value of the individual miner's earnings at thirty-one shillings per week in 1866, and at thirty-seven shillings per week in 1872. Large investments are now making in prospecting and opening up new leads, and it is expected that the present year will prove an unusually profitable one for the mining industry of Victoria.

The long-promised School of Science in Princeton College will be opened next September.

Borax at Cane Springs.

We make the following extracts from an article on the Borax Fields, from the *Havilah Miner*:

Sunday morning last, early, we left Havilah for the Borax Fields. We went by way of Erskine creek trail for Piute, where we arrived about 2 o'clock P. M.; enjoyed the hospitality of the Bathe Brothers for a couple of hours, looked into the Bright Star mine and through the mill, and then started for Sageland, where we arrived at six P. M., and camped for the night, being entertained by Mr. Joe Bridger and the pleasant society of several gentlemen engaged at the St. John mill. At eight o'clock next morning we started for the scene of the excitement, going by way of Kelseo valley until we came to the first ranch house, when we turned in an easterly course over the plains and mountains into Granite Pass; through this pass to Jawbone Cañon; down this cañon to the desert proper. At the mouth of this cañon you can see

Harry Ball's Station.

Distant about five miles, the road being heavy and through sagebrush. Arrived at the station about two P. M., a distance of twenty-five miles from Sageland and about sixty-five miles from Havilah. Resting an hour at the station, we again mounted our mustang (one of Dan Lightner's best) and rode up the valley, northward, four miles, to Cane Springs.

Here are the Borax Fields.

Here we found Mr. Geo. H. Chapman up to his eyes in borate of lime. After introducing himself, we proceeded with our interviewing. Borate of lime was discovered at this place about the 15th of February last by Mr. H. J. Lent. Mr. Lent was the discoverer of the Columbus, Nevada, borax fields. He was sent for to come and examine specimens found in Kern county and Slate Range, San Bernardino county. He found no borax in the specimens shown him, and started on his return home. He had not proceeded more than three hundred yards from Ball's Station when he saw an "indication" in the road; proceeded to examine it, and found it to be good borate of lime. He tried to be "mum," but his prospecting around caused the secret to leak out, and in less than ten days it spread like wild-fire and soon there was

A Rush of "Boraters"

From all parts of the State. Hundreds of acres are now located by those first to arrive. There is much ground left, but, of course, not as valuable as that now taken, or at least that is our opinion after thoroughly prospecting for ourselves. The claims of

Chapman, Ball and Lent

Are immensely rich—two of their three claims being near and including Cape Springs, the other on the east side of the lake.

Not in the Lake.

These rich deposits of borate of lime are not found in the lake as many have erroneously supposed, they are out from the lake proper and covered with sagebrush. The surface of the earth is covered with a whitish substance generally known as alkali, but which in reality is powdered soda and nitre. These substances are of no definite depth; varying from a dust to four inches. Beneath these layers, which are often indiscriminately mixed, is, if found at all, the borate.

Cane Spring District.

Each claim contains 160 acres. A recorder has been elected and local laws framed for the guidance of claimants. Work to the value of \$50 is required of the holder of a claim. He is also required to have his claim recorded with the County Recorder. This district is about twenty miles west from San Bernardino county line, and sixty from Los Angeles line. We now digress from borate to the surroundings.

Cane Springs.

These springs are white sulphur, but the taste of sulphur is not objectionable; they are on the west side of the lake, four miles north of Ball's Station; it is the proper place and will be the site of the new town of "Boritana." Here Mr. Chapman proposes erecting his works for the reduction of borate, high piles of which are already thrown up.

Mesquite Springs.

These springs are at the head, or north end, of the lake, about eleven miles from Cane Springs, and have a fine flow of water. There are other springs on the west side of the lake, and one has been found on the east side.

Building Material and Fuel.

There is no timber in site. Lumber can be had at Britte's Mill, Tehachepe, about forty miles distant; wood for fuel can be had in abundance about twelve miles distant, up Jawbone Cañon. Sage-brush in abundance all over the desert, which will be used in working borate.

Extent of the Fields.

The extent of the borate fields are estimated at fifteen miles in length by ten in width. The lake proper is not of very great extent; it is dry and covered with alkali—having the appearance of a great sheet of snow—but little borate yet having been found in it.

RAILROADS.—The whole cost of the American 69,000 miles of railroad is about \$3,437,638,749, which is a sum not very much greater than England has spent on her 16,000 miles of railroad.

Pope Valley Quicksilver Mines.

We took occasion recently to visit the Pope Valley Quicksilver mines, eight miles north-east of Calistoga, and eighteen miles northward from the town of St. Helena, where we left the cars, took a horse and rode over Howell Mountains, which is about 2,000 feet high, and down into Pope Valley, 900 feet above the sea. This valley is on a tributary of Pentah Creek, and has considerable area, but most of the soil is gravelly and not rich enough to produce large crops of grain.

The Phoenix Mine.

The Phoenix, the principle mine, was opened in a small way about twelve years ago, but did not begin to produce much until last year, when it turned out 1,047 flasks in six months. It is now in good working condition. It has 6,000 feet of tunnel and drifts, steam hoisting works, a good furnace built to run for six months continuously, and reduce 24 tons of ore per day, (though it has not averaged more than 18 as yet), excellent iron condensers, a boarding house, a good supply of water and wood, a stock of 4,000 tons of ore in sight, beside several seams where more ore can be found when needed, and a patent to the claim, 4,000 by 1,200 feet. We went into the mine and found that it looked well. The drifts are clean and superintended with care and competency. We are indebted to J. H. Cowan and George Porter, foremen, for attentions.

The Washington Mine.

Adjoining the Phoenix on the East is the Washington, which has a patent for 144 acres, a large part of which is covered with ore. Rich cinnabar can be found in the gullies, and the soil of acres contains enough quicksilver to pay for reduction. The pebbles, sand and clay are rich in metal. A drift has been run in 200 feet on the ore, rather to explore its extent than to secure supplies for present workings. Daniel Patten, in charge of the mine, calculates the amount of ore in sight to be 10,000 tons, most of it low grade, but still rich enough to pay. Last year 127 flasks were produced with a profit, working in a small way, and a greater amount is expected this year. The mine needs a larger furnace and improved condenser, and these will be furnished no doubt at no distant time, after certain negotiations for a sale, now pending, shall be completed or abandoned.

Other Mines.

The other quicksilver mines of the country are the Red Hill, Silver Bow, Valley and Pope. The Red Hill mine has a patent covering 128 acres, including much metalliferous ground, and the Silver Bow has about 40 acres. The Silver Bow and Valley mines reduced their ores at the same furnace last year, and exported about 200 flasks.

The general prospects of the Pope Valley quicksilver mines are promising, and the road thither decidedly romantic, passing several very pleasant places on the Howell Mountain. —*Alta*.

PETROLEUM NEAR LOS ANGELES.—The Los Angeles *Express* says: "There can now be no doubt of the success of the enterprise; and Dr. Gelcich will reap the reward of his energetic and persistent labors. He has just returned from San Fernando, and on yesterday sent out an additional force of six men with two twelve-mule teams loaded with supplies. There have been five claims located in the range. There is the Leaning claim, owned by a joint stock company which was incorporated February 10, 1872; they own 160 acres of petroleum deposits, with full title to the land, timber and water rights. Dr. Gelcich has recently purchased all interests in the Rice claim, of which he is now entire owner. There are also the Riley and Tubbs claims, both of which are now being worked with very encouraging results. The oil range is situated thirty-five miles northwest from the city of Los Angeles on the road to Fort Tejon, and thirteen miles from the Mission of San Fernando. Three tunnels have been cut from seventy to one hundred feet in depth, and from these and the two wells the flow of oil is continuous. The petroleum is led through iron pipes to large tanks, and is dipped with buckets from the springs. The cost of transportation to Los Angeles is about two cents per gallon. We have seen the report of Louis Falke, now State Assayer, who estimates the value of the crude petroleum submitted to him for analysis, to be much greater than that of Pennsylvania or elsewhere in the United States."

ANCIENT RELICS.—We are told, says the *Piñon Record*, that a number of additional relics of a bygone civilization have been found between here and Bullionville. We have in our possession a piece of the pottery, which is said to be exactly like similar fragments found in Arizona and New Mexico. It is different from anything in that line we ever saw, but looks more like old-fashioned stoneware than anything else we can think of. The coloring must be of metallic origin, for it is a deep black, and has not faded in the slightest degree through the probable centuries that the fragments have been exposed to storm and sun.

BORAX.—Four thousand five hundred pounds of crude borax, the first shipment, have arrived in Los Angeles. The entire district is now being thoroughly prospected and laid out in claims, numbering nearly two hundred, and extending over an area of 40,000 acres.

MECHANICAL PROGRESS.

On the Use of Steel for Boilers.

From a late number of the *Deutsche Industrie* we learn that Mr. R. L. Haswell, Engineer of the Austrian State Railway Co., spoke on this subject in the Society of Austrian Engineers. He remarked that the accidents which had occurred on railways using locomotive boilers of steel had thus far been only ascribed to the material; yet this was due, on the one hand, to the preparatory working of the plates, and on the other, to the small thickness, as well as to the insufficient mode of assorting them before they were used. Haswell only knows of five instances where such boilers got cracks, four of which occurred in the fire-box plate and one in the cylindrical part. He ascribes their faulty condition to the fact that they were rolled when too warm. This shows that even by purchasing steel plates from the most renowned establishments and of the best quality, one cannot depend on their superiority for the purpose in question, without assorting them with the utmost care; because it can readily occur that in heating the plates one or more get spoiled.

All plates should be subjected to tests for their tensile strength, before they are used. That three tests are perfectly reliable is shown by the fact that of 350 boilers consisting of tested steel plate, only a single one was found torn thus far, and this in the cylindrical part. The box plates not having been tested, it is readily explained that four boilers were injured in those parts. But although these plates had undoubtedly been impaired in their strength by over-heating, they would probably not have been torn if the construction of the boiler supports, did not involve an immense strength.

In order to obtain steel boilers answering all requirements, only correspondingly thick plates and plate of the best material, without any addition (for otherwise the steel is not homogeneous) ought to be used; they ought to be scrupulously assorted according to the texture and tensile strength. After boring or punching they should be carefully annealed, the riveting must be performed with pedantic care, and the bending only with wooden hammers. The steel plates manufactured in Austria are of excellent quality is proven by the manner in which boilers are there constructed, the box front plate, down cover, and the sides of the tubes are only furnished with an edge or border, while in England they are compelled to use angle iron for these connections.

Steel plates are preferable to iron plates, owing to the fact that they possess the same degree of elasticity in all directions (from 12 to 15 per cent.); in iron plate it is in the direction of the fibres, according to Kirkaldy, about 15 per cent., but in a cross direction only 5 per cent. If one proceeds in the manner indicated, says Haswell, steel plates may be used with perfect safety. The boiler manufacturer has the advantage that he finds less plates to throw aside, and the railways on the other hand will have more carefully constructed, stronger and, in the end, cheaper boilers.

RUSSIAN SHEET IRON.—The following is a brief description of the manufacture of Russian iron from Pampelly's "Acroes America and Asia": The magnetic ore is roasted at the mine in heaps of 10,000 to 15,000 tons to remove the little sulphur it contains. It is then smelted in charcoal blast furnaces. After being puddled the iron is rolled into plates about 2½ feet long, 5 inches wide, and half an inch thick. These, after being heated in a furnace with a very reducing flame, are quickly brushed to remove any foreign substance that may have fallen upon them, and are then passed between rolls, the upper one of which is unconnected with the lower, rolling only by friction. By the time the steel is cooled it is about 15 inches wide. Packages of three sheets are now laid in the furnace and then rolled again, after the upper sheet has been brushed and charcoal powder thrown between them to prevent adhesion. If thin iron is bored the sheets are subjected to a third heating in packages of four to six and re-rolled, after which they are trimmed to the proper dimensions. They are now sent to the forge, where they are heated and hammered three times in packages of from sixty to eighty. After the first hammering each sheet is swabbed with a wet mop to harden the surface. It is said that tar is sometimes used for this purpose. Two packages, one hot and one cold, are now mixed in alternate sheets to produce the greenish color in cooling, and the mixed package is then passed backward and forward under a large hammer, and, after this, is again mixed and re-hammered. The superiority of the Russian product, it is said, is due in great part to the cleanliness of the work and to the carefulness and skill of the workmen. Every sheet that is at all spotted is thrown into the second or third class, and the difference in value between these and the first quality is deducted from the pay of the workmen. The clippings of the sheets are worked up into fine iron, and loss of material by the whole process is reduced to from 12 to 15 per cent.

Two blocks of granite, one weighing when dressed 125 tons, the other 90 tons, were recently taken out of a quarry, at Gloucester, Mass., for the base of the Scott monument at Washington.

The Production of Bright Colors on Metals.

The *Hardware, Metals, and Machinery*, published at Birmingham, England, gives the following account of a new method of producing bright colors on metals:

"The German chemist, Puscher, proposes a new method of coloring metals, which can be executed quickly and cheaply. He produces on their surfaces a coating of metallic sulphides analogous to those found in nature—as for example, sulphide of lead. These very stable sulphur combinations, as is well known, are not affected by ordinary agents. According to Puscher's method, in five minutes there may be imparted to thousands of brass articles a color varying from a beautiful gold to a copper red, then carmine red, then dark, then light aniline blue to a blue white, like sulphide of lead, and at last a redish-white, according to the length of time they remain in the solution used.

The colors possess the most beautiful lustre, and, if the articles to be colored have been previously thoroughly cleaned by means of acids and alkalis, they adhere so firmly that they may be operated upon by the polishing steel.

To prepare the solution: Dissolve 1½ ounces of hyposulphite of soda in 1 pound of water, and add 1½ ounces of acetate of lead dissolved in half a pound of water. When this clear solution is heated to 190° to 210° Fahr., it decomposes slowly and precipitates sulphite of lead in brown flocks. If metal is now present, a part of the sulphite of lead is deposited thereon, and according to the thickness of the deposited sulphide of lead, the above mentioned beautiful colors are produced. To produce an even coloring, the articles must be evenly heated. Iron treated with this solution takes a steel-blue color; zinc, a brown color; in the case of copper objects, the first gold color does not appear; lead and zinc are entirely indifferent. If, instead of the acetate of lead, an equal weight of sulphuric acid is added to the hyposulphite of soda, and the process carried on as before, the brass is covered with a very beautiful red, which if followed by a green (which is not in the first-mentioned scale of colors), and changes finally to a splendid brown with green and red iris-glitter; this last is a very durable coating, and may find special attention in manufacture.

Very beautiful marbled designs can be produced by using a lead solution thickened with gumtragacanth on brass which has been heated to 210° Fahr., and is afterward treated by the usual solution of enlphide of lead. The solution may be used several times, and is not liable to spontaneous change."

A NEW GRATE has recently been patented in England, which consists of an ordinary fire grate, with bars in front, and back and sides of fire clay; the whole is elung upon pivots, so that it may be rotated in the same way as a grindstone is, the angle of rotation being perpendicular to the back of the grate or chimney. Small grates, forming segments of a circle, are placed on the bottom and top, and these are so arranged that while the bottom grate is kept fixed, that on the top can be removed to admit of a fresh supply of fuel, so that when desired the fire can be turned topsy-turvy to allow of a free and perfect combustion of the fuel. The result is that the gas from the fresh fuel, in passing through the red-hot coals above, gets perfectly consumed, a good bright fire is obtained, and little or no smoke is left to escape up the chimney, as the combustion is as nearly perfect as possible. It is said that this grate effects a saving of at least 20 per cent. Dr. Franklin invented a grate on the same principle as the one above described, but why it never came into general use we cannot say. The theory seems to be sound.—*Am. Manufacturer.*

A NEW CAR SEAT.—A Toledo man has just received a patent for a new and useful invention recently completed by him, for an improvement consisting of a combined seat and deck for railway cars. The device comprises a stiff spiral spring, situated in the base of an ordinary shaped stool, in such a manner as to receive the full weight of the occupant of the stool without permitting it to touch the floor. The spring serves to break all the jar and jolt caused by the motion of the train, thus affording a perfectly steady position to the small desk attached to the front of the stool. It is claimed by the inventor that the occupant may write letters or make reckonings while traveling at the rate of thirty miles an hour, with all the ease and legibility attainable in his own counting room. Should this new device be all that is claimed for it, it will prove a very valuable invention for stabilizing time and transacting business while performing a journey.

INCREASE OF IRON WORKS IN 1872.—The increase of the iron industry in this country during the past few years has been unprecedentedly large. Reports for 1872 show that 107 new furnaces were built, and 39 projected, and 36 new rolling mills built and 12 projected—making in all an addition of 194 new works. At the date of the above report there were five Bessemer works in operation in the country and four new ones projected.

SCIENTIFIC PROGRESS.

Gold and Platinum Alloys.

The whole subject of alloys is one of much interest and importance, and its true value in the arts is as yet very far from being fully understood. Comparatively few of the metals possess such qualities as render them suitable to be employed in the arts, alone or unalloyed. It is generally supposed that in the alloys of metals there was a fusion of each metal, and a blending together of the particles of each, so that for all practical purposes the compound should be recognized as one body. But Towne says that though metals may combine when melted together, it is doubtful whether they remain combined after the solidification of the mass; and the wide differences between the melting and solidifying point of certain alloys, appear to indicate that the existence of these compounds is limited to a certain range of temperature. Matthiessen regards it as probable that the condition of an alloy of two metals in the liquid state may be either that of: 1st, A solution of one metal in another; 2d, chemical combination; 3d, mechanical mixtures; 4th, a solution or mixture of two or all of the above; and that similar differences may obtain as to its condition in the solid state.

A curious result in relation to the combination of gold and platinum was recently observed by Dr. James Leelle, of Cincinnati, and communicated by him to the *Scientific American*, which appears to demonstrate that in melting together gold and platinum there is certainly no chemical union, no mechanical mixture; but that the platinum melts and arranges itself in small globules, distinct from one another, retaining their integrity in the melted mass.

The Doctor, in the communication above referred to writes:—"Thinking there might be some method of discovering how metals combine when fused, I made the following experiment, producing a result which is entirely new in the history of the noble metals:

I had a lot of dental gold plates, which had quite a number of small pieces of platinum wire attached, after breaking off the artificial teeth. There must have been about three pennyweights of platinum. The mass weighed nine ounces. I melted and poured the whole into an ingot; it was perfectly fused. On examining the bar closely, not a trace of platinum could be seen. I rolled it through the hand-mill, extending it to three yards in length; then cut it in pieces three inches long. I then exposed it to the actions of acids, in a manner entirely different from my usual method when refining gold foils. After a few hours chemical action, I observed a bright metallic point gleaming through the bars of a crystal cage, which a glass blower made for me for this special case. I took it out, and, on examination, I found it to be platinum. I placed it back again for further action; and, on its final removal, I have now a demonstration in a friable mass in which are seen six pieces of platinum as clear and perfect as if they had been rolled in a mill, and they are retained together by the undissolved gold to convince parties who otherwise would conclude such a result to be impossible. This is the first experiment I have made with arrangements devised by myself; what my success may be with metals lower in the scale, further experiments will reveal."

As if recognizing the fact that a matter of doubt might arise with regard to the above experiment, the Doctor, at the close of his communication says:—"In view of my discovery, I know the chemist and metallurgist will ask me: What new solvent have I found that dissolves gold, and yet leaves the platinum undissolved at the same time? I desire making further experiments before fully explaining my methods.

SCIENCE AND THE TRADES.—It was one of Colridge's most pregnant sayings that "every true Science bears in itself the germ of a cognate profession, and the more trade is elevated into profession the better." In France this truth has been for many years appreciated, and to this we believe the success of French enterprise in Italy and Spain is largely attributable. Any one who considers on the one hand, the overcrowded state of our learned professions, and on the other, the abundant room for scientific ability in numerous branches of manufacture and production, can hardly deny that a great waste of English intellect might be saved, and that an immense addition to our national resources might be effected by the elevation on the shoulders of science of various common occupations into skillful professions. We must, moreover, include in the waste of intellect all the ingenuity which debases trades by allance with adulteration and counterfeit production.—*Saturday Review.*

As an evidence of the practical progress which science is making there will be shown at the Vienna Exposition a special department for the display of useful products, made from what was the waste material of manufactures at the time of the London Exhibition of 1851.

SACCHARINE MATTER IN MUSHROOMS.—A. Minntz says that mushrooms yield a syrup, readily crystallizable; which presents all the properties of the sugar obtained from the manna of the East.

THE SUN'S RAYS, in passing through plain glass of uniform thickness is very much diminished, but not nearly as much so as heat from other sources.

Brain and Thought.

To regard thought as a secretion is reducing mentality, affection, reasoning, soul, spirit, or whatever there is of us distinct from the material organization that perishes, to a mere process, or circumstance, that has no absolute existence in and of itself, but is merely a transient manifestation of matter, as is said of nascent oxygen being ozone, of electricity being a mode of motion.

To say that mind is a property, or the effect of organization, is to reverse the order of nature. Mind is the cause of organization. Bodies do not create mind but mind creates them. The house does not make the tenet, but the person constructs the habitation. Nothing can form or produce anything superior to itself; effects can never be greater than their causes; nor can matter originate or produce anything different from matter; and as mind is entirely different from matter, in all of its laws, qualities, and manifestations, it follows that it has an existence independent of matter.

The secretions of the human organism are certain fluids to be used in its formative processes, as saliva, gastric juice, etc. Thought is no more like saliva or gastric juice than it is like a potato or a pumpkin. It is no more like bile than it is like a rotten apple or decayed cabbage.

What is thought! Thought is mental recognition. When the mind, through its general organ, the brain, and through its special instrumentalities, the five senses, takes cognizance of an object or thing, that recognition is a thought, a perception, an idea, a fact. Secretions and excretions only relate to the vital processes. Thought relates to external objects and other beings. A recognition of several objects or things constitutes thinking; a recognition of their relations to each other is the mental process of comparison; and a recognition of the principles into which the facts or data of knowledge (thoughts) may be arranged is the mental operation of reasoning. If thought is a secretion so is feeling, and so are all mental phenomena; and the great mysterious "ego" of the metaphysicians is nothing but a molecular transformation, or a chemical decomposition. How are thoughts and feelings, on the theory of secretion, communicated from one person to another? Secretions, as all physicians know, can not be transferred from one person to another. How about loving, hating, opinions, education, etc? Are they, too, secretions? And how about dreams, omnambulation, clairvoyance, judgment, will, memory, conscience? Are these secretions?—*Dr. R. T. Trall.*

EFFECTS OF A DRY COLD WINTER.—Prof. Shaler has a communication in one of our scientific periodicals of the winter of 1871-2—one of the driest and also one of the coldest on record. The snow-fall was light, and the ground froze to almost an unprecedented depth, being sufficient throughout the whole of New England to involve the roots of the vegetation and the forests. The tree which suffered most was the arbor-vitæ, more than half of these having died, and the rest being in a critical condition. The red cedar was likewise a great sufferer, as also the yellow and white pines; indeed, all the conifers in New England have been injured to a greater or less degree. The greatest damage was experienced in sandy soils. The only change experienced in animal life noticed by Prof. Shaler is the comparative scarcity of snakes, which he considers to be a very decided feature. The Professor contends that a slight addition to the degree of the drouth and the cold might have made such ravages with our forests as to have modified the climate and brought about a series of changes as great as those which mark the different geological formations of the past.

AUTOMATO TELEGRAPHY.—It is announced that this new system of telegraphy is now finished and in successful operation. By this system it is claimed that fifteen hundred words per minute, in clear characters, can be sent between Washington and New York, a wire circuit of three hundred miles; and that, by the use of a certain kind of automatic repeaters, messages can be sent any number of thousands of miles at the rate of six hundred words per minute. The matter to be sent by this new system is prepared by means of perforating machines, the use of which can be easily learned by any person of ordinary intelligence in ten days' time. These perforating machines can turn out the messages, ready for automatic transmission, at the rate of from one hundred to one hundred and forty words a minute. If the system will really do what is claimed for it, it is second only in importance to the telegraph itself.

FORESTS AND RAINFALL.—A NEW THEORY.—Experiments made by Von Pettenkofer on the amount of water evaporated from an oak tree, show that atmospheric humidity, in so far as it depends upon the presence of forests, is promoted rather by the roots of trees drawing moisture from the earth, than by any attraction exercised on rain clouds by the leaves. The latter serve rather as a outlet through which the moisture drawn from the soil passes into the air. The oak tree observed by Pettenkofer was estimated to have 751,592 leaves, and the total amount of evaporation in a year was computed to be 8½ times more than that of the rainfall on an area equal to that covered by the tree, the moisture exhaled by the leaves being equal to 211½ inches, while that from rainfall was but 25½ inches.

Our Weekly Stock Report.

There has been quite an excitement in the Stock market this week, and prices advanced more than they have done for some time past. On Tuesday last everything went up on the line of the Comstock, and Savage in particular has been held at a remarkably high figure. A short time ago it was \$38 and this week jumped to \$95, although it has fallen since. Many reasons are given for this rise any of which might be the one; rich ore in the mine of course. During the last two weeks the value of the leading mines has advanced about \$100,000, which shows what the advance has been.

The Crown Point and Belcher mines are turning out large amounts of money as usual. They paid out as dividends this month the aggregate sum of \$1,020,000, the Belcher paying the odd \$20,000. These two dividends are the largest ever paid by these mines. Business at the Stock Board has improved materially within the past two weeks, as the amount of sales will show, if nothing else. For the week ending on the 23d they amounted to over \$300,000 more than the previous week. The sales of this week will probably far exceed those of last. One of the low priced stock which has risen largely is Baltimore Consolidated, which sold for \$1 on Monday and \$1 on Tuesday.

The excitement of the week has been the Raymond & Ely and Hermes suit, which was decided in favor of the latter. The decision denies the right of the Raymond & Ely to 150 ft. of ground on the west of the claim which was claimed by both parties.

On Friday a pretty good business was done in the Stock market, but prices were scarcely so firm as on the previous day.

On Saturday the market was a little stronger and more active, but the fluctuations in prices were immaterial except in the case of Savage, which rose \$4, and Raymond & Ely which fell \$7; Hermes went up \$2.

Very little change in prices was apparent in the Board on Monday, and the market was quiet; Raymond & Ely fell \$9.

On Tuesday morning prices advanced all along the line, especially in Comstock mines. There was quite an excitement in the market at the advance and a good business was done. Savage showed the most marked advance of all—\$37. Belcher rose \$2.60; Chollar, \$7; Hale & Norcross, \$13; Ohio rose \$10; Overman, \$4. There were no transactions in Crown Point. Hermes rose \$5; Meadow Valley, \$1.

Wednesday the market was pretty active, but prices showed a decline, as people were cautious of buying at the comparatively high figures.

To-day there was some excitement in the Stock market in the morning, but a decline in prices was apparent, as will be seen by reference to our Stock Tables.

The following items of interest from prominent mines are collated from letters or telegrams from superintendents on file at the offices of the respective companies in this city.

American Flag.

Superintendent's letter of the 25th says the main shaft is down below the fifth station 106 feet, and they will, immerse

diately start the 6th level, and continue sinking the main shaft. Stopping ore at points mentioned in last report. Carrying ore to mill, and will start mill on flag ore to-morrow.

Amador Tunnel.

Letter of the 26th says the mine shows an improvement this morning in stop above lower drift, and also in winze below, and will furnish us more ore than we calculated on without sinking. The main shaft is going down slowly, the rock being exceedingly hard.

Arizona and Utah.

The letter of the 26th says everything is progressing as usual. Drift east from the shaft, at the 260-foot level, is finely under way. Are now twelve feet from the shaft, and have resumed sinking again. Have been obliged to stop sinking the shaft for two days, in order to get a start with the drift.

Belcher.

Dispatch of the 28th says the ore breasts and stope look well. Stopes on the 1200-foot and 1300-foot levels look splendidly; in very fine ore. Car samples, \$101 per ton.

Dispatch of the 29th says the car samples for that day were \$122 per ton.

Dispatch of the 30th says there is no change in the mine. The 1300-foot level is opening out finely in splendid ore. Car samples, \$119 per ton.

Buckeye.

Letter of the 26th says everything about the mine is going well; east drift looking as though it would change for the better. Winze on first station is doing well. Rock in the bottom prospects very well. Ledge is about two feet thick. The ore breasts look about the same as at last report; ore slips for the 25th, 26th, 27th, were 58 tons.

Chollar-Potosi.

Letter of the 28th says that during the last twenty-four hours there were 170 tons of ore extracted from the mine. During the last twenty-four hours all work was suspended, except at the fourth station, but commenced again this evening, and operations are now fully resumed. Nothing new at any point of the mine since Saturday. Ore slips for the 27th, 28th, 29th, were 100 tons.

Letter of the 29th says that during the last 24 hours 190 tons of ore have been taken out. Car samples, \$32. At the fourth station, in face of the drift, there is a small amount of water seeping through. No particular indications of precious metals are existing there. Main ore producing sections are the same as during the last six days. Ore slips for the 28th, 29th, 30th, were 150 tons.

Caledonia.

Letter of the 29th says there has been no change since last report in second station drift, the ground still continuing quite rough, and working a trifle harder than at last report. No change in winze; still have plenty of water, and consequently slow progress is being made. The general work in and about the mine is going ahead as usual.

Crown Point.

The haulion receipts on the 26th inst. amounted to \$28,169.88, making the total for the month, so far, \$619,224.63. Letter from the Superintendent under date of April 26th says they have shipped for the month of April, up to 26th, 11,753 1/2 tons of ore, which will yield, estimating it at 65 per cent of the assay value, \$333,563.93. General average per ton up to the 26th, \$75.56. The winze being sunk from the 1200 foot level is down 74 feet and is looking exceedingly well. The 1400-foot level south is in 133 feet and is still in that same body of barren quartz that was found on the levels above. The incline is down nearly to the 1500-foot level.

Dispatch of the 28th says the porphyry and barren quartz in the fifth floor crosscut of the 1300-foot level proved to be

Assessments, Meetings, Dividends.

[COMPILED DAILY FOR THE STOCK LEDGER.]

NOTE.—In the Stock Board an assessment is delinquent thirty days from the date of levy, exclusive of that date. The dates given in this list are those of the mining offices.

Imperial.

Letter of the 24th says they started the pumps to the 1300-foot level to-day. Everything works well. The mine generally looks more favorable than yesterday.

Letter of the 25th says there is no change of importance at the mine. Think we will get through with the pump to-morrow. Assays from the Empire mine to-day is \$7.41 per ton.

Ingomar.

Dispatch of the 29th says they have let contract and commenced work this evening.

Julia.

Letter of the 24th says the mine is progressing, the same as usual. South drift is looking about the same, except that the ledge has widened a little in the north drift. There has been a little change for the better.

Letter of the 26th says the drifts are making good progress. The north drift has been driven 22 feet—total length, 112 feet. There is a decided improvement in this drift. The south drift has advanced 23 feet—total length, 90 feet. This drift is looking exceedingly well, although there has been no material change.

Drift in the north and south mine are steadily improving at present, more especially the north, which is looking very well to-day. Getting ready to resume sinking, which we shall do next week. Everything is looking favorably.

Justice.

Letter of the 27th says that in the south works, main south drift, 2d station, as we approach the line, shows evidence of improvement, and may produce milling ore. The winze is now down 90 feet below the second station, improves as we go down, and now shows three feet of pay ore; should this continue, connection will be made as soon as possible with the main incline for its extraction. The main incline is 65 feet below the second station, and shows a change of low-grade ore, with better promise, being firm, good looking, and without gyp. In north works, main south drift in 326 feet, changed to hard quartz, with considerable water from west wall. Cresscut number two is in east 51 feet with quartz also and porphyry. Will commence cresscut west this week.

Lady Esten Tunnel.

Letter of the 23d says there is no special change in the appearance of the mine. The rock is quite hard and the formation is in its true position, and we may look for encouraging results any time. The tunnel is now in 250 feet; the fact more completes the contract. The ore vein which we have passed is rather favorable, assaying \$4 in silver and \$5 in gold. Prospects good.

Overman.

Letter of the 26th says they have made 85 feet of drifts during the past week. The face of west drift is in granite and porphyry. Have added 38 feet to this drift since last report. The face of the south drift is in granite and a little quartz, and have made 25 feet during the week. The north drift is in a mixture of granite and porphyry, with little seams of quartz all through it. Have made 22 feet this week.

Ophir.

Letter of the 25th says there has been nothing new to report to-day. Favorable progress is being made at all points but without showing any important changes as yet.

Raymond & Ely.

Dispatch from the Superintendent under date of the 26th says: "I shipped yesterday, \$40,212." This makes the total for the month, so far, \$216,501.

Letter from the Superintendent under date of April 22d says the mill are running well, reducing about 100 tons per day. Have resumed sinking in the shaft, which is now down 16 feet below the eighth level; total depth, 746 feet. Southeast drift on eighth level in 137 feet; rock hard. Drift going southwest is in 52 feet; rock working well. On seventh level, west drift is in 117 feet. Winze in the level is down 67 feet. Sixth level west is down 54 feet. East winze is 32 feet deep; vein three feet wide. Am preparing to sink a new winze on the new ore found in the seventh level. Extracting good ore in vicinity of Panaca shaft.

Dispatch from the Superintendent under date of the 1st inst. says: "The Hermes Co. have the verdict." The effect of this is only to deny the right of the Raymond & Ely Co. to 150 feet of border ground on the west, which was disputed territory.

Silver Hill.

On the 24th we shipped to Bacon mill 49 tons and 1,100 pounds of ore; assays on the same day gave \$17.27 in silver, and \$18.83 in gold, total value per ton \$35.10.

Letter of the 26th says they shipped to the Bacon mill on the 24th inst. 81½ tons of ore, and on the 26th 8½ tons. An assay on the 24th gave \$32.24, and on the 26th 41.01 per ton. The mine is looking very well in both north and south drifts. The second station still continues very hard, but we still keep driving away at it. The mill keeps running quite satisfactorily.

Letter of the 28th says they shipped 84 tons of ore to the Bacon mill on that day.

Shipped to the Bacon mill on the 29th, 50 tons 900 pounds. Assays on the 29th gave \$42.37 and \$22.75; 29th, \$38.50.

Sierra Nevada.

Letter of the 26th says the result of the last clean-up from the battery was \$1,851.20. The amount of ore worked was 693 tons. There is no material change in the mine. Some day it prospects well and the next poor. We are getting nearly all our ore from the northwest body. Have developed two small streaks of ore, which may lead to a large body. They are now from two to three feet wide, and prospect \$3 ore. The prospecting is kept constantly going on. The mill is in good condition and running constantly.

Silver Peak.

Letter of the 23d says the ore is nearly all hauled, and the mill will work it this week. The east drift is in 30 feet from the incline. The rock is getting softer, and still continues in good ore. The drift to the west is unchanged. Both have been quite hard and the progress is rather slow, during the past week. We have but little fire ore, most of the ore being in large pieces. Average sample for the fire ore have gone rather low, but the coarse rock has been good which has made up the whole to the general average. Sample for the 19th was \$84.82 and for the 21st \$56.56 per ton.

Letter of the 25th says the last load of ore was shipped to mill this morning, and the mill begins crushing to-day. Have taken out some very good ore the last two days, especially the coarse lumps which seem to be very rich. Sample for 22d, \$28.54; for 23d, \$19.54; for 24th, \$18.28, which shows a decided improvement. No important change in mine. Ore breasts continue to look well.

Woodville.

Letter of the 26th says the different slopes on the lower level are yielding well of good ore. The first level north, which was abandoned some time ago, we are now reopening, and it shows an increase in the size of the ledge. The rock is very rich, and assays from \$400 to \$500 per ton. A new streak of ore has appeared, resembling the Comstock ore, in this drift, which yields no free gold, but shows silver, sulphur, etc., assaying \$36.14, principally silver. Will make a partial clean-up of Rameled mill to-morrow. The Ione mill started on Saturday, and the copper plates show finely for the time running.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned:

California.

CALAVERAS COUNTY.

GOON PAX.—Calaveras Chronicle, April 26:—We learn that Messrs. Moser & Howarth, proprietors of the Sport Hill gulch claim, are doing remarkably well. They have swept away the tailings down to the bedrock for a considerable space, and are now engaged in shoveling the bottom gravel into sluices. With but 3 men employed we understand that they yield of the mine reaches as high as \$700 per week.

NAPA COUNTY.

OUR QUICKSILVER MINES.—Callistoga Tribune, April 24: During the past week, work on our quicksilver mines has been going on steadily, and prospecting has been lively. On Friday last, a fine discovery was made on the rancho of Mr. Wm. A. Stuart, a short distance from the Ida Clayton and Keyatone. The ore is undoubtedly the richest ever seen in this locality, or perhaps any other. This mine has been known to one individual for some time, but as it was not patented he said nothing about it until last week, when he pointed it out to Mr. Stuart for consideration. Mr. W. F. Linton, who is interested with Mr. Stuart in this discovery, is at work with a gang of men opening the mine, and informs us that every stroke of the pick displays the shining cinabar. This mine has been christened the "Yellow Jacket," which name was suggested in a singular manner. In making their first prospect, a nest of yellow jackets were found to have taken up their abode in the ore deposit, and for a time made it rather warm for the prospector. The rock from this mine assays as follows: Choice ore, \$3 18-100 per cent, or \$1,053 per ton. Fair ore, 16 per cent, or \$320 per ton. Average assay, 5 2-10 per cent, or \$104 50 per ton.

IDA CLAYTON.—This mine, also on Mr. Stuart's land, is progressing finely. The tunnel is in about sixteen feet. A good mountain of ore is now striking the ledge. The Goulding mine, owned by the American Quicksilver Co., are taking out 1½ bushels per day from this mine, which is about fifteen miles from Callistoga. A quantity of quicksilver has passed thence through Callistoga, the past week, on the way to San Francisco.

GALENA.—We have seen a rich specimen of galena found somewhere in the neighborhood of the old Kellogg rancho, 4 miles south of Callistoga, where it is said there is an extensive deposit. The exact location has not yet been made public.

SAN BERNARDINO.

A RICH MINE.—Southern Californian, April 26: Several months ago a number of gentlemen formed an association for the purpose of developing a silver mine which had been discovered in Arlington District, about 100 miles from Anaheim. The association is known as the "Virginia Mining Company of Anaheim." The two now at the mine report that they are at work on a ledge 2½ ft. thick, and are down 30 ft. A specimen of the rock which they are now taking out, has been subjected to a rough test, and has been found to contain nearly \$1,100 to the ton. Some of the rock first taken out was sent to San Francisco, and on being assayed was found to contain \$400 to the ton.

SIERRA COUNTY.

DEAD BROKE CLAIM.—Mountain Messenger, April 26: The other day while over south, we visited the Dead Broke Gravel Claim, and found it in excellent working order, paying \$2 to the load. Four men are steadily employed, and more will soon be engaged as the claim is now fully opened.

BATA MOUNTAIN.—This fine gravel claim is still as rich as ever. During the past two weeks \$7,000 has been taken out at an expense of \$2,500. The average yield all along has been about \$2.85 to the car load. Last year over \$54,000 was distributed in dividends. A candle box full of gravel, the other day, yielded 6 ounces of specimens. Amount of capital sunk before reaching pay ground, \$20,000. Average yield per day, \$500. 80 men are steadily employed. A giant powder is used. The tunnels and breasts are dry and the atmosphere pure.

Nevada.

URAL, MAMMOTH.—Reese River Review, April 21: This Co. has been sinking during the winter, but recently, at a depth of 190 ft., has cresscut to the Gould & Curry ledge and drifted north about 30 ft., finding the ledge well defined, 8 feet in width, and carrying from 2 to 3 ft. of first-class milling ore on the foot wall. The Co. is now cresscutting from the bottom of the shaft to the Ural ledge, distant about 60 ft. to the east, which carried much better ore at the surface than the Gould & Curry ledge. Working two shifts.

ESTR BUENO.—The main incline on this mine is now 300 ft. deep, when a cresscut drift, preparatory to commencing the fourth level, has been run to the hanging wall, a distance of 42 ft., through fair milling ore. A cresscut drift has also been run from the shaft to the foot wall, a distance of 35 ft., passing through 10 ft. of ore near the foot wall that will mill \$100 or more per ton. The 2d and 3d levels, 60 ft. apart, have been driven in 70 ft., where a winze connects the two and shows from 4 to 5 ft. of \$100 ore extending from level to level, none of which has yet been stopped out.

SMITH.—A mine which has been bonded to San Francisco parties for the past 4 months, is reported sold; figures not given. The parties to whom the mine was bonded, have been working 5 men on it for the last 6 weeks, finding several large and evidently continuous bodies of ore, assaying from \$70 to \$300 per ton. The location embraces 1,300 ft. in length, with an average width of ledge of over 30 ft. These extensions north and south have been located, covering a distance, in all, of 7,500 ft., through which the ledge is traceable.

CROWN MINE.—ONE.—On this mine R. O. Beatie & Co., are prospecting work diligently with a force of men. The present depth of the incline is 155 ft., from which a tunnel 2d level is being driven each way. On the south the level has reached a distance of 125 ft., showing a 2 to 3 ft. ledge, with a pay streak averaging 10 inches in width of ore that will mill well up in the hundreds. They are now putting a track in the first level, 80 ft. above the bottom of the incline, preparatory to stopping the upper backs. Their steam hoisting works are operating finely.

BRADLEY.—A mine, one of the earliest locations in Union District, Bradley and Hartman, have been working quietly for the past 3 months, and have on their dump sixty tons of ore, that will mill not less than \$200 per ton, with plenty more in reach without any expensive outlay in the way of dead work.

WASHOE.

BELSHOE.—Gold Hill News, April 26: Daily yield about 550 tons from the 1000, 1100, 1200 and 1300 ft. levels. The main incline is down 115 ft. below the 1200 ft. level, with the bottom in hard dry rock. The timbering of the main south drift at the 1200 ft. level is progressing well, and as soon as completed, drifting south will be resumed and pushed ahead as fast as possible toward the main incline. At the 1200 ft. level the north drift from the incline is in 244 ft. and the south drift to connect with it is in 404 ft. leaving about 85 ft. to run in order to complete the connection. Some unusually fine ore is complete from the breasts and slopes of the 1300 ft. level, by way of the Yellow Jacket shaft, and the other ore producing sections of the mine looking and yielding finely as usual. The bullion receipts for the present month will exceed those of the last, and with the large surplus left in the treasury after paying the last dividend, an increased dividend may be looked for. The machinery and everything works well.

CROWN POINT.—Daily yield 450 tons from the 1,200 and

1,300-ft. levels. The incline is down 170 ft. below the 1,400-ft. level. The bottom is in hard blasting rock, with very little water coming in. The south drift, 1,400-ft. level, is in 140 ft., the rock barren, but easily worked with a pick. The cresscut east from the 5th level above the 1,300-ft. level, 100 ft. north of the Belcher shaft is again in ore. The slopes in all the levels above the 1,400 are looking finely. The new pump will be in running order next week.

CON. VIRGINIA.—Main shaft down 352 ft. below the 500-ft. level. Ground works favorably, allowing of good progress. The great heat in the drift north from the Gould & Curry, at the 1,167-ft. level, does not prevent very fair progress being made under the circumstances. No new ore developments.

CROWN POINT RAVINE.—Have cleared out the main shaft down to the first station, 250 ft. from the surface, and the old west drift at that point a distance of 40 ft. This drift has been driven ahead about a week 12 ft. In new ground, composed of a clay and porphyry formation being evidently the east wall of the ledge. The increase of water was so great that further drifting had to be suspended and now hoisting arrangements erected, which will be completed and drifting resumed next Monday.

CHOLLAR. POROSI.—Daily yield 160 tons, assays of which average about \$33 per ton. The face of the drift at the 4th station is in quartz, carrying stringer of ore. The various breasts and slopes of the producing stations are holding out well with good prospects ahead.

YELLOW JACKET.—Drifting north and south on the 1,400-ft. level, is making good progress, with no change in the character of the rock. Drifting east on the 1,500-ft. level was resumed last Monday. The pumps keep the water down so that it does not interfere with work on this level. Cresscutting at the 1,300-ft. level with, progresses as usual, with no new developments. This mine is holding about 150 tons per day for the Belcher Co., the ore coming from the 1,300-ft. level.

GOULD AND CURRY.—The new pumps in the incline are completed and working well, draining the water so that sinking can be proceeded with immediately. The promising development of quartz at the 1,500-ft. level, with drift mentioned in our last, shows about the same. No further improvement. The main south drift at the 1,600-ft. level, to connect with the Savage south drift, is actively driving ahead, making good progress. Prospecting at various points going ahead as usual.

HALE & NONCROSS.—Daily yield about 50 tons, principally from the second station level, added by contributions from the 9, 10 and 12 stations. The main shaft is being reinforced for a distance of 300 ft., where the timbers are defective or settled out of shape. General prospects good, with no new level opened.

IMPERIAL.—The powerful new pumping machinery was started last Thursday, and is a great success, moving with less labor than any other on the lead. On trial yesterday, the water in the sump was lowered 5 ft. in three minutes, the pump working alone on the shortest stroke. The water is out of the sump in the main shaft, and to-day the men are taking the mud from the bottom. Work is being pushed energetically in and about this mine. The company are now making a comparative test of wood and coal, carefully weighing and recording everything.

MINT.—The east drift for the ledge, 75 ft. below the surface, is being actively driven ahead. Some very fine ore has been run into about 10 ft. from the main shaft. The vein is about 1 ft. in width. Some of the ore shown us this morning looks very rich in sulphurates, and so closely resembles Crown Point ore as hardly to be distinguished from it. The ore vein mentioned is evidently a spur of the main ledge, and the drift is in about 10 ft. beyond it, with every indication of soon striking the main ledge, as there are several feeders in the face of the drift which apparently lead to it. There is also a noticeable increase of water coming in, which is another favorable indication. The new hoisting works operate smoothly and well.

SAVAGE.—Producing no ore at present. The main south drift at the 1700 ft. level is driving ahead in favorable indications, and the north drift at the 1600 ft. level to connect with the south drift from the Gould & Curry is making as good progress as could be expected considering the great heat. No new ore developments to report, but everything in and about the mine is working well and advantageously.

WOODVILLE.—Daily yield about 20 tons of very superior quality, keeping the Rameled and Ione mills steadily running. The Ione started yesterday, and when some other available mill can be procured, it will be set to work. The slopes on the lower level are yielding well. The drift north, first station, has run into very rich ore during the past week, assaying over \$400 to the ton—more than half silver. The bullion promise of this mine is very flattering at the present time.

WHITE PINE.

THE HIDDEN TREASURE, White Pine News, April 26: This noted property, so well known formerly as one of the leading mines of this section, is now being energetically worked by a large force of men. Proceeding down the east declivity of the Hill, we enter the old tunnel, from which each level has been driven. Ore has been taken. After passing through the broken masses of rock for some 30 ft., we find the most perfect foot wall ever known in Eastern Nevada, or elsewhere, lying at an angle of 44 degrees, pitching east, as smooth as glass, with a slight stratification to the south; it runs almost due north and south, pitching east at an angle of 44 degrees, and is intersected by a tunnel we pass large artificial caves, from which great quantities of rich mineral have been extracted, and on an incline, (following the wall mentioned) at the depth of 230 ft. we arrive at the channel of ore, which is rapidly becoming rich in quality as it is in quantity.

WHEELER TUNNEL.—This immense undertaking was prosecuted for a period of six months. Through the hardest limestone, on a due west course, this work has been prosecuted to develop the truthfulness of the theory that an ore channel would be found at a depth. At a distance of 400 ft. from the face of this tunnel, the smooth foot wall, left in the Hidden Treasure workings above, was found, the distance from the surface being 500 ft. Here a quartz formation marked its appearance, some 80 or 70 feet east of the wall, which contained mineral of small value. The tunnel was run some 30 feet further west, or beyond the wall, and came to solid limestone, here of all indications of mineral. Returning, a drift was started south to prospect the ground under the workings of the Hidden Treasure; the vein matter, with mineral mixed in, being itself in the quartz formation. The wall above is the same as appeared in the Hidden Treasure, 500 ft. above, and, by actual survey, retains the same inclination in degrees as there found, proving it conclusively to be one and identical.

THE PERLESS CHAMBER.—This remarkable body of ore in the Eberhart & Aurora, which we have before attempted to describe, shows no signs of giving out, on the contrary, is daily increasing in size. The quality of ore taken from this superior body, which we have seen on Treasure Hill since the famous Eberhardt days.

MOREY DISTRICT.—From Perlia Rowell who has just returned from a ramble among various districts, we gather several interesting items respecting the mining sections which he visited. The most remarkable of the ore-producing region seems just now to be that of Morey District. We say remarkable, as, by the specimens shown us from the Magnolia, belonging to a New York company, we see 3 distinct and separate characters of mineral. At the surface we are shown yellow chlorides, evidently base in their character, and of but little value for reduction purposes; next we come to a species of antimonial silver ore, impregnated with pyrites of iron; and at the depth of 80 ft. in the shaft we find quartz with horn and ruby silver thoroughly mixed in.

Borax for the Epizooty.

A city paper remarks, that the proprietors of the establishment to refine borax on Powell street near Chesnut, have satisfied themselves that they have found a protection against the epizooty. Knowing that borax has a healing influence on inflammation of the mucous membrane of the month, in the human genus, they gave four ounces daily of it, refined and pulverized, in their food, to each of their horses, not one of which has been attacked, while many others about them not thus protected have been afflicted. The horses like the medicine. Physicians, familiar with the qualities of borax, anticipate favorable results from the use of the new remedy.

THE HORSE DISEASE has become general all over the State, but San Francisco naturally suffers most. The disease is said to be in a milder form than when it raged in the Eastern States but its presence is nevertheless very detrimental to business of all kinds. Oxen have appeared in our streets in limited numbers and we have taken advantage to some extent of the central population of the city and utilized small gangs of chinamen to draw market wagons, etc.

BENTOLA CEMENT.—The Benicia Cement Company's works have changed hands, and the new company will make extensive improvements. A large bed of cement rock has been discovered not far distant from the works, which will supply a much larger mill than the one in operation, with rock for years to come.

BORAX.—A dispatch from Los Angeles says that over 150 acres of valuable borate deposits are now uncovered near Deert Springs Station. There are about 500 acres of good land in the district, all of which has been taken up.

The New Coal Land Law.

We give below the text of the bill in relation to the location of Coal Lands in the United States, which was passed by the last Congress. The Commissioner of the General Land Office will shortly issue needful rules and regulations for carrying the provisions of the law into effect.

[GENERAL NATURE—No. 107.]

AN ACT to provide for the sale of lands of the United States containing coal.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That any person above the age of twenty-one years, who is a citizen of the United States or who has declared his intention to become such, or any association of persons, severally qualified as above, shall, upon application to the register of the proper land-office, have the right to enter, by legal subdivisions, any quantity of vacant coal of the United States not otherwise appropriated or reserved land by competent authority, not exceeding one hundred and sixty acres to such individual person, or three hundred and twenty acres to such association, upon payment to the receiver of not less than ten dollars per acre for such lands, where the same shall be situated more than fifteen miles from any completed railroad, and not less than twenty dollars per acre for such lands as shall be within fifteen miles of such road.

Sec. 2. That any person or association of persons severally qualified as above, who have opened and improved, or shall hereafter open and improve, any coal mine or mines upon the public lands, and shall be in actual possession of the same, shall be entitled to a preference right of entry, under the foregoing provisions, of the mines so opened and improved: *Provided*, That when any association of not less than four persons, severally qualified as in section one of this act, shall have expended not less than five thousand dollars in working and improving any such mine or mines, such association shall be allowed for the filing of a declaratory statement, and no sale under the provisions of this act shall be allowed until the expiration of six months from the date thereof.

Sec. 3. That all claims under section two of this act must be presented to the register of the proper land-district within sixty days after the date of actual possession and the commencement of improvements on the land, by the filing of a declaratory statement therefor: *Provided*, That when the township plat is not on file at the date of such improvement, filing must be made within sixty days from the receipt of such plat at the district office: *And Provided further*, That where the improvements shall have been made prior to the expiration of three months from the passage of this act, sixty days from the expiration of said three months shall be allowed for the filing of a declaratory statement, and no sale under the provisions of this act shall be allowed until the expiration of six months from the date thereof.

Sec. 4. That this act shall be held to authorize only one entry by the same person or association of persons under its provisions; and no association of persons any member of which shall have taken the benefit of this act either as an individual or as a member of any other association, shall enter or hold any other lands under the provisions of this act; and no member of any association which shall have taken the benefit of this act shall enter or hold any other lands under its provisions, and all persons claiming under section two hereof shall be required to prove their respective rights and pay for the lands filed upon within one year from the time prescribed for filing their respective claims; and upon failure to file proper notice, or to pay for the land within the required period, the same shall be subject to entry by any other qualified applicant.

Sec. 5. That in case of conflicting claims upon the same lands, the improvements shall hereafter be commenced, priority of possession and improvement, followed by proper filing and continued good faith, shall determine the preference right to purchase. And also where improvements have already been made at the date of the passage of this act, division of the land claimed may be made by legal subdivisions, to be paid for as may be, the valuable improvements of the respective parties; and the Commissioner of the General Land-Office shall he, and is hereby authorized to issue all needful rules and regulations for carrying into effect the provisions of this act.

Sec. 6. That nothing in this act shall be construed to destroy or impair any right which may have attached prior to the passage, or to destroy the sale of lands valuable for mines of gold, silver, or copper.

Approved, March 3, 1873.

The New Diggings of Oroville.

A correspondent of the *Sacramento Record* writes as follows concerning the new discoveries at Oroville: Those who imagine the palmy days of placer diggings to have gone by in California, are, it appears, about to be disabused of the impression. There always has been a large class of Californians who have insisted that the rich discoveries are yet to be made. That the surface skimming has not uncovered the wealth of our buried river beds; and that the days of '49 will be revived, so far as gold washing is concerned. The faith of such men is commendable and we are almost ready to join with them when they insist that

"Pactolus runs in every mountain stream,
And every reed that rustles, whispers gold."

Desiring to present the latest and most reliable information concerning the rumored placer discoveries at Oroville, and anticipating a harmful "gold fever" from exaggerated and flying reports, the *Record* dispatched one of its corps to the new mining grounds on Saturday last.

The Recent Discoveries.

About a half mile east of the Feather River, and about two and one-half miles from Oroville, in Butte county, is the scene of the new diggings. A year ago a young man named Kline was led to locate a claim, and prospect, at a point near that named. He, it appears, struck it rich, but kept the matter a profound secret, probably under advice of his step-father, a resident merchant of Oroville and a shrewd man. By some means, however, the success of the boy became known to Mr. Gray, who holds a ranch hard by, and he began a series of explorations upon his own ground, resulting in his finding pay dirt. This was about one month ago. Gray at once offered his land in the region of the mine for sale in small parcels, or for rent.

John Chinaman.

The Chinese, ever on the alert, heard of the new grounds, and were soon on hand to buy and to lease. Gray has been kept busy ever since in making transfers and leases. For 200 feet square of ground he received at first \$100, but since then few know what he has sold for, but it is sure that he has pocketed up to this time some tens of thousands of dollars by his shrewd and business-like management. Outside of the Gray ranch hundreds of claims have been located, and scores sold to Chinamen, as John is prohibited from locating for himself.

The Exodus.

There are now fully eight hundred Chinamen and two hundred white men upon the grounds, and more are coming hourly. All the Chinamen have moved from the opposite side of the river to Oroville, and the greatest excitement prevails in the Celestial ranks. Everybody who can walk—for Epizooty has got horseflesh badly here—has gone, or is to go, out at once and locate claims. One day's work in ten is all that is required to hold a claim—200 feet being allowed per man. The people of Oroville have looked upon this excitement like others which have grown up here, and hence the new discoveries have been sneered at and laughed about. Now, however, when the gold begins to come from the gravel, the Orovillans open their eyes, and all the country is striving to reach the mines. Few white men thus far have done work; nearly all locating being made to sell out to Chinamen. But John is no fool, and he has an agent whom he can trust, and whom he consults in every case of offer or purchase.

The Mines.

Of course my examination, as yet, has not been thorough, but up to this date the following information can be relied upon: The region already prospected is about one and a half miles square, not more than one-eighth of this lies within the bounds of any patented ranch. The soil is a sandy loam; the surface of the earth perfectly level. Sinking from eight to ten and twelve feet, the prospector strikes a stratum of gravel about two feet thick; this yields nothing, but in nearly every instance he finds pay dirt just beneath it. The dirt has been proven in some cases eight, and in others ten feet in thickness or depth. Water is obtained by sinking some twelve to eighteen feet, and drawn up for work. All the washing is with pan and rocker, in the most primitive style. The gold is fine, scaly, river gold, and lies closely together. As high as twenty-five cents to the pan has been taken out, but the average seems to be six and eight cents. No capital is required to work these mines, as now handled, \$7 or \$8 suffices for a very good prospect. There are plenty of Chinese who will sink the prospect hole for what they can get out of the bottom.

An Opinion.

Opinions are very conflicting as to the mines. Some people declare it to be another "fever" and a humbug. These gentlemen give no reason for their faith. By far the greater part believe the mines to be genuine. Nay, they go further, and declare that all the indications point to greater discoveries to be made here than California has yet heard of; that the hills and ravines about Oroville hold vast stores of wealth soon to be opened to the public gaze.

George Grouser, who sets in all purchases as the agent of these Chinese, tells me these mines are no humbug; that he has sanctioned claim purchases thus far for over \$10,000. He to-day bought for his clients claims to the amount of

\$1,500. He believes the region extends all the way from Oroville Cemetery to Kent's farm, down the river and embraces a region over four miles in extent. There is no doubt in my mind but that these new diggings are upon the old bed of the Feather River, where it flowed ages ago. Every examination confirms this belief.

What They Make.

The boy who located the first claim, to-day sold it for \$910, and could have had more had he managed properly. A friend located a claim for a lawyer here, and that individual to-day turned the back of his hand against \$500, bid for ground where he never struck a pick or even kicked up a dust with his boot heel. Five Chinamen in four hours to-day worked forty buckets of earth yielding \$60, and were proceeding at the rate of 200 buckets per day. Forsyth brothers sold a claim of 200 feet for \$370.

Van Pelt & Co. refused \$1,200 for 600 located feet. A number of sales at \$100, \$300 and \$400 have been made. Some claims are held at exorbitant figures. One man declared to me that he could not be touched with \$20,000. A Chinese boss told me he cleared \$180 net with four Chinamen on Friday, and he showed the gold dust to prove it. Several Chinamen working singly show gold valued at from \$8 to \$10 as the result of a single day's labor. These cautious people are arriving here rapidly, and seem to be well supplied with money to invest in the diggings. White men singly at work admit they bring out from a half to a whole ounce as the result of a day's labor. In other parts of the field but \$1.50 and \$2 per day is realized.

Conclusion.

I conclude after my examination that these new diggings are not superficial; that in certain streaks the pay dirt is exceedingly rich.

Gang Subsoil Plows.

Herewith we present an illustration of Myers & Gummow's gang subsoil plow, an implement quite unique in form, and said to be admirably adapted to the purposes for which it was invented. The inventors and patentee of these plows, are practical, energetic and thorough mechanics, and fully understanding the real want of the agriculturist in this department, brought out this plow, for which they claim the following new and distinctive features:

FIRST—That the plows can be used as an ordinary two gang plow, or with one plow and the sub-soiler.

SECOND—If used in the latter manner, the sub-soiler follows in the previously made furrow—not behind the ordinary plow, and they claim a decided improvement in this, inasmuch as the off animal always walks in a hard furrow.

THIRD—They claim a decided improvement over any axletree now in use, in strength and ease of raising and lowering the plows.

FOURTH—These gangs are made of all iron, except the pole, and are consequently very strong and durable. They can be set so as to plow any desired depth to eighteen inches.

This plow was awarded two premiums at the State Agricultural Fair at Sacramento, Cal., in 1872, and one premium at each of the Fairs held at Marysville and at Chico, California, same year.

The Crown Point Mine.

The science of quartz mining has been carried to a very high point, says the *Alta*, in the

MYERS & GUMMOW'S GANG SUBSOIL PLOWS.

Proceeds have already been shown which prove this. Old and experienced miners assure me that the district is richer than many of the old and noted placers ever were, and as these men give evidence of their faith by their works, I believe them honest in their expressions.

People shouldn't come rushing here just yet. True, it doesn't cost much, and it wouldn't hurt Oroville to have an influx of people with money to spend; but the new diggings are experimental as yet, and while I am inclined to believe them valuable, it is altogether possible that, save in a few rich streaks, they will yield profit to Chinese labor only. Again, there are people enough here now to locate all the land between here and tide-water, and they are preparing to do it.

LOWER CALIFORNIA MINES.—The *Union's* correspondent at San Rafael, Lower California, says work is soon to be commenced on the old San Jacinto mine, which was discovered in 1850 and condemned under the Mexican laws. The present owners have 150 tons ready for crushing.

The quartz crushing works run by water power in San Rafael are about to shut down for want of water. The ten-stamp mill at St. Nicholas is running steadily.

QUARTZ.—Reports from the gold-quartz discoveries in northeastern Nye county, Nevada, continue very flattering. Specimens have been shown from the ledges, spangled all over with gold. They are owned by practical miners of limited means, the deepest shafts only being seventy or seventy-five feet deep.

COPPER.—The Humboldt, Nev., *Register* of April 19, says: We have been shown a specimen of the copper ore from a ledge recently discovered in a range of mountains north of Golconda. The specimen showed us weighed several pounds, and was fully one-third native copper.

cars, which hold about 1300 pounds each. These run immediately upon the cage, are lifted to the surface by steel ropes worked by steam, and unload themselves into vehicles that take the ore to the mills. The powerful machinery is worked unremittingly through the 24 hours, as it were pumping ore from the levels, incline and shaft, and discharging in upon the railroad race that feeds the ten or twelve remorseless mills which extract from it the last speck of bullion. By this means, as we have said, 600 tons of ore is daily drawn from the bowels of the earth and ground into pulp at the mills. Now, it will be observed, that the incline car, or Giraffe, holds 3 tons, consequently it must be filled and emptied 200 times in a day, and must 200 round trips from the bottom to the top of the incline, a distance of 850 feet. But 200 trips in 24 hours is one trip in 7 minutes. The car then must be loaded and unloaded and travel 1700 feet in 7 minutes, and, as we have said, it has done it in 5 minutes to raise 850 tons in a day. This gives an idea of the precision and power of the machinery. It will be borne in mind that where so much ore is taken out a vacant space remains. These spaces are, as fast as the ore goes, filled in solid with heavy timber, so that caving is impossible. There is also at the surface an enormous tank kept filled, with water, raised by the pumps from below. This water is conveyed in pipes to parts of the mine, where it is used with ice by the men, and may be promptly applied, with the hose always ready, to deluge any appearance of fire. All these gigantic automata, directed by Mr. Kellogg, one of the most experienced and able engineers, are applied to the extraction of a body of ore which has no parallel as yet. It has been followed through four levels, and two more are about to be opened. The quantity of ore which has been laid open will last four years at the present rate of working, and there is no doubt whatever of its indefinite continuance. The peculiarity of this ore body is that while all these found hitherto in the Comstock have been perpendicular to the foot wall, and ending with it, that in the Crown Point runs with the stratifications and improves in size and richness as it goes downward. The great and continued improvements in the self-acting machinery nearly obviate the inconvenience of deep working since the expense of a few hundred feet, more or less, is barely appreciable. The United States Consul General, at Mexico, reports the Guatimocin silver mine, which produced \$997,000 profits for the year 1870, at a value of \$5,000,000. The Crown Point earned \$2,100,000 in three months to April 1, and paid \$1,100,000 to the stockholders. This month of April it will earn nearly as much as did that Mexican mine for a year.

An Illinois Law Against Coal Miners' Strikes.

On the 19th of March the following bill passed the Illinois Legislature, and was signed by the Governor the following day:

A bill for an Act to amend an Act entitled "An Act to amend Chapter Thirty of the Revised Statutes, entitled 'Criminal Jurisprudence,'" approved February 13, 1863.

SECTION 1.—Be it enacted by the people of the State of Illinois, represented in the General Assembly, that an act entitled "An Act to Amend Chapter Thirty of the Revised Statutes entitled 'Criminal Jurisprudence,'" approved February 13, 1863, be and the same is hereby amended so as to read as follows:

SECTION 1.—If any person shall, by threat, intimidation or unlawful interference seek to prevent any other person from working, or from obtaining work at any lawful business, on any terms that he or she may see fit, such person so offending shall be deemed guilty of a misdemeanor, and on conviction thereof shall be fined in any sum not exceeding one hundred dollars.

SECTION 2.—If any two or more persons shall combine for the purpose of depriving the owner or possessor of property of its lawful use and management, or of preventing by threats, suggestions of danger, or any unlawful means, any person or persons from being employed by, or obtaining employment from, any such owner or possessor of property, on such terms as the parties concerned may agree upon, such persons so offending shall be deemed guilty of a misdemeanor, and on conviction thereof shall be fined in any sum not exceeding five hundred dollars, or imprisoned in the county jail not exceeding six months.

SECTION 3.—If any person shall enter the coal-banks of another without the expressed or implied consent of the owner or manager thereof, after notice that such entry is prohibited, such person shall, on conviction thereof, be fined in any sum not exceeding \$500, or imprisoned in the county jail not more than six months.

SECTION 4.—If any person shall enter the coal-banks of another with intent to commit injury thereto, or by threats, intimidations, or other unlawful proceedings, to cause any person employed therein to leave his employment, such person shall be deemed guilty of a misdemeanor, and on conviction thereof be fined in any sum not exceeding \$500, or imprisoned in the county jail not exceeding six months, or both.—*Iron Age*.

COAL.—Fifty years ago there were only a few hundred thousand tons of coal raised in Germany, where now 20,000,000 tons are mined as cheaply as in England before the price advanced.

USEFUL INFORMATION.

Manufacturing Industry in California.

The Federal census gives the following return of manufacturing industry in California:

	Annual product value.
Flouring and grist mill products.....	115 \$9,036,386
Blacksmithing.....	433 1,161,990
Boots and shoes.....	420 2,214,673
Bakery products.....	74 1,185,620
Carpentering and building.....	268 1,391,163
Carriages and wagons.....	84 1,309,443
Chromos and lithographs.....	108 1,090,270
Gas.....	10 1,856,783
Iron castings (not specified).....	27 1,139,841
Malt liquors.....	16 1,099,207
Vinous liquors.....	98 1,841,444
Lumber, planed.....	22 1,052,850
Lumber sawed.....	291 1,622,117
Machinery (not specified).....	29 1,737,710
Steam engines and boilers.....	17 3,904,043
Sugar refining.....	3 1,028,446
Newspaper printing and publishing.....	60 3,405,673
Milled quartz.....	114 1,027,680
Smelted quicksilver.....	4 1,063,452
Saddlery and harness.....	88 1,909,227
Tobacco and cigars.....	5 1,102,784
Woolen goods.....	

ECONOMY OF FUEL.—A correspondent in *The British Workman* tells how to build a fire as follows: The person laying a fire should fill the grate up to the top bar with coals, putting large pieces at the bottom and smaller over them, then upon these, paper enough to light the sticks, which should be laid upon, and not under, the coal. Cover the sticks with the cinders remaining from the previous day's fire; these will soon become red hot; the coal below will be warmed sufficiently to make it throw off gas; this passing through the hot cinders, will be kindled, and will burn with a bright flame, instead of going up the chimney in smoke, as it does when the coals are laid on the top.

The fire thus laid will require no poking, and will burn clear and bright for from six to eight hours without the necessity for more coals to be thrown on.

USES OF RAWHIDE.—The skin of an animal, whether cow, calf, colt, or horse, that dies on the farm is worth more at home than at the tanner's. Cut it into narrow strips, and shave off the hair with a sharp knife before the kitchen fire, or in your workshop, on stormy days and evenings. You may make them soft by rubbing. A rawhide halter-strap an inch wide, will hold a horse better, and last longer, than an inch rope. It is stronger than hoop-iron and more durable, and may be used to hoop dry casks and boxes, and for hinges.

Try it on a broken thill, or any wood-work that has been split. Put it on wet, and nail fast. Thin skins make the best bag-strings in the world. A rawhide rope is a good substitute for a chain. It is valuable to mend a broken link in a trace-chain. For some purposes it is best to use it in its natural state. For other purposes it may be dressed soft.

FOR SMOKERS.—Smokers of the royal weed are recommended to place in the bowls of their pipes a little powdered tannin, or a sponge saturated with tannin. The smoke will thus be deprived of its characteristic aroma and all the vaporized nicotine, which is the intoxicating principle. At first the smoke will be entirely free from all taste and smell of tobacco, but as the sponge becomes charged with the nicotine the odor will reappear. By charging the sponge frequently, the smoker may indulge in his habit as immoderately as he pleases without injurious effect.

IMPROVED TRACING PAPER.—Fischer of Nuremberg has lately suggested a solution of castor oil in absolute alcohol for the purpose of manufacturing a tracing paper. The oil is to be diluted with one, two or three times its bulk of alcohol, according to the thickness of the paper, and the amount consequently required for rendering it transparent. This can be laid on by means of a sponge; and in a very few minutes after the application the paper will be dry, transparent, and ready for use. It will readily receive the mark of a pencil or India ink, and as by immersion in absolute alcohol the oil can be removed, the paper can be restored to its original condition if desired.

IMPROVED DRAWING INK.—The addition of one part of carbolic acid to 80 parts of the fluid India ink, while it does not impair its fluidity, causes it to dry rapidly even in heavy lines, so that they can be varnished over. The proper amount of carbolic acid to be added in any case may be ascertained by adding drop by drop the ordinary apothecary's solution of it in alcohol until varnishing does not effect the definition of a test line by causing it to run. The addition of too much carbolic acid is indicated by the transparency of the line and the inability to draw fine lines, a condition easily remedied by the addition of more of the fluid ink.

CARBOLIC ACID may be deodorized by mixing it in a crystallized form with twice its weight of gum camphor, and adding whiting to the compound. In this form it is said to be valuable both as a disinfectant and as a protection to furs against moths.

GASES.—Of the 28 gaseous bodies known, 25 are reducible to liquid, and 9 to solids. When compression is required they all spring back to their original conditions with great rapidity and in many cases with destructive energy.

CULTIVATION OF GREEN OYSTERS.—The green oyster is highly esteemed by epicures, as being far more delicious in flavor than the white. Hitherto it has been supposed that the green color could not be produced outside of certain favored localities, the Marennes Basine, for instance, in France, sheltered bays in the Hebrides, and on the coast of Scotland, etc. This supposition proves to be incorrect, as according to M. Rochebrune, of the French revenue service, he has succeeded in growing green oysters at Arcachon, where they were never grown before. The details of the process by which M. Rochebrune obtained this result were reported to the Bordeaux Scientific Congress of last year, and will probably appear in the published accounts of its proceedings.

OPIMUM EATING AMONG ANIMALS.—The *Agricultural Gazette* of India is responsible for the assertion that, when animals have once learned to know the taste and properties of opium, they become as fond of it as human beings. In China, it is necessary to fence the poppy fields very carefully to keep out the cattle. Horses and cows that have become accustomed to being fed on poppies, sicken and die if deprived of them. Hogs fed on poppy-heads fatten quickly, but they must then be slaughtered. Bees prefer this to any other food, and rats come to opium factories to enjoy breathing the very dust of it.

PROFESSOR LIEBIG, writing on the effects of various stimulants, describes the red wine in some cases beneficial, or at all events the least hurtful; white wines generally are detrimental to the nervous system; sherry and strong cider intoxicate more rapidly than most wines, and have a peculiar influence on the gastric juice. Beer produces a heavy and dull intoxication, although the drinker of it is not apt to get thin. But the consumers of whiskey and brandy "are going to certain death."

AN ANTI-SWINDLING BALLOT-BOX.—An ingenious Bostonian has invented an anti-swindling ballot-box. By a mechanical contrivance, the number of times the box is opened for the reception of ballots is marked. This register shows at all times the whole number of votes deposited, and, as it records but one every time the box is opened, any attempt at stuffing is at once discovered.

GOOD HEALTH.

A New Mode of Treating Dyspepsia.

The Archives of Scientific and Practical Medicine, a new monthly edited by Dr. Brown Sequard and published by the Lippincotts, contains, among other very interesting articles, one in which the editor describes a novel mode of treatment which he first tried with perfect success in a very bad case of dyspepsia in 1851, and which has since been tested, with more or less satisfactory results, in many cases of dyspepsia. The following is an extract from the account of the first case:

"After a few days, finding that he had not improved, I decided to try a radical change of his alimentation, as regards the quantity of food to be taken at a time. Instead of three meals a day, I made him take sixty or more. Every twelve or fifteen minutes he took two or three mouthfuls of solid food, chiefly meat and bread. He drank a little less than a wineglass of Bordeaux wine and water every thirty or forty minutes. On the very first day this mode of alimentation was begun his digestive troubles disappeared, and within a week he was so well that he returned to Paris. He continued the same mode of alimentation for almost three weeks, and then gradually diminished the number of his homœopathic meals, and increased the amount taken at each of them, until in about eight or ten days he came to eat only three times a day, and a full meal at each time."

The following paragraphs will serve to give the reader a clearer idea of the treatment recommended:

"The plan consists in giving but very little of solid or fluid food or any kind of drink at a time, and giving these things at regular intervals of from ten to twenty or thirty minutes. All sorts of food may be taken in that way, but during the short period when such a trial is made, it is obvious that the fancies of the patients are to be laid aside, and that nourishing food, such as roasted or broiled meat, and especially beef, mutton, eggs, well baked bread, and milk, with butter and cheese, a very moderate quantity of vegetables and fruit ought to constitute the dietary of the patients we try to relieve. This plan should be pursued two or three weeks, after which the patient should gradually return to the ordinary system of eating three times a day."

The most varied diet as regards the kind of food can be followed under this plan as well as when one has only two or three meals a day. The only absolutely essential points are that the amount of food taken every 10, 15, 20, or 30 minutes be very small (from one to four mouthfuls), and that the quantity of solid food in a day be from 32 to 40 ounces, or a little less when, instead of water, the patient drinks beef tea or milk."

ANCIENT CHINESE SURGERY.—It has been proved by the Chinese medical records that 1,600 years ago the doctors of that country used anæsthetics to make patients insensible during serious surgical operations.

COLD BATHING.—Just now there is a reaction against daily cold bathing. A medical man cautions his patients against too frequent bathing, for fear the oil may be removed from the skin. He tells them that twice a month during the winter and twice a week during the summer are quite enough for anybody. A well-known writer has cautioned the world against the removal of the skin oil by too frequent bathing. This is an entire misapprehension. In hydropathic establishments the patients are sometimes bathed three or four times a day, yet never lose the oil of the skin in consequence. Purgatives, in preparing for the prize ring, are bathed two or three times a day and rubbed with rough towels by the strongest arms. Heenan was bathed three or four times a day, and was rubbed by McDonald and Cusick with all the power of their strong arms fifteen minutes at a time, and with the roughest towels and brushes, and yet the account says that when he appeared in the ring his skin was as beautiful as a baby's. If cold water were used without soap, a bath every hour, with the hardest friction, would only increase the secretion of oils.

LUXURY AND POISON.—From experiments made by eminent physicians in France, it is shown that the articles ordinarily made and sold there under the name of "ice cream," is mainly manufactured of corn-starch, French clay, and poisonous coloring matter. The beautiful carmine which pervades the treacherous compound comes from the cochineal bug. A continued course of such poison produces the most direful maladies. First, dyspepsia, then scrofulous eruptions, accompanied by a loosening of the teeth, and a dropping out of the hair. This agent of destruction is not confined to the street corners alone. It is sold as well in innumerable gilded saloons and places of fashionable resort.

MEDICAL VALUE OF ASPARAGUS.—A medical correspondent of an English journal says that the advantages of asparagus are not sufficiently estimated by those who suffer with rheumatism and gout. Slight cases of rheumatism are cured in a few days by feeding on this delicious esculent; and more chronic cases are much relieved, especially if the patient avoids all acids, whether in food or beverage. The Jerusalem artichoke has also a similar effect in relieving rheumatism. The heads may be eaten in the usual way, but tea made from the leaves of the stalk, and drank three or four times a day, is a certain remedy, though not equally agreeable.

LEMONADE IN FEVERS.—A cotemporary says that in most cases of fevers we have no doubt that an attack might have been prevented and the patient well in a few days without a particle of medicine, by rest, partial fasting and free use of lemons and lemonade. The virtue of this article in bilious attacks and incipient fevers has been tested with best results and we commend its use as a preventive of these diseases.

EFFECTS OF EATING BRAN.—The N. Y. Farmer's Club asked "what probable effect it would have if people should eat the phosphate of lime found in their wheat, instead of throwing the most of it away, as they now do in the bran?" Dr. Smith answered that two or three generations hence the men would be taller and the women would have better teeth—something worth considering."

MOSQUITO BARS AND MALARIA.—Writers of experience in nature, strongly recommend the use of the mosquito curtain in tropical regions, as a precaution against malaria. They "sift the air, and besides tend surprisingly to keep the temperature within them uniform."

UTILIZING OLD IRON.—The *Sacramento Record* says: It is well known that the more frequently old wrought iron is worked over the better it becomes. Acting upon this principle, all the axes with worn journals on the Central Pacific Railroad are now sent to the shops in this city, and by a blow of the trip hammer the ends are cut off. These ends are thrown into the scrap pile and are worked over as needed. The amputated axle is now upset and the ends beaten out to a shape like a hollowed hand. Into this hollow a fifty pound piece of fresh iron, at white heat, is welded and thoroughly worked upon the axle, which, being returned in the lathe, is found to be superior in all respects to completely new axes. Since this plan has been adopted over ten thousand journals have been thus treated. The rapidity and neatness of the process will repay a visit to the works to witness it.

ANOTHER GOOD WAY TO KEEP MEAT.—Cut in slices ready to broil or fry for the table. Then putting down in a jar one layer of meat, sprinkle with salt and pepper, and so continue till the jar is filled, cover closely and set in the coolest part of the cellar. It will keep a long time, for I and my neighbors have tried it.

CAUSE OF DEOXY IN EGGS.—U. Gayou has advanced the novel idea that the main cause of the decomposition of eggs is the presence of small organisms, which must have formed in the eggs while in the oviducts of the fowl.

THE MANSARD BONNET is declared a nuisance in the lecture room; and in some public halls a rule is adopted requiring ladies to leave their Mansard at home.

MISCELLANEOUS.

A GERMAN DOMESTIC INVENTION.—An ingenious culinary utensil has been devised by Mr. Huch, of Brunswick, Germany. The apparatus consists in a unique arrangement of a coffee-pot, which is set over a lamp or gas flame, and closed airtight by means of a cover, the rim or flange of the latter dipping down into water contained in a deep trough that is formed around the pot. The lid of the pot is connected with the regulator of the lamp, or gas flame. When steam is generated within the pot, the lid commences to rise, and acting upon the regulator, it causes the flame to be generated with sufficient rapidity to raise the lid higher. Mr. Huch constructs the pot with an inner vessel, fitting closely within it at the upper part, and this inner vessel has a perforated bottom covered with felt, flannel, or similar material, on which the coffee rests. A pipe descends through the perforated bottom of the pot. When the water in the pot boils, the pressure of the steam drives the water up the pipe into the upper vessel and over the coffee. The water then comes in contact with the lid, the lid floats; being thus lifted, by means of apparatus connected with it, it extinguishes the flame beneath. The steam in the lower part of the pot condenses as the pot becomes cooler, and the vacuum so formed causes the water to descend through the coffee, and the infusion is then ready to be drawn off for use.

DINING-ROOM INNOVATIONS.—An article in the *Paris Sport*, makes mention of two innovations upon the established routine of the dining-room proposed by epicures of that city. One party of these bon vivants is desirous of introducing anew the ancient custom of dining without tablecloth, as was done by the Greeks of old in Europe until the Middle Ages, when they first came into use under the name of doublets. They also suggest that the objects used on the table should be still more varied and elegant in the material workmanship than is now the case. There is another party of epicure who opposes this plan, and proposes in its stead an innovation in quite another direction. Their wish is not only to maintain the present usage of the table-cloth intact, but even to extend the fashion in the matter of napkins. The ground taken by them is, that the napkins should be changed for the different parts of the dinner, as is done with the plates, wine-glasses, and knives and forks.

MILK, TEA AND COFFEE.—Prof. Loomie thus speaks of milk, tea, and coffee. "Milk contains in solution not only a due proportion of carbon, hydrogen, oxygen and nitrogen, but all the other elements necessary for the construction of bone, nerve, etc., and hence is always a proper food in all circumstances of health. Tea derives its beneficial qualities not from its direct supply of nutrition, but from its affording a peculiar substance called theine, the effect of which in the system is to diminish the waste, thus making less food necessary. Tea thus has a positive economic value, not as a supplying but as a saving nutriment. Coffee, though of a taste so little allied to tea, derives its value in precisely the same manner and from nearly the same substance. Its value and effect in the system are therefore the same as those above stated. It is hence evident that milk, tea and coffee are valuable articles of food under all conditions of temperature."

A DANISH BAKER has invented a way to prepare a fresh, palatable and nutritious article of food in the form of cakes, containing two and one-half parts of bread to one of meat, and sufficient condiments, which it is claimed will resist the action of weather, and is excellently adapted for food for soldiers in the field or on the march. A large field of usefulness is before an invention of this kind, in utilizing the flesh of our Texan cattle and those of South America and elsewhere, which is now left to rot, or, as at Galveston and other Texas ports, is towed out into the Gulf after the hides are stripped off. Preventable sickness and premature mortality among the underfed populations of older communities might be largely reduced by the use of food now wasted.

CHEAP MOSQUITO BAR.—There is a cheap mosquito bar in vogue among the plantation hands and boatmen in some parts of the South which answers every purpose to the letter—it is common coal oil. A small quantity of oil is dropped upon a piece of cotton, and then squeezed out as dry as possible; after which the cotton is rubbed over the face and hands. No mosquito will alight where the scent has been left. I have tried it, and then exposed myself to clouds of them on various occasions without experiencing the least annoyance. Thousands of them would hover within an inch of my face, and sing by the hour, but none dare touch.—*Eutomologist*.

CHEESE.—According to the statement of Professor A. J. Bellows, there is more than twice the amount of food of any other known substance. It should therefore be used in small quantities and with articles containing little nitrogen, such as fruits and fine flour. Those persons whose occupations necessitate hard labor, and who cannot afford much fresh meat, will find in cheese a most wholesome nutritious food, less expensive and less likely to develop in the human system those scrofulous diseases attributed to animal food.

Table of Contents.

GENERAL EDITORIALS.—An Unusual Mining Accident, 273. More About the Spectroscope and What it has Done, An Important Mining Decision, 280. The Alta as a Scientist, 281.
ILLUSTRATIONS.—A Nugget of Crystallized Gold, 273. Gang Subsoil Plows, 278. Fraser River Idols, 281.
CORRESPONDENCE.—Climate of San Joaquin Valley, 274.
MECHANICAL PROGRESS.—On the Use of Steel for Boilers; Russian Sheet Iron; The Production of Bright Colors on Metals; A New Car Seat; Increase of Iron Works in 1872, 275.
SCIENTIFIC PROGRESS.—Gold and Platinum Alloys; Science and the Trades; Saccharine Matter in Mushrooms; Brain and Thought; Effects of a Dry Cold Winter; Automatic Telegraphy; Forests and Rainfall—A New Theory, 276.
MINING STOCK MARKET.—Table of Daily Sales and Prices and Comparative Prices for the Week; Notices of Assessments, Meetings and Dividends; Review of Stock Market for the Week, 278.
MINING SUMMARY from various counties in California, 277.
USEFUL INFORMATION.—Manufacturing Industry in California; Economy of Fuel; Uses of Rawhide; For Smokers; Improved Tracing Paper; Improved Drawing Ink; Grasses; Cultivation of Green Oysters; Ophium Eating Among Animals; An Anti-Swindling Ballot-Box, 279.
GOOD HEALTH.—A New Mode of Treating Dyspepsia; Ancient Chinese Surgery; Cold Bathing; Luxury and Poison; Medical Value of Asparagus; Lemonade in Fevers; Effects of Esting Bar; Mosquito Bars and Malaria, 279.
MINERALS.—The Gold Product of Australia; Borax at Lane Springs; Pope Valley Quicksilver Mines; Petroleum Near Los Angeles; Ancient Relics; Borax, 274. Patents and Inventions, 277. The New Diggings of Oroville; Lower California Mines; Quartz; Copper; The Crown Point Mines; An Illinois Law Against Coal Miners' Strikes, 278. Utilizing Old Iron; A German Domestic Invention; Dining-Room Innovation; Milk, Tea and Coffee; Cheap Mosquito Bar; Cheese, 279. Siemens' Regenerative Gas Furnace With Peat as Fuel; Mining in Nevada County; Narrow-Gauge to Marysville; Diamonds; A Swift Type Setter; A Prize; Trout; Coal in China, 282.

GRAND CONCERT.—For some time past the Handel and Haydn Society have been preparing to give a series of three nights of Grand Concert in this city. The well-known reputation of the society as possessing in its members the best talent of the city, caused the lovers of music to look anxiously forward to the time a rare treat. On the evening of Tuesday, 29th ult., the first of the series was given in the Tabernacle on Tyler street, to a house comfortably filled with the best class of our citizens. The music of the old masters was rendered well, and the hearty applause and frequent encores gave efficient evidence of a performance well-enjoyed by all lovers of the fine art.

GOLD SANDS.—It is stated that although reports were current that the expedition of the "Buhne" in search of gold sands on the northern coast, was unsuccessful, that it was not in fact an entire failure. A considerable quantity of sand was raised, which, according to the Humboldt Times, although taken from the top of the deposit, exhibited the color of gold. In examining a handful of it, there were discovered a dozen or more particles of gold. If such is the case no doubt they will try it again.

WHITE PINE is picking up again and there has been a great rush of miners thither from Pioche and adjacent districts. The mine are looking well and labor is in demand, everything indicating a prosperous season.

THE Virginia and Truckee Railroad is crowded with business. One day last week 28 trains aggregating 360 cars passed between Virginia and Carson.

COAL.—It is stated that a good article of coal has been found near the old Roslin smelting works at Eureka, Nev.

More about the Spectroscope and what It has Done.

Professor Neri delivered the last of his course of lectures on Spectrum Analysis on Thursday evening, the 24th ult. The attendance was large and the interest in the subject was well kept up. In opening the lecture the Professor remarked upon the great interest which has ever, from the earliest times, been felt in the heavenly bodies. This interest has grown greater from age to age, as the progress of science has unfolded to man more and more of the immensity of space, the nature of the orbs with which it is filled and the laws by which they are governed. Yet all that has been previously learned is but little in comparison to what the spectro-scope has revealed within the last few years.

The Professor proceeded to show how we know that the spectroscopes reveals the fact that the sun and stars are made up of elements identical with those which are found upon the earth, paused, awhile to consider the intense heat or temperature of the sun, and proceeded to show how it was more difficult to ascertain the physical and chemical constitutions of the stars than of the sun.

The stars are farther off—so far that even when viewed with the most powerful telescopes, they still appear but as mere points of light in the heavens. It is more difficult to catch, disperse and analyse such feeble rays of light as reach us from those distant orbs. But, under the patient and skillful study of such men as Miller, Huggings and Lockyer of England; Young and Rutherford of this country and Father Secchi of Italy, the spectroscopes has been made to do even this work satisfactorily. The methods by which this has been done was lucidly and distinctly shown.

The stars have been classified by Father Secchi, with regard to their spectra, into four divisions or types, viz:—yellow, white, red and variable stars—our sun belonging to the yellow type. The color of the stars, however, is not due to any especial difference in their composition; but to the fact that the light which they emit is more or less absorbed by their surrounding atmosphere or vapors.

In the yellow stars all but the yellow rays are more or less absorbed, so of the red, etc. The particular substances which thus absorb the rays of light are not as yet fully known. The spectroscope has already revealed to us the presence in the stars of so many substances found upon the earth, that there can be no doubt of a great similarity if not an absolute identity in composition of sun, earth and stars; and that the stars are in reality self luminous suns, like our own, but many of them of vastly greater proportions.

One of the most marvellous revelations of the spectroscope is the information which it gives with regard to the motions of the stars. That instrument tells whether they are receding or approaching us, (or we them). It also gives a very correct idea of the rate of such motion. The manner in which this is done was fully and

Most Clearly Explained.

Sound and light travel by the same means—waves; in space, light travels by waves of the interpenetrating ether, in our atmosphere sound travels by the waves of the air. If you are traveling on a train of cars, and another train is approaching, the sound of the whistle increases in its pitch rapidly, and becomes higher and higher as the trains approach—and the reverse as they recede.

This is because sound depends on a number of vibrations, and the greater the number the higher the note; hence by approaching the sounding whistle you meet many more sonorous waves than though you remained constantly at the same distance, and this greater number of impulses in a unit of time produces the impression of a higher note, which note is continually increasing in pitch, as the number of vibrations increase.

So with light. The spectroscope distinguishes between the number of waves required to produce a red color and those required for yellow, etc. It can count the waves of light by noticing the degree of refrangibility belonging to the various rays, or the colors which they produce, as we count the waves of sound by observing the notes produced on the musical scale. By closely watching the spectrum of a ray of light from a star, the lines will be seen to shift, perhaps from red to violet; then, as we know it requires a greater number of waves to produce the violet we rightly infer the object emitting the light is approaching us; and vice versa. So the shifting of the lines on the spectrum tells us whether the star is moving, and whether towards or from us, and almost its absolute velocity.

Rapid Motion of the Stars.

It is by this means that astronomers have been able to learn that some of the stars are moving at the almost incredible rate of 216,000 miles an hour—three times as fast as the earth moves in her annual revolution, and 280 times as fast as a cannon ball flies. The minimum being 35,200 miles an hour, and the maximum as about 216,000.

Of the Planets

The spectroscope tells us but little beyond

what we knew before; but it fully confirms our previous theories. They reflect horrowed light. Jupiter, Venus, Mars and Saturn give indications of having an atmosphere similar to our own. Mars is fully cooled down and the others at least proximately so—thus fitting them for the habitations of human beings like ourselves.

Nebula.

The most wonderful of the heavenly bodies are the nebulae, which look like little patches of mist or clouds in the heavens. They are innumerable in number and of immense extent. Some may be seen by the naked eye—as the milky way; but they are generally visible only by the aid of the telescopes. These bodies present most varied, and sometimes most remarkable appearances. A large number of the most remarkable ones were projected upon the screen. The spectroscope has resolved large numbers into clusters of stars—one little nebula, which occupies a surface not larger than one quarter of the moon's disk, consists of at least 200,000 stars, each star at an immense distance from any other.

Analogy teaches us of what the resolvable nebulae consist. But what of the unresolvable nebulae? The spectroscope has fully answered the question, and in five minutes solved a problem which has puzzled astronomers for 200 centuries!

That instrument shows that some of the unresolvable nebulae give a continuous spectrum with dark lines, whereby we know that such light emanates from an incandescent, self-luminous, solid or liquid body, not a mere vapor; but bodies similar to our sun. Hence we know that these nebulae really consist of clusters of stars, at immense distances.

Other nebulae show bright lines upon the spectrum, by which we learn that the matter of which they consist has not yet been aggregated or separated into stars; but consists simply of an immense mass of glowing, highly rarified vapor, in all probability undergoing the transformations which will eventually separate or reduce that vapor into separate stars or suns.

Comets.

The consideration of the subject of comets, with their tails was introduced with a very clever piece of pleasantry, comparing them to a certain class of comers, also with tails, who visit us from another celestial region. The telescope tells us but little about comets, but the spectroscope has already revealed much, and will probably add much more in the future; as but little opportunity has been afforded astronomers to study this class of heavenly bodies since the spectroscope has been brought to its present state of perfection.

Comets show an intermittent, not a continuous spectrum. They are self-luminous, gaseous, highly rarified, and give but a very faint spectrum. They are so attenuated, that some which make a great show of body and tail, if condensed into solids might be stowed away in a gentleman's traveling bag. But little danger need be apprehended from them. They have collided and swept over the earth already, without our knowledge, until they had passed. Several of the most remarkable comets which have appeared were beautifully shown upon the screen. Their spectrum shows the presence of carbon and hydrogen—and probably consists of something similar to hydrocarbon vapor, or common illuminating gas.

The Professor remarked that the component matter of comets was so extremely attenuated that it was thought by some that the substance of which they are composed was perhaps divided into or never yet coalesced from their original conditions of independent atoms.

Sun Spots.

The Professor next called attention to those remarkable appearances upon our luminary, called sun-spots. They are simply gigantic cavities in the luminous and heated atmosphere of the sun, produced by currents of air in storms, similar to those in our own atmosphere. They are circular or nearly so, because the air currents in storms on the sun as well as on the earth move in circles.

These cavities are often of immense size and depth, often so large that the earth might be swallowed up in one as easily as a man can swallow a sugar-coated pill.

The atmosphere embraced within these huge sun storms, becomes, by the uprush away from the heated nucleus, slightly cooled, in comparison with the surrounding undisturbed atmosphere, and thus looks dark, in comparison merely, just as even a bright artificial light looks dark and even black when projected upon the sun's disk. The appearance which these spots present when viewed through a telescope were beautifully portrayed upon the screen; also a large number of so called protuberances and explosions, of which so much has been said and written during the past few years.

The professor closed his lecture and the series, with some eloquent and appropriate remarks upon the elevating and ennobling influence resulting from the study of science in general. He thanked his audience for their kind and patient attention through the lengthened sessions of the course; those of his pupils who had so kindly and efficiently assisted him in his experiments and illustrations, and expressed the hope that he might, at some future time, deliver another course, which might have a more practical value.

Although no formal expression was made, as there might and should have been, we feel well assured that every one of the large audience felt to acknowledge their heartiest thanks for the rich and rare intellectual treat which had been placed before them on each and every eve-

ning during the course; and we doubt not that the announcement of another course would be most enthusiastically received by the public of San Francisco, who are just now beginning to be fully alive to the importance of encouraging every reasonable means of popular, scientific instruction.

An Important Mining Decision.

Another notorious scheme prejudicial to miners, has been defeated by the righteous decision of the Secretary of the Interior in the Keystone mine case. The decision is one that will give universal satisfaction among the mining community, as it affects all the Western States and Territories as well as California. The claim was one gotten up by sharp speculators to obtain possession of the Keystone mine, and involved the question, of wide application, as to whether the grant to the State of California of the sixteenth and thirty-sixth sections for school purposes, under the Act of March 3d, 1853, included said sections when they were on mineral lands. This case has naturally excited much attention as the principle sought to be established by the claimants was a dangerous one to all parties holding claims on the sixteenth and thirty-second sections in all the mineral States and Territories. These claimants endeavored under the name of the State to obtain possession of valuable property by a mere legal technicality. The details of the case were given in our issue of April 19. In the decision Secretary Delano holds:

"First.—That title to said sections sixteen and thirty-sixth does not vest in the State until a survey has been made, which brings into existence and locates said sections, and that said mining companies having appropriated said lands under the Act of July 26th, 1866, prior to such survey, they had the better right."

"Second.—That the seventh section of the Act of 1853, excepts from the grant all of sections sixteen and thirty-six on which there had been prior to the survey, a settlement, by the erection of a dwelling-house, or the cultivation of any portion of the land, and that the settlement referred to was technically known as the pre-emption settlement." This point seems to protect settlers on these government lands from any sharp practices as in the case in question.

"Third.—That the grant was not intended to include, and does not include said sections when they are on mineral lands."

This last point knocked the bottom out of the job put up by the claimants of the Keystone mine, and establishes a principle which will effectually protect honest miners hereafter from the schemes of wily speculators, who want to profit by the work done by miners in good faith, by means of a mere legal technicality. All these points are adverse to the parties endeavoring to get possession of the mine and town site of Amador, and it is with satisfaction that we record this result.

There has been great pressure brought to bear on the Secretary of the Interior in this case according to current reports, and a great array of legal talent was employed to push the matter through. Mr. Sargent took sides with the miners and filed an argument with the Secretary holding that the lands should not go to the State as school lands which the Secretary's decision confirms. The decision of the Secretary was voluminous and interesting, according to a dispatch from Washington to the Call. He assumes in the outset that in every valid grant there must be a grantor capable of making a grant, and a grantee capable of taking it, and a thing granted capable of identification with reasonable certainty; also, that all grants by the General Government must be construed strictly against the grantee, that nothing passes by implication, and that the intent of the law makers, as gathered from the entire law, must govern. He rules that title to sixteenth and thirty-sixth sections vest in a State only after a survey; that prior to the survey the grant is in the nature of a float; until a survey has been made there are no tracts answering the call of the grant. Congress meantime may legally provide that lands shall never be surveyed, or in some other way provide that there shall never be sections 16 and 36. The school grants are similar to railroad grants, and the Supreme Court has repeatedly held that no title to specific sections vests until the railroad line be definitely fixed. Secretary Delano cites a Michigan case wherein the Supreme Court expressly recognized the power of Congress, by subsequent legislation, to interpose a legal impediment to title of school sections resting in the State upon survey. Other cases are cited tending in the same direction. He further holds that the seventh section of the act of 1853 excepts from the grant to the State, lands upon sections 16 and 36 upon which any settlements, by the erection of buildings or cultivation of any portion of the lands, has been made previous to the survey. He holds also that school grants include no mineral lands, presenting abundant conclusive evidence sustaining his position. If in error, he adds, the State has an easy method of presenting the question for a Supreme Court decision; while if he should decide in favor of the State, and be in error, there is no way in many cases whereby the error could be corrected.

Frazer River Idols.

All tribes of Indians have their peculiar customs with reference to disposing of their dead. Some bury them, some burn them, some smoke them, and others place them in hammocks raised from the ground. But whatever disposition is made of the bodies, the location of the remains is, as with civilized nations, more or less consecrated ground. The accompanying engraving shows one of the cemeteries of the Frazer River Indians. It is from a sketch made by Geo. H. Burgess, who visited that country during the "Frazer River excitement" in 1858. A few places of this character are found in that region, but this particular one possesses the same general characteristics as the others, and is moreover somewhat more extensive.

The spot is above the town of Fort Yale on the Frazer River in British Columbia, at the foot of a tremendous precipice about 2,000 feet high. The situation is a most romantic one, just below the entrance to "the Cañons" on the river, where the scenery is described as grand in the extreme. The square boxes in the back ground contain the remains of defunct Indians, piled one upon the other, and enclosed by a rude shed for protection from the weather.

the engraving, done in a rude manner and with imperfect tools. All the idols are painted in bright colors after Indian fashion. What the Indians suppose them to represent we have no idea. The different idols may be commemorative of some famous Indian, skilled in the arts of war or the chase, or they may be placed there as imaginary guardians of the dead to protect the remains of those who have gone to the "Happy Hunting Grounds." At all events the images are held in great respect by the Indians who inhabit that part of the country.

The Alta as a Scientist—the Late Lectures on Spectrum Analysis.

It is to be regretted, just as a growing interest is beginning to be manifested in this community, in favor of popular scientific lectures, that any journal should attempt to deprecate and discourage efforts having the furtherance of that object in view; and it is quite inexplicable that such a journal as the *Alta* should indulge in disparaging criticisms on such an eminently superior course of lectures as that recently given by Father Neri, at St. Ignatius College. In reference to these lectures the *Alta* of the 25th ult. said: "Father Neri delivered the last of his course of five lectures, on the 'Spectroscope,' last evening. The first was on the general principles of chemical

the new method of spectrum analysis, compared with the other systems generally employed. The lecturer explained the origin or starting point of the new method; the conditions requisite for its application to all substances, and the ease, delicacy and exactness of this analysis, showing that it was far superior to what is attained either by the dry or humid analytical processes of chemistry. He gave also an historical sketch of the rise of spectral analysis, with a mention of the scientists from whom it originated.

The second lecture was "On the prismatic analysis of light"—the work performed by the spectroscopist. This lecture involved the nature of the spectrum from luminous sources, and the composition and decomposition of light. The nature, sources, propagation, reflection and refraction of light were explained and illustrated, as the main principles on which all the working of the new analytical instrument—the spectroscopist—entirely depends.

The third lecture was "On the construction of chemical spectroscopes, and the results of their actual examination of all terrestrial substances." It introduced the application of the spectroscopist to the analysis of the alkalies and alkaline earths, the heavy and the noble metals and the gases. Its application to other sciences—geology, mineralogy, physiology, anatomy, etc.; to the industrial arts; technological researches; medico-legal investigation; microscopical studies, etc., were also shown. Absorp-

jects, it was simply bad for him, not for those who could comprehend the subject.

As to whether "all the lectures were too long," and "many persons tired out" with listening to them—the constantly increasing interest and enlarged attendance at each succeeding lecture, to say nothing of the special and unanimous demonstration made by the audience, on one occasion, when the lecturer proposed to cut short the most lengthy session of the series, will speak for themselves, and fully attest to the fact that the listeners were too well pleased to take the least note of time.

If "much of the material is to be found in the commonest text books" it was because the lecturer was compelled to use it in order to elucidate and show the great progress which has been made by the spectroscopist since the last "text books" have been prepared—and this the lecturer did, bringing the progress of science in this direction down to the very latest day.

The fact is this has been the most thorough and complete course of scientific lectures ever delivered in this city. It was not given for a mere pecuniary compensation, as the expenses of each lecture amounted to quite as much as the total amount realized from the nominal fee

BURIAL PLACE AND IDOLS OF THE FRAZER RIVER INDIANS.

The dead Indians are placed in these painted boxes with their clothes, blankets, etc., and about the boxes containing the remains are hung the personal effects and utensils of the deceased. On the top of the shed on the left will be noticed an old broken canoe, the property of some departed aborigine. The figures of animals which are carved in bass-relief, represent bears, otters and beavers. The central figures are an Indian and squaw, the man wearing a mask such as the Indians use on some of their festive occasions. The figure kneeling down is carved out of a solid piece of wood, and the gun in its hand has an iron barrel, taken from an old musket. This figure bears evidence of being made at some recent date after the advent of white people to the river, since it is represented as wearing a *bona-fide* beaver hat. The figure half seen behind the large idol on the left, is ornamented in the same manner.

All these figures are carved from wood and painted in a rude way. The Indians worship them after their manner and occasionally wandering parties come to the locality, place themselves in front of the idols and weep and wail after the fashion of California Indians at a burial. They respect the idols very much, and protect them from damage as much as possible. On one occasion a white man mutilated one of the images by firing a rifle ball into it, and an Indian who witnessed him followed and dogged his footsteps for some days, until he found an opportunity to kill him, which he did. The Indians who travel near these places will go out of their way to visit them on all occasions. The carving is, as will be seen by

an analysis; the second on the optics; the last on the spots, corona and elipsis of the sun. The third and fourth were mainly on the spectroscopist; in the others that instrument was brought in only incidentally. All the lectures were too long—sometimes reaching to 11 o'clock, so that many persons were tired out. Much of the material is to be found in the commonest text books, and although instructive to many, was tiresome to those prepared for a lecture on the spectroscopist.

All the information given in this course was highly proper for public lectures, but they would have been more satisfactory if each had been given under a title giving a true idea of the subject."

No intelligent reader who had the pleasure of listening to Prof. Neri, can fail to remark the utter lack of knowledge in the subject matter of the lectures, which the *Alta's* critic displays in the above paragraph. The subject of the first lecture was not at all as stated, neither was the second based upon the meaningless phrase—"On the Optics;" nor was the last "On the spots, corona and elipsis of the Sun." For the double purpose of giving our readers a brief reamé of the subject matter of these lectures, and to show how much thereof the critic of the *Alta* could have heard or understood, we append the following brief synopsis or plan of the course:—

The first lecture was "On the advantages of

spectra were explained, also phosphorescent and fluorescent spectra.

The fourth lecture explained "The principles upon which the spectroscopist grounds its achievements in the heavenly regions—the foundations of solar and stellar chemistry—how it proves the existence of certain substances in the sun,—selective absorption, dark solar lines and their coincidences with our bright metallic bands." The physical spectroscopist—instruments of great dispersive powers, etc., were the principal themes of the explanations, illustrations and experiments of this lecture.

The fifth and last lecture of the series, a report of which will be found in another column, was "On the revelations of the spectroscopist from its investigation of the celestial bodies." It applied the principles previously explained to the discovery of the composition and constitution of the sun, the stars, the nebulae, the comets and meteors. It gave the explanation which the spectroscopist furnishes of the most difficult, puzzling and ancient astronomical questions—of the sun's daily meteorology, its spots, faculae, prominences, etc., and the nature of its corona during total eclipses, mentioning the wonderful work and construction of the tele-spectroscope, and the almost incredible strides made with it in astronomy.

From the above, the reader will be able to judge whether the spectroscopist was actually made, as professed, the real subject of the course, or whether it "was brought in only incidentally."

It will also be observed whether the lectures were strictly connected and followed in due and natural sequence. If the *Alta's* critic did not or could not see aught but detached ab-

charged for admission—to say nothing of the work of preparation.

CHEMICAL LABELS.—Mr. Henry G. Hanks, No. 649 Clay street, has issued a little pamphlet of chemical labels, arranged so that the labels may be cut out and used to make known the contents of the bottles upon which they are placed. The labels are arranged alphabetically and numerically and comprise the names of all the reagents used in analysis, both qualitative and quantitative, and also those used with the blowpipe. They are printed in plain neat letters of a convenient size and will be found of great convenience in the laboratory, assay office and similar places. The little book will be sent free on application.

MINING SUIT.—A. D. Daunes has brought suit against the Riveride Mining Company, in Tuolumne county, to compel the transfer of 235 shares of stock on the company's books in the name of Donald Davidson, which were sold at Sheriff's sale to satisfy a judgment against Davidson obtained by one Edward Heskner and by him assigned to the plaintiff.

COIN.—There was \$106,000 in gold coin and \$153,510 in fine silver sent to New York by rail during the past week. During the past twelve weeks, \$3,765,100 in gold coin has been sent to New York by rail.

THE BRISTOL FURNACE went into operation last week on ore from the National lode.

Siemens' Regenerative Gas Furnace With Peat as Fuel.

Action has recently been taken by the Council of the Royal Dublin Society on the important question of the utilization of peat in the manufactures. Professor Reynolds suggests the use of a mode of employing peat as fuel for industrial purposes, which according to Iron, appears to have been either overlooked or entirely neglected. In his opinion the successful and economical use of peat in manufactures is more likely to depend on the proper adjustment of the furnace to the fuel, than of the fuel to the furnace, the costly preparation of peat being open to many serious objections.

In 1862 the venerable Professor Faraday delivered his last lecture at the Royal Institution of Great Britain, and took for his subject "Siemens' Regenerative Gas Furnace." At the time Professor Reynolds was very much impressed by the admirable apparatus described, in consequence of the facilities it afforded for the combustion of any such bulky fuel as peat. Since 1862 Mr. Siemens has taken out no less than eighteen patents for improvements in his apparatus, and it now appears to be exceedingly well adapted for peat burning. In the regenerative gas furnace, the fuel is very simply converted into combustible gas in a separate chamber of peculiar construction; the gases are then conducted into the furnace containing the material to be heated, and are then burnt with hot air. After use, the intensely heated products of combustion are made to pass through brick chambers called "regulators," and the heat which would otherwise be wasted is caught, stored up in the bricks, and subsequently made to raise to a very high temperature the air, etc., required to supply the furnace. In addition to the economy of heat resulting from the use of this apparatus, two special and most important advantages are gained. In the first place a bulky fuel like peat, containing a large proportion of worthless and often injurious ash, can now be easily and successfully employed in several important manufactures, since it is no longer necessary to bring the solid fuel into direct contact with the material to be heated. Secondly, the use of a very dry fuel is not required, owing to a peculiarity in the mode of working the furnaces. Siemens' apparatus is therefore specially suitable for the combustion of rough and simply air-dried peat.

Mr. Siemens states that his opinion perfectly agrees with that of Professor Reynolds. "I have used peat abroad for working glass furnaces, and I have employed it with complete success for making steel in England; indeed the men gave the preference to peat over Staffordshire coal in working the regenerative gas furnaces. In England, coal is, of course, the cheapest fuel; but I am convinced that through the application of peat, as Professor Reynolds suggests, several branches of industry may be planted with great advantage in Ireland. Regarding the heating value of peat as compared with coal, it can be arrived at for my purpose by simply ascertaining the relative percentage of solid carbon in both. The water (if not in excess) may be regarded merely as a deduction, without injury to the heating value of the solid constituents. The vapor of water mixed with the gas is all condensed in the cooling tubes of my apparatus before reaching the furnace.

The Royal Dublin Society have received from a committee which they appointed at the instance of Prof. Reynolds the report appended below. The evidence given to the committee and the result of their own inquiries have led them to the following conclusions, viz.:

1. That Siemens' Regenerative Gas Furnace is eminently adapted to a very large number of manufacturing purposes; in fact to most in which a very high temperature is required, and in which the work to be done permits the furnace to be entirely closed. It was given in evidence that it has been successfully applied to the production of iron and steel direct from the ore, to glass works, potteries, zinc works, forging on the largest scale, and many branches of manufacture.

2d. That rough air-dried peat, containing on the average 25 per cent of water, is suitable fuel in a Siemens' furnace.

3d. That peat, when burned in this furnace, compares more favorably with coal, as regards heating power, than when used in any other known way. It has been stated to the committee that with ordinary appliances the general heating power of $2\frac{1}{2}$ tons of average peat is about equivalent in practice to one ton of average coal.

On the other hand, the proportion in Siemens' furnace appears to be much more in favor of peat, and to assign a value to peat not less than 65 per cent. of the value of Staffordshire coal.

The committee have not been able to ascertain the heating value of coal refuse, which is also a fuel employed in Siemens' furnaces, so that the committee are unable to state the proportion of value between peat and such fuel. The committee has been informed by Mr. Siemens' that peat mixed with about 25 per cent. of coal-dust gives a richer gas than peat alone.

The extent of hog which is available appears to be immense, and the bogs are so distributed over Ireland that they must, in many cases, be in the immediate neighborhood of the places where manufactures may be expected to arise.

In such cases the gas-producing apparatus might be situated at the bog, and the gas conveyed to the factory by culverts. The facilities of transport are likewise very considerable. The Midland Great-Western Railway Company alone have lines running through seventy miles of bog, and it is well-known that the Royal and Grand Canals pass through the bog of Allen—the most extensive in Ireland. Peat is at present delivered into the canal boats at 7s. per ton. This corresponds to a price of about 12s. for large quantities in Dublin. The application of machinery, the committee are led to believe, would greatly reduce the cost of cutting and saving turf.

Two Siemens' regenerative gas furnaces have been constructed at the works of the Great Southern and Western Railway, at Inchicore, with a view to the employment of peat. These will afford an opportunity of more fully testing the value of this mode of using the chief fuel of Ireland.

MINING IN NEVADA COUNTY.—The following information is from the Nevada Transcript: The impression now prevails that the present season, which appeared so excellent for hydraulic mining a few months ago will be two months shorter than the run of last year in those localities, where they only have water part of the year. Though much snow fell, there was no rain to pack it. It was very light and melted rapidly, so that little now remains to depend upon for a long supply. At some points in the county the supply is already failing. The Manzanita hydraulic claims located on Bourbon Hill, are now running 1,000 inches of water, and washing off a large amount of ground through the old flume, while the bed-rock tunnel is being run to strike the gravel at the bank 47 feet below the surface. This tunnel was commenced in 1867, and it is to be 2,600 feet in length. When Roberts & Co. bought in they had 1,595 feet still to run. On Saturday last they made the connection between shafts 4 and 5 at the face of the bank, striking it as true as though the entire work had been above ground. They have now only 294 feet to run to complete the tunnel, and this they are working out from six faces.

NARROW-GAUGE TO MARYSVILLE.—The Nevada Transcript, of April 22d, has the following: "We learn from a gentleman who has just returned from San Francisco that the project of building a narrow-gauge railroad from this city to Marysville will be revived again. William W. Magary, the gentleman who visited this city a few months ago to see how our people felt on the subject, and went away perfectly satisfied with the encouragement he received, will be here in the course of two weeks in company with other parties connected with the road. They say they mean business, and will bring the books with them for the purpose of giving our citizens an opportunity to subscribe for stock. The company is already incorporated under the name of the California Central Narrow-Gauge Railroad Company.

DIAMONDS.—According to official documents published by the English Colonial office, the value of the Cape diamonds which left the colony last year is estimated at not less than \$10,000,000. The supply is very far from being exhausted, and for many years finer gems than any that have yet been discovered may be expected from that country. The mineral resources of the interior of South Africa seem well-nigh boundless. Several hundred diggers have already made their way to the newly discovered gold fields of Marabastad, in the South African Republic, about 350 miles beyond Klipdrift, where the indications are said to be of a more promising character than at the remote Tatin quartz reef on the Limpopo River.

A SWIFT TYPE-SETTER.—Edmund C. Hubbell, of whose remarkable feat of type-setting mention has been made in the papers, undoubtedly stands unrivaled. A week or so ago he accomplished the feat of composing in ten hours time 15,290 ems solid brevier, and in one single hour composed 1,960 ems. On April 5th he composed in ten hours working time 16,005 ems, and in two hours set up 3,982 ems. The type used was minion and brevier. This gentleman has not yet attained his majority, but he bids fair to soon surpass the noted George Ahrensberg.

A PRIZE.—The Council of the British Society of Arts have resolved to offer the gold medal of the Society to the manufacturer who shall produce and send to the London International Exhibition of 1873, the best collection of specimens of steel, suitable for general engineering purposes. The specimens exhibited must include a complete illustration of the applications of the varieties of the steel submitted.

TROUT.—The California Acclimatizing Society have hatched about 250,000 trout this year at their ponds, near San Pedro. From 120,000 eggs about 90,000 came to maturity. The patent-hatching boxes with charcoal sides are used.

COAL IN CHINA.—The backwardness of China is indicated strikingly by the simple fact that, although her coal-fields cover 400,000 square miles, she mines no coal, and although she has an inexhaustible supply of iron ore, she smelts very little.

Twenty thousand coal miners in Leicestershire have struck.

DEWEY & CO.,

American & Foreign Patent Agents,

OFFICE, 338 MONTGOMERY STREET, S. F.

The best, speediest, and surest method for you to obtain patents, file caveats, or transact any other important business with the Patent Office at Washington, or with foreign countries, is through the agency of DEWEY & CO., PUBLISHERS OF THE MINING AND SCIENTIFIC PRESS, SAN FRANCISCO, an able, responsible, and long-established firm, and the principal agents on this side of the continent. They refer to the thousands of inventors who have patronized them, and to all prominent business men of the Pacific Coast, who are more or less familiar with their reputation as straightforward journalists and patent solicitors and counsellors.

We not only more readily apprehend the points and secure much more fully and quickly the patents for our home inventors, but with the influence of our carefully read and extensively circulated journals, we are enabled to illustrate the intrinsic merits of their patents, and secure a due reward to the inventor, besides serving the public who are more ready to give a fair trial, and adopt a good thing, upon the recommendation of honest and intelligent publishers.

To Obtain a Patent,

well-constructed model is generally first needed, if the invention can well be thus illustrated. It must not exceed 12 inches in length or height. When practicable, a smaller model is even more desirable. Paint or engrave the name of the article, and the name of the inventor, and his address upon it.

Send the model (by express or other reliable conveyance), plainly addressed, to "DEWEY & CO., MINING AND SCIENTIFIC PRESS OFFICE, SAN FRANCISCO." At the same time, send a full description, embodying all the ideas and claims of the inventor respecting the improvement describing the various parts and their operations.

Also send \$15 currency, amount of first fee of the Government. The case will be placed on our regular file, the drawings executed, and the documents made up, and soon sent to the inventor for signing.

As soon as signed and returned to us with the fees then due us, it will be sent straightway to the Patent Office at Washington.

When the invention consists of a new article of manufacture, a medicine, or a new composition, samples of the separated ingredients, sufficient to make the experiment (unless they are of a common and well-known character), and also of the manufactured article itself, must be furnished, with full description of the entire preparation.

For Processes, frequently no model or drawings are necessary. In such case, the applicant has only to send us an exact description, and what is desirable to claim.

For designs no models are necessary. Duplicate drawings are required, and the specifications and other papers should be made up with care and accuracy. In some instances for design patents two photographs, with the negative, answer well instead of drawings.

For further information, send a stamp for our illustrated circular, containing a digest of PATENT LAWS, 112 illustrated mechanical movements, and HINTS AND INSTRUCTIONS regarding the RIGHTS AND PRIVILEGES of inventors and patentees, which will be furnished post paid. Also a copy of NEW PATENT LAW of 1870.

Address DEWEY & CO.,
PUBLISHERS, PATENT AGENTS AND ENGRAVERS,
No. 338 Montgomery street, S. F.

Polishing and Fluting Iron.

This new invention takes the place of two articles needed in nearly every house. As a POLISHING IRON it has no superior. The part used for fluting is made of brass, and highly polished. A receipt for making FRENCH GLOSSING STARCH, that gives a superior polish, goes with each iron. The Polishing Iron and Fluter, being in one, are both heated at the same time. We are now prepared to furnish them in quantities to suit. Price, \$3.

WESTER & CO.,
17 New Montgomery street, San Francisco,
General Agents for Pacific Coast.

NICKEL PLATING.

The San Francisco Nickel Plating Company are prepared to plate articles of all descriptions, of any metal. Cutlery, Liquor Flasks, Pistols, Guns, Swords, Bridle Bits, Pole Crabs, Hub Bands, Dash Rails, and all articles of household hardware plated at short notice, and warranted. Nickel Plate never tarnishes or corrodes, always retaining its polish until the article is worn out. Office at the KIMBALL MANUFACTORY WORKS, Cor. Fourth and Bryant Streets. 12v26-3m

THE EAGLE HAY PRESS.

The above is a correct representation of this remarkable EAGLE HAY PRESS, the invention of J. A. McCallister, of Illinois, to whom Letters Patent were issued Jan. 10th, 1865, and July 24th, 1866.

Several years were devoted by the patentee to the perfection of this powerful press, and its unprecedented sale in the East induces the proprietors to introduce it into California and the Pacific States.

All who have seen or used these presses pronounce them superior to anything used heretofore. The power is applied by means of two levers, and it will be seen the power increases in ratio to the resistance, as the levers approach a horizontal position the power can scarcely be estimated. It is not only a powerful press, but has the advantage of being cheap, and also simple, therefore not liable to get out of order.

Three men with one horse can bale from TEN TO FIFTEEN TONS PER DAY, each bale weighing 250 to 300 pounds. It obviates all necessity of heating the hay before pressing. On account of its great power it is well adapted for pressing HYDES, RAGS, WOOL OR COTTON. When a bale is pressed and fastened the roller runs down of its own weight, and the bales can be taken out on either side. On April 18th, 1871, this Press was tested at the State Agricultural Hall, Sacramento, and stood the test of a bale of wool, 550 pounds. Reference, Maj. Rob't Beck.

We have added to this Press this season an improvement (patented) which does the stamping, dispensing with men to tread down the hay in the Press, facilitating the operation, and saving much hard work. The additional cost being but \$25, paying for itself in labor saved in a week.

These Presses are now manufactured in San Francisco by the

Kimball Car and Carriage Manufact'g Co.,

Who are the Proprietors on the Pacific Coast, and will endeavor to have a supply constantly on hand.

EUCALYPTUS.

The attention of the Medical profession is respectfully called to the following preparation of this new remedial agent. Eucalyptus and its preparations have been found useful in obstinate cases of intermittent and Marsh Fevers, often supplanting the use of Quinine. The paroxysms of Asthma and Catarrh are greatly controlled, and in various Kidney diseases and Catarrh of the Bladder it seems to act like a specific.

FLUID EXTRACT EUCALYPTUS.

This extract represents in a concentrated form the medicinal effects of the leaves of Eucalyptus Globulus.

THE ELIXIR OF EUCALYPTUS.

This compound presents the properties of the leaves in a palatable form and elegant appearance. Dose—One tablespoonful, to be repeated as often as the case demands.

Cigarettes of Eucalyptus Globulus, useful in Asthma, Difficulty of Breathing, Incipient Pleurisy, etc. Prepared and sold by JAMES G. STEELE & CO.,

Chemists and Apothecaries,
No. 621 Montgomery St., between Clay and Commercial, San Francisco. n028

chants in England and France,
thus enabling vendor, purchaser, and consumer not only to
identify the genuineness of the capsule, but likewise
the contents of the vessel to which it is applied.
The LORD CHANCELLOR, in his judgment, said that the
capsules are not used merely for the purpose of the orna-
ment, but that they are serviceable in protecting the wine
from injury, and insuring its genuineness.

KNOWLES' PATENT STEAM PUMP.

It has no Cranks or Fly-Wheel, and has no dead points where it will stop, consequently it is always ready to
start without using a starting-bar, and does not require hand-work to get it past the center. Will always start
when the steam cylinder is filled with cold water of condensation.

CENTRAL PACIFIC R. R., OFFICE OF THE GEN'L MASTER MECHANIC,
SACRAMENTO, Cal., January 14, 1871.
A. L. FISH, Esq., Agent of the Knowles Steam Pump, San Francisco—Dear Sir: In reply to your inquiry as to the
merits of the Knowles Steam Pump, in use upon this road, I will say that it gives me great pleasure to report that they
have performed their work well whenever called upon. In no instance have they failed. We have now over 30 of them
in use on this road as fire engines, and pumping water for shop and station use. I consider the Knowles Steam Pump the
best in use, and prefer it to any other. Yours truly,
A. J. STEVENS, General Master Mechanic.

U. S. NAVY YARD, NEW YORK, June 3, 1871.
Messrs. Knowles & Sibley, 92 and 94 Liberty street, New York—Gentlemen: In reply to your note of 31st, re-
questing my opinion of your Steam Pump, etc., as suggested from my experience with them in actual service, I have to
state that I have used your pumps, and entertain the most favorable opinion of their great merit and usefulness, and for
every purpose believe them to be superior to any others, and have recommended and adopted them. They have
given complete satisfaction in all cases that have come under my observation.
Yours very respectfully,
WM. W. W. WOOD.

A. L. FISH, Agent Knowles' Steam Pump—Dear Sir: In answer to your inquiries, we state that the highest award
for Steam Pumps at the Eighth or last Mechanics' Fair in San Francisco, was a First Premium and Diploma, awarded
to the Knowles Steam Pump, as published in the Official List September 24, 1871.
A. S. HALLIDIE, President Board of Managers.
W. H. WILLIAMS, Sec'y Board of Managers Eighth Industrial Exhibition, M. L.

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they
have no equal. No effort has been, or will be spared
to have them constructed in the most perfect manner
and of the great number now in operation, not one has
ever required repairs. The constant and increasing de-
mand for them is sufficient evidence of their merits.
They are constructed so as to apply steam directly
into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows.

The pan being filled, the motion of the muller forces
the pulp to the center, where it is drawn down through
the aperture and between the grinding surfaces.
Thence it is thrown to the periphery into the quicksilver.
The curved plates again draw it to the center, where it
passes down, and to the circumference as before. Thus
it is constantly passing a regular flow between the grind-
ing surfaces and into the quicksilver, until the ore is
reduced to an impalpable powder, and the metal amal-
gamated.

Settlers made on the same principle excel all others.
They bring the pulp so constantly and perfectly in con-
tact with quicksilver, that the particles are rapidly and
completely absorbed.

Mill-men are invited to examine these pans and settlers
for themselves, at the office, 229 Fremont Street,
San Francisco.

PATENTS & INVENTIONS.

Telegraphic List of U. S. Patents Issued to Pacific Coast Inventors.

[REPORTED OFFICIALLY FOR THE MINING AND SCIENTIFIC PRESS, DEWEY & CO., PUBLISHERS AND U. S. AND FOREIGN PATENT AGENTS.]

By Special Dispatch, Dated Washington, D. C., April 29th, 1873.

FOR WEEK ENDING APRIL 15th, 1873.*

HYDRO-DYNAMIC STEAM ENGINE.—Wm. Burnett, San Francisco, Cal.

MUSEUM LEAF TURNER.—Anthony Rosenfield, assignor to self and Henry Polley, San Francisco, Cal.

CONSTRUCTION OF HOUSES.—David L. Emerson, Oakland, Cal.

ANIMAL CAVE TRAP.—Sylvester W. Rice, Roseburg, Oregon.

WOOD PAVEMENT.—Henry M. Stow, San Francisco, Cal.

RE-ISSUE.

WIND MILL.—Wm. J. Tustin, San Francisco, Cal.

*The patents are not ready for delivery by the Patent Office until some 14 days after the date of issue. Note.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with greater security and in much less time than by any other agency.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co., Scientific Press American and Foreign Patent Agency, the following are worthy of mention:

PREVENTING INCRUSTATION OF BOILERS, TUYERES, ETC.—R. A. Fisher, San Francisco, Cal. Mr. Fisher has discovered a simple, cheap and effective remedy for the incrustation of boilers, tuyeres, etc. His invention has been thoroughly tested and proven, and we doubt not will save many a dollar which is now expended and lost in replacing and repairing leaky tuyeres in our smelting furnaces.

MACHINE FOR CUTTING VENEERS.—E. S. Gilmore, San Francisco, Cal. This invention relates to a device for feeding blocks of wood to the knife of a veneer cutting machine by which the block will be automatically moved up against the knife, after each slice is cut and thus he in position to receive the knife when it again descends. A weighted rod is suspended so that its lower end bears against the block opposite the blade. The weight causes the rod to continually exert a pressure against the block and as each veneer is cut the block is moved forward against a gauge plate on the knife frame, which can be set so as to gauge the thickness of the veneer as desired.

FILTER.—Prosser Huerne, S. F., Cal.—This patent is for a filter which is intended more particularly for house use, in place of the ordinary water cock or faucet. Mr. Huerne makes a globular or oval shell inside of which he secures a round or oval filtering stone. The stone is somewhat smaller than the interior of the shell so that a space is left entirely around it. The pipe which receives the filtered water passes through the case and into the center of the stone while the unfiltered water is delivered by a pipe into the space surrounding the stone. The pressure in the filter causes the water to pass through the stone to its center, where it is received by the interior pipe and from which it can be drawn. The large area which Mr. Huerne obtains by using the round or oval stone in the above described manner renders the filter quite effective as the larger the filtering area the greater the quantity of water it is capable of filtering. The filter can be reversed when it is desired to clean it so that the water is delivered to the interior of the stone and filters outward into the surrounding space, thus effectually cleaning the stone so that it filters freely again.

SAW SWAGE.—Alfred J. Hinde and James S. Howe, of Santa Cruz, Cal. These inventors claim a saw swage made partly of wood and partly of metal. The two substances are so combined that while the metal portion serves as a bearing for the point of the tooth which is being swaged the wood rests upon the edge of the saw blade, thus preventing the saw blade from being marred, as is often the case when a metal swage is used. The form of the swage is also claimed, as it is better adapted to fit between the teeth and plate.

ANTI-FRICTION METAL.—Geo. S. Hunt, Sacramento, Cal. This patent is for the well known I. X. L. anti-friction metal which is so extensively used on this Coast as a bearing for journals.

GANG PLOW.—Charles Kewin, of S. F., Cal. In no part of the United States are gang plows used as extensively as in California, and no other part of the country has contributed as many improvements in gang plows. Mr. Kewin claims that his plow is easier operated, and less liable to get out of order than those now in use.

BALANCE SLIDE VALVE.—Henry Kessler, S. F., Cal. This patent relates to a balance slide

valve which is especially adapted to locomotive engines. The valve is so constructed that it bears against the underside of the steam chest and upon the valve seat. An arrangement of springs serves to relieve the pressure of the valve between its hearings so that it will move easily while the pressure of the steam is balanced by the equal area exposed upon all sides.

SEDIMENT COLLECTOR.—Leonard & Hancock, Oroville, Butte county, Cal. Claims a combined sediment collector and blow-off for steam boilers by which the sediment which collects at the bottom of boilers can be removed in an instant by the pressure inside of the boiler. A tube which is provided with numerous perforations is placed in the boiler below the water level. A smaller pipe passes through a stuffing box in the end of the boiler and into the perforated tube. A blow-off cock is provided at the end of this pipe outside of the boiler. The perforated tube will collect the sediment and the sliding pipe serves to carry off the impurities when the cock is opened, and for this purpose it can be moved along inside of the perforated tube. The pressure inside of the boiler serves to drive the sediment out through the pipe.

The Engineering parties on the Northern Pacific Railroad in making surveys for the location of the road between the Missouri River and Rocky Mountains will be amply protected, judging from the preparations in progress. The expedition which will start from Fort Rice, Dakota, by the 15th of June, will consist of a battalion of 10 companies of cavalry, 19 companies of infantry, a detachment of 75 Indian scouts and five selected scouts who were on the Yellowstone expedition and a detachment of artillery sufficient to man two Rodman rifled guns. Over 200 six-mule teams will accompany the expedition, which has been organized under the instructions of General Sherman. With all this escort the engineer corps of the railroad ought to possess themselves in peace, for there will not be much danger unless the Modocs get after them.

A NEW RAILROAD.—We understand that the contract for constructing the Clay Street Railroad has been let to W. H. Martin & Co. to be completed on or about the 31st day of July, 1873. It will be about two miles in length. As it is to possess some engineering novelties we may illustrate the method of operation in some future issue.

SAN DIEGO MINES.—A recent clean up from the Ready Relief mine of 80 tons of ore yielded \$2,000. The Helvetia has cleaned up a lot of \$30 per ton. The Golden Chariot, the representative mine of Banner District has just cleaned up a lot which run \$100 per ton. All the mines are doing well and times there are said to be lively.

BAKER CITY, Oregon, is quite a lively place at present. The quartz mill is running night and day, and trains are constantly arriving heavily loaded with quartz. Business of all kinds is said to be flourishing, buildings going up, freight coming, etc., all of which pleases the Baker City people greatly.

A NEW ROAD.—The superintending engineer of the Bantas and Oakland railroad, via Martinez, has commenced work with his assistants on the road. Operations were to have commenced on the tunnel at the mouth of the straits.

BOUNDARY SURVEY.—Colonel A. W. Von Schmidt has gone to Hot Springs from which point he will continue the boundary survey between Nevada and California. The survey will be made from there to the Carson Valley, and thence to the Colorado river.

NAVAL CONSTRUCTION.—Preparations are being made at Mare Island for constructing one of the eight new ships authorized by the last Congress. The armament will consist of four eight-inch and one eleven-inch gun.

LARGE FIRE.—The Lancashire Railway Company's carriage works, in Manchester, together with fifty locomotives and one hundred and fifty coaches, were burned on Sunday night.

IDAHO.—At its last clean up the Idaho Mining Company, at Grass Valley, made a larger clean up than ever was made at the mine before in the same length of time.

FOSSIL PALMS.—It is stated that between Dayton and the mouth of the Sauto Tunnel, fossilized palm trees are found in great abundance.

New Incorporations.

COLIPISE AND LEE G. AND S. M. CO.—April 29. Location: Tulare Co. Capital stock, \$500,000, in shares of \$250 each. Trustees—G. W. Ryckman, G. A. Treadwell, Wallace Emerson, C. W. Rand and O. H. Bogart. **WONDER G. M. CO.**—April 30th. Location: Tuolumne county, California. Capital stock, \$3,000,000, in shares of \$100 each. Trustees—W. J. Caday, A. F. Angell, D. H. Crocker, C. G. Jackson and Charles Keller.

Meetings and Elections.

At the annual meeting of the stockholders of the Huhn & Hunt Mining Company, held on the 28th inst., L. Maynard, J. H. Baird, James T. Boyd, J. G. Mather, R. S. Floyd, Joseph Qingot and Michael Skelly were elected Trustees. Officers—L. Maynard, President; Jas. T. Boyd, Vice-President; T. W. Colburn, Secretary; Bank of California, Treasurer.

Machinery.

N. Seibert's Eureka Lubricators.

THE HIGHEST PREMIUM

Awarded by the Mechanics' Institute Fair, San Francisco, and State Fair, Sacramento, 1871.

These Lubricators are acknowledged by all engineers to be superior to any they have ever used; feed constantly by pressure of condensed water, supplied by pipe A, regulated under the oil by valve J, and forced out through check valve and pipe B into the steam pipe C; it then becomes greasy steam, passes to all the valves and cylinder at every stroke of the engine; glass tube I indicates amount used per hour. Packing on rods and stems lasts longer, and the rings on the piston will not corrode. One pint of oil will last from three to six days, according to speed and size of engine; I, sliding gauge; K, valve to shut off when engine stops; H, F, valves to shut off in case of frost; steam does not enter the cup; it is always cool; warranted to give satisfaction. Patented February 14, 1871. Manufactured by California Brass Works, 125 First street, S. F. 24v23tf

Notice is hereby given, that the copartnership heretofore existing between A. J. Severance, Charles W. Randall and J. Gus. Burt, under the firm name of "Severance, Holt & Co.," is this day dissolved by mutual consent. A. J. Severance, having purchased all the interest of his late partners, will continue the business of manufacturing and selling Diamond Drills as before, under the style of A. J. Severance & Co. Dated San Francisco, Nov. 24, 1871.

BUY BARBER'S BIT BRACE. 2v

BROWN'S PATENT LAMP.

One of these Lamps, when placed at a distance of 200 feet from the bank, will light up a bank surface 250 feet in length and 150 feet high, and to a much better advantage than any other light heretofore tried, and at an expense not to exceed five cents per hour. Lamps furnished at short notice.

Letter of Recommendation.
Ma. C. B. BROWN—SIR: Your Patent Lamp for lighting hydraulic mines, which you sold to me in December last, has given entire satisfaction, and far exceeds my expectations, and I think it the best and cheapest light ever used to light mining claims by night, and am satisfied that I have saved three hundred dollars by the use of it in the last mining season over pitch or any other light of the same brilliancy; and I will also say that if I could not get another lamp, five hundred dollars would not buy it.
Yours,
W. D. APLIN.
Little York, Nov. 5, 1872.

For further particulars, address,
fe22-4f C. B. BROWN, Placerville, Cal.

P. J. PHILLIPS & CO., No. 608 Clay street, near Montgomery, San Francisco, are agents for Brown's Lamp, where it may be seen.

The California Powder Works

No. 314 CALIFORNIA STREET.
SAN FRANCISCO.

Manufacturers and have constantly on hand
SPORTING,

MINING,
And BLASTING
POWDER,

OF SUPERIOR QUALITY, FRESH FROM THE MILLS. It being constantly received and transported into the interior, is delivered to the consumer within a few days of the time of its manufacture, and is every way superior to any other Powder in Market.
We have been awarded successively

Three Gold Medals
By the MECHANICS' INSTITUTE and the STATE AGRICULTURAL SOCIETY for the superiority of our products over all others.
We also call attention to our

HERCULES POWDER.
Which combines all the force of other strong explosive now in use, and the lifting force of the best blasting powder, thus making it vastly superior to any other compound now in use.
A circular containing a full description of this Powder can be obtained on application to our Office.
16v20-3m JOHN F. LOHSE, Secretary.

BURLEIGH
ROCK DRILLS

—AND—
Air Compressors.

The Burleigh Rock Drills, which have stood the test of five years' constant use at the Hoosac Tunnel, and which are now in use in nearly every State in the Union, as well as in Europe and South America, are unequaled in efficiency and economy by any other Drilling Machine. They are of various sizes, and equally well adapted to Tunneling, Shafting, Open Out or Quarrying, and will drill six to ten inches per minute in granite. They are driven by steam above ground. The Burleigh Air Compressor is the best engine yet devised for furnishing the "air motor" for the many purposes to which it is now being used.

They are to be used on the St. Gothard Tunnel, Switzerland, Tunnel 13 miles long. We refer to the following gentlemen and works:
Gen. Newton, U. S. A. Hell Gate Tunnel, L. I.
Mess. Shanley, Hoosac Tunnel, Mass.
J. Dutton Steele, Nesquehoning Tunnel, Pa.
Sidney Dillon, Fourth Avenue Work, N. Y.
Col. Roehling, East River Bridge Company, N. Y.

Valuable Premiums FOR Subscriptions.

A Sewing Machine
of Real Value
(Beckwith's)
given for \$40
worth of Sub-
scriptions.

The AMERICAN AGRICULTURIST, in speaking of this Machine, says:
We are prepared to indorse the Beckwith Sewing Machine as one worthy of being at once secured by all who cannot purchase the expensive machines.
It is well and strongly made.
2d. It is easily attached to any table or stand having a leaf or edge projecting an inch or so, and can thus be used in any part of the house, near a window, etc.
3d. It makes the elastic loop stitch (the same as the Willcox & Gibbs and some other good machines), which with a little care in making the closing stitch is abundantly strong for nearly all kinds of sewing, and less liable to break in washing and wearing, owing to its elasticity.

WE WILL GIVE

For \$12, a Machine and the Illustrated Press, 1 year.
For \$12, a Machine and the Mining & Scientific Press, 6 mos.
For \$12, a Machine and the Pacific Rural Press, 6 mos.
For \$13.50, a Machine and the Mining & Scientific Press, 1 yr.
For \$13.50, a Machine and the Pacific Rural Press, 1 year.
For \$40, we will give a Machine and \$40 worth of subscriptions to either paper or all jointly. Send for Circular.

Express charges must be paid by the purchaser. Address, for further particulars, the PUBLISHERS OF THIS JOURNAL.

Scientific and Practical Books on Mining, Metallurgy, Etc.

Published or issued, wholesale and retail, by DEWEY & CO., MINING AND SCIENTIFIC PRESS OFFICE, S. F.

BY GUIDO KUSTEL,
MINING ENGINEER AND METALLURGIST.

Roasting of Gold and Silver Ores, and the Extraction of their Respective Metals without Quick-silver. 1870.

This rare book on the treatment of gold and silver ores without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and explains the why and wherefore.

It contains 142 pages, embracing illustrations of furnaces, implements and working apparatus.
It is a work of great merit, by an author whose reputation is unsurpassed in his specialty.
Price \$2.50 coin, or \$3 currency, postage free.

Concentration of Ores (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arsenides, and Gold and Silver Ores generally, with 20 Lithographic Diagrams. 1867.
This work is unequalled by any other published, embracing the subjects treated. Its authority is highly esteemed and regarded by its readers; containing, as it does, much essential information to the Miner, Millman, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print. It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. It contains 120 diagrams illustrating machinery, etc., which alone are of the greatest value. PRICE REDUCED TO \$5.

Nevada and California Processes of Silver and Gold Extraction, for general use, and especially for the Mining Public of California and Nevada, with full explanations and directions for all metallurgical operations connected with silver and gold from a preliminary examination of the ore to the final casting of the ingot. Also, a description of the general metallurgy of silver ores. 1864.
As its title indicates, this work gives a wide range of information applicable to all vein miners and workers in precious metals, affording hints and assistance of exceeding value to both the moderately informed and the most expert operator.
Price, \$5 in cloth; \$6 in leather—coin.

BY OTHER AUTHORS.

The Quartz Operator's Hand-Book; by P. M. Randall, 1871. Revised and Enlarged Edition. Cloth bound, 175 pages. Price, \$2.

Sulphurets: What They Are, How Concentrated, How Assayed, and How Worked; with a Chapter on the Blow-Pipe Assay of Minerals by Wm. M. Barstow, M. D.; 1867; cloth bound, 114 pages. Printed and sold by Dewey & Co. Price, \$1; postage free. The best written work, and most complete work on the subject treated.
ANY OTHER BOOKS DESIRED will be furnished at the most reasonable rates, by Dewey & Co., Mining and Scientific Press Office, S. F.

SHAREHOLDERS,

TRUSTEES, and
SECRETARIES OF

ALL MINING COMPANIES,

Should see to it that their Notices are advertised legally in THE DAILY STOCK LEDGER, or the MINING AND SCIENTIFIC PRESS, at much less cost than the usual rate of daily publications. Every person interested in the prosperity of legitimate mining enterprises should favor such practical economy. THE PRALL CONDENSING STEAM PUMP.

The Cheapest, Most Reliable, Most Durable and Most Economical Pump in Use.

This remarkable Pump, though having been used extensively in the Western States for the past year, is now for the first time offered to the trade of the Pacific Coast.
It is adapted to the raising of water or other liquids, under all possible conditions where steam can be obtained, operating absolutely without machinery with more economy and less liability to derangement than any Pump in use. As a MINING PUMP its advantages are most obvious.

The steam is condensed instead of being exhausted into the shaft or tunnel. It is not affected by mud, sand or grit, having no working parts to wear or cut out.
It is economical of steam, because all friction is avoided, and the steam is made to do double duty, that of direct pressure and then by condensation, utilizing the atmospheric pressure to lift the water to the Pump.

It requires no lubrication nor any attention whatever.
For IRRIGATION and raising water for stock purposes, the Prall Pump is vastly superior to anything ever before invented.

It requires less steam to elevate water from 20 to 30 feet than would be necessary to move any other style of Pump doing no work.

It is so simple that any one of ordinary intelligence, however unaccustomed to machinery, can operate it.
They are constructed of seven different sizes, with capacities ranging from two to fifty thousand gallons per hour.

Boilers furnished with the Pumps when desired.

Manufacturing Agents, Pacific Iron Works,

P. O. BOX 726, SAN FRANCISCO.

THE GIANT POWDER COMPANY

Are now manufacturing besides the famous regular

GIANT POWDER, A NO. 2 GIANT POWDER,

Somewhat slower in its Explosion, which we recommend for

BANK BLASTING, COAL MINES,

AND FOR ALL SUCH WORK WHERE THE ROCK IS NOT VERY HARD

It is fully as safe as the other and evolves neither smoke nor noxious fumes when exploded.
Price, 50 Cents per Pound.

The sales of both grades increase very fast, which is the best proof of their superiority over other explosives.

LEA & PERRINS'

CELEBRATED

Worcestershire Sauce.

Declared by Connoisseurs to be the only good SAUCE

Caution Against Fraud.

The success of this most delicious and unrivalled Condiment having caused certain dealers to apply the name of "Worcestershire Sauce" to their own inferior compounds, the public is hereby informed that the only way to secure the genuine is to ask for LEA & PERRINS' SAUCE, and see that their names are upon the wrapper, labels, stopper and bottle.

Some of the foreign markets having been supplied with a spurious Worcestershire sauce, upon the wrapper and labels of which the names of Lea & Perrins have been forged, L. & P. give notice that they have furnished their correspondents with power of attorney to take instant proceedings against manufacturers and vendors of such, or any other imitations by which their right may be infringed. Ask for LEA & PERRINS' Sauce, and see name on wrapper, label, bottle and stopper.
Wholesale and for export by the Proprietors, Worcester: Orosse & Blackwell, London, &c., &c., and by Grocers and Oilmen universally.

At the lowest Market Prices.

HALLIDIE'S

Patent Endless Wire Ropeway.

Covered by Numerous U. S. Patents.

IMPORTANT TO

Mining Companies, Civil Engineers, Contractors, Etc.

The system of transporting material, such as Ores, from the mine to the mill, Earths for embankments, Rock from quarries, etc., by means of steel wire rope, has been well tested and found more economical, advantageous and reliable than any other method of transportation; and to the annexed certificates in connection therewith I beg to call the attention of those interested:

EUREKA, Nevada, July 10, 1872.

T. M. MARTIN My dear sir: On your leaving for San Francisco, it gives me great pleasure to hand you my written acceptance of the HALLIDIE TRAMWAY put up by you upon our mine in Freshburg.

It is a perfect success, discharging ten tons of ore per hour with two men's labor. It is perfectly simple in construction, and, as far as I can judge, there is nothing about it to ever get out of order—nothing to wear out. While ours requires but about two thousand five hundred feet of wire rope, I can see no reason why the line could not be extended almost indefinitely with equally happy results. Again, the carrying capacity might be doubled or quadrupled if desired. After several weeks trial upon our mine, the unanimous verdict of all who have seen it is a complete, unquestioned success. If this can be of any service to you, use it in any way you think proper. Very respectfully, O. O. GOODWIN.

EMMA HILL CONSOLIDATED MINING CO., Little Cottonwood, Utah. Superintendant, Sept. 26, 1872.
T. M. MARTIN, Esq., Sir: The Ropeway constructed by you (HALLIDIE'S PATENT) for the Emma Hill Consolidated Mining Company, has been built in a most substantial and workmanlike manner, and is at this time in splendid working condition. I most cheerfully accept the work for the Company, and recommend it to others wishing a safe and speedy transit for ores over places impracticable for wagon roads, etc. Respectfully,
L. W. COLBATH, Superintendent.

"The Vallejo works smoothly with the elevated wire tramway, which carries its load of ore as quietly and easily as if there were no winter or snow in the world."
"Whatever the objection to wire tramways may be on account of their cost, I have seen nothing yet that even approaches them in the facilities they afford for moving ore at all seasons of the year."—Correspondent Utah Mining Journal, Alta, Jan. 8, 1873.

The Vallejo Ropeway.

The Vallejo Tunnel Company's Tramway in Little Cottonwood, built on the HALLIDIE PATENTED PLAN, is a complete success. It is between 2,300 and 2,400 feet in length, and is supported by thirteen stations. The fall in the distance is about 600 feet, and the wire rope, which is four-fifths of an inch in diameter, will easily and easily deliver one hundred tons in six hours. The machinery is automatic, loading and unloading the sacks or buckets. About one ton and a half can be sent down at one time. The stations are about two hundred feet apart, and the entire apparatus is strong and safe. As the wire rope is elevated about forty feet above the surface of the hill, the Tramway can be worked all winter long, without the slightest trouble.—Utah Mining Journal, Salt Lake, Sept. 23, 1872.
Mining Companies and others desiring to negotiate for the erection of this system of Ropeway, can communicate with me personally, or through Postoffice Box 904.

A. S. HALLIDIE, Patentee,
112 and 114 California Street, SAN FRANCISCO.

WIRE ROPE

For hoisting from mines, transmitting power, ship rigging, etc., of all kinds and sizes, on hand and made to order.
Wire of all kinds and descriptions, furnished at lowest rates.

Stebins' Hydraulic Elevator.

Was always objected to climbing up hill. Even in our younger days when our heavy editor took the utmost delight in coasting down the steep hill sides, this sport lost more than half its pleasure because he never slid down but what he had to climb back again up the hill. It was the old story of the boy who "would walk a mile to get a horse to ride a half mile."

But when increasing age began to rob us of our youthful elasticity, and especially those of us to whom increasing age added increasing bulk, we began to have a horror at the sight of a hill to be climbed or a flight of stairs to be mounted. A simple flight of stairs we might accept as a necessary evil not greatly to be dreaded, but when it comes to climbing to the third, fourth or fifth story of a building we feel like asking to be excused. Some people tolerate this method of making the ascent from one floor to another on the grounds of exercise. We believe in exercise, but prefer to have it a little more mixed. If we could imitate Woodward's monkeys by changing the performances from our feet to our hands occasionally, one set of muscles would be relieved by another, and the exercise would be more beneficial when simply viewed as exercises. But we are not monkeys, Darwin notwithstanding, and to act like a monkey now-a-days is not considered *au fait*.

In this extremity modern invention has come to our aid. Where the ancients were content to use the primitive ladder, we are content with nothing less comfortable than an elevator. Heretofore elevators have been principally operated by steam power, and the idea of employing the hydrostatic pressure principle for this purpose is a quite recent invention, say within the last twenty years. The hydraulic elevator as formerly used was too expensive where water was paid for by the gallon, as it required just as much water to raise the empty cage as it did when it was heavily loaded. Mr. Timothy Stebins has solved this last problem for us and now we are able to employ our elevators with economy as well as with profit and pleasure.

Let some of our readers may not be well posted in the hydrostatic pressure principle, which Mr. Stebins employs, we will explain that the application of the principle consists in introducing water which is incompressible and non-elastic, into a strong metallic cylinder under pressure. This cylinder is truly bored and furnished with a movable piston, which is made perfectly water tight by means of suitable packing, neatly fitted into the cylinder, and the pressure of the water upon this piston will move it from one end of the cylinder to the other.

Thus it will be seen that a machine can be made capable of exerting as great a force as may be needed by enlarging the piston area. Mr. Stebins employs the water pressure in our

city water pipes, for obtaining the necessary force for raising his elevator cages.

The cylinder which he uses is a horizontal cylinder (seen at the left side of the drawing). It is the water pipe through which the water is introduced into the cylinder between the piston and cylinder head so as to force the piston to the opposite end of the cylinder. The piston

tion as the cage descends and as the water flows out. Mr. Stebins has also invented a novel three way cock which he employs both to admit the water to and discharge it from the cylinder, both operations being performed by pulling upon a single rope, so that any person, however ignorant of mechanics in general and elevators in particular, can operate the cage.

strength by simply pulling a little harder upon the rope. This arrangement accomplishes a great saving of water in the course of a year, and for stores and other places where it is frequently necessary to raise heavy loads, the double cylinder arrangement would be preferable, but for private dwellings, hotels and business houses we can conceive of no more economical and neater arrangement than the one herewith illustrated. Besides the above inventions Mr. Stebins has improved various parts of the apparatus used in connection with the elevator, relating to the safety and the easy working of the apparatus so that he is now able to furnish what seems to be a perfect machine.

A number of these elevators have been put up and are now in use in this city. Among other places where they are used we refer to Heyneman & Co., No. 5 Sansome St.; Heller Bros., 112 and 114 Sansome St.; Triest & Friedlander, 116 and 118 Sansome St.; Feigenbaum & Co., 120 and 122 Sansome St.; Goodkind & Fecheimer, Bush St., between Sansons and Battery; Steinhart & Co., Oriental Block, Howard's building, (2 elevators) corner O'Farrell and Stockton Sts.; and Milton S. Latham's residence, Menlo Park, all of whom give the elevator the highest praise.

For further particulars apply to, or address, Stebins' Hydraulic Elevator Co., No. 32 Merchants' Exchange building, San Francisco, Cal.

THE BENICIA RAILROAD.
Another narrow gauge railroad enterprise was inaugurated last week, on the occasion of breaking ground at Benicia on the California Central Narrow-gauge Railroad Company's road. This road will run through the counties, Solano, Yolo, Colusa and Tehama to Red Bluff, a distance of 158 miles, being about 86 miles shorter than the present route from Benicia. The road will run northerly, crossing the valley north of Bridgeport, thence in a northeasterly direction near the foothills north of Fairfield, to Woodland; thence via Colusa, to Jacinto, Tehama and Red Bluff. From Jacinto a branch road is to be constructed to Chico, and Governor Bidwell has taken a large amount of stock. In order to induce farmers generally to take stock, the company contract with all who subscribe equal to one dollar for each acre owned, to transport their farm produce for 2½ cents per mile, for 5 years after the completion of the road. It is thought the rich farming land through which this road will run and its connection with rich mining counties, will make the road a profitable one. The following are the officers of the company: Cornelius Cole, President; M. D. Townsend, Vice-President; R. L. Tracey, Treasurer; Wm. W. Magary, Secretary; Wm. S. Watson, Chief Engineer.

The Epizooty is disappearing slowly from our midst, but a few ox teams are employed yet by Wells Fargo & Co., for hauling silver bullion and other heavy freights.

STEBINS' HYDRAULIC ELEVATOR.

has a flexible piston rod which is made of steel wire. This piston rod passes through a stuffing box in the end of the cylinder and around the large pulley as shown. It then passes upward and over another pulley near the roof of the building and thence down to the cage, to which its opposite end is secured. Now it is evident that when the piston is caused to travel through the cylinder by the water pressure the flexible piston rod raises the cage or elevator platform. Then by shutting off this water and opening a cock which allows the water to discharge from the cylinder the weight of the cage will draw the piston back to its original position.

All he will have to do is to pull upon the cord until the cage begins to ascend, and then leave it alone until he arrives at his destination. A further pull upon the same cord will then stop the ascent of the cage, and when he desires to descend another pull upon the same cord opens the discharge cock and the cage moves down again. This is what we call simplicity simplified. Mr. Stebins is also the inventor of an elevator in which two upright cylinders are employed in such a manner that when a light load is to be raised only a single cylinder is employed, but when an unusual weight is to be raised both cylinders will respond with their united

CORRESPONDENCE.

The Vienna Exposition.

[From our Regular Correspondent, GUIDO KUSTEL.]

In spite of the continued labor at the Vienna Exposition ground, the totality will not be finished before the opening on the first of May. The Austrian

School Objects Exposition

Has been, by order of the Ministry of Education placed in the Rossaner gymnasium. It comprises five main groups: the University, Middle schools, Municipal and Technical schools and children-gardens. It shows a massive material of students' elaborations and means of education; but it does not quite distinctly represent a summary view of school matters. Nevertheless there is a rich and multifarious collection, well arranged in groups. A very interesting and most perfect analytic preparation of injected insects, human and animal organs is that of Prof. Hyrte; also a picturesque representation of the theory of glaciers, zoological objects, etc. In one of the rooms are the elaborations of scholars of the technical schools. In this department, Bohemia is well represented.

The lower school department shows also a rich collection of pictures, models and other collections. Very attractive are those of the middle schools, showing physical instruments, models, drawings, hand-writings, etc. The Prussian Ministry of Education sends to the exposition a model of a "Turnhalle" with side rooms belonging to it. It represents the Turnhalle of royal Wilhelm's gymnasium at Berlin, 1-12 of the natural size. In the same proportion are all utensils and the whole inner outfit.

The jury Commissioners of the Exposition will commence their examination and investigation on the 15th of June, and have to finish it at the beginning of August. Each group of the jury will have a president and two vice-presidents selected from the different nations exhibiting.

An international congress for the

Discussion of Patent Rights

Will meet at Vienna on the 4th, 5th and 6th of August, under the following rules:

1st. All industrial representatives, technologists, farmers, etc., of all nations are entitled to a participation in this congress.

2d. The application for participation in the Congress has to be made at the relative exposition offices of the different States.

3d. The Government of the exhibiting nations can, if they choose, be represented by their delegates.

4th. The general directory will appoint a Preparatory Committee to prepare all the material submitted to the Congress.

5th. The Congress will be opened by the general director of the Exposition; it then elects its President and the Bureau arranges the order of business.

6th. The Congress language will be German, but English, French and Italian will also be admitted.

7th. All papers, propositions with reference to patent rights, are to be directed to the "General Direction of the Exposition" at Vienna, if dispatched before the meeting of Congress, if during the same, to the "Bureau of Congress."

Experiments with Agricultural Machines

Will be made on the field, four miles from Vienna on the farm Leopoldsdorf, between 23d of June and 30th of July, according to the condition of the weather. Three days after the experiment the machines must be returned to the Exhibition Palace. Each steam plow receives for a preliminary experiment 14 acres of land, and all steam-plows for regular plowing experiment 50 acres of clover-land and for plowing in of dung 42½ acres. Every thing necessary for experiments with other agricultural machines is provided for.

Miscellaneous Doltings.

An agreeable promenade of 120 miles has to be performed through the various avenues and alleys of the Exposition building, in order to see everything in detail that is exhibited there, including all the villas and other buildings. Thirty-two potentates will visit the Vienna Exposition. Among the medical plants at the Exposition there will be "Valeriana celtica." This plant, under the name of "Speik," is exported annually up to 10,000 oz., principally to India, where it is burned in honor of different idols. From Lower Kurnten (Austria) will be exhibited a desk made of ninety different kinds of wood, grown there; San Francisco sends a table showing the variety of California woods.

It is admitted even by the French, that the superiority of the German arms and their victories are based on the higher technical education of the people. It is illustrated by the following fact: Of 13,000 students of the German high schools, 4,510 took up arms in the late war. Of this number, 2,745 were combatants, and 248 were killed. The proportion

shows that 30 per cent. of the school youth offered their lives for the defence of Germany, while only 3 per cent. of the total population took part in the battle and other war services. Again while only two per cent. of the latter lost their lives, of the combatant students full 10 per cent. were killed.

Professor Boeck was appointed to collect and arrange for the exposition all material of the protestant schools of Cisteithania(?). The French corporation of working men in Paris resolved to vote the necessary funds for the purpose of sending some of their men to the Vienna exposition, after a help from the national assembly had been refused.

Influence of the Velocity of Impact on the Effective Duty of Stamps.

By WILLIAM MAIN, JR.

It is well known that but a fraction of the mechanical work expended in lifting stamps, is usefully employed in the fall, also that the value of this effective fraction varies between wide limits. The total amount of power developed in the fall, may be divided into two portions; first, that usefully expended in actual crushing; second, that which is wasted, in jarring the foundation, and in heat. The heat is produced both by friction and by force of compression, not expended in fracture. The most economical work would be performed, when the blow is exactly sufficient to crush the rock with a minimum of jar communicated to the mortar bed. A fragment of rock may be just strong enough to resist the blow of a stamp; the whole force of the blow will be transmitted through it to the foundation. A slightly harder blow or smaller piece of rock, would have caused a useful expenditure of power in breaking the rock to fragments, leaving a smaller residue for useless vibrations.

Stamps may be classed under two heads. First, those with a free fall. Second, those whose fall is accelerated by a force added to that of gravity. The latter division includes all those of which the fall is accelerated by the pressure of steam, air or springs.

The same amount of mechanical power may be expended in raising a heavy stamp a certain height, or in raising a lighter stamp to a proportionally greater height or, in raising a light stamp to the height of the heavy stamp, and then accelerating its fall by a pressure equal to the difference of weight. In all these cases the amount of power expended is the same while the useful effect will be different.

It must be distinctly realized that all solid bodies, however hard, are to some extent elastic, and therefore capable of compression, with certain limits, without fracture. A body is harder as the resistance it offers to change of shape is greater; more brittle as the limits are narrower within which change of shape may be effected without fracture. A stamp falling on a block of rubber may cause a depression of three inches; falling on a block of granite, a depression of 1-50 of an inch. The pressure to which the blow is equivalent is inversely proportional to the depth of compression. The pressure on the granite will be 150 times that on the rubber. The time occupied in effecting this depression will, according to the laws of retarded motion, be twice that occupied by the stamp in passing freely, at its maximum velocity, over an equal space. In striking the rubber block, the stamp will be brought to rest in a time during which, at its maximum velocity, it would have fallen six inches. Striking the granite block, effecting a depression of 1-50 of an inch, it is brought to rest in a space of time during which it would have fallen 1-25 of an inch, had the block not been there.

A stamp which has fallen freely 15 inches, will have attained a velocity of nine feet per second (very nearly) and will be arrested by the rubber in 1-18th of a second, by the granite in 1-2700th of a second. The speed with which the vibration, or impulse of compression is transmitted through a solid body, is far greater than the greatest velocity of any stamp. At the instant the stamp has come completely to rest, the compression it has made will have extended into the block to a depth ranging with the nature of the material.

Vibrations are transmitted through granite with a velocity of 1,660 ft. per second. In the case presupposed, the stamp will have expended its whole force in 1-2700th part of a second, and the compression caused by it will have extended a little over seven inches in all directions from the stamp. The figure of this solid of compression (if it may be so termed), which has taken up the whole force of the stamp, will approach a hemisphere having a radius of seven inches.

Let us suppose that instead of raising a stamp of 400 lb. weight to a height of 15 inches, an equal amount of power is expended in raising a 100 lb. stamp to four times the height, or in raising it 15 inches, and then accelerating its fall with a pressure of 300 pounds of steam. In each case 500 ft. lb. are consumed, the final velocity of the lighter stamp being twice that of the heavier.

To compare the effects of bodies possessing the same mechanical movement but different velocities, let V denote the velocity with which

the resistance R is encountered at the beginning of the time T . Let v denote the final velocity, G the weight of the body, and g the acceleration due to gravity. We have then from the laws of retarded motion the formula—

$$v = V - \frac{R}{G}t$$

When the body is brought to rest, v becomes zero and the equation

$$V = \frac{R}{G}t$$

t being the time required in coming to rest.

If a body of one-fourth the weight (1-4 G) having a double velocity (2 V), encounter an equal resistance, it will be brought to rest in a space of time represented by t . By substituting these values and combining the new equation with the last we find $t = \frac{1}{2}t$. The body of one-fourth weight, but double velocity, comes to rest in one-half the time, expending of course, an equal mechanical power.

Applying these principles to the case in point, we see that, as the lighter stamp expends its whole force in 1-5400th part of a second, the compression caused by it can extend in that time but $3\frac{1}{2}$ inches into the block. If the face of the stamp shoe is very small, the bulk of the rock over which the compression would extend itself, would be to that compressed by the heavier stamp, very nearly as one to four, or inversely as the cubes of the velocities. If the upper face of the block is not larger than that of the stamp, the whole compression will be transmitted directly downward, and the bulk of rock compressed will be inversely as the velocities.

By the more rapid blow the same amount of mechanical power has been concentrated on a smaller bulk of rock and the crushing effect is proportionally greater. Let us suppose the block of stone to be formed into a die with a face equal to that of the stamp-shoe and a depth $3\frac{1}{2}$ inches. At the instant when the heavy free-falling stamp has come to rest, exerting its maximum of compression, one half of the force of the blow will have passed through the block into the foundation and be expended, in jarring it and the ground about it. If, as before said, the stone be just strong enough to resist the blow, the whole force of compression will pass off in useless vibrations.

If the lighter stamp with accelerated motion strikes the same block, the compression produced by the blow will not have extended to the foundation, before the whole force of the stamp is expended. The stone will therefore be crushed to pieces.

Future economy in stamping is likely to be attained, not by increasing the weight of stamps, but the velocity of the blow. Practical objections to a high lift are numerous. Velocity can be much better attained by accelerating the fall, as the height of the lift may remain the same or even be diminished, and a greater number of blows struck per minute. The forging of hot iron so obviously demanded this, that the principle has long since been applied to the trip hammer.

In wet stamping, the rapidity with which a stamp is raised, influences greatly the amount of solid matter held in suspension. As the stamp rises, water flows from all sides to supply its place. The more rapid the rise of the stamp, the greater will be the velocity of the water, and the more surely will the finely crushed rock be whirled up into a state of suspension. If the blow is succeeded by another before the finer particles have settled, the stamp will act only on the coarser particles, packing less and sending more of the slime through the screen.

In some of the later forms of the stamp mill, while the principle of an accelerated blow is adopted, other novelties with which it has been combined, have been less well-conceived, and have done much to conceal its advantages.

The principle of high velocities finds its commonest illustration in the action of a bullet on a freely suspended object. If it be a block of wood, even although too thick for the ball to pass entirely through, almost the whole of the mechanical effect will be expended in crushing and dividing the fibres directly in its path, leaving little residue for producing oscillations. A heavier body with less velocity, would cause less crushing but greater oscillations. Stamps of high and low velocities of stroke have similar comparative effects in crushing the fragments of rock lying immediately under them, or jarring the mortar bed.

In blasting rock, quickness of explosion is equivalent to velocity of impact. The force of compression radiates in all directions from the drill hole. While the slower explosives take advantage of the weaker seams and have a splitting effect that runs to greater distances, the shattering effects of the explosion will vary directly as the volumes of gas generated, and inversely as the cubes of the times of explosion.—*Engineering and Mining Journal*—from the forthcoming Report of the U. S. Commissioner of Mining Statistics.

RYE PATCH MINES.—A dispatch to the *Alta* from Rye Patch dated the 1st inst. says that four bars of bullion were shipped from there the day before by the Rye Patch Company, making \$16,000 shipped on the April account. The ore developments in the north drift of the above named mine are simply immense. The pulp assay gives \$120 per ton. Assays made from a selection of ore samples gives \$1,150 per ton. With additional milling facilities, this mine must soon be added to the list of dividend-paying ones.

The Crown Point Mine.

The science of quartz mining has been carried to a very high point, says the *Alta*, in this case of the magnificent works of the Crown Point. The perfect machinery and appliances of that mine work with the noiseless precision of a clock, and 600 tons of ore of the value of \$48,000 per day are drawn from the drifts, lifted 1,700 feet to the surface, and transported to mill almost without handling. This is the regular work, but as much as 850 tons has been sent from the bottom of the mine to the mill in a day. It is very difficult for the uninitiated to appreciate the vastness of this result, or the automatic vigor with which it is produced. The main shaft of the mine was sunk 1,000 feet perpendicular to the 10th level; it there struck the body of ore now working. This ore is in a vein of which the foot wall is a hard species of granite, descending at an angle of a little less than 35 degrees. On this foot wall an incline was started, which has now reached nearly to the 15th level, a perpendicular of 500 feet, or over 850 on the incline from the bottom of the shaft, or 1,850 feet from the surface. As this incline descended levels were opened at each perpendicular depth of 100 feet. The ore which had been struck in the 10th level was found to be more extensive and richer in the 11th. The 12th showed still better results. The 13th is now 400 feet long, over 100 wide, and the ore mills \$80. The 14th is nearly ready to open, and the 15th level has been reached by the incline. On this incline runs an iron car of the newest construction, of a capacity of three tons of ore. It is worked by a steel rope operated by the steam works above. This car they have named the "Giraffe." Along each of the open levels, the 13th, 12th, 11th and 10th, run cars which bring the ore from the breasts and dumps into the Giraffe as it ascends the incline. Thus loaded the Giraffe reaches the top of the incline, or bottom of the shaft, where it dumps its load into small cars, which hold about 1300 pounds each. These run immediately upon the cage, are lifted to the surface by steel ropes worked by steam, and unload themselves into vehicles that take the ore to the mills. The powerful machinery is worked unrelentingly through the 24 hours, as it were pumping ore from the levels, incline and shaft, and discharging in upon the railroad race that feeds the ten or twelve remorseless mills which extract from it the last speck of bullion. By this means, as we have said, 600 tons of ore is daily drawn from the bowels of the earth and ground into pulp at the mills. Now, it will be observed, that the incline car, or Giraffe, holds 3 tons, consequently it must be filled and emptied 200 times in a day, and must 200 round trips from the bottom to the top of the incline, a distance of 850 feet. But 200 trips in 24 hours is one trip in 7 minutes. The car then must be loaded and unloaded and travel 1700 feet in 7 minutes, and, as we have said, it has done it in 5 minutes to raise 850 tons in a day. This gives an idea of the precision and power of the machinery. It will be borne in mind that where so much ore is taken out a vacant space remains. These spaces are, as fast as the ore goes, filled in solid with heavy timber, so that caving is impossible. There is also at the surface an enormous tank kept filled, with water, raised by the pumps from below. This water is conveyed in pipes to parts of the mine, where it is used with ice by the men, and may be promptly applied, with the hose always ready, to deluge any appearance of fire. All these gigantic automata, directed by Mr. Kellogg, one of the most experienced and able engineers, are applied to the extraction of a body of ore which has no parallel as yet. It has been followed through four levels, and two more are about to be opened. The quantity of ore which has been laid open will last four years at the present rate of working, and there is no doubt whatever of its indefinite continuance. The peculiarity of this ore body is that while all those found hitherto in the Comstock have been perpendicular to the foot wall, and ending with it, that in the Crown Point runs with the stratifications and improves in size and richness as it goes downward. The great and continued improvements in the self-acting machinery nearly obviate the inconvenience of deep working since the expense of a few hundred feet, more or less, is barely appreciable. The United States Consul General, at Mexico, reports the Guatimocin silver mine, which produced \$97,000 profits for the year 1870, at a value of \$5,000,000. The Crown Point earned \$2,100,000 in three months to April 1, and paid \$1,100,000 to the stockholders. This month of April it will earn nearly as much as did that Mexican mine for a year.

ORE SHIPMENTS.—A dispatch from Salt Lake states that Little Cottonwood's ore shipment for last week was 600 tons. The Emma mine is shipping fifteen tons daily. Much preparatory work is being done in this mine. The Flagg-staff is shipping thirty tons of ore daily to the Davenport Smelter. This mine has just shipped seven tons and \$1,100 worth of bullion. Fifty tons are to follow.

RAILROADS.—The whole cost of the American 69,000 miles of railroad is about \$3,437,638,749, which is a sum not very much greater than England has spent on her 16,000 miles of railroad.

MECHANICAL PROGRESS.

Paper as a Material of Construction.

The *Iron Age* contains an article on the use of paper as a material of construction from which we condense as follows:—Whether or not we are about to enter upon what will be known in the future as "The Paper Age," has lately become quite an interesting topic of discussion. Be this as it may, there is evidently a future for paper, in which it is to become the general, if not universal, substitute for wood, leather india rubber, and, to some extent, copper, tin, and zinc.

During the past few years a great deal of attention has been given to this subject, and the results already attained, though comparatively unimportant in themselves, show the possibilities of this material and its more or less perfect adaptation to a thousand uses to which no one has yet thought of applying it. In proportion to weight it is, probably, the strongest material known, and combines more perfectly than any other substance the qualities of strength, lightness, flexibility, durability, and cheapness. So many and various are the materials of which it can be made, that it can be manufactured in quantities practically unlimited in every civilized country of the world, and so long as plants grow, paper manufacture can be sustained. It is, under all circumstances, an easy material to work and handle; in short, it possesses every requisite quality, and, like many another material now indispensable, its utility is discovered just as we are beginning to feel the need of something cheaper and more abundant than wood, leather, and hard rubber to substitute for them.

Some idea of the diversity of uses to which it has already been applied may be inferred from the fact that, at the recent fair of the Franklin Institute, the display of articles made wholly, or in great part, of paper, comprised oil cloth, patent leather, and leather suitable for insoles, gas pipes, whip handles, saw handles, knives and forks, combs, buttons, washers, roofing and car-wheels. There are also many other uses to which it has been adapted, which were not shown, such as slats for window-blinds, panels for doors and ceilings, boots, collars, cuffs, bosoms, etc. The Japanese, in fact, make almost every possible article of clothing of paper, from a pocket-handkerchief to an overcoat.

Even iron is not adapted to use so widely various, and certainly no other material has yet been found which, at the same cost, could be made to answer so many purposes. These, it must be remembered, are but the first fruits of American inventive talent, as yet scarcely stimulated in this direction; and what may we not expect when, with a growing demand for manufactures of paper, there shall be more inducement than now offers for investigation and experiment.

Why cannot our railroad cars be made of paper, instead of iron, as proposed, so as to prevent the danger of splintering and burning, in case of accidents? As timber becomes scarce, our houses can be entirely built of paper.

It is said that paper pulp can be readily brought to such a state of toughness and solidity, by pressure, as to be almost as fire-proof and indestructible as iron.

It requires but little farther progress in this new branch of manufacture to so perfectly and universally adapt it to all the varied requirements of the human family, that "the coming man" would have little use for anything else from the time he was placed in his paper cradle until he should be "gathered to his fathers" in a paper casket.

ASPHALT PAPER is likely to become of great use in many ways. In thin sheets it is useful for wrapping silks or other fabrics that need protection from moisture, for lining the cases, or packing boxes for pianos, etc., or rolled up into pipes for conveying water. Asphalt tubes are only one-fifth the weight of iron, will not rust, and are quite tough and strong. The tubes are simply sheets of paper, of a peculiar quality, dipped in melted asphalt, and then rolled upon a cylinder. A machine for preparing the asphalt wrapping paper consists of a hollow cylinder, heated by steam, and a wedge-shaped box, containing the hot asphalt. The box has a narrow slit, the width of the paper, and as the paper passes, a thin layer of asphalt is distributed on the paper just before it passes the cylinder.

EXPERIENCE WITH STEEL-TOPPED RAILS.—The *Springfield Republican*, of March 25, says: "The German steel rails laid as an experiment, last fall, for two miles east of this city on the Boston & Albany Railroad, are not working very well, the steel top fits into the iron bottom somewhat wedge-fashion, and the weight of the trains is crushing out the iron."

FIRE-PROOF ARTIFICIAL STONE.—A French company are manufacturing an artificial stone by mixing quartz sand with a saturated solution of chloride of calcium, and burning like fire-brick. Some of the sand unites with the calcium to form a silicate of lime, which cements together the remainder of the sand into an artificial sand-stone.

Wire for Building Purposes.

A singular novelty has recently been introduced in England—an invention for applying wire to building and other purposes. The invention—which is due to Mr. Humphrey Turner, of the Cardigan Steel and Wire Works—consists in the application of wire cast in strips, of iron rolled to special patterns, for walls, ceiling, roofs, and floors of buildings, as well as for cisterns, water tanks, brewers' squares, and other vessels. Its chief utility however, is in the erection of houses.

The inventor proposes to use it in this way. The foundation is laid, and brought up 12 to 18 inches above the ground. Cast metal standards and straining posts are fixed at certain distances. Wire, from a half to two inches apart, is attached to these, and strained from the posts through holes in the standards. Panels and proper stay posts are then fixed inside the wire at proper distances, varying according to the thickness of the walls required. While the walls—formed by means of a concrete—are being raised from the inside, the plasterer may carry on his work on the outside, by laying on a superior material, consisting of cement and sharp sand. The wall having been brought up to the height required for the first floor, iron plates are then laid upon them, with holes for the wire to pass through. An iron or cast-metal beam is next thrown across the centre of the rooms from wall to wall, and when the walls are complete the wire is strained upon them through the plates.

In this manner, it is claimed, the whole of the building is securely "tied." The inventor thinks that the wire will supersede the use of floor joints of wood, and will, at the same time, form beds for concrete floors. Another advantage is, that they will serve on the under side as laths for the plastered ceilings, and the plastering may be carried on at the same time as the laying of the floor in concrete. The builder—or rather, wire worker—then goes on to the next floor, which is completed in a similar manner. When the height is attained, the plates and beams are laid so as to give the necessary fall for the water, and a wall is carried on the top of the plates for three or four feet. The wires are then strained across the whole of the top. Concrete is laid on these, rafters and slates being thus dispensed with. For this, as for all new things, great merits are claimed—no wood save for doors, cupboards, sashes, and window-frames; houses almost fire-proof, and vermin-proof as well. It will be a singular circumstance if the manufacturer of wire, which has of late years been marvellously increased, should be extended to "stringing up" houses in the manner indicated by Mr. Humphrey Turner's invention.

Proposed Sawing by Electricity.

We made mention some time since of the application, by an American inventor, of electricity as a medium for sawing wood.

When an electric current is transmitted through a fine platinum wire, the wire becomes red hot. The invention in question is for utilizing this principle for the purposes of cutting wood. The patentee says that he was led to this novel application of electricity by observing the facility with which a platinum wire, when raised to a white heat, effected the removal of tumors. It is anticipated that by means of this invention, which requires, so it is said, only a simple quantity battery, trees may be felled and divided into logs, and other wood-cutting operations performed with more facility than by the usual methods.

An English writer throws a wet blanket over this proposed novelty as follows: "We venture to say that no tree ever has been felled or ever can be felled by this method. If a tree were a fusible substance, like soap or tallow, a red hot wire might no doubt be passed through it, but even then there would be a continuous absorption of heat in the liquefaction of the material which might prevent it from being a beneficial process. Timber, however, mainly consists of charcoal, which is infusible; and although in a very superficial cut sufficient air might obtain access to the heated wire to enable the charcoal to be burnt, no such result could be expected in the case of such deep cuts as are necessary in felling trees; and if the charcoal can neither be melted nor burnt how can the felling operation be performed? The most moderate penetration is sufficient to show that the scheme is visionary, and it will be time enough to believe that the felling of trees can be accomplished by this method, when the felling operation has been successfully performed."

SAWDUST FOR ARTIFICIAL WOOD WORK.—The use of sawdust for artificial woodwork, seems to promise a success. Alum, glue, and sawdust are kneaded with boiling water into a dough, which is pressed into moulds; when dry it is hard, and capable of taking a high polish. Similar ornaments of greater beauty and resembling carved wood work very closely, are being made by pressing veneers between steel or copper dies.

DANKS, the well-known inventor of the Rotary Puddling Furnace, which bears his name, has invented an improved method of lining such furnaces, for which the furnace is said to be greatly improved in its weakest point.

SCIENTIFIC PROGRESS.

The Mechanical Equivalent of Heat.

A writer in the American *Artisan*, who has evidently paid much attention to the subject, says:—"The mechanical equivalent of heat seems to be a myth. Thus, Dr. Meyer makes 772 foot pounds the equivalent of a unit of heat, by assuming that the heat, which disappears during the expansion of a gas under the pressure of the atmosphere, is the energy which overcomes all this pressure; that is, fifteen pounds per square inch. But this is obviously an error; the resistance to the expansion of the gas, being only the difference between the pressure of the atmosphere, and the expansive force of the gas at that temperature. Thus, the elastic force of a cubic foot of air, exactly balances the pressure of the air surrounding it, and if its volume be doubled without adding heat, it will still press about five pounds on the surrounding air, therefore, the work done in overcoming the pressure of the atmosphere, when doubling the volume of gas by heat, is five pounds to the inch, instead of fifteen pounds, as assumed by Mayer, and illustrated by Tyndall, in his *Heat as a Mode of Motion*."

Again, "The sensible heat, 490°, added to the gas at 32°, to double its volume, exactly balances the atmosphere at each step of expansion, so that, though 351 foot pounds of work is done for each unit of heat which disappears, it does not appear how this disappearing heat does more work than is theoretically required to 'tip the beam' of a perfect balance."

All the figures are given in round numbers, but approximate the truth sufficiently to illustrate the principles involved. Notwithstanding Joule, in his efforts to prove the theory by hundreds of experiments arrived at results varying from 587 to 1,086, foot pounds, and Seguin, after the elaborate experiments of Reynault, fixed the equivalent at 3,000 foot pounds; still the "authority" have accepted the figuring of Dr. Mayer—772 foot pounds, as an elementary principle in Dynamical Philosophy.

The writer in the *Artisan* continues as follows: "Heat, light, electricity, magnetism, chemical affinity, and mechanical motion are energies, which interchange, directly, or indirectly, with each other, and very little is known of the exact conditions required for their interchange. Thus, the friction of phosphorus produces light, friction of glass and amalgam, electricity, and that of some perfectly homogeneous substances, more heat relative to other molecular energies. And, again, it is impossible to determine the exact quantitative relation between heat and light; for light exists where it is imperceptible to our senses, but perceptible to the vision of some animals and insects.

In view of these facts it would seem impossible, in the present state of knowledge, to determine the exact mechanical equivalent of either of these molecular energies, isolated from the others. That is to say, friction, or percussion, equal to 772 foot pounds of mechanical power, produces undeterminable quantities of these energies, severally depending on the molecular construction of the rubbing or colliding substances, and on other conditions, of which we are ignorant; therefore, it is irrational to assume, under any circumstances, that this mechanical power is all metamorphosed into heat. And, further, the instability of molecular energies, or their liability to interchange with each other, or otherwise disappear, as in electricity, steam-power, and generally in heat and the combustion of fuel, demonstrates both the complexity and our ignorance of the laws which govern them.

Thus, fuel burned in a furnace, subject to precautions against waste, which appear to insure perfect combustion, produces but about one-twentieth as much heat as when burned in the animal body. And further, it has been found that the mechanical power produced by the evolution of equal quantities of these energies through animal bodies, and inorganic mechanisms, is severally, as six to one, though the experiments were made with dead animal matter.

That mechanical and inviolable motions have their exact relative equivalents may not be denied; but an exact mechanical equivalent of heat scarcely harmonizes with observed phenomena, and may, logically, be considered a myth."

PRACTICAL APPLICATIONS OF THE ELECTRICAL LIGHT.—The disaster to the Northfleet has been the means of directing attention to a powerful electric light, to the inventors of which the Academy of Sciences in Paris have awarded their great prize of 50,000*fr.* It is the solution of a problem that has occupied the minds of electricians for many years past, and it is the only method by which a continuous current can be obtained by means of a magneto-electric machine. It is, then, specially applicable for producing a powerful light, to be placed on the foremast of an ocean-going steamer; for, in contradistinction to all other magneto-electric light machines, the simplicity of its working parts is so great as to enable it to be worked for months together without requiring even the smallest attention. It can be driven by a very small steam-engine, or by using a very small amount of the power of the engine which drives the vessel, and the experiments made with it in Paris appear to have been so successful as to induce one of the great French steamship companies to adopt its use.

Relation Between Heat and Electricity.

The following facts concerning the relation between heat and electricity have been laid before the British Royal Society by Mr. Frederic Guthrie. The discharging power of a hot body diminishes with its distance and increases with its temperature. But the discharging power of a hot body does not depend upon the quantity of heat radiated from it to the electrified body, but chiefly upon its quality. Thus a white hot platinum wire connected with the earth may exercise an indefinitely greater discharging power, at the same distance, than a large mass of iron 100 deg. C., though the latter may impart more heat to the electrified body. Neither the mere reception of heat, however intense, by the electrified body unless the latter have such small capacity as to be itself intensely heated, discharges the electricity if the source of heat be distant; nor is discharge effected when the electrified body and a neighboring cold one are surrounded by air through which intense heat is passing. But for the discharge, it is necessary that heat of intensity pass to the electrified body from a neutral body, within inductive range.

As hot iron shows a preferential power of discharging negative over positive electricity, so it is found that white-hot but isolated iron refuses to be charged, either with positive or negative electricity. As the iron cools it acquires first the power of receiving negative and afterward of receiving positive. Further, while white-hot iron in contact with an electrified body prevents that body from retaining a charge of either kind of electricity, as it cools it permits a positive charge to be received, and subsequently a negative one. White and red-hot metallic neutral bodies exercise this discharging power even when isolated from the earth, but always with less facility than when earth-connected. The hotter the discharging body, whether isolated or earth-connected, the more nearly alike do positive or negative electricities behave in being discharged; but at certain temperatures distinct differences are noticed. The negative electricity, in all cases of difference, is discharged with greater facility than the positive. It is shown that various flames, both earth-connected and isolated, have an exceedingly great power of discharging both kinds of electricity.

Iron and Steel in Early Times.

A late number of *Nature* gives the following interesting notes on the use of iron and steel by the ancients:—"Iron was not in common use till long after the introduction of copper. It is far more difficult to procure, because it is not met with in the native state, and the fusing point is very high. The metallurgy of iron is more complex than that of copper, and when obtained it is a more difficult metal to work. According to Zenophon the melting of iron ore was first practiced by the Chalubes, a nation dwelling near the Black Sea; hence the name Chalubus used for steel, and hence our word *Chalybeate* applied to mineral water containing iron. Steel was known to the ancients, but we do not know by what means it was prepared; it was tempered by heating to redness and plunging in cold water. According to some, kuanos mentioned by Homer was steel; but Mr. Gladstone prefers to conclude that it was bronze. Iron was known at least 1537 B. C. It was coined into money by the Lacedaemonians, and in the time of Lukouros in common use. It was used in the time of Homer for certain cutting instruments, such as woodmen's axes, and for ploughshares. Its value is shown by the fact that Achilles proposed a ball of iron as a prize for the games in honor of Patroklos.

Neither iron money nor iron implements of great antiquity have been found, because, unlike the other metals of which we have spoken above, iron rusts rapidly, and soon comparatively disappears. No remains of it have been found in Egypt, yet Herodotus tells us that iron instruments were used in building the pyramids; moreover, steel must have been employed to engrave the granite and other hard rocks, massive pillars of which are often found engraved most delicately from top to bottom with hieroglyphics. Again, the beautifully engraved Babylonian cylinders and Egyptian gems, frequently of cornelian and onyx, must have required steel tools of the finest temper. We have no record of the furnaces in which iron ore was smelted, but we know that bellows were in use in the 15th century B. C., in Egypt, and some crucibles of the same period are preserved in the Berlin Museum. They closely resemble the crucibles in use at the present day." We may add that Mr. Layard found an iron saw at Nineveh.

CARBON WATER FILTERS.—Water standing in a glass globe, the mouth of which was stopped with cotton wool, showed after some days signs of vegetable growth on its surface. The same water, filtered through a carbon filter into a globe free from air, also soon showed like signs of the existence of life. The same water after boiling remained perfectly clear for days. I therefore conclude that carbon filters are useful only in purifying water from mechanical impurities, as sand, lime, etc., but that they cannot remove the so-called germs.—*Julius Muller.*

INDIUM IN ZINC BLENDE.—Professor Cornwall, of Columbia College, N. Y., has, by means of the spectroscope, detected a notable amount of indium in various samples of zinc blende from New Hampshire and other States.

Our Weekly Stock Report.

THURSDAY EVENING, May 8, 1873.

There has been nothing like the present excitement in the stock market for over a year, the season of depression which has lasted so long having at last passed by. Washoe stocks particularly are affected, Ely and Idaho stocks showing very small fluctuations. As we go to press everything is still on the rise with more buyers than sellers. The activity in the Board is so great that on Wednesday, at 12 o'clock, when at ordinary times the whole list would have been concluded, they only got to Crown Point. At 4.30 p. m., the Board had not concluded the calling of the regular list and adjourned until Thursday morning. The operations in Savage affect the whole list of Washoe stocks. The transactions in stocks which have taken place this week indicate a more plentiful supply of money in the community than was supposed to be in circulation. A large increase of orders to buy shows the confidence evinced in the state of the market. There has been very little excitement in Ely stocks at the Board as people are waiting to see which way the suits of promising mines there will go.

The rapidly improving value in some of the Comstock mines inspires confidence in that quarter. The production for the month from the Belcher mine was \$1,300,000, and that mine has declared a dividend of \$3 per share, aggregating \$332,000. This makes \$2,392,000 paid out as dividends by Belcher since the 1st of January this year. The amount of money carried over in May is \$200,000, making about \$1,000,000 carried forward.

The bullion received at the Crown Point for April up to the 7th inst. aggregates \$1,060,479.84, and about \$120,000 more is expected, making upwards of \$1,200,000 for the month. The dividend declared is \$10, or \$1,000,000 in all; the largest ever declared by any mining company. These two dividends alone will aggregate \$1,832,000, to be paid to stockholders this month. The Eureka dividend of \$2 adds 40,000 more, making \$1,872,000 altogether. The Consolidated Amador will probably pay \$1 per share or \$300,000, swelling the amount for the month of May to \$1,858,000.

Raymond and Ely, which has until lately suffered a heavy dividend, will probably not do so this month on account of legal difficulties, but consolation is found in the fact that the bullion is steadily accumulating, and a big dividend will be announced in due time. No dividend is yet announced from the Monitor-Belmont mine this month, but letters from there give encouraging prospects for the mine. After the very general and long continued depression in the stock market the present rise is doubly welcome, and is an indication of renewed confidence in mining interests throughout the coast.

The Pioche Phoenix assessment of 50 cents has been resold and a new assessment of \$1 per share amounting to \$50,000 delinquent June 16th has been levied. So far this month the following assessments have been levied: Bowery Consolidated, 50 cents, delinquent June 18th; Insurance, 26 cents, delinquent June 6th; Mint,

10 cents, delinquent June 10th; Pioche Phoenix, \$1, delinquent June 16th; Portland, 25 cents, delinquent June 7th; Utah, \$1, delinquent June 10th; Eliza, \$1, delinquent June 9th; Newton Booth Con., 50 cents, delinquent June 14th; Summit, 25 cents, delinquent June 5th.

On Friday the market showed gathering strength and prices were strong with an increase of business. Activity prevailed during the season of the Board on Saturday, and prices were pretty firm. At the close Baltimore Con. was \$2 higher; Chollar, \$5; Caledonia, \$4; Crown Point, \$1; Gould & Curry, \$1; Ophir, \$1; Overman, \$1; Savage, \$3; Seg. Belcher, \$1; Jacket, \$2; Hermes fell \$2.

On Monday the market was very active and a general advance in prices was apparent. Baltimore Con., advanced \$2.50; Belcher, \$3.50; Crown Point, \$3; Chollar, \$6; Con. Va., \$3; Caledonia, \$2; Gould & Curry, \$3; Hale & Norcross, \$2; Ophir, \$4; Overman, \$3; Savage, \$5.

Tuesday's market showed a still further advance in prices, with great activity in business, particularly for Nevada stocks. The prices of that list closed in the morning at a general advance. Alpha, \$3; Arizona, \$2; American Flat, \$2; Baltimore Con., \$1; Best and Belcher, \$3; Crown Point, \$3; Chollar, \$3; Con. Virginia, \$1; Confidence, \$1; Caledonia, \$1; Empire Mill, \$1; Gould & Curry, \$3; Hale & Norcross, \$6; Imperial, \$1; Julia, \$1; Kentuck, \$4; Knickerbocker, \$5; Ophir, \$3; Overman, \$10; Savage, \$31; Seg. Belcher, \$3; Jacket, \$1. After the morning Board there was a reaction in Savage to \$110, but in the afternoon it rallied to \$110. Raymond & Ely was \$5 higher; Hermes, \$1; Meadow Valley, \$1.

Wednesday's market still continued and the stock market was still stronger than on the previous day. Savage, which was the main feature, sold before the Board at \$144; it opened at the Board at \$125, and closed at \$134. At the afternoon Board an active business was done, at rising prices. The advance for the day was general in the Washoe list. Alpha rose \$4; Belcher, \$4; Caledonia, \$3; Crown Point, \$2; Con. Virginia, \$5; Confidence, \$2; Empire Mill, \$3; Imperial, \$4; Knickerbocker, \$3; Hale & Norcross, \$2; Justice, \$2; Ophir, \$2; Overman, \$5; Sierra Nevada, \$3; Savage, \$18; Yellow Jacket, \$15.

In today's market some descriptions of stock show a decline from yesterday's prices and not so much business was done at the Board. The fluctuations will be seen by reference to our Stock Table.

The following items of interest from prominent mines are collated from letters or telegrams from superintendents on file at the offices of the respective companies in this city.

Belcher. Dispatch of the 5th says there is no change in the mine. Car samples, \$157. Bullion produced during the month, \$1,300,000; profit, \$1,000,000. A dividend of \$3 per share has been declared, payable May 10th.

Dispatch of the 7th says there is no change in the mine. Car samples, \$172 per ton.

Buckeye. Letter of the 5th says there has been no change since last report. The ore producing sections continue to show finely. Ore slips for the 2d and 3d, 33 tons.

Crown Point. The amount of bullion received at the San Francisco office on the 2d was \$28,552.20; on the 3d, \$37,953.56; on the 5th, two shipments of \$23,956.61 and \$47,493.44—making this total for the April account, so far, \$1,003,703.40.

The amount of ore shipped to the mills during the past

NOTE.—In the Stock Board an assessment is delinquent thirty days from the date of levy, exclusive of that date. The dates given in this list are those of the mining offices.

week was 3,325 tons 861 pounds; sixty-five per cent. of the assay value, \$275,736.49.

Dispatch of the 6th says that since the last report the crosscut from the fifth floor of the 1500-foot level has much improved. The whole face will now average \$30 per ton. The breasts and floors are all looking well as ever, and everything is looking well in and about the mine.

Dispatch of the 7th says the crosscut from the fifth floor of the 1500-foot level is in very rich ore. The mine looks well at all the prospecting points.

Bullion received at the office on the 7th, \$56,775.94, making the total for the month of April, so far, \$1,060,479.84.

Eureka Con. Letter of the 4th says the mine generally is looking well. Ore from the third level raises holds out strong, and of a good grade. Two

The Mining and Metallurgical Laboratories of the Massachusetts Institute of Technology.

By PROF. ROBERT H. RICHARDS.*

Of the several professions—the chemist, the civil engineer, the mining engineer, the mechanical engineer—the courses of instruction, as arranged at the scientific schools, differ considerably as to the amount of practical information which the student is able to gain. The analytical chemist has facility for a very thorough review of the processes which he will be called upon to perform. The student in civil engineering by his field practice learns the use of his tools and the art of taking field-notes. The mechanical engineering student is in the vicinity of machine-shops, which he can visit, and at which he can work. The student in mining engineering has no such advantages. The mines are at a distance, and the railroad fare to get to them is oftentimes an insuperable difficulty.

The aim of these laboratories is essentially to give to the student in mining and metallurgy a chance to study on a small scale the practical parts of his profession. We cannot, in a small laboratory, build a mine to timber, to work and to survey; we cannot make artificial quicksands and other impediments to mining. In short, we cannot study exploration; but we can study the mechanical preparation and the subsequent smelting of ores. Before presenting the plan of these laboratories it may be interesting to indicate the progress of the idea from its beginning.

During the summer of 1870 President Runkle visited the mines of Colorado, and while there, conceived the idea of making an expedition with the mining students to some of the western mining regions. He talked over the scheme with many railroad and mining men, and everywhere received encouragement. In the summer of 1871 the Institute party visited the mines of Colorado, and spent six weeks in taking notes of them. President Runkle here conceived the idea of building up a mining and metallurgical laboratory; and by the aid of Booth & Co., of San Francisco, a stamp mill was obtained, with the Washoe silver-working apparatus. During the year 1872 this metallurgical laboratory was brought to its present state of advancement by Prof. Ordway.

These two laboratories are intended to give students an opportunity to work, on a small scale, with all the mining and smelting apparatus which can be used to advantage in a laboratory. And this apparatus has been chosen, with this view to illustrate, as far as possible, the principles of all machines used in mining.

The mining laboratory now contains a fifteen horse-power engine; a Blake crusher; a stamp mill; a Washoe pan, settler and concentrator; a Rittinger automatic shaking table; a little hand jiggr; a rotary pulverizer; and a fan-blower. The metallurgical laboratory contains a blast furnace; a roasting and a smelting reverberatory furnace; a cupelling furnace; assay furnaces and a forge. The laboratory is equipped for easy blast furnace experiments, such as the smelting of copper and lead ores, for roasting operations on gold, silver, lead, copper, and antimony ores, and for the "Freiberg process" for silver.

A student receives an ore for examination, and in the presence of his instructor selects specimens containing all its characteristic minerals, which he determines, and then selects the method of treatment. Specimens are saved; the ore is crushed and sampled; assays are made, to determine its value. The ore undergoes the treatment which was chosen. Actual results are compared with the assay value of the ore, and, wherever practicable, the amount of fuel, power, labor and water consumed is noted.

But few experiments have as yet been tried, since these laboratories are scarcely yet completed. A gold ore from Acworth, Georgia, yielded the following results when treated by battery amalgamation:

Ore taken.....	176 lb.
Gold on plate.....	3.07 grains.
Gold panned from Battery.....	13.4 grains.
Rate of gold in the ore.....	\$1.76 per ton.
" " tailings.....	1.57 " "
Percentage saved.....	83 per cent.

Apparatus for iron working is not yet represented in the laboratories, partly for lack of space, and partly because we have not yet decided what furnaces could be most usefully employed in a laboratory. A pair of crushing rolls is now in course of manufacture.

The mining schools of Prussia are owned and controlled by the Government, as is the case also with most of the mines and metallurgical establishments. In consequence, students have great facilities afforded them for acquiring practical information. In this country no such bond of union exists between the mines and the schools. The schools must here depend on the generosity and sympathy of the public, and, to obtain such help, they must in some way reciprocate it.

It is fully expected, that, by making students do systematic and careful work, results will be obtained which will be of such value to the donors of the ores that they will feel more than repaid for sending them. If this expectation fails, the alternative always remains, that ores can be bought and shipped by the school.

The mutual interchange of ideas, between the instructors of the Institute and the miners, which will grow out of such work, is regarded

as no mean part of the value of this laboratory to this school and to the public.

With regard to working ores for outside interests only, results being returned promptly, and a fee received in compensation for work done, I can only say that we have not found enough this school-year to make any promises whatever. I expect to be able to do prompt work in future years.

With reference to the students' work, the suggestion has been made that we should hold a tournament, as it were, for a month, keeping all mining students engaged at work in their regular shifts; that we should run all the apparatus during the month; have our regular break-downs, stoppages and patchings up, and settle up accounts at the end of the month, making such assays and analyses as are needed.

* A paper read before the American Institute of Mining Engineers, Boston, Feb. 19, 1873, and published in the *Engineering and Mining Journal*.

Original Potato.

In our illustration we present a branch of this plant and the tubers of the original, native potato, both of this natural size. They are found growing in abundance among the mountains of South America and in that part of Mexico between Fort Wingate and Fort Defiance. The Navajo Indians inhabit this section and this

NATIVE POTATO (*Solanum fendleri*.)

native potato is one of their chief articles of diet in winter.

By giving this indigenous potato good cultivation in good soil, the tubers which are from one-half inch to an inch in diameter, are largely increased in size, so that the third year's product from the native root, are as large as hen's eggs; and by continuing the process of reproduction always from the larger tubers, the full-sized potato is obtained and often of good quality; whilst the crossing of this, with some of the old improved varieties is supposed to give a renewed vigor to this plant and certainly a largely improved product over the yield from the original variety.

SALTING.—The Salt Sake *Tribune*, publishes a card signed by J. F. Harrison of New Orleans, charging four persons with swindling him and a New Orleans company, by the sale of a salted mine, for \$165,000. The card denounces the men for villains, who have robbed the widow and orphan, and deserve the hangman's rope, as cowards too mean to earn an honest living.

UTAH RAILROADS.—The Jordan and Wahsatch narrow-gauge road started its first train on Monday, everything moving smoothly.

About Postage.

By the terms of recent legislation, the franking privilege is abolished, and it is provided that, "All laws, and parts of laws, permitting the transmission by mail of any free matter whatever, be, and the same are hereby, repealed, from and after June 30, 1873." This cuts off the free exchange of newspapers between publishers, and the free circulation of papers within the counties of publication.

No changes in the rates of postage have been made, and, consequently postage charges will be as follows:

Letters.

To all parts of the United States, three cents per half-ounce.

Papers, Etc.

Pamphlets, occasional publications, transient newspapers, magazines, handbills, posters, unsealed circulars, prospectuses, book manuscripts, proof sheets, maps, prints, engravings, blanks, flexible patterns, sample-cards, photographic paper, letter envelopes, postal envelopes and wrappers, cards, plain and ornamental paper, photographic representations of different types, seeds, cuttings, bulbs, roots, and scions, can be transmitted through the mail, at the rate of one cent for each two ounces or fraction thereof.

Books, two cents for each two ounces or fraction thereof. Samples of merchandise, metals, ores, and mineralogical specimens can pass through the mail in packages not exceeding twelve ounces, at the rate of two cents for each ounce or fraction thereof; to be left

ceived in the office with stamps cut from stamped envelopes, or with such postage stamps as were in use prior to 1861, or with revenue stamps on them, are treated as "unmailable" and sent to the Dead Letter Office. Letters which have not been delivered can be forwarded, without additional charge, upon a written request.

Letters once delivered from a post office cannot be re-mailed without additional charge. Departmental postage after June 30, 1873, will be prepaid by special stamps, prepared and furnished by the Post Office Department.

Silver in Michigan.

It is with pleasure that we make the important announcement that the silver vein discovered last fall in Iron River has been explored and opened on Section nineteen on land belonging to the Ontonagon Silver Mining Company, a Co organized under the mining laws of this State; the stockholders being principally Marquette men, whom we congratulate upon the discovery and commend their pluck and energy in prosecuting the work under the many disadvantages they have had to contend with.

Work was commenced on the ground about four weeks since, in a section of country where no person was living. All their supplies, tools and material have had to be drawn from Ontonagon by dog trains, and the men have been compelled to camp in a temporary brush camp. Add to this the inclement weather we have had, and the fact that the ground was covered with four feet of snow and our readers can readily see that the company have had more than ordinary difficulties to contend with. However, with a firm faith that the vein would continue its course as shown in Iron River, and be found on their land, they have pushed the work with commendable vigor until they attained the object of their search. The vein opened is about twenty rods south of the east and west line, and near the north and south lines of the northwest quarter of Section nineteen, Town fifty-ones, north of Range forty-one west. Its dip is the same as in the out-crop in Iron River—north, or a little east of north—and occupying the same geological position, at the junction of the slate and sandstone, the slate for the north and the sandstone for the south wall. The vein is about seventeen or eighteen inches wide and rich in native silver and silver ore, the specimens obtained being in the estimation of many richer in silver than those obtained from the surface of the vein in Iron River. One fact is evident, that it carries more native silver and less silver ore where it is opened on Sec. 19 than it does in Iron River, but that may be accounted for from the fact that where the vein was opened on Iron River it was subjected to atmospheric action and disintegration and decomposition by the waters of the river running over it.

The fact of its being opened some fifty rods off from the river would seem to leave no doubt of its being a continuous vein, and we presume the owners of the land adjoining will not be slow in following up the exploration and opening on the vein in other places. The pit has been enlarged and properly timbered up so that the skeptical can see for themselves. A force of men are now employed in clearing up this land, getting out timber, erecting houses, and making preparations for active work. We are glad to learn that it is the intention of the company to push the work as fast as possible. They have faith that the vein is a valuable one and will be highly remunerative. As soon as navigation opens a sufficient amount of the vein will be taken out and submitted to several treatments for the extraction of silver on a large scale, and as soon as it is ascertained which is the best method their plan of work will be decided on.

We have contended from the first this discovery was a valuable one and shall look with some interest for further developments in this pioneer enterprise in the newly-discovered silver district in Ontonagon. We have confidence in the men that stand at the helm, and we hope that the snags and pitfalls which have proved the ruin of so many enterprises started heretofore, by extravagance and imprudent management, will be avoided by them.—*Ontonagon Miner*.

THE SAUCILITO RAILROAD.—Of actual novelty in the work done on the North Pacific Coast Narrow-Gauge Railroad, we have little to note this week. On the Saucilito side the grading, cutting and filling is going forward with energy. A large force is now at work, the number of laborers having been increased to one hundred. During the week a mild attack of strike afflicted the men as to the date when they should receive their stipends. A few hours effected a compromise satisfactory to all parties. On the Strawberry Point side the surveyors have finished their work from this summit to near Collins' place, and have gone forward. This party is under the charge of Mr. Robert Finley. On this side blasting, filling and cutting is being done with as great, if not greater, energy than on this other side. The whole line presents a pleasing and busy scene. Workmen are going backward and forward constantly. Here the force of laborers is constantly on the increase. At the tunnels at White's Hill work has been delayed somewhat by the reason of a land-slide over the face of the large tunnel which took place during the week. However, the greater part of this has been removed, and the work into this tunnel is again going forward.—*Saucilito Herald*.

RICH GOLD discoveries are reported in the Osceola district, about 65 miles north from Pioche.

Regular Publications.

Newspapers sent by mail must be prepaid by stamps, unless "regularly issued and sent to regular subscribers" by publishers or newsdealers, when the following rates are charged, payable quarterly in advance, either at the mailing or at the delivery office:

Dailies.....	35 cents.
Six times a week.....	30 cents.
Tri-weeklies.....	16 cents.
Semi-weeklies.....	10 cents.
Weeklies.....	5 cents.
Semi-monthly, not over 4 ozs.....	6 cents.
Monthly, not over 4 ozs.....	3 cents.
Quarterlies, not over 4 ozs.....	1 cent.

Newspapers and circulars dropped into the office for local delivery must be prepaid at the rate of one cent for two ounces, and an additional rate for every additional two ounces or fraction thereof; and periodicals weighing more than two ounces are subject to two cents, prepaid at all letter-carrier offices.

The postage on regular papers, etc., must be paid in advance, either at the place of delivery, to the carrier, or at the office, otherwise they will be chargeable at transient rates.

Book Manuscript.

Book manuscript passing between authors and publishers requires prepayment at the rate of one cent for each two ounces or fraction thereof.

Manuscript intended for publication in newspapers, magazines, pamphlets, etc., is subject to letter rates of postage.

General Rules.

Full prepayment by stamps required on all transient printed matter, foreign and domestic. All letters not prepaid by stamps, all such as are re-

USEFUL INFORMATION.

PAINTED ZINC.—A difficulty is often experienced in causing oil colors to adhere to sheet zinc. Boettger recommends the employment of a mordant, so to speak, of the following composition; one part of chloride of copper, one nitrate of copper and one of sal ammoniac are to be dissolved in sixty-four parts of water; to which solution is to be added one part of commercial hydrochloric acid. The sheets of zinc are to be brushed over with this liquid, which gives them a deep black color; in the course of from twelve to twenty-four hours they become dry, and to their now dirty gray surface a coat of any oil color will firmly adhere. Some sheets of zinc prepared in this way and afterwards painted have been found to entirely withstand all the atmospheric changes of winter and summer.

COLORS CANDIES.—WHAT THEY ARE MADE OF. Some months since, a great variety of the candies sold in New York were analyzed by Dr. Endemann, assistant chemist to the health department of that city, and reported in the *American Chemist*. Reds were either carmine or aniline red (both harmless). Blues were either ultramarine or Prussian blue (also harmless). Yellows were either saffron, chromate of lime, chromate of baryta, chromate of lead, gamboge, or vegetable colors. Of ten samples, five were coloured with chromate of lead, and one with gamboge (both poisonous). Greens were harmless, so far as examined. Starch sugar is a common constituent of some kinds of candy, and starch is often substituted for gum arabic. In two cases gypsum was found, three and six per cent; no other inorganic adulterations were detected.

ARTIFICIAL TORTOISE SHELL.—This substance may be made by melting gelatine with various metallic salts. According to the *Art Journal*, the appearance of tortoise shell may be given to horn by brushing it over with a paste made of two parts of lime, one part of litharge, and a little soda lye, which is allowed to dry. This is the same as the Indian hair dye, and acts by forming sulphuret of lead with the sulphur contained in the albumen of the horn, producing dark spots, which contrast with the brighter color of the horn. One of the most extensive comb manufactories in the world is in Aberdeen, where there are thirty-six furnaces on the works for preparing horns and tortoise shell for the combs, and no less than 120 iron screw presses worked by steam.

THE COMMON HOUSE CRICKET has the notable peculiarity of possessing both inositive and molar teeth. This enables the insect to destroy roaches much larger than itself, and to eat through very tough substances. Crickets have been known to spoil the soles of boots left within their reach over night, and they will frequently make holes in wet stockings, under like circumstances. The power of chirping belongs only to the males. These are provided with what corresponds to a little drum or tambourine, formed by the horny or parchment-like substance of the short upper wings. These wings have roughened edges, and, being rubbed with a vibratory movement, upon the integument forming the drum, produce the familiar "creek, creek" of the insect.

VENETIAN BLINDS OF COLORED GLASS.—A good idea has been put into form in an invention, patented by Mr. Peattie, of Rankellow street, Edinburgh. It is simply the substitution, with several little improvements, of colored and ground glass instead of wood, in the ordinary Venetian long and short blinds for windows. The glass is bound with brass to preserve it; and heavy blinds are simply wound up and down with something like a clock-key. The play of colors, it is easy to see, may thus be managed so as to give beautiful effects. Outside at night and inside by day, windows will look as if they were illuminated; and a city seen from the streets of a evening, under such circumstances, would have quite a gay and novel effect.

ANCIENT RELICS.—We are told, says the *Pi-ocche Record*, that a number of additional relics of a bygone civilization have been found between here and Bullionville. We have in our possession a piece of the pottery, which is said to be exactly like similar fragments found in Arizona and New Mexico. It is different from anything in that line we ever saw, but looks more like old-fashioned stoneware than anything else we can think of. The coloring must be of metallic origin, for it is a deep black, and has not faded in the slightest degree through the probable centuries that the fragments have been exposed to storm and sun.

BRONZING AND VARNISHING PLASTER FIGURES. These should be sized first, and painted with color according to the colored bronze required, as red, white, green, yellow, black, etc. Before the colors are thoroughly dry, that is when they feel "tacky," the prominent parts should be dabbed with bronze powder and a piece of ohamois leather. Varnish afterwards with some quick drying varnish.

IMPORTING PULP INSTEAD OF RAGS FOR PAPER. A paper manufacturer of Lee, Mass., has accepted an engagement to go out to Yokohama, Japan, to build and superintend a paper pulp mill. The pulp will be bleached and shipped in bales to this country.

THE HEART AND THE BRAIN.—For thousands of years, the hearts of animals had been beating before it was discovered that the purpose of the continuous action of that organ was to bring the supplies required for interstitial repair to the remotest members of the animal body, and at the same time to carry off the waste which had been replaced by fresh material. For thousands of years, human hearts had been beating, and, misled by superficial observation, the heart was supposed to be the seat of thought and passion, the center of good and evil, devotion and love; and it was even compared by poets to an altar on which flames were burning, etc.

But modern biologists have changed all this. The human heart is no longer the seat of the noble feelings of generosity, charity and of love; all these functions have been transferred to the brain, while the heart has been degraded to a simple hydraulic apparatus, in fact, to a machine to all intents equivalent to a pump.

ROLLING MILL NOTES.—It is estimated that one-tenth of the entire population of the United States is dependent for support upon the production and manufacture of iron. The value of the metal annually manufactured is \$900,000,000, and 940,000 workmen are employed in the industry, the aggregate of whose wages reaches \$600,000,000. There has been a vast increase of furnace capacity and additional machinery put in by our rolling mills during the past eight or ten months, and there is every prospect of still further growth.

TEMPERING SAWS.—Take a piece of iron plate sufficiently large to protect the whole surface of the saw; place it upon some bricks, or place it over a furnace, rub your saw with some clean tallow, and place it upon the plate with a good fire under it. It will soon begin to smoke. Take a lighted stick or lath, and apply to the saw; if it takes fire take it off and plunge it into either some ashes or a bed of sawdust, and let it cool by itself. If not soft enough, proceed as before, but let it burn until it burns out; then take off and plunge as before.

WAX.—According to Wagner, Corsica produces the largest quantity of wax of all the countries of Europe, if not of the world. In ancient times, as well as in medieval times, the inhabitants paid their taxes in wax, and supplied 200,000 lbs. annually. Since wax is to honey, in quantity as one to fifteen, the Corsicans must have gathered each year 3,000,000 lbs. of honey.

TO MEND CHINA, take a thick solution of gum arabic in water, and stir into it plaster of Paris, until the mixture is of a proper consistency. Apply with a brush to the fractured edges of the china, and stick them together. In three days the articles cannot be broken in the same place. The whiteness of the cement renders it doubly valuable.

GOOD HEALTH.

The Noise of Children.

There is too much fussing about the noise of children, consequent upon too little knowledge of the requirements of youth in its effervescent state. If growth and health are considered in their true bearings, children cannot make too much noise. The school-mistress who enforces silence on her pupils is committing, unintentionally, of course, an offence against reason, worthy only of a convent. Every burst of laughter, every shout, nay, every moderate fit of crying conduces to health, by rapidly filling and emptying the lungs, and changing the blood more rapidly from black to red—that is, from death to life. Andrew Combe is a great authority in such matters as these, and he tells a story of a great charity school, where the pupils were forced to be so silent that a large portion of them fell ill. Without doubt this is one good reason why children of delicate constitutions cannot go through our public schools without breaking down. They are kept too still. Often too, teachers are disposed to insist on a posture so erect as to be absolutely injurious; for the body has more parts than one, and while to sit upright is good for the chest, it is, if long continued, an intense strain on the spine. The truth is, children should not be subject to monotony of any kind. They should speak and be silent, sit erect and loll, very much as nature inclines grown people to do. It is time that more attention is paid to the Kindergarten system in schools, and less to the State's prison one so generally in vogue.—*Ex.*

DUST AND BREATHING.—It may be interesting to persons who suffer from the direct effects of the dust, or who are necessarily exposed to the night air in places where there may be malaria, to know that a respirator of clean cotton wool, packed moderately close, sifts the air, and makes it perfectly pure. It is believed that even the penetrating malaria of vegetable decay is excluded by such a sieve. The construction of the respirator is of no importance; the only thing to secure is that the air passes through the cotton before it is breathed. Such an instrument, if it is only a small roll of cotton folded in a handkerchief and held over the nostrils, will afford essential relief to every one who finds the dust of the streets or railway cars irritating to the throat and lungs.

NATURAL DURATION OF LIFE.—According to Prof. Faraday, the crime of suicide is very common in this age of the world, for he estimates that all who die under one hundred years of age may be charged with self murder; that Providence, having originally intended man to live a century, would allow him to arrive at that advanced period if he did not kill himself by eating unwholesome food, allowing himself to be annoyed by trifles; giving license to passions and exposing himself to accidents.

Flourine advanced the theory that the duration of life is measured by the time of growth. When once the bones and epiphysis are united the body grows no more, and it is at twenty years this union is effected in man. The natural termination of life is five removes from the several points. Man, being twenty years in growing lives—or should—five times twenty years; the camel is eight years in growing, and lives five times eight years; the horse is five years in growing, and lives twenty-five years; and so with other animals.

LIGHT.—The more light admitted to apartments, the better for those who occupy them. Light is as necessary to sound health as it is to vegetable life. Exclude it from plants, and the consequences are disastrous. They cannot be perfected without its villifying influence. It is a fearful mistake to curtain and blind windows so closely for fear of injuring the furniture, by exposure to the sun's rays; rooms positively gather elements in darkness, which engender disease. Let in the light often, and fresh air too, or suffer the penalty of aches and pains, and long doctor's bills, which might have been avoided.

BREATHING THROUGH THE NOSTRILS.—When a respirator is not at hand or cannot be conveniently obtained, a great advantage may be gained by breathing through the nostrils. When breathing air that is dusty, or ill-smelling, or otherwise impure, draw the breath slowly through the nostrils. In this way the dust or other impurities are in part arrested in the moist and narrow nasal passages, and are prevented from being thrown upon the lungs. When we breathe through the mouth, they are carried more directly thither. Many would lengthen their lives by resolutely breathing through the nostrils.

PINE LEAVES are largely utilized in Europe. They are converted into a kind of wool or wadding, which is used for upholstery instead of hair. A kind of flannel is also made from this fibre, which is said to be very superior for many hygienic uses, as for rheumatism and skin disease. Vests, drawers, loose shirts, etc., are also made. In the process of manufacture an ethereal oil is also obtained, very useful as a solvent, and as a curative agent. Gas is also made from the refuse and used for lighting the manufactories, or the entire refuse may be pressed into the form of bricks, when it becomes a most excellent substitute for coal.

FLOOR WAX.—Nessler gives the following formula for the preparation of floor wax: Take 2 ounces of pearl ash, and 10 ounces of wax, and about half a pint of water are heated to boiling in a dish, which is frequently agitated, until a thick fluid mass is formed, from which, upon removal from the fire, no watery liquid separates out. Boiling water is now cautiously added to the mass, until no watery drops are distinguishable. The dish is again set on the fire, but its contents are not allowed to boil, otherwise myricin would separate out, 8 or 9 pints of water being added, little by little, with constant stirring. Coloring matter may be added, if desired.

HOW TO MAKE CHEAP FRAMES.—Cut strips of stiff pasteboard about an inch wide the desired length, clip the ends to a point, and cover with any nice black cloth like broadcloth or fine cassimere, lap the ends at the corners of the frames and fasten with a white or gilt button. Bind your picture and glass together with strips of gummed paper and glue on to the frame. Hang against a white wall. Bronzed paper which can be bought for eight cents a sheet, may be used instead of cloth, in which case a short strip across the corners of the frame is a great addition to its comeliness.

NEW ANESTHETICS.—Two new anesthetics are announced, each of which is claimed to be safer than the agents usually employed. The first consists of the compound radical ethyl combined with bichloride of methylene. It has been very successfully used in dental and ophthalmic cases. The other anesthetic is the lightest of all known ethers, its specific gravity being about one-half that of water. At the temperature of the human body it boils violently. This, too, has been tried, with gratifying results.

WHY DO DOGS BARK?—Wild dogs, we are told, never bark; they howl. There are numerous troops of wild dogs in South America. Two of these that were carried to England could never bark, but continued to utter their habitual howl. But a younger one of the same species learned to bark. Many years ago dogs were left by the Spaniards in the Island of Juan Fernandez, for the purpose of exterminating the goats. In a few years all barking had ceased among them. It has been suggested that barking originated in the attempt to imitate the human voice.

DOMESTIC ECONOMY.

The Old-Fashioned Bake-Kettle.

When cooking stoves came in, the bake-kettle, or covered skillet, went out, and with it went a large part of what was good in our American cookery. How many of your readers ever saw a bake-kettle? Probably only those who enjoy the blessing of a wood fire to cook by. Just send an artist down to the back woods of Maine or away "out west," and have a drawing made of this most capital kitchen utensil. "Pioneers will know what I mean without a drawing. [The bake-kettle was in quite common use among the early California Pioneers, especially among those who crossed the Plains; but it seems to have gone quite out of use even here. Ed.—PRESS.] It is a shallow kettle with a lid, which has a turned up edge, and upon which coals are placed; and the thing to be cooked is "between two fires." Those who are roughing it in log cabins or in camp, know what a useful thing it is. In it the bread is baked, meat roasted or fried, coffee browned, dish-water heated—in short it is one thing handy to have in the house.

I say, much good cooking disappeared with the bake-kettle. It allowed food to be cooked as it seldom is by the stove—long-continued, slow cooking, with all the juices and flavors kept in. Were there ever such chicken and veal pies as our mothers used to make in the bake-kettle? We have now-a-days what is called roast veal—half burned and wholly spoiled in the stove oven. But stuff a knuckle of veal and put it in the bake-kettle and let it "sizzle with fire above and below for three or four hours. It cooks quietly and slowly, all the moisture is retained, and comes out not only a delicious, but a digestible morsel.

The French who, say what you will, bring more skill and common sense to the subject of cooking than all the rest of the world, *braise* a certain class of dishes, and they have for the purpose a *braisier*, or braising-pan, which is really only the old bake-kettle Frenchified. Ducks, pigeons, and fowls, even if tough, may be admirably cooked in the bake-kettle. Our people have much to learn about the advantages of slow and long continued cooking—a treatment which is hardly practicable in a stove oven, as that dries as well as cooks. The "modern improvements" in the way of stoves and ranges have resulted in a deteriorated cookery. Let us go back to the days of our grandmothers so far as to restore the bake-kettle to the kitchen—or, if it will be fancied better, we will call it a "*braisier*."—*Am. Agriculturist*.

REMOVING TAR SPOTS.—The old remedy for removing tar is butter; tar is soluble in fat, and especially in butter; when this is left on the tar spot for some time, both butter and tar are easily washed out by a sponge, with soap and water. It is the same with resinous wagon grease. Recently Dr. Briker announced that he had discovered that a creamy mixture of powdered extract of liquorice, with oil of aniseed, will easily dissolve tar, resin, pitch, Venice turpentine, etc. It is afterward washed out with soap and warm water.

BOGUS LARD.—An Ohio paper states that some of the articles of Commerce sold as lard is really corn meal lard. The process of manufacture is to melt the lard and then add the meal, stirring the mixture well together. When meal is sixty cents a bushel and lard twelve and a half cents a pound, it is evident that the profits to the manufacturer must be immense. The Yankee wooden mntnngs and basswood hams compare favorably with this specimen of rascality.

An excellent washing fluid may thus be made: Three tablespoonfuls of soda, the same quantity of dissolved camphor (the same as kept for family use), to a quart of soft water; bottle it up and shake it well before using. For a large washing take four tablespoonfuls of the fluid to a pint of soap, make a warm suds, and soak the clothes half an hour; then make another suds, using the same quantity of soap and fluid and boil them just fifteen minutes, then rinse in two waters.

HOW TO BAKE AN APPLE.—To bake an apple perfectly can only be done by giving it time, keeping it under heat—steady at that—for from four to six hours, depending upon the size and quality of the fruit. It requires this length of time to reduce it to a fine pulp and destroy all rawness. The flavor is changed and improved, making, if the Spitzenburg or some other good fruit, one of the choicest and simplest of dishes. The point in baking is to give all the heat that can be born without bursting the skin, thus retaining the moisture.

TO MAKE COCOANUT CANDY.—Rasp very fine a sound, fresh coconut, spread it on a dish and let it dry naturally for three days. Four ounces will be sufficient for a pound of sugar for most tastes, but more can be used at pleasure. Boil the sugar, and when it begins to be very thick and white, strew in the nut; stir and mix it well, and do not quit it for an instant until it is finished. Keep the pan a little above the fire to prevent the nut from burning.

REMOVING IRON RUST.—Put one-half teaspoonful oxalic acid to one-half teacup of water, and apply it to iron rust, fruit and other stains. Exposure to the sun will remove them.

W. B. EWER.....SENIOR EDITOR

DEWEY & CO., Publishers.

Table of Contents.

GENERAL EDITORIALS.—Black Sand Mines; Mining Suit at Pioche; Large Mining Dividend Companies, 296. The Supposed Ancient Sea Levels of the Pacific Coast, 297. Cal.; Academy of Sciences, 300.

ILLUSTRATIONS.—Stebbin's Hydraulic Elevator, 299. Original Potatoes, 294. Ancient Sea Levels of the Pacific Coast, 297.

CORRESPONDENCE.—The Vienna Exposition, 290.

MECHANICAL PROGRESS.—Paper as a Material of Construction; Experience with Steel-Topped Rails; Fire-Proof Artificial Stone; Wire for Building Purposes; Proposed Sawing by Electricity; Sawdust for Artificial Wood Work, 291.

SCIENTIFIC PROGRESS.—The Mechanical Equivalent of Heat; Practical Applications of the Electrical Light; Relation Between Heat and Electricity; Iron and Steel in Early Times; Carbon Water Filters; Indium in Zinc Blende, 291.

MINING STOCK MARKET.—Table of Daily Sales and Prices and Comparative Prices for the Week; Notices of Assessments; Meetings and Dividends; Review of Stock Market for the Week, 292-3.

MINING SUMMARY from various counties in California and Nevada, 292-3.

USEFUL INFORMATION.—Painted Zinc; Colored Candles; Artificial Tortoise Shell; Venetian Blinds of Colored Glass; Ancient Relics; Bronzing and Varnishing Plaster Figures; Importing Pulp Instead of Rags for Paper; The Heart and the Brain; Rolling Mill Notes; Tempering Saws; Wax; To Mend China, 295.

GOOD HEALTH.—The Noise of Children; Dust and Breathing; Natural Duration of Life; Light; Breathing Through the Nostrils; Floor Wax; How to Make Cheap Frames; New Anesthetics; Why do Dogs Bark, 295.

DOMESTIC ECONOMY.—The Old-Fashioned Bake-Kettle; Removing Tar Spots; Bogus Lard; How to Bake an Apple; To Make Coconut Candy; Removing Iron Rust, 295.

MISCELLANEOUS.—Influence of the Velocity of Impact on the Effective Duty of Stampers; Rye Patch Mines; The Crown Point Mine; Ore Shipments; Railroads, 290. The Mining and Metallurgical Laboratories of the Massachusetts Institute of Technology; About postage; Silver in Michigan; The Saucello Railroad, 294. Mining as an Investment; Ely District; Russian River Water Power; Imperial Pumping Machinery; The Probable Appreciation of Gold, 298. Patents and Inventions, 297.

MINING DECISION.—The Commissioner of the General Land Office has decided the following mineral land cases: W. F. Anderson, of Austin, Nevada, applied for a patent for eight hundred feet of the Hidden Treasure lode in White Pine mining district. C. E. De Long, minister to Japan, and others, filed an adverse claim to the same property, alleging it to be part of the Edgar lode. The Commissioner rejects the adverse claim, because it is not clearly shown either that the two lodes conflict or are identical.

John Moore and others applied for a patent for fourteen hundred feet of the Wandering Boy lode, in Little Cottonwood District, Utah, and Thomas H. Bates filed an adverse claim, alleging it to be part of the Porcupine mine. The Commissioner rejects the adverse claim for the same reason as above.

CHEROKEE FLAT MINES.—The Spring Valley Canal and Mining Co., at Cherokee Flat, shipped on the 7th inst., a single gold bar, weighing 81 lbs., valued at \$24,000, and on April 20 one of 91 lbs., valued at \$26,000. These are the result of one month's run in their hydraulic claims, and are the largest gold bars ever made in California.

GOLD SANDS AGAIN.—The Gold Bluff Submarine Mining Company, composed of New York parties, has chartered the steamer *Monterey*, put some gold-raising machinery, with all the latest improvements on board of her, for the purpose of getting up the gold sands of the northern coast.

THE KEYSTONE mine decision which we published last week, is to be appealed to the courts. The Rose party are of course dissatisfied and announce their determination to take the case to the Supreme Court of the United States.

"Black Sand" Mines.

Considerable interest has been manifested by the public of late with regard to the gold sands on the Oregon Coast, and several expeditions have been organized for the purpose of raising these sands from the bottom of the ocean, and obtaining the gold which is supposed to have collected in large quantities. The impression prevails to a certain extent that the existence of these sands is confined to the ocean beach, but such is not the case. A number of claims are located within a few miles of the ocean which have been worked for several years. The surface of the country for some little distance back from the ocean is comprised of low rolling hills of sand and gravel, covered with a thin soil. These hills follow the line of the coast in the form of bluffs. On the beach at the foot of the bluffs very rich sand has been found and in years past large amounts of money have been extracted. As it is probable that the waves washed away these bluffs, in the course of time, they have performed a sort of hydraulic process on a gigantic scale and left the heavy particles of gold on the beach. The supposition is that outside the line of surf this fine gold has collected in large quantities in pockets or crevices in the rock. The existence of these beaches so far back from the coast and the fact that the waves would naturally throw up the lightest instead of the heavier particles, is sufficient evidence to overthrow the old theory, that these sands were thrown up by the action of the waves from the bottom of the ocean.

It will probably be interesting to our readers to learn something of the manner in which these "black-sand" claims are worked, that is, those which are situated not on the present beach, but back in the timbered country several miles from the beach proper. The deposits generally lie parallel to the present beach and are buried under from 50 to 75 feet of common white sand. The great difficulty in making these claims profitable has been from the reason that the gold is very difficult to save. In the first place it is extremely fine and light, and the difference in specific gravity between it and the black sand, containing a large proportion of magnetic iron, with which it is associated, is so little that separation by ordinary means is inconvenient. Moreover, the gold is coated with some foreign substance which prevents its amalgamation with quicksilver. This is thought by some to be chiefly organic matter, perhaps of bituminous oils, and by others simply oxide of iron. At all events this peculiarity is a disadvantage to making the claims profitable, as so much is lost.

Colonel Lane, one of the proprietors of the "Pioneer Black Sand Mine," near Randolph, Coosue County, Oregon, was in this city this week purchasing improved appliances for working the sand, and he has furnished us with some interesting information concerning the method of working. The deposit upon which this claim is located is about 350 feet wide, and lays parallel to the present beach, with an average depth of six feet. The deposit is covered with about sixty feet of white sand, on top of which is a growth of timber. This deposit extends, to Col. Lane's knowledge, about three miles, and lies about two miles from the present ocean beach. The mine has up to this time been worked in the old-fashioned way, with sluices, copper plates, riffles, blankets, and the usual gold-saving apparatus. In this rude manner of working they have managed to save only about one-tenth of what was in the sand, but even then have done pretty well with the olism. They have saved about \$2.50 per ton at an expense of 50 cents per ton. Difficulty is experienced in opening these mines from the water, and they require to be drained before much can be accomplished. In order to work it, deep cuts are sluiced through down to the bed-rock, and then tunnels are run, and the heavy sand which contains the gold is brought out in cars to the sluices. The lagging in the tunnels is set very close, and where the water is very bad moss is caulked into the cracks. The top and sides being of sand, of course great care must be taken in timbering.

To get water to this claim a ditch and fluming 6 miles long was made, and in opening a tail race to the ocean from the claim a large cut had to be made through the rolling hills from 40 to 80 feet deep a length of about 2 miles. There is only about 175 feet fall from the bedrock in the claim to the beach. In cutting this tail-race it was necessary to cut through a large deep lagoon, which was a very difficult operation, an immense amount of labor being expended in this alone. Although there is plenty of water

in the winter, in the summer it is scarce, as all the soil thereabout is sandy and will not hold it. For this reason all the sluicing off of the top dirt is done in the winter, though there is water enough for working purposes on a small scale in summer. The character of the ground upon which these claims are located is described at length in a paper read before the California Academy of Sciences, by W. A. Goodyear, of the State Geological Survey, and published in the *MINING AND SCIENTIFIC PRESS* of December 14th, 1872. In the claim mentioned, at this time of the year they have about 50 inches of water, but only 20 feet fall. However, a powerful head of water is not needed for this sand as would be the case in regular hydraulic diggings.

As mentioned previously, great trouble is experienced in working these sands to a profit, and Col. Lane and others have tried innumerable experiments to obviate this difficulty, and devise some plan to work them economically and carefully. In some claims in that region the chlorination process is employed with good results as far as working is concerned, but the expenses almost eat up the profits. They have tried working it in ordinary pans, but the black sand and gold combined, is so heavy that the quicksilver "flours" very badly, and the results were not satisfactory. In some cases the sands have been burned before amalgamating, in order to free the gold of the covering of extraneous matter. This of course entails additional expense. As a result of some recent experiments at the "Pioneer" claim new machinery has been constructed in this city, which will shortly be put up at the mine. As soon as any practical results are accomplished in working these sands economically, we will give a description of the process employed; until such time it is hardly worth while for us to go into detail.

Mining Suit at Pioche.

The excitement in Pioche, Nev., over mining suits continues, and there is a great row among the lawyers. During the continuance of the Raymond & Ely vs. Hermes suit the whole community seemed to divide into hostile parties, and street fights were all the rage. The court house was crowded from day to day, the arguments of the lawyers were long and heated, the jurors were confined like prisoners, attended by officers at all times, the Court house was surrounded by men in the interests of both parties, to prevent either judge or jury from being improperly approached, and when the verdict was rendered, the excitement instead of decreasing as one would naturally expect, seemed to increase. The case is not yet determined, however, a stay of proceedings having been granted. It is stated that after the jury had retired, the first ballot taken was on the question as to the validity of the Panaca title, which resulted in a unanimous vote against it. After which the vote was taken on the equity part of the case, resulting in nine for Hermes, and three for Raymond & Ely Company, thus giving defendant a verdict. Judge Fuller granted a stay of proceedings in the case, to give plaintiff time to file an application for a new trial, on the grounds of misconduct by the jury, of the verdict being contrary to law and evidence, and on the rulings of the Court, to which exceptions were taken. Out of twenty-six rulings, defendants only got three rulings in their favor. The ground in question is known as virgin ground and is very rich.

The case of the Raymond & Ely vs. Kentucky is for all the Kentucky claim lying east of the point 525 feet west of Lightner Shaft, consequently, it is for about 800 feet of the Kentucky claim. The tracings from the surface of the Kentucky cut to the fourth level of the Raymond & Ely Mine, prove the ledge to be one and the same throughout. Rumor has it that this case will be settled in some way without legal trouble, and if that is so probably all the heavy mining suits now pending in Pioche will shortly be settled. Although all the trouble is a great burden to Ely District, it proves the richness of some of the ground there, for if it were not valuable, there would be no contention concerning it.

THE VIENNA EXPOSITION opened as was announced, on the 1st of May, but the United States Department is in confusion—a consequence of the difficulty in relation to the Commission. The proceedings began with an address from Archduke Charles to the Emperor, congratulating His Majesty on the auspicious event, and asking him to pronounce the exhibition open. The Emperor replied briefly, expressing satisfaction at the completion of preparations for the great work. He then formally declared the Universal Exhibition of 1873 opened.

The American department remains in confusion, but Minister Jay is endeavoring to repair the effects of previous mismanagement.

Large Mining Dividends.

People who doubt the permanence and richness of the Comstock lode, and who revile against mining operations on general principles, will doubtless be surprised at the dividends paid by the companies on this lode this month. The Crown Point mine has declared a dividend of \$10 per share aggregating \$1,000,000, the largest dividend ever paid by a mining company in one month on this coast, or elsewhere as far as we know. The Belcher's dividend of \$8 per share, aggregating \$832,000, is the next largest ever paid, both together amounting to \$1,832,000 from these two mines for one month. The Eureka mine has declared a dividend of \$2 per share, equal to \$40,000, and the Consolidated Amador will probably pay \$1 per share, or \$30,000, which will aggregate \$1,858,000 for one month. The dividend of the Crown Point mine is just double what it was in April, when \$5 per share was declared, aggregating \$500,000, which added to that of the Belcher for April amounted to \$1,020,000. Moreover the surplus of the Belcher for April was \$200,000, which added to the surplus on hand, makes about \$1,000,000 carried over to be added to the production for the current month.

As showing the relative increase in the amount of dividends disbursed by these companies, the following figures are interesting. During the year, 1872, the amount disbursed in this manner by mining companies called on our Stock Board was \$6,731,100; in 1871 the mining dividends were altogether only \$4,837,850, showing an increase of \$1,893,150. This increase occurred, notwithstanding a number of prominent companies which paid dividends in 1871, paid none in 1872. They were the Amador, Eureka Consolidated, Redington Quicksilver, Sierra Nevada, Succor, and Yellow Jacket. The sum paid in 1872 was by the following companies:

Belcher.....	\$2,184,000
Cedarberg.....	36,000
Chollar-Potosi.....	55,000
Crown Point.....	1,850,000
Eureka.....	40,000
Keystone Quartz.....	30,000
Mahogany.....	15,000
Meadow Valley.....	360,000
North Star.....	27,000
Pioche.....	40,000
Provident.....	3,100
Raymond & Ely.....	2,070,000
Yule Gravel.....	10,000

Total.....\$6,731,100

The dividends thus far this year are as follows:

COMPANIES.	AMOUNT.
Belcher.....	\$2,490,000
Crown Point.....	2,100,000
Consolidated Amador.....	120,000
Cedarberg.....	24,000
Diana.....	1,181
Eureka.....	120,000
Meadow Valley.....	60,000
Monitor-Belmont.....	50,000
Raymond & Ely.....	300,000

Total.....\$5,265,181

These dividends were paid irregularly. The Diana and Meadow Valley paid one each, the Monitor-Belmont, and Raymond & Ely two, and the others three each up to this month. This is exclusive of coal mining companies, our figures having to do only with gold and silver. Besides these, the Idaho mine, at Grass Valley, not called in our Stock List, has just paid \$20 per share, not taken into account.

From these figures will be seen the great increase in amount of mining dividends this year. The amount for the first five months of 1873—some dividends for May not yet having been declared, moreover—exceeds the total dividends of 1871 by \$427,231. The dividends thus far in 1873 being, \$5,265,181 and that of the total for 1871 being \$4,837,950, leaving a difference in favor of these first five months of \$427,231.

It must be remembered, however, that these figures only represent the dividends of those mines dealt in at our Stock Board, a point always to be borne in mind. Thousands of mines scattered over the Pacific Coast pay out large sums to their owners of which the public hear nothing. Some of our heavy mining capitalists own these mines alone, or associated with one or two others, and as only private reports are made, the figures are not made public. We know of a number of such instances. The hydraulic claims of our own State, owned by a few hard-working men, pay large sums monthly, which do not find their way into the statistics. An example of this is shown in an item in another column, where it will be seen that the Spring Valley Canal and Mining Company at Cherokee Flat, Cal., turned out \$50,000 in gold in April. Consequently people should not say, "mining does not pay," because they see in the papers that during 1872 only \$6,731,100 was paid out as dividends, while the bullion production was \$62,236,914. This money not only went into business channels, but supported many thousand men and made fortunes for thousands more.

UTAH RAILROADS.—The Jordan and Wahsatch narrow-gauge road started its first train on Monday, everything moving smoothly.

The Supposed Ancient Sea Levels of the Pacific Coast.

At the last meeting of the California Academy of Sciences, Professor Geo. Davidson of the U. S. Coast Survey, read a very interesting paper on "The Abrasions of the Continental Shores of Northwest America, and the Supposed Ancient Sea Levels." As the ideas advanced are somewhat at variance with the generally received theory on the subject, we have prepared a synopsis of the paper. In making examinations of the well marked benches or plateaus bordering the Pacific Coast, northward of Cape St. Lucas, Professor Davidson has been led to doubt their marking the ancient sea levels, arising from an elevation of the coast line, or that they were the work of water alone. That some few of the smaller ones which are composed of gravel, etc., were made by the action of water, and may mark ancient sea levels, may be admitted; but those that exhibit on an extended scale, level plateaus of rock, which have every degree of inclination or contortion of stratification, and an infinita variety of texture, cannot have been so wrought.

Other forces more powerful and more uniform and constant in action than water, shaped these flat-topped rocky benches or plateaus; and these forces, if more than one, were those that abraded the present continental line of our coast and the larger islands of the Santa Barbara channel. The terraces may have been formed at the surface of the sea or above it, but more likely beneath it, and subsequent elevations of the land brought them to their present position. Much of the sharp outlines of this abrasion and terrace forming, has been obliterated by subsequent causes; principally by water from precipitation, alternations of heat and cold, and the action of water. After this Professor Davidson enumerated the principal examples which he gathered in a recent trip to Mexico together with those which he had examined in past years, to the northward and southward of San Francisco, a few of which we quote with the illustrations. Northward of Cape Colnett he had very favorable opportunities to study the coast lines, and the numerous and well marked examples of terraces that are cut and planed in the flank of the high rocky coast barrier. Vancouver has a view of the mesa or table forming Cape Colnett, with the strata inclined at a large angle and the surface out off quite level. Five miles southward of Point Grajaro about lat. $31^{\circ} 35'$, a deep cañon-like valley opens upon the ocean and exhibits numerous and very sharply marked rock terraces on both sides and at all elevations reaching nearly a thousand feet. The cañon stretches well back into the mountains. (See Fig. 2.)

The northernmost of the Todos Santos Islands about latitude $31^{\circ} 40'$, and not laid down on recent charts, is itself a well marked, rocky, horizontal plateau, thinly covered with soil; whilst the southern island has two terrace marks—the lower corresponding to the level of the top of the northern islet, another higher one near the summit of the islet, about twice the height from the sea. Even a lower terrace line may be traced about 15 feet above the present sea level. When passing abreast of the northern point of Todos Santos Bay, no less than four well marked terrace rocky points were sketched in the same view. Each point had other terraces of greater elevations rising inland; whilst to the northward stood out the well-known Table Mountain with its remarkable flat top 2,244 feet above the sea and having a breadth of 4,800 feet. On this single view (See Fig. 3) no less than fourteen terrace markings are exhibited, including Table Mountain. The vicinity is the best marked terrace formation that Professor Davidson knows of on the Coast. They are not made in soft soil, but appear as if a planing machine had cut them out of the solid rocks. Between Point Loma and San Juan Capistrano on the Coast is another example; a broad table land of from 100 to 300 feet in elevation, stretches many miles; and at certain points over the plateau there are gravel deposits of peculiar shape for which I have in vain endeavored to find a cause in the movement of water. Their low rounded summits are about two feet above the general level, from twelve to twenty feet in extent, and lie contiguous to each other, over occasional large areas, ceasing suddenly and giving place to the very flat table.

Point Dume lying about 25 miles W. N. W. from Point Vicente is another well-defined table, where a projecting spur from the mountains has been planed off for two or three miles, whilst towards the extremity a deeper grooving has been plowed out and left the head as a dome shaped point (See Fig. 1.) At San Buenaventura and hence towards Point Conception, we found numerous narrow rocky plateaus, but most remarkably exhibited in the vicinity of Point Conception, where the bluff shows every inclination of stratification, but the top is flat and comparatively smooth. It is a counterpart of Point Dume, but more extended.

Anacapa Island lying in the throat of the Santa Barbara Channel and directly abreast the

opening of the extensive valley of Santa Clara consists of a very narrow five-mile ridge of coarse dark gray sandstone; two thirds of the length, reckoned from the Eastern extremity, has been planed off. (See Fig. 4.) The sides are perpendicular and the summit of the Eastern part is almost 300 feet above the sea; whilst the western part rises 930 feet in height, but the line of the level of the summit of the Eastern part is marked around the flanks of the western, notwithstanding the deep gulches with almost perpendicular sides which cut from the summit the top of the bluff. Innumerable instances were cited by the Professor with relation to the general existence of these terraces the whole length of the Coast, but the cases spoken of above will be sufficient for illustration. In most of the cases mentioned the rock appears to have been absolutely planed off, and the different degrees of hardness of the stratification have no apparent influence upon the mechanical forces at work. At Point Arena, for instance, some of the terraces near the cove reach over 200 feet elevation, and whilst the bluff for miles exhibits every contortion of stratification and every degree of hardness, the surfaces of the terraces are planed off.

No indications of terrace formation are shown by photographs taken along the outer shores of Vancouver or Queen Charlotte Islands, nor did Professor Davidson find them among the inner passages of the Great Archipelago extending from Olympia in 47° to the mouth of the Chilkah river in 59° , although he measured the directions and depth of the markings of ice action among the islands of Washington Sound and the adjacent parts of Vancouver Island, both in the clear cut and very deep groovings, and in the presence of large numbers of erratic boulders. Middleton Island, in the Gulf of Alaska, is the only flat-topped rocky island mentioned or depicted by any of the navigators in that direction. Among the Aleutian Islands, or along the pen-

insula of Alaska, Professor Davidson saw no terrace formations, such as have been described as occurring lower down this coast. In all these instances, and others not enumerated, we find a prevailing feature, regardless of the dip or stratification of the rocks—a nearly level surface of rock, with a comparatively thin layer of soil thereon; the plateaus, sometimes miles in extent, bordering the coast line with jagged cliffs, which illustrate the action of water and weather. Above these plateaus are frequently others stretching in shore, and reaching elevations of certainly 1,200 feet, and probably more.

Fig. 1.—Point Dume.

Fig. 2.—Valley Opening on Coast, South of Todos Santos Island.

Fig. 3.—Table Point, North of Todos Santos Bay.

Fig. 4.—Island of Anacapa.

Whilst the general plateaus are level, or nearly so, there are numerous indications that broad groovings have been made across them, as exhibited in the cuts of Points Dume and Anacapa Islands. These plowings or groovings are across the points and across the islands, and run with the general trend of the coast line. These prominent features are sufficient to satisfy us that more effective and regular agencies were at work to form them than are at work on such a vast scale today. The upheaval of the continental shores by subterranean action, cannot produce such terraces and plateaus; if the shores of the Pacific were to-day to be raised, say 200 feet, we know from the depths bordering them that such results would not be one of the consequences. The action of water will not account for them. Whether by "continued dropping," or by storms, it first wears away the soft, friable parts, leaving the harder; it destroys shores by undermining, and then grinding, it leaves jagged, irregular surfaces. These irregular surfaces, if upheaved above the level of the sea, would not wear away regularly by the weather; the inequalities would in time be filled by disintegrated material, but the surface of the rock would not bear the impress of a planing machine.

We must be guided in a great measure by experience, and judging by our knowledge of present glacier action, I think we can appeal to

the action of ice moving slowly but surely as a great planing machine; its lines of movement, perhaps controlled by masses and elevations of land not now existing as such and by forces no longer acting on such a scale. We may suppose a great ice belt to have existed contiguous to the continent and running parallel with it; and existing at the same period with the ice sheet that covered the continent or lower parts thereof. Some of the mechanical effects of this belt may be those we see exhibited upon the islands and the general coast line; the effects of the latter in the gorges opening upon the shores, in the interior valleys and the mountain flanks when at right angles to the coast line.

All the groovings on Vancouver Island and the islands of Washington Sound at the southern extremity of the Gulf of Georgia, point to the agency which caused them as moving southward; and if we accept an ice sheet over the continent or a part thereof, and an ice belt contiguous to the continental shores, we can readily understand from the manner of the formation of glaciers that it moved as a great stream, or more likely in currents from the north, probably with great slowness but with certainty. Moreover, a body of ice contiguous to the shores of the continent will do its work more or less effectually and at greater or less depths in proportion to its rate of progress and its thickness; so we can understand how terraces of different elevation may have been formed during that period without any relative change of the level of the sea and bordering land, although the same general effects would have been produced if the land had been rising or subsiding. Besides, the mass of ice resting on the land may have done similar work above the level of the sea to what may have been beneath.

Thus these terraces may not indicate the different steps of the elevation of the continental shore; and instead of resorting to the theory

just north of Judas' Head on the Island of Margarita.

To the northward it is reasonable to suppose that the ice-belt lingered longer than at the south; and that when it was dissipated, the destructive agencies of great climatic changes and excessive rainfall were much more active and wearing. Above latitude 40° we do not find the long gently sloping surfaces of disintegrated material; as we advance, even the steep sloping hill-sides give way to the fiord-like coasts of Vancouver, and the Archipelago Alexander. There violent storms, excessive moisture and precipitation and great thermal changes, are producing a hundred-fold greater effect than to the southward, and obliterating whatever evidences existed of the terrace formation. The terraces may have been but partially developed on account of the direction of the movement of the ice-belt not following the trend of the coast line from the westward; or there may have followed a subsidence instead of an elevation of the continental shores of Alaska as before indicated.

PATENTS & INVENTIONS.

Telegraphic List of U. S. Patents Issued to Pacific Coast Inventors.

[REPORTED OFFICIALLY FOR THE MINING AND SCIENTIFIC PRESS, DEWEY & CO., PUBLISHERS AND U. S. AND FOREIGN PATENT AGENTS.]

By Special Dispatch, Dated Washington, D. C., May 6th, 1873.

FOR WEEK ENDING APRIL 23d 1873.

DRENGER.—Ephraim B. Bishop, S. F., Cal. HORSE POWER.—Addison G. Waterhouse, assessor of 6-10ths interest to J. S. and M. Nichols, S. F., Cal.

BAND SAWING MACHINE.—Olpha Bonney, S. F., Cal.

SCRUBBING MACHINE.—Simeon H. Bush, Washington Ter.

The patents are not ready for delivery by the Patent Office until some 14 days after the date of issue. NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with greater security and in much less time than by any other agency.

THE WHITMAN MINE.—This mine is located in Indian Springs Mining District, Lyon County, Nevada. It was sold about three years ago, by the Whitman Gold and Silver Mining Company to the present company who have re-incorporated under the name of Whitman Silver Mining Co. They have been sinking on their mine for the past five months and it is said have found a well-developed ledge of good pay ore ten feet in width at a depth of seventy feet from croppings. Some of the ore is very rich, assaying up in the thousands; the owners have started another shaft to strike the ledge two hundred feet from the croppings, and intend to put up hoisting works this summer.

THE HORTICULTURAL FESTIVAL.—The Bay District Horticultural Society opens its Spring Exhibition at their hall on Stockton street, on this, our day of writing, Thursday May 8th. The public are promised therein one of the finest exhibitions of floral beauty that has ever graced this city, renowned as it has been for its floral displays. This afternoon Dr. E. S. Carr, Professor of Agriculture of the University of California, is to deliver the opening address, and as he is strong on flowers and horticulture we are expecting a rich treat, of which our readers will hear in our next.

SALT LAKE MINING TROUBLES.—Great excitement is caused in mining circles in Salt Lake City by the card of General J. F. Harrison, of New Orleans, Superintendent of the Stafford Lone Star silver mines, denouncing the whole project as a fraud and swindle. Nearly \$200,000 worth of stock was taken and paid for principally in New Orleans. Harrison denounces by name Major J. D. Woolley, of Cheyenne, Colorado; W. J. Jones, of San Francisco, and Col. Anson C. Tichnor and William Gardner, of Salt Lake, as the alleged projectors of the swindle.

STEAM ON THE STREETS.—The Supervisors of this city have granted permission to certain parties to use a method of propelling street cars by steam. They are to be run by the Thermo-Specific engine, a description of which was published in the MINING AND SCIENTIFIC PRESS some time since. It is the invention of Dr. Lamme, of New Orleans, where the method has been practically tested.

DARIEN EXPLORING EXPEDITION.—A dispatch from New York states the members of the United States Darien Exploring Expedition have returned. They report the ship canal via Kappic and De Guado rivers will be twenty-eight miles long, with a tunnel of three miles. It is estimated the entire work will cost \$70,000,000.

Mining as an Investment.

The following interesting and sensible letter we found in the correspondence of the *Mining Journal*: Can mining be made to pay? is a question perpetually being asked; reason says it can, and experience called from a thousand cases gives a sad, emphatic no. Well, let us see how it is, and I shall now speak of failures coming under my own observation. My first experience was with a Chicago company, composed chiefly of bankers and merchants; they bought the A gold mine, and immediately erected a 20-stamp mill, with all the then improved machinery necessary to work 40 tons per day up to perfection. They spent \$52,000 finding out what I showed their superintendent in five minutes, in a pan—that there was no gold in the ledge. But he was a "practical" man, and would believe the returns of a salted mill before a practical miner. When it was plain to his eyes that he was being swindled he couldn't see it. The mill was abandoned and finally sold to pay the taxes. No doubt their experience will ever sadly whisper, no.

Contrast.

This failure of a purse proud corporation with the experience of a few western boys not over half a mile distant, they located in '67 the B lode, took out a few tons of ore, which they crushed in an arrastra of their own building; kept out of debt till they could buy and pay for a mill, which they now own. They have erected excellent hoisting works and have steady paying property, with which neither waster or summer, nor the price of corn makes any change. They have paid their way and kept their expenses far within the capacities of their mine to bear.

Observation No. 2.

In the fall of 1870 a Pittsburg company bought the S. C. mine, employed a general manager, superintendent, assayer, two foremen for the tunnel (they were running to tap the mine at a depth of 130 feet) one foreman of construction, two cooks, six carpenters, a blacksmith and a watchman; proceeded to erect extensive buildings at the mine, spent \$40,000 and quit, without having touched the mine. So do I; this is enough to illustrate my point, though I can give a dozen more just as bad from my experience. Now to reason with such people or to expect that their success is any criterion, would be sheer folly. But let us take the records of legitimate mining and see the result.

In Nevada

During the year 1872, from a partial list before me, I find the following mines have paid dividends as follows: Belcher, \$2,184,000; Crown Point, \$1,860,000; Collier Potosi, two months, \$56,000; Meadow Valley, nine months, \$360,000; Raymond & Ely, \$2,070,000; Pioche, \$400,000 for two months given on the list, besides six others mentioned in this statement paying dividends ranging from \$3,100 to \$20,000 per month. What the whole profit of this industry amounts to we may realize when we consider a State containing only 50,000 people, including Indians, females and non-producers, yielding twenty-five and one-half millions of dollars from this source alone.

California

Comes next with her nineteen millions of ready cash; Montana with four millions; Colorado, three and a half; Idaho with two millions; while the web-foot push nearly two millions more into the national purse as the contribution of Oregon. Other Western States and Territories aggregate nearly seventeen millions more. Without counting our own advancing

Utah

From the table before me I find the actual shipments from the Territory, to be as follows: Silver ore, almost 11,000 tons; unrefined bullion, 5,653 tons; silver bars, \$600,000. This does not, of course, take any account of the ore produced but not shipped, nor bullion at the furnaces which, at the time of making up this report, must have been very considerable, as I know of one pile of over 500 tons that could not have entered into this computation. However let us suppose it has, and we find the silver product of the Territory for the year of 1872 to be equal to one half the entire accumulations of the Territory for the previous 24 years of its settlement as per U. S. census of 1870. In addition to the magnificent and highly gratifying exhibit of profitable returns, we have the no less remarkable increase of profitable and permanent improvements—the direct result of the necessities of the mining population and largely depending upon it for their future profit. There are at present completed in the Territory, according to the latest authority I can find, 22 works smelting for silver ores, with 45 furnaces having a daily capacity of 794 tons. The majority of those works are situated in Salt Lake county and the next adjoining ones west and south. The refinery on the Big Cottonwood has a capacity for 45 tons daily, and is regarded as one of the most successful works for separating in the world. There are also seven stamp mills with a capacity of 167 tons daily; two pulverizers, one at Fairfield and one of Paul's patent at Springville, each of a capacity of about 10 tons per 24 hours. The entire cost of the works for the reduction of ores must amount to nearly \$3,000,000. Those works, or the majority of them, have found steady and remunerative employment from the start, and will

doubtless be largely increased during the coming season. From all sources of information I find that the cash investments in mines in this Territory will not exceed \$10,500,000. Now if we take one-fourth of the amount of silver shipped from the Territory as net profit, which is nearly 25 per cent. less than the ratio of Nevada, we find that the mines of Utah have returned a dividend equal to 10 per cent. on the entire amount invested in her mines—in some cases we know the ratio is much greater and in others much less, but this will serve for an average of returns on investments in Utah mines. Another consideration is, that with few exceptions the permanent works about the mines have been paid for from the product of the mines themselves, notably so in the Cottonwood and American Fork districts. This would be accounted for among the profit of any other business and of course of mines also. I believe that no other productive industry in Utah can show as clean a balance sheet as the mines, and certainly none any better prospects for the future.

Mining as an Investment.

Intelligent people East as well as West know that nothing can exceed the permanence of a well defined silver lode; some in Europe have been worked for over 2,000 years and are still productive. The Comstock mines were it not for their rascally trustees, were never more valuable than they are to-day, notwithstanding the loss consequent on our crude modes of reduction, the dividends of our Flagstaff, Emma, Last Chance and other mines are far in advance of the customary profits of any other legitimate business. Then why is this cry so often heard of unprofitable mines, no returns, a continued outlay, etc. I answer that where common good judgment has been used in selecting the mine, and after the necessary developments have been made, then if the mine does not pay, it is either owing to the most wanton extravagance or a criminal waste of ore about the mine, or a waste of this natural product in the reduction of the ore. What must be done, and what it is notorious is not done is cut expenses down to the last cent consistent with an intelligent system of work; every ounce of ore extracted should be saved if not profitable to work now to keep until new processes shall make it so, contract work should be employed whenever possible in order to obtain just value for the money expended; officers and non-producers should be dispensed with except where absolutely necessary, and in mines employing a small force, one superintendent, or good foreman, will generally be found to be all the mine can afford to pay; still I have one mine in my mind's eye now that this winter employed a general manager, superintendent, clerk, foreman, timberman, blacksmith, cook, and four miners, perhaps this mine will pay some time; it has declared no dividend yet; with increasing intelligence in the working of ore and increased facilities for communication; we may look confidently to the future as an era when mining will be the legitimate pursuit of the people of the trans-Mississippi States of the Union; at present while mining-men are employing an army of parasites to devour the product of their mines and gaily floating one-half of the precious metals down stream or out in the fumes of their furnaces, the only wonder is that there are so many paying mines in the country. That the present gives promise of an improvement is evident, the total yield of 1872 is largely in advance of that of the preceding year while the increase of dividends paid by American Cos. is full fifty per cent. greater than the former year, showing that even upon a corresponding product the net or divisible surplus may be made proportionately much greater.

This will become more apparent as year after year new processes will cheapen the cost of working ore, and also give a higher per centage of metal to the ton, and as the growth of intelligence in matter relating to mines shall have taken the place of the gross ignorance now so manifestly displayed. I venture the assertion that no other industry would suffer a loss of fifty per cent of its entire product in the course of manufacturing as gold and silver mining has done and is doing and still keep up its existence as a business. The loss from this cause alone during the past year has been not less than fifty millions of dollars. Thanks to growing intelligence, the percentage is yearly decreasing and as steadily is the value of our mines becoming more a subject of inquiry among moneyed men.

ELY DISTRICT.—Next week, in a single mine in Pioche, we have it from good authority, says the *Record*, of April 27th, an additional force of two hundred men will probably be put to work, while the forces on half a dozen other mines will probably be increased. We may have the good old times of yore back in a few days, and—we may not. It is evident a crisis is being reached in the affairs of the Ely Mining District, with the chances, according to our judgment, in our favor.

RAILROAD EXPENSES are relatively increasing. Steel rails are taking the place of iron, light rails are taken up, and heavier rails laid down. Better bridges, double tracks, solid earthworks, stone ballast, add both to the cost and durability of the work, as well as to their economy.

RUSSIAN RIVER WATER POWER.—A late survey shows that Russian river falls 171 feet in fourteen miles above Healdsburg, and it is proposed to carry the water in a ditch to the latter place for manufacturing purposes.

THE gold quartz discoveries near Shoshone Valley continue to attract much attention.

Imperial Pumping Machinery.

We are pleased to note the preparations made by some of the companies operating on the Comstock, for carrying on mining operations at great depths by the introduction of machinery commensurate with the work to be performed. We give herewith a somewhat detailed description of the pumping machinery now in operation in the Imperial mine: The foundation consists of 24 feet of stone laid in cement, to which the pumping machinery is anchored by bolts having eyes turned at the bottom, through which bars of iron are passed, so that each bolt has the weight of the entire foundation, estimated at 6,000,000 pounds. The engine, 160-horse power, has a 22-inch cylinder and a 42-inch stroke; length of walking-beam 27 feet. The weight of the engine bed, complete, is 13 tons.

The engine shaft is nine inches in diameter and has two fly-wheels of 11 feet in diameter and weighing 11,000 pounds each. There are two pinion-wheels on this shaft for driving the spur-wheels; also a reel with a 2½ inch hemp cable for handling the pumps in the shaft. There are two spur-wheels, each 11 feet 6 inches in diameter, 14-inch face and weighing 20,000 pounds each. These wheels are placed 18 inches apart, and the wrist-pin, to which is attached the pitman rod for working the pumps, passes through both wheels thus insuring great steadiness and strength. The whole foundation of wood-work is made of California spruce, each one of the timbers being 24 by 26 inches. This is the first pumping machinery so arranged, and from the satisfactory manner in which it appears to work, we have no doubt the plan will hereafter be universally adopted for similar work. The spur-wheel shafts are 10 inches in diameter. There are six 10-inch pumps in the perpendicular shaft, and two of 9-inch in the incline shaft.

The pumps are all of the kind known as "plungers." The pump rods are of timber, 13 inches square and heavily strapped with iron. The weight of the rod is counterbalanced by four balance bobs, carrying 160,000 pounds of ballast; the chord to this main bob is 26 by 24 inches and 30 feet in length. The pumps at present are pumping from a depth of 1,700 ft., and with this present quantity of water will require to be run not to exceed eight hours each in 24. The capacity of this machinery is estimated to be equal to draining the mine to a depth of 3,000 ft. Every portion of it is made in the best manner, and certainly it is not equaled in power or completeness by any on the Pacific coast, and so far as we know, by none in the United States. As showing the energetic character of this machinery, we may mention that on being set to work yesterday afternoon, it pumped up to the surface 22,250 gallons of water in the short space of two hours!—*Gold Hill News*.

The Probable Appreciation of Gold.

In regard to the value of gold in the future, opposite views have been maintained, supported by arguments of some weight on both sides. On the one hand, it is urged that the causes which produce depreciation are only beginning to operate, and a still greater decline in price may be expected, and on the other side it is asserted that there are sure signs of a falling off in production, together with a probability of increasing demands, tending inevitably to an appreciation of the standard the next 20 years.

The current supply of gold has been calculated to amount to about \$20,000,000. The current demand is reckoned at \$12,000,000 which is made up thus:—

English annual consumption	\$5,000,000
Indian ditto	4,000,000
Australian ditto	1,200,000
South American ditto	1,000,000
Portuguese, Spanish, etc., ditto	800,000

Total.....\$12,000,000
Hence it appears that there is an annual excess of \$8,000,000, which would produce depreciation if it were not absorbed by the extraordinary demands likely to occur. That there will be such demands for gold is very certain, and it is also most probable that the \$8,000,000 will prove inadequate to meet them.

The demand for Germany is very urgent and of great magnitude. The Germans have decided to have a gold currency, and this means that within the next few years Germany must obtain, in round numbers, between \$60,000,000 and \$80,000,000 of gold. In 1872, in fact, Germany coined about \$21,000,000, and she proposes to coin \$18,000,000 in 1873. Germany is a good deal more populous than France, but France, twenty years back, took up about \$200,000,000 of gold, therefore, to assume that Germany will use up half that amount, is no extravagant supposition.

Omitting minor demands, such as the Scandinavian, of an extraordinary character, it is necessary to count on great requisitions of gold for the United States and France in a not distant future, owing to the resumption of specie payments in those countries. It is probable that the decline of the German demand will coincide with the commencement of the demand for the United States, and that, by the time this latter is satisfied, France will come into the market as a large buyer of gold.

The conclusion, therefore, to be drawn from these arguments is, that for some years to come there will be a great demand for gold probably exceeding the supply; and, unless there be an improvement in the annual production of gold, or some compensation be found in a greater economy of existing stocks, it is reasonable to expect that, during the next decade, gold will rise in value.—*Iron*.

DEWEY & CO.,

American & Foreign Patent Agents,

OFFICE, 338 MONTGOMERY STREET, S. F.

PATENTS obtained promptly; Caveats filed expeditiously; Patent reissues taken out; Assignments made and recorded in legal form; Copies of Patents and Assignments procured; Examinations of Patents made here and at Washington; Examinations made of Assignments recorded in Washington; Examination ordered and reported by Telegraph; Rejected cases taken up and Patents obtained; Interferences prosecuted; Opinions rendered regarding the validity of Patents and Assignments; every legitimate branch of Patent Agency Business promptly and thoroughly conducted.

Our intimate knowledge of the various inventions of this coast, and long practice in patent business, enable us to abundantly satisfy our patrons; and our success and business are constantly increasing.

The shrewdest and most experienced Inventors are found among our most steadfast friends and patrons, who fully appreciate our advantages in bringing valuable inventions to the notice of the public through the columns of our widely circulated, first-class journals—thereby facilitating their introduction, sale and popularity.

Foreign Patents.

In addition to American Patents, we secure, with the assistance of co-operative agents, claims in all foreign countries which grant Patents, including Great Britain, France, Belgium, Prussia, Austria, Victoria, Prussia, Russia, Spain, British India, Saxony, Prussia, Columbia, Canada, Norway, Sweden, Mexico, Victoria, Brazil, Bavaria, Holland, Denmark, Italy, Portugal, Cuba, Roman States, Wurtemberg, New Zealand, New South Wales, Queensland, Tasmania, Brazil, New Grenada, Chile, Argentine Republic, AND EVERY COUNTRY IN THE WORLD where Patents are obtainable.

No models are required in European countries, but the drawings and specifications should be prepared with thoroughness, by able persons who are familiar with the requirements and changes of foreign patent laws—agents who are reliable and permanently established.

Our schedule prices for obtaining foreign patents, in all cases, will always be as low, and in some instances lower, than those of any other responsible agency.

We can and do get foreign patents for inventors in the Pacific States from two to six months (according to the location of the country) SOONER than any other agents.

Home Counsel.

Our long experience in obtaining patents for Inventors on this Coast has familiarized us with the character of most of the inventions already patented; hence we are frequently able to save our patrons the cost of a fruitless application by pointing them to the same thing already covered by a patent. We are always free to advise applicants of any knowledge we have of previous applications which will interfere with their obtaining a patent.

We invite the acquaintance of all parties connected with inventions and patent right business, believing that the mutual conference of legitimate business and professional men is mutual gain. Parties in doubt in regard to their rights as assignees of patents, or purchasers of patented articles, can often receive advice of importance to them from a short call at our office.

Remittances of money, made by individual inventors to the Government, sometimes miscarry, and it has repeatedly happened that applicants have not only lost their money, but their inventions also, from this cause and consequent delay. We hold ourselves responsible for all fees entrusted to our agency. The principal portion of the patent business of this coast has been done, and is still being done, through our agency. We are familiar with, and have full records, of all former cases, and can more directly judge of the value and patentability of inventions discovered here than any other agents.

Situated so remote from the seat of government, delays are even more dangerous to the inventors of the Pacific Coast than to applicants in the Eastern States. Valuable patents may be lost by the extra time consumed in transmitting specifications from Eastern agencies back to this coast for the signature of the inventor.

Confidential.

We take great pains to preserve secrecy in all confidential matters, and applicants for patents can rest assured that their communications and business transactions will be held strictly confidential by us. Circulars free.

Engravings.

We have superior artists in our own office, and all facilities for producing fine and satisfactory illustrations of inventions and machinery, for newspaper, book, circular and other printed illustrations, and are always ready to assist patrons in bringing their valuable discoveries into practical and profitable use.

EUCALYPTUS.
The attention of the Medical profession is respectfully
called to the following preparation of this new reme-
dial agent. Eucalyptus and its preparations have been
found useful in obstinate cases of intermittent and Marsh
Fever, often supplanting the use of Quinine. The
paroxysms of Asthma and Catarrh are greatly controlled,
and in various Kidney diseases and Catarrh of the Blad-
der it seems to act like a specific.

FLUID EXTRACT EUCALYPTUS.
This extract represents in a concentrated form the
medicinal effects of the leaves of Eucalyptus Globuli
THE ELIXIR OF EUCALYPTUS.
This compound presents the properties of the leaves
in a palatable form and elegant appearance. Dose—
One tablespoonful, to be repeated as often as the case
demands.
Cigarette of Eucalyptus Globulæ, useful in
Asthma, Difficulty of Breathing, Incipient Pleurisy, etc.

SAN FRANCISCO, CAL.

RECOMMENDATION.
St. Patrick Mill, Placer Co.,
Feb. 10, 1873.
JOSHUA HENDY, ESQ., SAN FRANCISCO:

Dear Sir: We, the undersigned, take pleasure in giving
you the following testimonial as to the merits of the Hendy
Governor, which we ordered from you about four months
ago. Though more than pleased with its workings at first,
we deferred writing until we had tested it thoroughly.

Our engine is 12x36 (carrying 70 lbs. of steam), driving 15
stamps, 725 lbs. each; 1 Wheeler Pan, 1 Knox Pan, 6 Hendy
Concentrators. The discarded Governor was the common
"Arm and Ball Governor" it giving but poor satisfaction,
we decided to try the "HENDY," and are pleased to report
in its favor for the following reasons:

1st. It SAVES US FUEL. Previous to attaching your Gov-
ernor we were burning 34 cords of wood per 24 hours. We
now consume but 2½ cords doing the same work.

2d. FOR SAFETY. The "trip" saved us from an expensive
smash up but a few days ago, during the temporary ab-
sence of our engineer. The governor belt run off the Pul-
leys. Your little automatic trip worked like a charm, and
but one or two revolutions was the result, and no damage.
Had we been using any other Governor, the probability is
that we would not have had a whole cam in the mill.

3d. IT IS A PERFECT GOVERNOR. We can turn off the
Wheeler Pan and hang up one-third of our stamp, without
any perceptible change in speed.

4th. THE ADJUSTMENT for regulating the speed without
increasing or reducing the size of our Governor pulley, is
admirable, and as easily managed as setting a clock.

5th. IT IS SIMPLE and not liable to get out of order, or
requiring more than ordinary care.

Yours respectfully,
JAS. H. CROSSMAN, Supt.
GEO. H. BARNEY, Chief Eng'r.

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.
For rapidly pulverizing and amalgamating ores, they
have no equal. No effort has been, or will be spared
to have them constructed in the most perfect manner
and of the great number now in operation, not one has
ever required repairs. The constant and increasing de-
mand for them is sufficient evidence of their merits.
They are constructed so as to apply steam directly
into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows.
The pan being filled, the motion of the muller forces
the pulp to the center, where it is drawn down through
the aperture and between the grinding surfaces.—
Thence it is thrown to the periphery into the quicksilver.
The curved plates again draw it to the center, where it
passes down, and to the circumference as before. Thus
it is constantly passing a regular flow between the grind-
ing surfaces and into the quicksilver, until the ore is
reduced to an impalpable powder, and the metal amal-
gamated.
Settlers made on the same principle excel all others.
They bring the pulp so constantly and perfectly in con-
tact with quicksilver, that the particles are rapidly and
completely absorbed.
Mill-men are invited to examine these pans and settlers
for themselves, at the office, 229 Fremont Street,
San Francisco.

Academy of Sciences.

The regular semi-monthly meeting of the California Academy of Sciences was held at their rooms on the 5th inst. Messrs A. P. Moore, and W. H. Hollister, were elected life members and C. V. B. Keating and O. C. Pratt resident members. Among the donations to the Academy was the

First California Shad,

Which was presented by Wm. Throckmorton, one of the State Fish Commissioners. In presenting the specimen Mr. Throckmorton said that on the 27th of June, 1871, this shad was three-quarters of an inch in length, and was put into the Sacramento river at Tehama, after making a trip across the continent. One of the first efforts of the Commissioners was to get shad, from the Eastern coast, because it was emphatically a food fish; and the desire was to ascertain whether it could be propagated on this coast with success. The Commissioners opened correspondence with Mr. Seth Green on the subject of bringing over the fish. He discouraged the Commissioners at once, from the fact that the shad is hatched in from 36 to 45 hours. The Commissioners then tried to obtain a small supply of water for transit, and the railroad companies were kind enough to give them the use of a construction train for the purpose. Mr. Green said it was impossible to bring the adult fish across the continent, and it was useless to try. The Commissioners experimented on the last alternative. They sought to ascertain whether it was possible for the young fish to live in fresh water instead of salt, long enough to cross the continent. They did not hear from Mr. Green for three months, and he stated that he had spent that time in experiments. He had hatched young fish, had them kept in glass jars, and had ascertained that life could be preserved for several weeks, and be could transport any number required.

He brought on to this coast 15,000. They were hatched in the Hudson on Saturday night; they arrived here on Tuesday week, and at nine o'clock that night they were placed in the Sacramento above Tehama. Mr. Green examined the water there, and pronounced the conditions favorable. He afterward examined the mouth of the harbor, and found the feed good on the coast. No fish were lost on the way, except those removed from the water for experiments. Above Tehama last year an Indian caught a little fish, and no one could tell what it was. Mr. Throckmorton had not seen it. The first which had been presented was caught recently in a trap below Vallejo. It was a male, and was not full grown. The fish would be at maturity next year, and they might be expected in the harbor from the sea by the month of April. They would be full-sized breeding fish, and if a quarter of the 15,000 came back as breeding fish, they would be sufficient to stock our coast.

Last year the Commissioners had sent East for 50,000 fish, but the very hot weather which prevailed broke up the arrangement. This year the Commissioners have made ample arrangements for a supply of Eastern fish. They have now at Charleston, New Hampshire, a full-sized car, which they have obtained from the Central Pacific Company. The car was being fitted up with all the appliances for the conveyance of a large assignment of fish; which will consist of black bass, white perch, yellow perch, and glass-eyed perch, eels, cat-fish and lobsters; and when it arrived at the Hudson River it would stop long enough to take in 100,000 shad. The car would arrive in California by the middle of June. From this consignment the Commissioners hoped to make a fair start in stocking this Coast with food fishes. They had taken no account of fancy fishes, but had endeavored to spend the moderate appropriation of the State for some permanently useful purpose. The reports as to other shad having been caught, the Commissioners have not been able to authenticate.

White Fish.

This season the Commissioners had brought across the Continent a large number of white-fish eggs, and had succeeded in hatching 125,000. They were now alive and well in Clear Lake, removed from all risk, having been placed there three weeks ago in healthy condition. These fish had come from the northern lakes of New York.

Orchilla.

Professor Davidson presented specimens of orchilla from Magdalena Bay Mexico. This is mainly used in the production of red and purple dye. In connection with this plant Dr. Kellogg said that it is used to a great extent in giving brilliancy to other colors.

The peculiar iridescence of French ribbons and many choice silks, and also of broadcloth, when looked at a slant before a bright light, is attributed to the orchilla, a small quantity of the dye from which is put in with the other dyeing materials.

Dr. Stont remarked that the orchilla plant fetches from \$250 to \$300 per ton in England and thought that California might be able to supply itself with this valuable agent in dyeing. Of course we should have to contend against aniline colors, and other cheap dyes, which might prevent it being a useful product to California; but as the distance in order to import is so great, and the rates so high, we might fairly suppose that we ought to have the advantage of a productive manufacture for California.

Miscellaneous.

A paper was read on the Abrasions of the Continental shores of Northwest America and the supposed ancient sea levels, by Professor

Davidson; the substance of this paper will be found in another column.

A letter was received from officers of the United States Steamer *Saranac*, conveying to the Academy an interesting collection made by their late messmate, Lieutenant Dennison, and designed by him for presentation to the Academy. The collection embraced rare marine specimens among which were the hermit-crab, porcupine, fishes, hippocampus (sea-horse), etc.

Dr. Kellogg presented a number of new botanical specimens.

After adjournment the members were permitted to inspect a collection of beautiful illustrations of astronomical observations, received by Professor Davidson from the Cambridge Observatory.

Meetings and Elections.

THE ONEIDA M. Co. held its annual meeting on the 5th, and the following Trustees were elected: S. Heydenfeldt, J. Berlemin, Wm. Stewart, J. Steinhardt, B. T. Sherwood, Proctor S. M. Co. Trustees—J. D. Fry, A. K. P. Harmon, Robert Sherwood, J. E. de la Montaigne and Wendell Easton; O. E. Elliott, Secretary.

ORIGINAL HYDREN TREASURY M. Co.—W. B. Bourne, (President), Robert Sherwood, J. H. Crocker, Walter Laidlaw, J. E. de la Montaigne, S. Pinkham and Henry Toomy; D. A. Jennings, Secretary.

NEW INCORPORATION.—THURTELL G. M. Co.—May 3. Object to acquire mining property in township No. 4, Calaveras county, State of California, and work the same. Capital stock, \$5,000,000, in shares of \$100. Trustees—J. Blumens, Jr., R. F. Knox, J. A. Hutchinson, E. J. Hutchinson and H. M. Eddy.

INCREASE OF CAPITAL STOCK.—A certificate of the increase of the capital stock of the Green Gold and Silver Mining Company was filed on the 7th inst. in the County Clerk's office. The original amount of the capital stock was \$600,000 in shares of \$250 each. It has been increased to \$2,400,000, in shares of \$100 each. The amount of capital actually paid in is \$25,000, and the debts of the company amount only to \$50.

A NEW BOOK ON MINING.

The Explorers', Miners' and Metallurgists' Companion; Comprising a Practical Exposition of the Various Departments of Exploration, Mining, Engineering, Assaying, and Metallurgy. The Most Practical and Comprehensive Work on Mining Subjects Extant. Comprising 540 Pages, and 81 Engravings. By J. S. Phillips, M. E. Price, bound in cloth, \$10 (in coin); in leather, \$12. Forwarded by mail, in cloth, \$11.40, currency; in leather, \$13.75. Issued and for sale by Dewey & Co., Patent Agents and Publishers Mining and Scientific Press, S. F.

Try Dr. Evory's Diamond Catarrh Remedy. Only 50 Cents.

Says John to Nance, you look so bright,
Your eyes they sparkle, like a star.
Oh! yes, says Nance, Dr. Evory's remedy
Has cured that horrid, bad catarrh.

OUT OF THE FOG AT LAST.—Dr. Evory has discovered the only sure cure for Catarrh and Ooids. One bottle gives immediate relief, and a few bottles effect a cure. All we ask is a trial. If your druggist don't have it, send to Dr. A. F. Evory & Co., 9 Post street, S. F. It only costs 50 cts. 14725-3m

Leather Market Report.

(Reported for the Press by Dolliver & Bro.)

SAN FRANCISCO, Wednesday, May 7, 1873.

CONTINENTAL LIFE INSURANCE CO., No. 302 Montgomery street, corner of Pine.

LEA & PERRINS'

CELEBRATED

Worcestershire Sauce.

Declared by Connoisseurs to be the only good SAUCE.

Caution Against Fraud.

The success of this most delicious and unrivalled Condiment having caused certain dealers to apply the name of "Worcestershire Sauce" to their own inferior compounds, the public is hereby informed that the only way to secure the genuine is to ask for LEA & PERRINS' SAUCE, and see that their names are upon the wrapper, labels, stopper and bottle.

Some of the foreign markets having been supplied with a spurious Worcestershire sauce, upon the wrapper and labels of which the names of Lea and Perrins have been forged, L. and P. give notice that they have furnished their correspondents with power of attorney to take instant proceedings against manufacturers and vendors of such, or any other imitations by which their right may be infringed.

Ask for LEA & PERRINS' Sauce, and see name on wrapper, label, bottle and stopper.

Wholesale and for export by the Proprietors, Worcester; Cross & Blackwell, London, &c., &c., and by Grocers and Chimney universally. 15724-4f

TUBBS & CO.

17726-4f 511 and 513 Front street, San Francisco.

THE PRALL CONDENSING STEAM PUMP.

The Cheapest, Most Reliable, Most Durable and Most Economical Pump in Use.

This remarkable Pump, though having been used extensively in the Western States for the past year, is now for the first time offered to the trade of the Pacific Coast.

It is adapted to the raising of water or other liquids, under all possible conditions where steam can be obtained, operating absolutely without machinery with more economy and less liability to derangement than any Pump in use. As a MINING PUMP its advantages are most obvious.

The steam is condensed instead of being exhausted into the shaft or tunnel. It is not affected by mud, sand or grit, having no working parts to wear or get out.

It is economical of steam, because all friction is avoided, and the steam is made to do double duty, that of direct pressure and then by condensation, utilizing the atmospheric pressure to lift the water to the Pump.

It requires no lubrication nor any attention whatever.

For IRRIGATION and raising water for stock purposes, the Prall Pump is vastly superior to anything ever before invented.

It requires less steam to elevate water from 20 to 30 feet than would be necessary to move any other style of Pump doing no work.

It is so simple that any one of ordinary intelligence, however unaccustomed to machinery, can operate it. They are constructed of seven different sizes, with capacities ranging from two to fifty thousand gallons per hour.

Boilers furnished with the Pumps when desired.

Manufacturing Agents, Pacific Iron Works,

P. O. BOX 726, SAN FRANCISCO.

BROWN'S PATENT LAMP.

One of these Lamps, when placed at a distance of 200 feet from the bank, will light up a bank surface 250 feet in length and 150 feet high, and to a much better advantage than any other light heretofore tried, and at an expense not to exceed five cents per hour. Lamps furnished at short notice.

Letter of Recommendation.

Ma. C. B. BROWN—SIR: Your Patent Lamp for lighting hydraulic mines, which you sold to me in December last, has given entire satisfaction, and far exceeds my expectations, and I think it the best and cheapest light ever used to light mining claims by night, and am satisfied that I have saved three hundred dollars by the use of it in the last mining season over pitch or any other light of the same brilliancy; and I will also say that if I could not get another lamp, five hundred dollars would not buy it. Yours,

W. D. APLIN.

Little York, Nov. 5, 1872.

For further particulars, address,

1622-4f C. B. BROWN, Placerville, Cal.

P. J. PHILLIPS & CO., No. 608 Oley street, near Montgomery, San Francisco, are agents for Brown's Lamp, where it may be seen.

The California Powder Works

No. 314 CALIFORNIA STREET.

SAN FRANCISCO.

Manufacturers and have constantly on hand

SPORTING,

MINING,

And BLASTING

POWDER,

OF SUPERIOR QUALITY, FRESH FROM THE MILLS. It being constantly received and transported into the interior, is delivered to the consumer within a few days of the time of its manufacture, and is in every way superior to any other Powder in Market. We have been awarded successively

Three Gold Medals

By the MECHANICS' INSTITUTE and the STATE AGRICULTURAL SOCIETY for the superiority of our products over all others.

We also call attention to our

HERCULES POWDER.

Which combines all the force of other strong explosive now in use, and the lifting force of the azar BLASTING POWDER, thus making it vastly superior to any other compound now in use.

A circular containing a full description of this Powder can be obtained on application to our Office.

16v20-3m JOHN F. LOHSE, Secretary.

BURLEIGH ROCK DRILLS

—AND—

Air Compressors.

The Burleigh Rock Drills, which have stood the test of five years' constant use at the Hoosac Tunnel, and which are now in use in nearly every State in the Union, as well as in Europe and South America, are unequalled in efficiency and economy by any other Drilling Machine. They are of various sizes, and equally well adapted to Tunneling, Shafting, Open Cut or Quarrying, and will drill six to ten inches per minute in granite. They are driven by steam above ground. The Burleigh Air Compressor is the best engine yet devised for furnishing the "air motor" for the many purposes to which it is now being used.

They are to be used on the St. Gothard Tunnel, Switzerland; Tunnel 13 miles long. We refer to the following gentlemen and works:

Gen. Newton, U. S. A. Hell Gate Tunnel, L. I.
Mess. Shanley Hoosac Tunnel, Mass.
J. Dutton Steels Nesquehoning Tunnel, Pa.
Sidney Dillon Fourth Avenue Work, N. Y.
Col. Roehling East River Bridge Company, N. Y.

SAN FRANCISCO.

Send for Illustrated Catalogue.

16v2-2m

STEVENSON'S PATENT MOULD BOARD AMALGAMATING PAN.

This Pan is far superior to all others in several important particulars. The grinding mullers are near the center, requiring less power. The plow-shaped grooves raise the quicksilver with the pulp regularly, with less power, without violence, and with better amalgamating effect, besides admitting of a larger charge. The inclined-shaped housings of the muller-plate openings efficiently force the pulp directly under the mullers.

Manufactured at the Golden State Iron Works (Co-operative), 19 First street, S. F.

Where it can be examined and further particulars be learned; or persons may apply to the inventor or patentee, Mr. O. O. STEVENSON, at the Douglas Mine, GOLD HILL, STATE OF NEVADA, where the Pans have been in constant operation. 16v20-1mr, lamtf

Polishing and Fluting Iron.

This new invention takes the place of two articles needed in nearly every house. As a POLISHING IRON it has no superior. The part used for fluting is made of brass, and highly polished. A Receipt for making FRENCH GLOSSING STARCH, that gives a superior polish, goes with each iron. The Polishing Iron and Fluter, being in one, are both heated at the same time. We are now prepared to furnish them in quantities to suit. Price, \$3.

WIESTER & CO.,

17 New Montgomery street, San Francisco, General Agents for Pacific Coast.

It has been constantly running for over eight months, and has proved, in competition, to produce a higher percentage of hullion, with less power and with great saving of quicksilver, over any other pan in use. It is simple in construction and operation, and cheaper in first cost and economy in wear.

IMPORTANT TO

Mining Companies, Civil Engineers, Contractors, Etc.

The system of transporting material, such as Ore, from the mine to the mill, Earths for embankments, Rock from quarries, etc., by means of steel wire rope, has been well tested and found more economical, advantageous and reliable than any other method of transportation; and to the annexed certificates in connection therewith I beg to call the attention of those interested:

EUREKA, Nevada, July 10, 1872.

T. M. MARTIN My dear sir: On your leaving for San Francisco, it gives me great pleasure to hand you my written acceptance of the HALLIDIE TRAMWAY put up by you upon our mine in Frohburg.

It is a perfect success, discharging ten tons of ore per hour with two men's labor. It is perfectly simple in construction, and, as far as I can judge, there is nothing about it to sever get out of order—nothing to wear out. While ours requires but about two thousand five hundred feet of wire rope, I can see no reason why the line could not be extended almost indefinitely with equally happy results. Again, the carrying capacity might be doubled or quadrupled if desired. After several weeks trial upon our mine, the unanimous verdict of all who have seen it is a complete, unquestioned success. If this can be of any service to you, use it in any way you think proper. Very respectfully, C. C. GOODWIN.

EMMA HILL CONSOLIDATED MINING CO.,
Little Cottonwood, Utah.

Superintendent. Other Sept. 2, 1872.
T. M. MARTIN, Esq., Sir: The Ropeway constructed by you (HALLIDIE'S PATENT) for the Emma Hill Consolidated Mining Company, has been built in a most substantial and workmanlike manner, and is at this time in splendid working condition. I most cheerfully accept the work for the Company, and recommend it to others wishing a sure and speedy transit for ores over places impracticable for wagon roads, etc. Respectfully,
L. W. COLBATH, Superintendent.

"The Vallejo works smoothly with the elevated wire tramway, which carries its load of ore as quietly and easily as if there was no winter or snow in the world."

"Whatever the objections to wire tramways may be on account of their cost, I have seen nothing yet that even approaches them in the facilities they afford for moving ore at all seasons of the year."—Correspondent Utah Mining Journal, Alta, Jan. 8, 1873.

The Vallejo Ropeway.

The Vallejo Tunnel Company's Tramway in Little Cottonwood, built on the HALLIDIE PATENT PLAN, is a complete success. It is between 2,500 and 3,000 feet in length, and is supported by thirteen stations. The fall in this distance is about 600 feet, and the wire rope, which is three-fourths of an inch in diameter, will easily deliver one hundred tons in six hours. The machinery is automatic, loading and unloading the sacks or buckets. About one ton and a half can be sent down at one time. The stations are about two hundred feet apart, and the apparatus is strong and safe. As the wire rope is elevated about forty feet above the surface of the hill, the Tramway can be worked all winter long, without the slightest trouble. —Utah Mining Journal, Salt Lake, Sept. 23, 1872.
Mining Companies and others desiring to negotiate for the erection of this system of Ropeway, can communicate with me personally, or through Postoffice Box 964.

A. S. HALLIDIE, Patenteo,

112 and 114 California Street, SAN FRANCISCO.

WIRE ROPE

For hoisting from mines, transmitting power, ship rigging, etc., of all kinds and sizes, on hand and made to order.
Wire of all kinds and descriptions, furnished at lowest rates.
A. S. HALLIDIE, 112 and 114 California St.

MINING AND SCIENTIFIC PRESS.

An Illustrated Journal of Mining, Popular Science and Progressive Industry.

VOLUME XXVI.
Number 20.

The Labor School Movement.

The old idea that labor and study are incompatible has already become fully exploded; and that other error—that what we learn from books alone is education, while that which is learned by practice in a shop, is a trade and not education, is also fast becoming obsolete. A people's degree of civilization has come to be measured by what they know of the useful arts, rather than by their scholastic distinction or drawing-room politeness. Civilization is a sequence of wealth; and wealth in those latter days, comes of a knowledge of the industrial arts—that knowledge which enables man to bring to his aid those forces and machines which multiply his capacity for production, and gives him an increased control over nature.

The exercise of the industrial arts is but the application of science; and hitherto the scientist has considered his work done when he has developed a principle, deeming it beneath his profession to make the practical application of that which he has wrested from the secret archives of nature. That has been left to the mechanic. Even the application of science to engineering has, until recently, been considered an inferior and secondary matter unworthy of the attention of the scientist. It would never do for the professor or the scientist to blacken his hands or soil his garments in the shop; oh, no! Even the students in our technical schools, connected with classical departments, were, until recently, quite unwilling to don their overalls and jackets in the presence of their classical companions.

But this state of things is fast disappearing, and men are beginning to be judged rather by their achievements than by their acquirements. Indeed the day is not distant, when, as has been tersely expressed, "the classical student, who will not be seen walking with the dirty mechanic, can go behind."

The line of social distinction between the man who thinks and he who works—provided he works intelligently—is already pretty well broken down; the two are engaged simply in different branches of the same pursuit, which have such correlation and intimate connection, as lead ultimately to a single line, interlinked in the one great chain of human knowledge.

So intimate is the connection between labor and science that the time is fast approaching when the trades, as well as professions, will be taught in schools and universities; the earning a trade or learning a profession will be considered equally honorable. Learning a trade is no drawback in time to acquiring an education.

On the contrary, experience is proving that the education is all the better and sooner obtained in connection with some manual labor; while the physical condition is vastly the gainer. Nor need the trade with an education be much, if any, more costly than when learned in the shop exclusively. In a trade, acquired in connection with a school or college, the applied sciences will be found as valuable as the tools of the workshop in almost every operation involving movement, composition of material, etc., and will place the possessor so far in advance of his brothers of the trade, who have graduated from the shop alone, that his services would always command a much higher price, and put to utter naught any possible interference of cheap, uneducated labor with his interests as a workman.

Not, however, until our established schools and colleges, offer such advantages as are not at command in ordinary machine and other

shops, can we hope to reap the advantages indicated. Labor schools should be as free and easy of access as the common schools, and should be graded in like manner, with the State University at the head. These are no utopian ideas. The system is already at work in Europe, and to some extent in the Eastern States.

It is to be hoped that the labor school movement, just initiated in this city, will not stop short of the point herein indicated. In no part of the country is such a movement more practicable than right here in San Francisco; and with wise management the "Mechanics' Deliberative Assembly," may not only establish "a system of labor schools, to enable boys and girls to learn a trade as a part of their education in the common schools," but they may also graft the same upon our entire common school system, by gradations which shall take the pupil up to the highest grade of education in both the sciences, and mechanical and engineering arts.

The trustees of Girard College, at Philadelphia, have already taken the initiatory steps in such a movement, and propose to teach their pupils how to work with their hands as well as with their brains. The classes there work two hours in the morning and two in the afternoon, and, as a matter of encouragement, the boys are allowed a moderate recompense for their services. A turn at the work bench for a boy is found to be an agreeable relaxation from the mental strain of the school-room.

The faculty of mechanic arts at the Cornell University have also just completed arrangements for a similar practice at that institution. Hereafter all students in the course of mechanic arts there will be required to take at least ten hours shop practice per week, under the supervision of a skillful master mechanic. It is intended to combine thorough practical instruction in the shop with the theoretical instruction of the lecture-room, thus making it possible for the graduates from that department if they so desire to enter at once upon the active duties of practical journeymen, which, instruction by text books and models, as heretofore has been the practice, would not enable them to do.

With such a course of instruction the degrees conferred will hereafter mean something more than the mere capacity to theorize. It is well known that the first eighteen months of an apprentice are usually occupied in mere drudgery—servitude in which he learns nothing, and which may as well be performed by the common laborer or helper, who has no aspirations for anything higher. At the school this lost time is saved, and every hour of available time is directly applied either to the practical acquisition of his trade or to the philosophy and theory upon which it is founded. Such an education enables the young man to take his place at once among the best mechanics in the country, and to stand side by side the equal and superior, even; of the mere professional man.

In the division of time in such schools, five to six hours are sufficient for active daily study, while four can be given to labor, which will leave enough for amusement, social intercourse and sleep.

We have called attention in the PRESS to such a plan as this time and again, for several years past, and feel to rejoice that a movement has finally been set on foot which may lead to all the benefits capable of flowing out of such a system of study conjoined with labor.

NEW SILK FACTORY.—The Union Pacific Silk Manufacturing Company will have their factory running within a month or six weeks. They have erected a factory in Visitation Valley, 262 x 50 feet with a separate engine and dye house 160 x 30 feet. It is proposed to manufacture ribbons from the raw material imported here from China and Japan.

The Columbus Mill at Austin, is turning out \$1,200 of bullion per day.

Mechanical Movement.

The accompanying cut represents a new form of Hooke's Joint, as recently shown in the *English Mechanic*. Take two rings, and connect them as shown in the engraving. If the shafts

of these links are now placed in the bearings *b*, so that it will be impossible for them to slip, the rotation of the shaft *A*, will be communicated to the shaft *B*.

Hodge's Anti-Friction Roller for Endless Chain Horse-Power.

We illustrate, herewith, an improvement in endless chain horse-power, invented by Geo. C. Hodge, of North Danville, Vermont, which has received high encomiums, and has, by practical test, proved itself to be valuable.

The improvement was awarded the diploma and premium, at the Vermont State Fair, in 1872. It was patented March 5, of the same

year, and has been described in the *American Artisan*.

Heretofore, each deck has been supplied with one string of rollers, of sufficient length to enclose the entire deck and its supports. The disadvantages of this construction is, that these long strings of rollers have too much lateral play. They therefore deviate and crowd against the sides of the channel in which they run, carrying the endless chains of the lags against the sides, and creating much wear and friction.

The improvement consists in strings of rollers made in sections, by which the disadvantages named is obviated. In the engraving, the roller deck is constructed with side pieces, *a*, and a center piece, *b*, all running lengthwise. On each side of the center piece are channels, *c*, in which the sectional strings of rollers *d* and *e* run, each string inclosing a support resting upon the upper edges of the side and center pieces, *a* and *b*. These sectional strings of rollers are made so wide that they cannot deviate sufficiently to crowd on either side of their channels. Each section is placed beside the gap between other sections, thus connecting the endless chain to the several sections.

Machines, with improved roller deck attached, are manufactured at North Danville, by the inventor. State rights will be disposed of. For further information the patentee may be addressed as above.

BINGHAM CANON MINES exhibit encouraging prospects for a successful season. The grading on the proposed railroad is nearly completed and many new discoveries are reported.

TRIAL OF BLOWERS.—We have been shown the report of a very interesting trial between the Sturtevant and Root's Blower, to test the relative capacity of these two blowers for doing the work required of them. The trial was made at the Tilgman Sand Blast Company's Works, at South Boston, on the 24th of March last. The test was in reference to the power required to maintain a pressure of nineteen inches of water in the blast pipe, and was made under the supervision of Prof. F. W. Bacon, consulting Engineer of the above company's works, where both blowers are employed. The result of the test, as reported by Prof. Bacon, were that while the pressure named was maintained with the Root Blower at the expenditure of only 5.14 horse power; the power required to keep up the same pressure with the Sturtevant Blower, indicated 10.41 horse power.

The Root Blower is largely employed in this State, where great numbers of them are employed, and we understood that they have recently been very successfully introduced in England. W. T. Garratt, corner of Fremont and Natoma streets, is agent for the Root Blower on this coast.

CINCINNATI INDUSTRIAL EXPOSITION.—The Fourth Industrial Exposition at Cincinnati, will open on September 3d and continue until the 4th of October. It will be held in a building especially erected in the heart of the city, presenting an available exhibition space of 338,000 square feet or nearly eight acres under roof, constituting the largest exposition ever held in the United States. Parties who propose to exhibit articles will be furnished upon application by mail to A. T. Goshorn, President or W. W. Taylor, Secretary, with a pamphlet containing the premium list and full instructions to exhibitors. All applications for space must be made on or before the 20th of August, on the printed blank forms which will be furnished by the Secretary, and applicants after that date will not be allotted space until those entered by August 20th have been assigned. Space allotted to applicants and not occupied by them on or before August 20th, may be assigned to others.

PICOCHE MINES are leaving that camp in numbers, but others are taking their places rapidly. The *Record* thinks that many who are leaving will wish themselves back within 60 days. It seems strange that men who have held out at Pioche through hard, dull times should now leave just as better days are coming. Many new buildings are being erected at Pioche, a feature which evinces faith in the permanence of the mines. The *Record* says there is no ground for the report that the Raymond & Ely vein is pinching out on the lowest levels. The present activity in Pioche is thought to be due more to the result of several rich strikes in the camps than the activity in the stock market. There has been recently a more decided improvement in business than has prevailed for months.

CROWN POINT MINE.—During the month of April, the Crown Point mine turned out 14,443 tons of ore averaging, \$82.11 per ton, or \$1,185,920. Most of this ore came from the lower levels of the Comstock lode which speaks well for the permanence of the mining interests in that section of country. The mills are all busy at Washoe and a prosperous summer is expected.

A MEETING has been held in Los Angeles by parties interested in organizing a stock company to build a refinery for reducing crude borax.

CORRESPONDENCE.

Mining in Mexico Improving.

EDITORS MINING AND SCIENTIFIC PRESS:—It has been some two years since I wrote last, since then mining has come up finely, due to the introduction of American stamp mills principally, whereby low grade ores of \$80 per ton and upwards are successfully treated. The following mills are now in operation at Rosario the Tajo mill of 20 stamps is running to its full capacity, the mine doing well also. Sinking a new shaft 600 feet to intersect the vein; new hoisting works going up over it and a tailing mill. At Guadalupe de los Reyes the 20-stamp mill, producing \$80,000 or \$90,000 per month, burned down, but a new one will go up immediately. The new pumping works are nearly ready. In Coahuila the Cuatro Señores mine in bonanza. They are working their ore in a leased mill, but are to erect a new 20-stamp mill, etc.

At San Dimas the 10-s amp mill of the American Co. has just started up and works well. Roasting furnaces are used here.

In Ventanas a 5-stamp mill has started up; result unknown yet. At Chapote the Tomanil mine is undergoing consolidation previous to the erection of a 10-stamp mill, or perhaps a 20. Sr. D. Vicente Lavaga, of San Francisco, is the operator in this business. At Panaco the Mechado family are going to erect a mill for their Mina Grande. They are one of the influential Mexican families of that section.

In San Vicente District the mines are looking well, and ores of ordinary base mines are being hauled to the San Dimas District for reduction in the mill there.

Inside of two years there will be a great impulse in mining in these districts and some others near at hand.

All the abandoned mills of "62" are being repaired and worked. The impulse will be a healthy reaction and not a fever, and no country has better mines for such a reaction to work upon than Mexico.

All that is needed is the completion of the net-work of railroads now commenced.

We are busily "pegging away," and by-and-by" we will drop you some more lines.

Yours truly,
VALVERDE.
SAN DIMAS, State of Durango, Mexico, April 20th, 1873.

Wages and Labor in San Francisco.

The prosperity of every country, says the *Cull*, is truly measured by the condition of its working classes; and the rewards obtained for labor are so many indices on its social thermometer, so to say, by which may be measured its commercial and industrial status. The truth of this is manifested by the experience of century after century; its tests are world-wide. Amongst the countries of Europe, there is none whose commercial and industrial pulse beats more healthily than that of England; none whose wealth is greater, whose manufactures are so extensive and varied, and none whose workmen are so well paid. The United States, in this respect, is far ahead of the Old World. Here, to, prosperity is measured by the wages of the workman, who if he be at all economical, lives as well as does the middle-class tradesman of England. And California, where the wages paid to the mechanic and the laborer are greater than those current in the Eastern States, is, in proportion to its age and population, far in advance of any in the United States, save, perhaps, some of the new western ones of its own age, where the rewards of labor are fully as high. And while the wages earned in this city are in some instances rather low, in others they are such as would, in a few years, make capitalists of every one of them, if they practice economy in living. This, however, is not universally true; and some of the occupations given in the table at the conclusion of this article, are, when we consider that the employees are not constantly employed throughout the year—badly paid, even when measured by Eastern standards. These, however, are few in number. In the following article, we aim to give a correct showing as to the number of workmen and remuneration of

The Various Kinds of Labor,

Premising that there are not less than about 180 different manufactures, or other works, on which our army of labor is employed. This is a great number for a young city like San Francisco, and argues well for the future. In fact, to use a common saying, there is nothing, from a needle to an anchor, that San Francisco has not workmen competent to manufacture, had she the capital, or the market for these productions. And the enterprise of Californians has left but a few avenues to wealth untried. Some manufactures, however, have not prospered so favorably as they ought. First in order, and first in importance, comes the

Workers in Iron and Steel,

Who number nearly three thousand. In busy times every one is employed, and then all that portion of the city lying south of Market street and east of Second is alive with busy traffic, the workshops are full of cheerful toilers, who live amidst the clanging of hammers, the whizz and buzz of machinery, and the torrid heat of a hundred fires. When the furnaces of that portion of the city are aglow, when the mines are prosperous, and when there is a demand

for machinery and railroad iron from the foundries, machine-shops, boiler-shops, rolling mills, etc., they keep over thirteen hundred hands at work.

The Lumber Workers

Of our city number not less than 2,500, who, when business is brisk, are making doors, windows and sashes for this coast, the Islands and Australia, railroad cars and street cars for the coast, woodenware for our farmers and for domestic use, wine casks and vats to carry the products of our vintage to Europe and the East, boxes in millions for the vast demands of our trade, and frames for pictures, resplendent in gold, and more gorgeous than the pictures themselves. And this year some hundreds of shipwrights and caulkers were employed, not in building new ships as they should have been, but in repairing the old ones that came to carry away our grain.

The Workers in Leather

Number more than four thousand, of whom about two thousand are white, and the balance Chinese. The boot and shoe makers are probably the most independent body of men on the Pacific Slope, as the manufacture in which they are engaged has swelled to vast dimensions. After them come the tanners and curriers, who number over two hundred, and then the saddlers, harness and collar makers, who can muster, if they like over four hundred men. Taking these and the precedent workers in metals, lumber and leather from the roll of our manufacturers, there will be left of the

Thirteen thousand White Workers,

About seven thousand artisans, laborers, women and boys, employed in the various manufactures of this city, of whom two hundred and seventy are employed by our manufacturing jewelers, lapidaries, etc.; twenty-six hundred in helping to clothe the people of the city; three hundred and eighty in manufacturing beer and spirituous liquore, and over one thousand manufacturing articles of domestic economy. In miscellaneous manufactures over another thousand are absorbed; while it will surprise many to find that San Francisco contains nearly eight hundred persons employed in the printing and newspaper offices of the city. In

The Building Trades

There are something over a thousand persons constantly employed, of whom much the larger proportion are carpenters; the bricklayers, stone-masons, and stone-cutters who are not employed on the new Mint or the new City Hall, being few, indeed. For these last few months building has been to a very great extent enfeebled, and but few houses are now going up. This will probably be rectified in the course of the next few months, when the gold and silver paid for the wheat products will find its way into the pockets of producers and those whom they patronize. Then there will probably be a temporary scarcity of men in the building trades, for during the last year nearly all the unemployed ones found their way East, to St. Louis or Chicago.

The Wages Paid to White Labor

Differ very much in amount, as may be seen by a glance at the concluding table. Many of the same per diem appear very large, but in the majority of instances this is much reduced by the circumstance that these wages are paid only for a portion of the year. The emoluments of the workmen vary from \$2 to \$8 per day, the latter being paid to first-class watch-makers. The mechanic in the foundry and machine-shops receive from \$3 to \$5 per day, and the unskilled workmen, \$2 to \$2.50. But both these rates become very considerably reduced when the number of days worked is taken into account the mechanic then appearing to receive only from \$2.50 to \$2.80 per day, and the helper \$1.50 per day. The boiler-makers, last year, did better than their brethren of the foundries and machine-shops, mechanic having earned from \$4 to \$4.50 per day; and laborers from \$2.25 to \$2.50 per day; the averages being for the year for mechanics, \$2.91 to \$3.75, and those for the laborer being \$1.98. The mill hands, or those employed in the factories for the manufacture of doors, windows, etc., have been paid an average daily salary of \$4.50, while the laborers have been paid \$2 per day. The boot and shoemakers can earn, some of them, \$30 per week; but here again, idle time during the year reduces the earnings to \$4 or less per day. The wages made by saw-makers and billiard-turners, who do not lose a day, are very large—the former being not less than \$5 per day, and the latter \$5.50. In trunk-making some of the skilled artisans work for \$1.50 per day, that is, \$1.50 per day when divided amongst the whole number of days in the year. The helpers in the carriage and wagon building average only \$1.80 throughout the year. In the building trades all but the carpenters, average \$4 and \$5 per day—the carpenters are an exception, on account of their numbers, and because, in this city, every one who can handle a saw and a plane is dubbed a carpenter. Some watch-makers earn as much as \$3 per day, though the average for the whole is but \$5, and some men can be had for \$3 per day.

The Yearly Earnings,

As may be seen, vary all the way from \$468 for iron-fitters to \$1,716 for ivory-turners—a difference of nearly 400 per cent. The length of time in the year during which steady work is obtained varies considerably in the several kinds of manufacture, the workmen in some being employed all the time, while in others, during a couple of months the full complement of hands is seldom or never worked. Thus, the foundrymen average about nine months, or

only three-fourths of the year; the boiler-makers average about ten months; the mill hands nearly all the time; the boot and shoemakers about ten months, as also do the box-makers, the stair-makers, and many others. The brewers, saw-makers, billiard-table makers, flour-mill hands, trunk-makers, and furniture-makers are employed full time. So also are tailors, compositors for the most part, electricians, and a great many other workmen.

The Occupations of Women and Girls,

In the way of trades and manufactures, number twenty-four. Over one thousand are occupied in the manufacture of white goods; over two hundred in the manufacture of textile fabrics and in boots and shoes. There were over thirty employed in the type-foundry, and a few in the manufacture of gold-leaf and in silver plating. All, or nearly all, the boys' caps are now made by women, as also is a great deal of the ready-made clothing sold in this city; and a few are employed by our hat-finishers. They are also found in photographic establishments, and in book-binders and in many other light employments. The whole number of women and girls employed in this way in the city is about 2,250. Their wages vary from \$5 to \$30 per week, generally averaging about \$10. Boot-closers and those employed in hat-finisher earn sometimes \$30 per week, or as much as men. The couple of dozen hands employed in type-sticking also earn tolerably high wages.

The Boys Employed

Are very few, not numbering quite a thousand. Of these, probably one-half are learning trades; the balance cannot, it is said, be induced to stay long enough in a place to learn anything thoroughly, but once that one thinks he has learned anything, he is off to look for higher wages—and so of course he never learns a trade. Where, then, are we to look for our supply of mechanics, hy-and-by? Must we always import artisans from Europe and the East? The wages of boys in the several branches of business vary from \$3 to \$15 per week.

The System of Co-Operation

Has been in existence in this city for the past few years, first beginning with the boot and shoemakers and the carpenters. Since then, the marble-masons, the foundrymen, the furniture-manufacturers, the printers, and the saddlers have taken it up; but the majority of the co-operative institutions have died. The cause has been disagreement amongst the members and want of business tact. The men would become dissatisfied, and, one by one, withdraw, until the association became dissolved, and its property owned by one or two persons. Such has been the case with all the co-operative boot and shoe factories save one; with the co-operative marble masons; with the Mechanics' Mill and some others.

The Golden Gate, Columbia, and Miners' Foundry were conducted for a year or two on the system of industrial partnership, the employees having a share in the profits; but that has now been abandoned in all save the Miners' Foundry. In each of these foundries, at first the men put in a small sum of money and gave so many days' labor, after which they were entitled to a share in the profits when a fair interest on their employers' capital had been deducted. The proprietors of the Miners' Foundry think well of the system, and we hope that many others will carefully watch the workings of the example just set.

In the following table nearly all the occupations that can properly be claimed as industrial are given, together with the wages at present prevailing in them; leaving out of enumeration those engaged in domestic service, and the sewing-women who work out by the day.

WOLFRAM STEEL.—Some of the most extensive iron establishments in England and Germany are now producing large quantities of what is called Wolfram steel, and it is becoming an important article in commerce and manufactures. The qualities of this steel are very remarkable: When annealed it is so hard that it will stand the best file, but when chilled it becomes soft, though ordinary steel would be hardened. When chilled, it gets covered with cracks, but it may be very well hammered when at a red heat. But any tools met met made at once with the hammer in their required shape, as the file will do nothing more to it. Planing machines, etc., made of this metal are said to outlast those made of the best Sheffield steel.

To BE EXTENDED.—The Virginia and Truckee Railroad is about to be extended from its present terminus, near Mill street, across the hollow forming the head of Six-mile Canyon to near the Ophir works. The road, for a distance of 375 feet, will pass over a wooden trestlework. The road will doubtless soon be extended as far north as Seven-mile Canyon.

MECHANICAL PROGRESS.

Soldering Metals.

For large and heavy pieces of iron and steel, copper or brass is used. The surfaces to be united are first filed off in order that they may be clean. Then they are bound together with steel, and upon the joint a thin strip of sheet copper or brass is laid, or, if necessary, fastened to it with a wire. The part to be soldered is now covered with a paste of clay, free from sand, to the thickness of one inch, the coating being applied to the width of a hand on each side of the piece. It is then laid near a fire, so that the clay may dry slowly. The part to be soldered is then held before the blast, and heated to a white heat, whereby the clay vitrifies. If iron is soldered to iron, the piece must be cooled off in water. In soldering steel to steel, however, the piece is allowed to cool slowly. The semi-vitrified clay is then knocked off, and the surface is cleaned in a proper manner.

By following the hints given, it will be found that a durable and clean soldering is obtained. If brass instead of copper is used, it is not necessary to heat so strongly. The former recommends itself, therefore, for steel. Articles of iron and steel of medium size are best united with hard or soft brass solder. In both cases the seams are cleanly filed and spread over with the solder and borax, when the soldering seam is heated. Hard brass solder is prepared by melting in a crucible eight parts of brass, and adding one part of previously heated zinc. The crucible is then covered and exposed to a glow-heat for a few minutes, then emptied into a pail with cold water, the water being strongly agitated with a broom. Thus the metal is obtained in small grains or granules. Soft brass solder is obtained by melting together six parts of brass, one of zinc, and one of tin. The granulation is carried out as indicated above. Small articles are best soldered with hard silver solder or soft solder. The former is obtained by alloying equal parts of fine silver and soft brass. In fusing, the mass is covered with borax, and, when cold, the metal is beaten out to a thin sheet, of which a sufficiently large and previously annealed piece is placed with borax upon the seams to be united and heated.

Soft silver solder differs from hard silver solder only in that the former contains one-sixteenth of tin, which is added to it during fusion. Very fine articles of iron and steel are soldered with gold—viz., either with pure gold or hard gold solder. The latter can be obtained by fusion of one part gold, two parts silver, and three copper. Fine steel wire can also be soldered with tin, but the work is not very durable. Hard and soft brass solder are used for uniting copper and brass to iron and steel, silver solder for silver, hard gold solder for gold.—*Exchange.*

NEW PROCESS FOR MAKING STEEL DIES.—A new process for making steel dies is spoken of, that work being accomplished by heating the metal to a white heat in a close chamber to exclude the air, and then pressing it upon the material to be copied. It is claimed that by means of this process the hardest steel may be stamped by any soft metal—even lead—so as to make a perfect die of the objects impressed. A carved ring, for instance, might be used to stamp its own image on the hardest and most finely tempered steel, reproducing all its delicate tracing and outline with absolute precision and perfection without injury to the stone.

It is said that the secret of thus being able to bring together friable and easily melted substances, such as lead or precious stones, with semi-fused steel consists in the process of heating the steel disk, which must be of a certain degree of temperature. Admitting the possibility of such a thing, we might remark that it would enable every counterfeiter to get perfectly accurate dies of all kinds of coins, and may be used for the cheap reproduction in steel of any kind of engraving in wood, copper or type metal. The most elegant chiseling, heretofore made at great expense, might thus be cheaply stamped, and the small castings of copper, brass and bronze might be imitated in the hardest steel. Stereotype plates that will defy the wear of years may be made in the same manner.

HARDENING IRON SURFACES.—By means of a simple compound, just invented, the surface of iron may, it is alleged, be hardened in a manner superior to that obtained by any other now in use—the compound, in this case, being mixed with iron in a melted state, and the hardening to take the place of the chilling process. The method in question consists of mixing, in a melted form, three pounds tin, one pound iron, four ounces copper, one half-ounce aluminum, and one-fourth ounce quick silver; and then, from one-eighth to one-quarter of a pound of said compound is mixed with five pounds of cheap iron, in a melted form. The greater proportion of the compound mixed with the iron the deeper from the surface does the hardening process extend. The effect of applying this compound is to make the surface of about that of hardened steel, and it is claimed that it is fully equal to steel in other respects; moreover, the surface will not rust, but will retain its color and brilliancy. The cost, taking into account the difference in the amount of time and labor involved, must be considerably in favor of the new process.

The Gunpowder Pile Driver.

In answer to a correspondent who desires to know the mechanical construction of the recently invented gunpowder pile driver, we give the following description from an exchange: The gunpowder pile driver, brought out originally in this country, was introduced into England some five years since, and its workings has demonstrated that by its use a considerable saving is effected both in time and cost as against the ordinary method of pile-driving. The apparatus consists of an ordinary pile-driving engine having a ram, from the upper and under side of which a plunger projects. The ram is fitted with an arrangement by which it may be retained at any desired height above the pile head. A cast iron cap, having a hole in its centre into which the lower plunger of the ram will fit, is placed on the top of the pile to be driven, and in the hole is inserted a small charge of gun powder. On the ram being released the lower plunger enters the hole in the cap and, compressing the air within, generates heat, which ignites the gun powder. The force of the explosion is utilized partly in driving the pile downward, and partly in throwing the ram upward, the latter being detained at the required height ready for the next blow. Should the ram be thrown too high, the upper plunger enters an air cylinder, compressing the air and cushioning the blow. The charges of gunpowder were at first fed into the cap piece by hand, but a self-acting feeding arrangement is now used which supplies ammunition automatically after every shot.

Railroad Consumption of Timber.

But few people are aware of the immense drain which the railroads make upon the timber resources of the country, and what a boon it would be to the Railroad Companies and the desired permanence of our forests if some practical device could be introduced as a substitute for wooden ties. It is estimated that the number of railroad ties in present use in the United States are 150,000,000. And as young timber is mostly used, a cut of 200 ties to the acre is above rather than under the average, and it therefore has required the product of 750,000 acres of well timbered land to furnish the supply. Railroad ties last about five years, consequently 30,000,000 ties are used annually for repairs, taking the timber from 150,000 acres. The manufacture of rolling stock requires the entire yield of 350,000 acres, more every year. Thus it appears, that our railroads are stripping the country at the rate of 500,000 acres per annum, and their demands are rapidly increasing.

LARGE CALORIC ENGINES.—The reason that large caloric engines are not more used, is that they do not produce power enough. They are only available for such labor as requires little power, like grinding, running printing-presses, small turning lathes, etc.; but when applied to a planing-machine, circular-saw, paddle-wheel, or screw-propeller of a ship, etc., they are comparatively powerless. This was the cause that in the steam ship *Ericson*, the caloric engine was taken out and a steam engine substituted. This ship, which was built at a cost of nearly \$1,000,000 by a young enterprising merchant of New York, under the immediate supervision of Capt. *Ericson*, the inventor himself, in order to give his invention a fair test on a large scale, was such a decided failure, that not only could it not be propelled with any reasonable velocity, but the engine had not power enough to make it possible to steer the ship, so that when at one of its trials in New York harbor a stiff breeze made it keel over, the engine was too weak to steer it in the wind. The result was that the water ran in the ports, and she sank in 40 feet of water. After taking her out, the caloric engine was abolished, having fully proved to be a colossal failure.

INGENIOUS ENGINEERING.—During the construction of the bridge at Kullenborg, Holland, says the *Chronique de l'Industrie*, one of the principal traverses, some 465 feet in length, was placed about one inch too far on the piles. This error was rectified in a very ingenious manner. The expansion of the mass of metal was exactly .0394 inches per Fahrenheit degree. At the locality of the work the difference between the temperature of the atmosphere by day and by night was 25° Fah. In the morning the too far advanced end of the traverse was securely bolted down, when during the day the heat of the sun expanded the metal so that the free extremity advanced .395 of an inch. Then at night the latter end was fastened and the contraction caused a like movement of the opposite free extremity. This operation twice repeated, brought the traverse into its proper position.

ENAMELED FACED BRICKS.—We have already alluded to a new style of brick, by which that useful building material was to assume a more decorative character than heretofore, and it is now stated that extensive works are being erected in Pittsburg to manufacture pressed bricks with enamelled facings. The enamel is made of various colors to suit the tastes of architects or builders, and as it is impervious to water or acids, having a surface that can be cleaned like glass, it is well adapted for building purposes in the smoky cities of the West. The enamel is claimed to increase the strength and durability of the bricks, while giving all the beauty of the surface to be obtained from stone or marble. The cost is said to be \$20 per thousand over common pressed brick.

SCIENTIFIC PROGRESS.

Frictional Electricity.

Some recent experiments, on frictional electricity, made by Edward Hagenbach, seems to contradict the principle so generally taught, that when glass is rubbed with cat's fur, negative electricity is produced. The principal has been so generally believed, that the name of vitreous electricity has been proposed, and in some text-books adopted, instead of, and as synonymous with, negative electricity.

Hagenbach observed, on rubbing a glass tube with the fur from the neck, or hind leg of a wild cat, that if the rubbing was continually in one direction, the glass became negative; but if rubbed first one way, and then the other, it became positive; when he used fur from the back of the animal, glass rubbed in one way only, also became positive. The pressure exerted during the rubbing also made a difference, a light pressure producing negative, and heavy pressure positive. It also makes a difference whether the glass is rubbed with the fur, or the fur is rubbed with the glass. In these experiments, Hagenbach says he used smooth glass, for mat glass, or glass that had been passed through the flame of an alcohol lamp, always became negative when rubbed with fur.

If the glass was rubbed with a fox's tail, it always became positive.

Porcelain exhibits a phenomenon similar to glass; a smooth porcelain tube rubbed with wool or silk, becomes positive, a rough one negative.

The phenomenon observed on rubbing a rough porcelain tube with vulcanized india-rubber, is quite peculiar. At first it becomes positive, but with longer and bolder rubbing, it becomes negative, and so it remains, whether rubbed much or little. By drawing through a flame, or cleaning with chemical agents, it loses the property of becoming negative, which property is restored by rubbing with flowers of sulphur.

Different kinds of paper vary greatly, according to material, and method of manufacture. The hand-made paper of the sixteenth century, as, also, Chinese and so-called silk paper, becomes negative, if drawn violently through the fingers; by rubbing gently with the fingers, it becomes positive. Sometimes machine paper also exhibits two actions towards electricity. Paribent paper, formed by the action of sulphuric acid, is more inclined to positive electricity than most other kinds of paper. Pyroxiline paper becomes negative whether rubbed with the hand, with silk, or with india rubber, but positive when rubbed with gun-cotton. Pogendorff proposed to use pyroxiline paper, rubbed between the fingers, as an electroscope for detecting negative electricity. An electroscope for positive, may be made of a dry strip of ordinary paper rubbed with vulcanized rubber, or better still, with gun-cotton.

The above are but a few of the many curious and unexpected results which Hagenbach has obtained, and who knows but they may lead to an easy and practical method of deciding between substances which very closely resemble each other in other respects? The action of different kinds of fur on the same piece of glass, may yet enable the inexperienced to ascertain on what animal it grew; or, perhaps, it may prove a guide as to the quality or composition of the paper we are buying.—*Am. Artisan.*

DEEP SEA CURRENTS.—The principles involved in the circulation of the waters of the sea were beautifully shown before a late meeting of the British Royal Geographical Society, by a simple experiment. A trough with plate-glass sides, about six feet long, and a foot deep but not more than an inch wide, was filled with water. At one end a piece of ice was wedged in between the sides to represent the polar cold; while the tropic heat was represented at the other end by a bar of metal laid across the surface of the water, the projecting end of which was heated with a spirit lamp. Red coloring matter was then put in at the warm end and blue at the cold end, so that the currents could be traced. The blue water, chilled by contact with the ice, immediately fell down to the bottom, crept slowly along, and gradually rose towards the surface at the equatorial end, after which it gradually returned along the surface to its starting point. The red water crept first along the surface to the polar end, then fell to the bottom just as the blue had done, and formed another stratum, creeping back again along the bottom, and coming again to the surface. Each color made a distinct circulation during the half hour in which the audience viewed the experiment.

GUM IN PLANTS.—From experiments made with pyrogallie acid, Struvé concludes that gums perform a function in plants analogous to that of the blood in animals. Pyrogallie acid in contact with alkalies oxidises rapidly, becoming of a dark brown color; with other substances, such as gum arabic and blood, the oxidation is slow, a yellow color is produced, and long needle-like crystals form, which are insoluble in water. The least trace of this yellow substance produces an intense blue with ammonia or other caustic alkalies. The exact composition of this curious substance has not yet been ascertained.

The Composition of Rust.

Prof. Grace Calvert, a distinguished English chemist, has been investigating the circumstances under which rust is formed. He found that iron rust is a much more complicated substance than is generally supposed. Two specimens—one from Conway Bridge, and the other from Llaugocollen, Wales—had the following composition:

	Conway Bridge	Llaugocollen.
Sesquioxide of iron.....	62,900	93,094
Protoxide of iron.....	6,177	6,810
Carbonate of iron.....	0,617	0,605
Carbonate of lime.....	0,235	0, 98
Silica.....	0,121	0,196
Ammonia.....	trace	trace
Total.....	100,000	100,000

This proves that the decomposition of water has less to do with the formation of rust than has heretofore been supposed, and that carbonic acid is the most powerful agent. This was also proved by direct experiment. Clean iron blades were exposed in glass tubes to the action of various gases, wet and dry. Under these circumstances, pure and dry oxygen does not determine the oxidation of iron; moist oxygen has only a feeble action; dry or moist pure carbonic acid has no action, while oxygen containing traces of carbonic acid acts most rapidly on iron, giving rise to protoxide of iron, then to carbonate of the same oxide, and lastly to a mixture of saline oxide and hydrate of sesquioxide. Carbonic acid and water acted with energy, an abundant and perfectly white deposit was formed on the surface of the water, accompanied with decomposition of fluid.

Minute quantities of foreign substances affect the liability of iron to rust, some increasing it and others lessening it. Thus impure iron may have a greater or less tendency than the pure metal to oxidation, and this fact is exceedingly important, for it points the way to investigations which may lead to a new classification of irons. Cold short and red short, hard and soft, are qualities which affect the commercial uses of iron, and if to these can be added rusting and non-rusting iron, there will be immediate use for the latter among bridge and foundation builders, and many other consumers.

Solutions of alkalies, either caustic, carbonate or bi-carbonate, prevent the rusting of iron; and Prof. Calvert suggests that caustic alkalies can be thrown into the holds of iron ships that suffer from the action of bilge water on the plates. Sugar greatly increases the tendency to oxidation, a fact that explains the rapid destruction of iron ships engaged in carrying sugar. Prof. Calvert renews the recommendation he made some years ago, that a small piece of zinc should be fixed to each plate of iron. This renders the metal "passive" and prevents oxidation. Under ordinary circumstances, the zinc will protect the iron when it covers only 1-100th part of the latter's surface; but, with sugar water the proportion must be 1 zinc to 15 iron surface.

CHEMICAL ACTION OF THE SOLAR RAYS.—Mr. Marchand, says *Les Mondes*, has just completed a long and careful study of the chemical action of solar rays. He exposed to light a mixture of definite proportions of oxalic acid, perchloride of iron and water. Under the influence of the rays, the perchloride was decomposed and became protochloride; the chlorine, set at liberty, combined with the hydrogen of water, to form hydrochloric acid; and the oxygen of the water, uniting with the oxalic acid, transformed it into carbonic acid, which was disengaged. The quantity of carbonic acid thus given off is proportional to the intensity of the light, and serves as its measure. The difficulty was, however, to determine accurately the amount of carbonic acid without having recourse to mercurial apparatus, very expensive and hard to manage. M. Marchand has found, however, and *Les Mondes* terms it a great discovery in practical chemistry, that, for the determination of the carbonic acid, glycerine may be well substituted for mercury. He has also observed that his mixture, considered as a reagent of chemical rays, differs from the nitrate of silver in the particular that the maximum of its intensity is at the middle of the blue, while that of the nitrate is at or near the violet.

VOLATILIZATION OF IRON AND GOLD.—It seems that iron is volatile at very high temperature, the same as gold and platinum. Dr. Elsner, Director of the Berlin porcelain factory, enclosed a small piece of wrought iron in an unglazed crucible and exposed it for several hours to a temperature of at least 3,000° C. On removing the cover of the crucible, small needles of metallic iron were easily discerned, clearly showing that iron can be volatilized at high temperatures.

CARBON AS AN ANTIDOTE TO PHOSPHORUS.—The property of charcoal or bone black to remove metals from their solutions is well known, and the recent discovery of MM. Eulenberg and Wohl that phosphorus may also be thus eliminated has been applied with success in cases of poisoning by that element. In the match factories of France, charcoal pills have been used for more than a year past, with most encouraging results.

POTASSIC CHLORATE.—It has been lately discovered that tin-foil, wrapped round a few crystals of potassic chlorate, can be made to detonate loudly by striking it smartly with a hammer on an anvil or in a mortar.

Our Weekly Stock Review.

THURSDAY EVE, May 15, 1873.

The Stock Market this week has been in nearly as excited a state as it was last week, and prices generally have kept up remarkably well. The transactions in Ely stocks have not been so free as in Washoe. The former being comparatively depressed. The southern end of the Comstock has come into favor this week. The raise in Baltimore Consolidated on account of the ore strike in the lower level in the mine carried its neighbors with it. Caledonia, Knickerbocker, Overman and Danby all felt its influence. It has become known that work on the lower level of the Baltimore Consolidated has been suspended on account of an order from this city. It is stated that the second discovery of ore which caused the raise from \$14 on Saturday to \$22 on Tuesday, came 30 days before it was expected, deranging a good many plans. Beside the report of the strike in Baltimore Consolidated, there are reports of a rich strike of a body of ore in the 8th level of Meadow Valley No. 3.

The large amounts of money paid out by the Crown Point and Belcher mines, the comparative ease in the money market, and the generally favorable reports from prominent mining districts, all tend to advance the prices of stocks and inspire confidence in values. The hullion from the Washoe mines and other sources is crowding the Gold and Silver Refinery to its utmost capacity, and the Mint has its hands full. It makes money more plenty, however, to have this large amount monthly added to our coin supply. The select at the Board last week exceeded those of the previous one some \$900,000. They amounted to \$3,933,650—the largest sum in many months. The most active stocks were, Baltimore, Consolidated, American Flat, Imperial and Westington & Creole.

The Cherokee Flat Blue Gravel Company propose on the 12th of June to increase their capital stock from \$65,000 in 650 shares, to \$3,120,000, in 31,200 shares. An interesting letter in relation to the Washoe mines will be found in our editorial columns.

On Friday the activity of the market still continued, with an unusually long session of the Board. A considerable advance was manifest at the Afternoon Board; Belcher rose \$7; Crown Point, \$14; Imperial, \$2; Overman, \$3; Seg. Belcher, \$10; Caledonia, \$5; Baltimore Con., \$1; Meadow Valley, \$8.

Saturday prices were firm and the market still active and excited. Belcher closed \$1.50, (dividend off) Crown Point, \$3; Alps, \$5; Baltimore Con., \$4; Con. Virginia, \$3; Empire Mill, 6 1/2 cents; Gould & Curry, \$1; Julie, \$5; Overman, \$2; Savage, \$1.

Monday the market opened strong, with an advance in prices. Belcher closed \$1.50; Baltimore Con., \$7; Knickerbocker, \$2; Caledonia, \$5; Nevada 25 cents; Justice, \$5; Chollar, \$2; Ophir, \$1; Overman, \$3; Jacket, \$4; Raymond & Ely, \$7; Meadow Valley, \$1.

On Friday the market continued its activity, the Board meeting half an hour earlier than usual to accommodate increase in business. Savage rose in the afternoon \$4 and other descriptions, from \$1 to \$4.

Wednesday showed some activity in stocks, particularly for Washoe mines. Savage going up \$30; some descriptions however, showed a decline.

To-day prices declined materially, most descriptions selling lower than yesterday. This collapse is caused by the desire of holders to realize on the advance of the past few weeks. The fluctuations will be seen by referring to our Stock Tables.

The following items of interest from prominent mines are collated from letters or telegrams from superintendents on file at the office of the respective companies in this city.

Amador Tunnel.

Dispatch of the 8th says the mine is improving very much. Shaft is progressing favorably.

Letter of the 9th says they are timbering the sixth level station. Will commence sinking for seventh level soon. Stopping ore from the sixth level will soon be commenced, developments of high grade ore have been made. Stopping ore over the fifth level, east of main shaft, as usual with an improvement in the quality of the ore body. Fifth level raise, west of main shaft, shows ore twelve inches thick. Fourth level winze, west of main shaft, shows a body fourteen inches thick. New stop, west of main shaft in the fifth level shows ore body sixteen inches in the face. Are stopping in Nos. 1, 2 and 4 levels west. Shipped 30 tons ore to mill to-day. Mill running on flag ore.

Arizona & Utah.

Letter of the 12th says the work is progressing favorably at the mine. The drift continues to advance steadily. Rock is very hard again. Doing nothing in the bottom of the Shaft. Water decreasing some. Everything looks well.

Belcher.

Dispatch of the 14th says that in the connection on the 1200-foot level the Surveyor made a mistake of four feet in the grade. It will take a week to grade over running and ore. Ore breaks everywhere looking well. Car samples, \$104 per ton.

Buckeye.

Letter of the 10th gives the following summary of operations for that week: ore extracted and forwarded to the mills 151 tons 300 pounds, average assay value of ore extracted as determined by car samples \$17.36 per ton. Ore worked during the week 153 tons. Gross yield in bullion \$1,638.80 average per ton \$11.03. During the week no change of importance has occurred at the mine.

Crown Point.

The bullion shipment on the 8th was \$72,335.03, making the total amount received on the April account, so far, \$1,122,814.37.

Dispatch of the 14th says the whole face of the crosscut from the third floor is giving a fair quality of ore. The crosscut from the fifth floor of the 1300-foot level is in porphyry. We are putting in last station a set of timbers at the 1500-foot level, and have one set in the incline below the 1500-foot level. The mine looks well at other points.

Dispatch of the 12th says the face of the crosscut from the fifth floor of the 1300-foot level is in ore of fine quality, except two feet in the top, which is hard porphyry. The crosscut from the third floor is badly mixed with porphyry, with some rich streaks running through it. The mine generally looks well.

Dispatch of the 13th says the crosscut from the fifth floor of the 1300-foot level is in porphyry, which is probably the east wall. The crosscut from the third floor of the 1300-foot level, 40 feet from the Belcher, is mostly waste. No change since last report in other parts of the mine.

Assessments, Meetings, Dividends.

(COMPILED DAILY FOR THE MINING PRESS.)

NOTE.—In the Stock Boards an assessment is delinquent thirty days from the date of levy, exclusive of that date. The dates given in this list are those of the mining office.

ASSESSMENTS.—Stocks on the Lists of the Boards.

Ophir.

Letter of the 10th says the 1200 and 1300-foot levels are progressing well in fair ground; the ledge could be reached by both of the crosscuts in about two weeks.

Letter of the 12th says there is no change to report except an improvement in character of material being cut from the north mine first station. All work going on well.

Overman.

Letter of the 10th says the new to report. Rocking the west drift is somewhat softer, having made 38 feet in that drift during the past week. Rock in the north drift is very hard; made 18 feet during the week; face of drift is in granite. South drift is in granite and porphyry, with occasional streaks of quartz; made 38 feet this week. Water in shaft gradually decreases. Machinery works well. Everything above and below the ground is working well.

Page & Panaca.

Letter of the 4th says the main drift is now in 700 feet from shaft. Are now getting into good quartzite again, similar to that in the Raymond & Ely mine, which gives great encouragement. We have a small ledge or seam of ore 600 feet from the shaft, which has yielded ore assaying \$12 per ton.

Raymond & Ely.

Dispatch from the Superintendent under date of the 9th says: "I shipped yesterday, \$21,012." Provisions shipment this month, \$33,051, making the total for the month, so far, \$54,063.

Dispatch from the Superintendent under date of the 13th says: "I shipped yesterday, \$24,614." This makes the total for the month, so far, \$78,677.

Dispatch from the Assistant Superintendent under date of the 14th says no change in eighth level. Seventh level (Meadow Valley extension ground) the winze is thirty feet deep. Getting out five feet of ore, leaving it in the hanging wall. No change in the eight drift from the seventh level in Meadow Valley extension ground. Sixth level winze is through to seventh level. No change in stopes.

Senator.

Letter of the 10th says we have since the 3d, retimbered shaft 24 feet, have added to depth 20 feet, making a total depth of 335 feet. Bottom of shaft shows some quantities of quartz bearing metal; ground is very favorable.

Silver Hill.

Letter of the 7th says last night while drifting north from the first crosscut we run into a lot of ore, showing better than any yet found, and still looks as well this evening. The second crosscut shows signs of a near approach of ore. Second station drift continues very hard. Mill is running and looking very well. Shipped on 7th to Bacon mill 694 tons of ore; assay same day, \$37.37.

Letter of the 8th says there is no change in the mine, except in the second station, which is working better and making more headway. Shipped to the Bacon mill on the 8th, 34 tons and 900 pounds of ore. Assay same day gave \$70.64.

Letter of the 10th says no change in mine of note, the second station continues working very satisfactorily. The mill is running well and is in good order. Shipped to Bacon mill on the 9th, 85 tons and 1,300 pounds, assay same day, \$55.88.

Woodville.

Letter of the 11th says they will make another partial clean-up of both mills on Tuesday next. The prospects of the mine are very flattering. Stopes on lower level are looking and yielding well. The first station north is improving.

Wellington.

Letter of the 9th says the mill is looking well and shipping ore at \$11.50 and \$12 per ton. The Emma engine house was burned yesterday.

MINING SUMMARY.

This summary is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

California.

BUTTE.

THE NEW PLACER DROGGINGS.—Butte Record, May 10: The interest below town continues unabated. The Greely company have nine claims on their claims, and are putting in pumps to drain them. The Glohe company are also progressing with their claims, and all will soon be able to make a profitable showing. The Children are still active in buying everything in sight that has a title that will enable them to hold their purchase. Several claims have been sold at a very fair figure during the week. The most extensive sale noted is that of Dr. Jenkins, who has disposed of his fine ranch and 40 acres, vineyard, with a fine brick residence, and all necessary buildings for the manufacture and storing of wines, to Chinese miners for the sum of \$4,000. This is one of the oldest and finest vineyards in the county, requiring irrigation, and producing an extensive and valuable crop of grapes. Whether our celestial miners mine up the vineyard, depends, we suppose entirely upon the fact whether they can find "one dollar hemp" per day he needs it. They readily find all the ground to which they can find title, and have plenty of money for that purpose. An American mining population could prosper here, but this class do not appear to care for diggings that cannot be worked with sluice and hydraulic, and dispose of their claims for a few hundred dollars in coin. The Chinese population is rapidly increasing, and are overrunning the valley and giving it the appearance of an ant's nest.

BROWN FINE CHEROKEE.—A gold brick, heavier than a man could handle with one hand, and valued at \$25,000, came down from Cherokee the other day, to swell the circulating medium of the Pacific Coast. Operations on the Cherokee ditch from Butte Creek continue to be vigorously prosecuted, and Cherokee will soon have constant supply of water for mining purposes. The necessary pipe is under way for conveying the water from Dogtown ridge to the Cherokee hills, and will soon be received, either at Rohle's station, on the Butte Creek, or at Groville.

CALAVERAS.

RAILROAD FLAT DISTRICT.—Oslaveras Chronicle, May 10: 100 tons of ore from the Sanderson, crushed at Clark's mill, yielded at the rate of \$25 per ton. The 100-ft. level is being extended north of the shaft, showing richer ore than the south chimney. Sinking will be resumed immediately. Gamble & Co. have taken out 80 tons of ore, which is being hauled to Clark's mill. The Prussian Hill mine is to be started again.

MOQUITO DISTRICT.—Brown & Co. crushed 20 tons of ore, which paid over \$30 per ton. The substantial mine shaft of the Good Hope, 10 by 4 in the clear, is going down rapidly to the tunnel, 130 ft. below surface. A tunnel has been started on the Woodcock, to run on the vein; the tunnel will be 200 ft. below the surface of the deepest shaft, some 450 ft. distant from the mouth of the tunnel. Work in the levels of the Dolly Varden has been stopped with the intention of sinking the main shaft 100-ft. deeper (200 ft. in all) previous to attaching a mill to the mine. The dumps are well filled. The ore prospects from \$10 to \$200 per ton.

WATER FORT DISTRICT.—Ohio Con. running levels on west vein. Cross drift to east vein in 30 ft. Zaca-tone let contract to sink the main shaft 50 ft. deeper at \$15 per ft. Gre from the Lone Star being crushed at Carlton's mill will probably yield \$50 per ton. The

Harris is still yielding fair quantities of pay-ore above water. No attempt has as yet been made to test this mine below water, although the vein is large at water level. A small but rich vein is being worked by Gouldson & Co., west of the village.

BLUE MOUNTAIN.—The damage inflicted upon the Hockendorn Company's mill at Blue Mountain, by the heavy snowfall of last winter, is completely repaired. The new building is substantial enough to prevent the recurrence of any similar accident in the future. The mill is now in first-rate order, running day and night, crushing very rich rock from the mine.

IMPERATRICE Eugenie proves also to be rich. The vein is gradually increasing in width, its dimensions at present being 12 ft. The Co. has already cleared and leveled the site for a mill, which will be built as soon as episodic will permit tenders to haul up material.

HAPPY VALLEY FLEMING CLAIM.—We are pleased to learn that this old claim, which years ago was one of the best paying gravel mines in the county, has again become largely remunerative. In fact, we have it from good authority that the proprietor, Mr. Patrick Drumm, is absolutely taking out gold by the pound!

KLAMATH.

BLACK BEAR.—Grass Valley Union May 8: A telegram from Yreka, dated May 6th, says: "The Black Bear Co. at Sawyer's Bar, Klamath county, are now taking out immense quantities of rich quartz, and their ledge which have now uncovered is 35 ft. in width. Several new ledges have been discovered in the Salmon river district."

PLACER.

OUR MINES.—Placer Argus, May 10: The Eclipse Mill, Ophir, under the superintendency of J. B. Patterson, has been for the past 2 weeks doing custom work, and the result we consider to be a fairer and much more satisfactory test of the value of our mines than rock taken from but one ledge. From Mr. Patterson we learn that out of 30 tons of rock crushed for Fred. Forster he obtained \$900, from 18 tons crushed for Nick Marling, \$700, and 15 tons for Joe McLaughlin, a little over \$500. Mr. P. is the owner of the Sonora ledge, situated near Ophir, which has been recently opened, from which he is taking very rich rock.

The Yolo Co. have had some rock crushed from their mine, at the Green mill, the returns from which were so flattering that the Co. have determined to develop the mine in a scientific manner.

SAN DIEGO.

SAN DIEGO WORLD, May 3: Several claims are now being worked with splendid promise that have been abandoned for years. Amongst others, the Great Eastern, which is owned by G. P. Powers. The Messrs. Dwyer, Kowalsky, DeFrees, and Taylor have purchased and are actively working the Van Wirt, which had also been abandoned. These mines all give promise of a satisfactory pecuniary outcome. The ore from both at the present slight depth, grades \$35 to the ton.

The Owens brothers are still sinking, but propose to commence taking out rock to crush at 25 ft. The accounts from the Golden Chariot are most flattering. As a result of their crushing, so far, they have about 240 ounces of amalgam on hand. This will average \$12 to the ounce. They have some 500 tons of ore ready for the mill, and the lowest estimate put upon the rock is \$25 to the ton.

The San Jacinto and Union Co. have begun work, under the supervision of Lloyd.

TUOLUMNE COUNTY.

THE SPARK GULCH CO.—Sonora Independent, May 10: Have recently crushed 130 tons of rock—resulting in 155½ ounces or about \$2,500.00.—The total expenses of working this amount of rock was \$1,100.00—leaving \$1,400.00 clear profit to be divided among 5 shareholders. In view of erecting new hoisting works on a large scale in the spring of the mine, and the fact that a natural stream of water in use will give out in August, but the proprietors in prospecting the hills above have discovered a stream that, with an outlay of about \$2,000.00 can be brought to the mine that will last the year round.

BROTHMAN.—Is situated about 18 miles east of Sonora, and about 2 miles from S. ring Gulch. The lead is owned by Cashwiler & Tullock—J. Tullock, Superintendent. Will commence operations the coming week, and will work 10 or 15 men, as the case may require. The vein is 15 ft. wide, and rock is said to pay \$15 per ton. Shaft in the old works, 150 ft.

THE GOLDEN GATE.—In the Golden Gate shaft, the boys have struck pay-ore which gives prospects very rich. Mr. Long, the Superintendent, informs us that in the tunnel the vein shows a width of 9½ ft., the hanging wall not heard from.—The sulphates are rich, and the rock carries good pay in free gold besides.

YUBA COUNTY.

BROWN'S VALLEY.—Marysville Appeal, May 11: A few additional items from the above mines were obtained yesterday. 150 tons of paying ore has been raised, and there are about 50 more tons broken in the mine and ready for raising. The hands are working day and night in the drifts and shaft, and the Superintendent expects to be able to keep the stamps in motion. The Superintendent intends to go down with the shaft as deep as the stamps will permit, and as drift northward through the old Pennsylvania ground into the Danneberg claim, culling all the pay chimneys as the work progresses. By this course Superintendent Stoch will be able to obtain much valuable rock which former miners endeavored to get by sinking their shafts. During the winter the engine at shaft No. 1 consumed about 10 cords of wood per day, but this is now run with 3 cords. The estimated value of the mine and mill property is estimated at \$5,000, and it is anticipated that 1,000 tons of ore can be raised and crushed. The ore raised and in sight promises to pay well—the best of it from \$20 upwards. The mill is furnished with silver pistons manufactured by O. Lawton & Co., San Francisco, which cost \$1,500.

YREKA.

KLAMATH.—Yreka Times, May 10: This mine on Salmon started their new 32-stamp mill on Monday. There are, now employed about this mine and mill some 80 men and soon a much larger force will probably be put on.

Nevada.

ELY DISTRICT.

AMERICAN FLAG.—Pioche Record, May 10: This mine is proving itself to be one among the richest after the Nevada. The ore here is of the richest kind, and has lately been struck on the 5th and 6th levels. From 25 to 30 tons of high-grade ore are being hoisted daily, and the company's mill is running regularly, yielding most satisfactory returns. The ore is being hauled to the mill as fast as hoisted.

BULLION.—Four large bars of fine bullion from the Bullion and will be shipped this morning by Wells, Fargo & Co.

RUMON says that 24 ft. of solid ore, much of it of the rich chloride class, has been struck deep down in one of the celebrated mines of Ely district.

BELMONT.

EL DORADO.—Reese River Reville, May 10: The big strike in the south end of the 400-ft. level is creating much excitement. This lower level in running south for the last 100 ft., was run in the hanging wall. Yesterday a crosscut, at a point 240 ft. south of the main incline, opened out one of the finest bodies of black metal ever found in this section. Stripping the ledge as the work proceeded, and the stratum being followed back parallel with the drift towards the incline.

Seven more bars of bullion were shipped this morning from the express office here, 4 from El Dorado and 3 from Belmont Co. This makes 15 bars so far this week.

ROBINSON DISTRICT.

HAYES.—White Pine News, May 10: We were kindly shown through the underground workings by Superin-

tenant D. T. Elmore, and found that at the depth of 150 ft. the vein which has been traced from the surface some hundreds of feet, was found running easterly from the hill on which the mine is situated. A large body of ore is now in sight, and one fact demonstrated, viz., that depth exists in the mineral wealth of Robinson District.

ALTUN.—This remarkable location can be described no better than by comparison with the mines in Eureka district on Ruby Hill, differing from them only in the greater value of the ore, particularly in its gold-bearing quality. Hendrie, the lumber dealer, being one of the party, having been to the mine for some experience, and with him "pan out" some of the fine ore lying at the furnace erected on the companies property. We procured a tin pan (a little greasy from the last batch of beans cooked in it), and took about 20 lbs of the finest dirt from one of the numerous piles, and went to work. The result was as fine a prospect as one could wish to see, being 25 cts. worth of fine gold. The main shaft is down 180 ft., all the way in ore of high grade and a tunnel has been driven in 640 ft. from the face of the hill, which cuts the ore channel at about 600 ft., making a known width, at the present time, of from 40 to 60 ft., all good paying mineral. Mr. Ogden informs us that he will soon commence building another furnace, when active work will be resumed.

WASHOE.

BELCHER.—Gold Hill News May 10: Daily yield over 550 tons, 200 of which comes from the 1300-ft. level, through the Yellow Jacket shaft. The ore stopes and hauls in that and the other producing levels are looking finely, as usual. The main incline is now down 124 ft., below the 1200 ft. level. The drift north at the 1200-ft. level is in 277 ft. from the incline, and the drift south from the stopes to connect with it is 453 ft., leaving only about 20 ft. to complete the connections. Drifting south at the 1300-ft. level is not resumed as yet, as the timbering in the Yellow Jacket shaft is not yet completed. It with the level above is also being widened and timbered for ore-raising purposes. When the drift connection with the main incline is completed at the 1200-ft. level, with the incline, the ore from the 1300-ft. level will be hoisted through the winze aforesaid and sent out of the 1200-ft. level and raised through the Belcher incline and shaft instead of through the Yellow Jacket shaft as at present.

BALTIMORE CONSOLIDATED.—This mine continues to be the centre of attraction at this end of the ledge, from the important and still improving developments made in it, in the shape of a good body of rich pay ore, the extent of which is not yet ascertained. The west drift at the 250-ft. level has been cut into the new ore body 29 ft., and shows a sign of being on the vein. The second or 550-ft. level is being rapidly driven ahead.

CROWN POINT.—Daily yield 480 tons. The various ore producing levels continue looking and yielding finely as usual, especially the 1300-ft. level, which hides fair to yield better than either the others, and hold out longer. The cross-cut from the 5th floor above this level is being driven in the hanging wall, over 40 to the ton, and the winze from the 1200-ft. level is down 103 ft. all the way in fine ore. The main incline is down to the 1500-ft. level, and the station timbers are being put in for that level. The drift south at the 1400-ft. level is in 157 ft.

UNION CONSOLIDATED.—Drifting and prospecting in the main ledge, with plenty of ore, which gives little anxiety. The company justly consider that they are not deep enough, and are about starting a new shaft some distance east of their present working. This is to be a good sized working shaft, and will be sunk to the depth of 1,000 ft. before drifting for the ledge.

VOONVILLE.—Daily yield about 35 tons, which is all as much more than the Russell and Jones mills can crush. The drift on the 1400-ft. level is being driven, and the winze from the ore-dump run from \$30 to \$120 to the ton. Both mills are kept steadily running to their full capacity.

JUSTICE.—The drift south of the 400-ft. level is progressing with favorable indications. Some very good ore is being taken out near the south line, 200 ft. below the 400-ft. level.

JACON LITTLE.—Upper tunnel in 380 ft., developing a large, fine ledge of both silver and gold. The latest assays ran from \$180 to \$200 to the ton, about one-third of which is silver.

GEHRA.—The north drift at the 1,300 ft. level is going ahead as usual, with very encouraging and improving indications. The drift on the 1,400-ft. level is being driven, and the winze from the 1,455-ft. level. Forty tons of good ore has been taken from the old works and sent to the mill. If it turns out well, there is more where it came from.

YELLOW YACER.—The east drift at the 1,500-ft. level is in the ledge, showing good quartz with porphyry and no ore. The water has been let out and does not interfere with the work. At the 1,400-ft. level, connection has been made with the north winze and drifting both north and south proceeds as usual. Nothing doing at the 1,300-ft. level.

KNICKERBOCKER.—The reports of a strike in this mine during the past week are assuming definite shape. We are informed that the assays have improved considerably during the past 3 days and the ore dipping to the east. The body of water tapped impedes further development very materially at present.

SILVER HILL.—The Bacon mill is still kept running steadily on ore from this mine. No new developments. Average ore assays \$34 per ton.

HASE & NORRIS.—Daily yield, 75 tons. The timbering in the 1,400-ft. level is being driven, and the winze is going ahead actively, and will be completed in about 3 or 4 weeks. Cross-cutting at the 1,700-ft. level is going on as energetically as the heat will admit of, with no new ore developments as yet.

SAVAGE.—Drift north at the 1,500-ft. level to connect with the Gould & Curry, and at the 1,700, to connect with the 1,800-ft. level. The drift on the 1,800-ft. level is being driven, and the winze is going ahead actively, and will be completed in about 3 or 4 weeks. Cross-cutting at the 1,700-ft. level is going on as energetically as the heat will admit of, with no new ore developments as yet.

CHOLLAR-PODS.—Daily yield, 185 tons, all from the old ore producing sections. Average assays, about \$33 per ton. A new and good development of pay-ore is reported to be made at the 750-ft. level near the Halse & Norcross line.

IMPERIAL.—The drift south of the 1,700-ft. level, as well as the cross-cut from it, is in quartz and porphyry. A winze connection being effected with the level above, better air circulation is afforded. Sinking is resumed on the incline.

DANEY.—New shaft down 77 ft. in good working rock. Gould & Curry.—The new pump in the incline proves effectual in keeping the water out, and sinking is actively resumed. Prospecting at the 10th and 11th levels developed only barren quartz and porphyry as yet.

SEARON.—Total depth of shaft 335 ft., 20 ft. having been added during the week. No water interferes, the machinery works well, and all operations go ahead smoothly and effectively.

BUCKEYE.—Daily yield about twenty tons. The winze below the first station is down 82 ft. in good ore, and the regular ore producing sections all show finely.

LAKE.—The ore taken out this week shows considerable free gold, mixed with black sulphurets. Still drifting north with good progress.

LAMO.—Sinking deeper and progressing as usual, the rock showing improvement and growing softer. Very little hoisting is required.

Arizona.

MINING IN YUMA COUNTY.—Arizona Citizen. The Castle Dome mine is being vigorously worked by its proprietors. There are at our landing 60 tons of ore, for shipment to San Francisco per Steamship "Newbern." The only draw back to this mine is the high prices asked for transportation of ore from the mine to the landing. But even this is being removed every day by the proprietors putting ox teams of their own to work. The Silver Hill mine, located in the Blackhead, (Ca-

beza Prieta) mountains, 40 miles south of the Olla river and about 75 miles from this city, was discovered and located, not long since, by Alvah Smith. The ledge is 2 ft. wide and about 1500 ft. long. The ore will average at least \$100 in silver to the ton.

The Golden Era is a gold-bearing quartz mine, situated about 15 miles south of Rattlesnake, and 45 from this city. The vein is 4 ft. wide, and prospects very rich. No assay of this ore has yet been made; it will in our opinion, go \$200.

The Kerr mine is only 20 miles from here, near Gila City. Its ore assays \$50 in silver and \$40 in gold to the ton. The vein is 6½ ft. wide, and is owned and worked by Col. A. F. Rockwell, A. Smith, A. Long and O. E. Buck, each having 1500 feet.

RICH DISCOVERIES.—San Diego World, May 3: We were favored with a call from Mr. Lallier, who has spent some months in Arizona, and who brought in with him some rich specimens of silver ore collected on the Arizona and Sonora line. The region from which this rock is taken is remarkably rich in minerals. Some of the ore shown us by Mr. Lallier is very strongly charged with galena. Other specimens show copper. The percentage of silver is large, and there are considerable traces of gold.

These specimens were mere surface croppings. The ledges are about 2 ft. wide at the surface, and extend for an immense distance. The locality prospected is distant from Yuma city about 80 miles. One of the ledges has been called "Silver Queen," and the ore from it is of a specially fine quality. Mr. Jones, Mr. Lallier and others, are interested in the mines, and they are destined shortly to have a very handsome outcome, we have no doubt.

Colorado.

MINING ITEMS.—Colorado Herald, May 7: But little mining is being done in Russell District this year. Joseph Shinnaman, Strader & Co., have leased the Missouri and are raising mill ore that yields 8 ounces per cord. Paul & Sawyer have been raising very valuable ore from the Wantoga ledge. Mr. Thnh is operating profitably on the Lancaster ledge at the head of the Virgin canon. His mill ore was 8 ounces gold to the cord. He has sold 6 tons of ore to the Whale mill company for \$100 per ton.

Monday & Taylor are raising one ton of smelting ore per day on the Leavenworth ledge, in Leavenworth gulch, beside large quantities of mill ore. Bors & Co., are doing equally well on the adjoining claims.

Mining is carried on steadily and profitably on Seaton Hill, above Littleton. The Seaton ledge is worked in two places. Ford, Lewis & Seaton are working on the 100 ft. level in their mine, and are raising large quantities of valuable ore. They are also raising ore from the deep shaft, at the bottom of which, 270 ft. below surface, they will commence drifting. They have from one to two million dollars worth of ore on the Seaton dump. T. J. Dean is working on his claim and is taking out large quantities of rich ore. The quartz from these mines is sold to the B. & O. Smelting Works at Black Hawk.

EMPIRE.—Gen Munson is selling ore regularly to Pearce's Swanes Smelting works at good prices from the Tenth Legion ledge. He is working at a depth of 200 ft., and has a crevice of good size with plenty of ore in sight.

Montana.

TUCKER GULCH MINES.—Helena Herald, May 1: Wm F. Wheeler & Co. own 160 acres of mining ground lying east of "Tucker" and includes the famous "Uncle Sam" ledge. Collins & Walker have a patent for 47 acres in Tucker, joining the above claim on the west. These mines have been prospected and worked from time to time, as much as the small supply of water would permit. In 1855, large quantities of gold have been taken out and there yet remains about three-fourths of the ground untouched.

Since January, 1872, about the time that Mr. Blais Walker purchased his half interest therein, the claimants have put in a 16-inch flume, 1,900 feet in length, 475 feet of which is set in a tunnel, cut through solid granite, at a cost of \$9,000. They have constructed such capacity as such capacity as to supply 180 inches of water for ten hours' working with a hydraulic; from this reservoir they have laid an iron pipe, 5 inches in diameter, giving them a "head" of about 90 ft. perpendicularly: to the end of this pipe is attached 130 ft. of hose with a two-inch nozzle. Here was a successful opening of a valuable mine, and a supply of water at a rate cannot fail to yield a large rate cannot fail to yield a handsome income. If not a large fortune. The precious metal is there, for I saw it with my own eyes.

We yesterday saw at the Cosmopolitan a gold brick weighing 94.77 oz., 838 fine, and of coin value \$1,641.70, being the result of a run in the Harvey mill, Grizzly Park, upon 54 tons of ore from the McCrea ledge, at the head of Nelson. This is the third run made on ore from this ledge, the first paying \$14, the second \$19, and this one \$80 per ton greenbacks. This ledge was discovered last August by Mr. McCrea, and it is thought by many to be the extension of the famous Park ledge. It is developed to the depth of 130 ft., and has a crevice of from 6 inches to 2 ft.

A. Davis ledge, at Cherry Creek, named after its discoverer, is supposed by a majority to be the largest yet found in this district. The shaft is 60 ft. deep, and at the bottom the crevices shows a width of 8 ft. I saw returns of 3 assays made from rock taken from this crevice. The lowest went \$60 dollars to the ton, the next \$125, while the highest reached the good grade of \$175. There are said to be many more of these high-grade ores. There are many more ledges embraced in this district, several of which will compare favorably with those I have enumerated.

BULLION.—Montanian, May 1: Messrs. Wiant & Lehman of the Clipper mine, Silver Star District, on Sunday last sent up to Banker Elling, for shipment, another batch of 80 ounces of bullion from their ledge. The regularly with which these shipments are made, justifies us in saying the Clipper is paying a handsome profit to its owners, and is the treasure-house of the district.

ANOTHER CLEAN-UP.—Helena Gazette May 7: Messrs. Keating & Blacker have just made another run and clean-up at their quartz mill at Keatingville, Jefferson county, and the result is: 520 ounces of gold retort, which was brought to this city yesterday by them in person and deposited in the First National Bank. The value of this bullion in currency is about \$12,000. It will be remembered by our readers that it has only been a few days since Messrs. Keating & Blacker made their first run of the season, which was valued at over \$14,000. These runs are from the average rock on the dump.

URAL MINING Co.—We have received the prospectus of the Ural Mining Company, Oswego N. Y., a company organized to work mines near Ellsworth, Nye county, Nevada. The company claim level lying parallel to each other known as the Vernon, Adrian, Oakland, Gould & Curry Nos. 1 and 2, Ural and Union, covering in all 6,375 feet.

SILVER CITY, NEV.—Under date of May 9th, J. D. writes: Times are quite lively, and stocks are going up. The mills are nearly all running, and there is considerable prospecting being done outside of the large mines. Also some surface mining and about American Flats.

New Incorporation

WATSON M. Co.—May 10. Location: White Pine, Nevada. Capital stock, \$3,000,000. Trustees—S. A. Raymond, D. P. Elmore, Henry Raymond, Ohas. Jones and Wm. H. Watson.

Edible Cacti.

GIANT CACTUS, (*Cereus giganteus*).—This noted plant of the barren hills of Arizona is commonly called monumental or giant cactus. It grows twenty-five or fifty feet high, and four and a half in diameter, is deeply ribbed, and covered with long black spines. Its fruit, Fig. 1, is pear-shaped, of a greenish-yellow color, with a few small spines scattered over the surface, which fall off as the fruit becomes thoroughly ripe. The fruit is borne upon the highest part of the plant, and is usually gathered by means of long, hooked sticks.

The interior of the fruit is of a beautiful red color, and looks tempting; the rind is pulpy, fibrous, juicy and sweet; the pulp is very palatable, and is full of small black seeds, which are also eaten, reminding one of figs, the only difference being that it has more moisture. The seeds are indigestible, unless well chewed. The Indians of Arizona, Sonora and the southern portion of California consider this one of their greatest luxuries, and as long as the fruit is obtainable care for nothing else.

To dry this fruit as a preserve, the seedy pulp is placed between soft inner corn husks, the ends of which are tied, and is then dried in the sun, for winter use or trade. It is also put into earthen pots when fresh, seoured from the air, and sold in the settlements. It retains its sweetness for a long time. A clear, light-brown syrup is expressed from the pulp, and sold in one gallon jugs, (also made by the Indians,) for \$2 to \$5. The Papajo Indians are the largest producers of this syrup. The Pimo Indians, of the Gila river, annually prepare a wine from this fruit, called by the Mexicans tiswein, by taking the fresh pulp or the syrup and mixing with it a certain quantity of water in earthen vessels, and exposing it to the sun for some time to ferment, after which it is fit for drinking.

It is highly intoxicating, with the taste and smell of sour beer; but some time elapses before its stimulating effects are felt. When the wine is ready for use, the Indians celebrate an annual drinking festival. These gatherings are anxiously anticipated for months, and expeditions which have been planned against the Apaches, while under the influence of drink, are then carried into execution. It is of a clear, amber color, and in every respect superior to much of the wine on sale.

Thuber's Cactus.

(*Cereus Thurberi*.)—This is commonly called pitahaya by the Mexicans. It grows in the Papajo Indian country, on the borders of Arizona and Sonora, eighteen to twenty feet high, and four to six inches in diameter, and bears two crops of fruit per year. The fruit is the size and shape of an egg, and is thickly covered with long, black spines. As it ripens it becomes tinged with red, the spines fall off, the fruit splits open, and exposes a rich red, juicy pulp, with small black seeds. This is decidedly better fruit than that of the *Cereus giganteus*, but it is used in every respect for the same domestic purposes.

The Papajo Indians, in transporting earthen vessels filled with syrup or preserves made of the fruit to market, cover their jars with a thick coating of mud, which renders them less liable to break in handling, and at the same time keeps the contents cool, and prevents evaporation, the crockery used being very porous. The fruit is eaten in enormous quantities, and, being very nutritious, the consumers quickly acquire an extraordinary increase of bulk. In making wine or a syrup the seeds are easily separated from the pulp by the use of water. They are carefully collected, dried, parched, and pulverized, after which process they are digestible and nutritious.

THE PEASIMON, (*Diospyros Virginiana*).—This fruit grows abundantly in the Indian Territory and Arkansas. The Indians consume large quantities of it when ripe. It is prepared for future use after the manner of making apple-butter.

Echinocactus Wislizeni, Fig. 2.

This singular species of cactus is commonly called by the Spaniards biznacha, and being twenty inches or more in diameter, a section of the stem is often employed as a cooking vessel. The seeds are small and black, but when parched and pulverized, make good gruel and even bread. The pulp of the fruit is rather sour, and not much eaten. Travelers in passing the cactus wastes often resort to this plant to quench their thirst, its interior containing a soft white watery substance, of slightly acid taste, which is rather pleasant when chewed.

It is a common sight to see on each side of the road these plants with a large perforation made by the thirsty traveler. An Indian, when traveling and wishing to make a meal, selects a large plant, three feet or more long and two in diameter, cuts it down and hollows it out so as to form a trough; into this he throws the soft portions of the pulpy substance which surrounds the central woody axis, and adds meat, roots, seeds, meal, fruits or any edible thing on hand; water is added, and the whole mixed together; stones are then highly heated and dropped into the mixture, and, as they cool, are taken out, licked clean, reheated, and returned to the cooking vessel, until the mixture is thoroughly

boiled. This is a favorite dish with the Yabapais and Apaches of Arizona.

The Papajo Indians pare off the rind and thorns of large plants of this species of cactus, letting it remain several days to bleed, when the pulp is pared down to the woody axis, cut up into suitable pieces, and boiled in syrup of the *Cereus giganteus* or *Cereus Thurberi*. If a kind of sugar which is made by the Mexicans is attainable, it is employed instead of the syrup, thus forming a good preserve. These pieces,

little, it becomes stimulating and nutritious. Some Indians roast the leaves of the *Opuntia* in hot ashes, and, when cooked, the outer skin, with the thorns, is easily removed, leaving a slimy, sweet, succulent substance, which is eaten.

The St. Lawrence Mill at Kelsey's.

A correspondent sends us the following, with regard to operations at the St. Lawrence mine,

Fig. 1.

Fig. 3.

Fig. 2.

FRUITS OF THE CACTUS.

when taken out of the liquid and dried, are as good as candied citron, which they much resemble in taste and substance.

MULBERRY (*Morus rubra*).—This tree grows abundantly in Northern Missouri and along the rivers of Kansas, the fruit being large, sweet, and of a black color. The Indians will travel many miles in search of it. It is found also in the Indian Territory.

Prickly Pear,

(*Opuntia Engelmanni*, *O. vulgaris*, *O. Camanchica*, *O. Rafinesqui*, *O. occidentalis*, Fig. 3.)—The fruit of these species of cactus is much eaten by all the Indians of New Mexico, Arizona, California, and Utah, under the common Spanish name of *tunas*, great quantities being dried for use in the winter. These plants grow in arid desert localities which produce nothing better; they are large and of a bright red to purple color; of a rather pleasant, sweet, somewhat acid taste, and have thin skins and rather large seeds, which are discarded. The skin is studded with bunches of very fine downy spines, which the Indians brush off with a bunch of grass. The Apaches use wooden tongs to gather the fruit, to prevent being scratched by these spines or thorns of the plant.

The Pawnees and Papajoes dry the unripe fruit of the *Opuntia* for future use, to be cooked with meat and other substances. The fresh unripe fruit is often boiled in water from ten to twelve hours, until soft, when it becomes like apple-sauce; then being allowed to ferment a

near Kelsey's Dry Diggings, El Dorado county:—This mine was purchased in March 1871 of Robt. Doran by J. C. Bateman, David Bud and Henry P. Machevin.

FLEXIBLE CURRY COMB.

There was a tunnel run, which cut the ledge 115 feet from the surface, upon which they had run a short distance and extracted about 150 tons of ore, since which time, it has been worked vigorously by the present owners. The shaft is down now 520 ft. on the vein, with drifts running north and south on the ledge every hundred ft. in depth and varying from 200 to 400 ft. in length. The ledge varies in width from 3 to 10 ft. and yields from \$9 to \$30 per ton, free gold. They have a 20 stamp mill to which 10 more have just been added. The mill is complete in all its arrangements and can be classed as one of the most perfect mills on this coast. It has been crushing thirty tons every 24 hours; when the additional stamps are running the mill will be able to reduce 45 tons in the same time. They have a 35 horse-power engine at the hoisting works and a saw-mill attached, where they saw their own lumber and timber for the mine. The hoisting works are located at a distance of 75 feet from the mill. As the ore is hoisted from the shaft it is run on a track and dumped into the ore-house, from whence it passes through the rock-breaker to the feed floor. The pulp after leaving the battery passes through Henley's Concentrators, when the sulphurets are saved, after which it is caught in reservoirs below.

One-half of the property was sold some two months ago to some English capitalists for a large amount, and I think they will not have occasion to regret their purchase. One of the original owners, Machevin, is living at the mine and has been since its purchase superintendent of the same.

Flexible Curry Comb.

We herewith give illustrations of a new, patent flexible curry comb, that seems to possess peculiar merit, in its complete adaptability to every part of the animal upon which it is used. All who have the grooming of horses are aware how sensitive the animal becomes, when the harsh and unyielding teeth of the ordinary comb is made to pass roughly over the points of the bones of the leg and other parts of the body barely skin covered.

The new flexible comb entirely remedies this fault in the old fashioned comb, besides being one that can be easily cleaned, since by doubling it up in the hand, the mat of hair collected is loosened and easily removed. But there is another advantage it possesses and one which should commend it particularly to the notice of manufacturers; it is a comb that can be made and sold so low as to enable any farmer in the United States to have one, and still pay a handsome profit to the manufacturer.

A sample can be seen at Wiester & Co's., 17 New Montgomery Street, who are agents for the sale of rights to the Pacific Coast.

The Quartz Mining Interests of Calaveras.

Calaveras has a wider area of quartz bearing country than any other county in the State. The auriferous belt is at least thirty miles in width, reaching from West Point on the east to Camanche on the west, and extends from the Mokelumne to the Stanislaus river. Between the boundaries indicated the country is ribbed with quartz, and there is scarcely a locality in which the richness of the ledge has not been tested. Paying mines have been developed in almost every portion of the territory that carries quartz, and new discoveries are constantly being made as research is continued. While it is true that mills are going up all over the county, and we are making rapid progress in the development of our quartz interests, still the field for operations is so wide that there is yet abundant opportunity for the adventurous prospector and the most favorable inducements for the investment of capital. The present condition of the quartz mining interests of the county is in a great degree encouraging. We hear the most flattering reports from all quarters, and feel justified in saying that the yield of our mines the coming season will be at least double that of any former year. We base this opinion upon the fact that a number of comparatively new mines are just becoming remunerative, while in many instances those that have paid in the past have greatly increased their former capacity for production. Prospecting is also extensively carried on, and before the lapse of another year it is more than probable that additional batteries will be put in motion. Capital no longer holds aloof, but in combination with labor is very materially assisted in forwarding development and receiving large returns for the investment. Wherever labor makes a fair showing no difficulty is experienced in putting up the requisite machinery for working, and to that fact, more than anything else, is due the flourishing condition of affairs to-day.

With the opening of spring, has come a splendid revival of the quartz mining interests of the eastern portion of the county. Times have not been so lively in the "upper country" for several years as they are at present. At West Point work has been resumed upon the celebrated Zacatero mine. New and extensive hoisting works are being erected, and everything placed in proper condition for active operations. The Lone Star, Ohio Consolidated and a host of others are yielding good rock. Not a mine in the district is idle. At Railroad, the Wolverine and Sanderson continue to pay largely, and a great number of less extensive claims are paying handsomely. In the Mosquito District work is going on vigorously. The Good Hope hoisting works are nearly completed and the mill is ready to run. The San Bruno, Good Hope, Dolly Varden, Cuba and other mines are showing excellently well. In the Sheep Ranch district, the Wallace & Ferguson mine—one of the very best in the county—is still paying enormously. At Rich Gulch, Central Hill, San Andreas, Angels and the vicinity of Murphy's, operations are being steadily conducted with the most flattering results. Taken altogether the quartz mining interests of the county are in a most promising condition, and the life and activity that pervades that branch of industry is beginning to be felt in other avenues of business.—*Calaveras Chronicle*.

USEFUL INFORMATION.

POSITION OF A RESIDENCE.—Houses on streets running nearly north and south are far preferable to those located on those going east and west in a sanitary estimate. In the first, here at the north of the equator, the sun shines brilliantly in the forenoon on the front, and with nearly equal force in the afternoon on the rear. Thus dampness is expelled and the whole edifice is dry and the air far purer for its solar exposure. If a house is on an east and west street, those fronting north are decidedly the best for a residence, because the sun's action on the yard, the kitchen, and usual regions of neglected accumulations, purifies and modifies the humid atmosphere that is sure to predominate in yards and the back side of houses whose rear is north of the street. Thus circumstanced, the back rooms are never so pleasant, cheerful or economically warmed in winter or ventilated in summer, as when on the south side. Opening on the street, the frame of each gets both light and air by reason of the frequent swing of the front door. Here is a law of health in a nutshell.

"LIMITED."—As the meaning of this word as applied to English corporations is not generally understood, the following definition may be of interest. In England they have a limited liability Act, by virtue of which, shareholders in a corporation are exempted from all liability for the debts of an incorporation beyond the sum of their shares. A similar law exists in many of our States, but in England it is customary for subscribers to the stock of a corporation, to pay their subscriptions in installments, and under the law they are only bound for the amount remaining unpaid. Hence the use of the terms "paid" or "unpaid" in their stock report, as either shows the extent of the liability of the company. The term "limited" is simply used to denote that the shareholders of an incorporation, are only liable for its debts, to the amount of their unpaid subscriptions, as distinguished from incorporations on the old individual responsibility plan.

WHERE CHLOROFORM COMES FROM.—We are indebted to the insect tribe for chloroform, one of the most powerful agents in alleviating pain. The little ant contains a substance called formic acid, about which old Jobu Ruy and Martin Lester corresponded a century ago; and they found that it contained an acid; and so it got into books as formic acid. It was found to be composed of a compound radical formyle, and three atoms of oxygen. Dumas substituted chlorine for the oxygen, and thus obtained trichloride of formyle, which is chloroform. Then the Americans found that either was capable of taking away all sensations of the human body; and Dr. Simpson of Edinburgh, found that trichloride of formyle was more thoroughly adapted for this purpose than oven either. All this has arisen from a study of the habits of insects.

THE MERCHANT FLEETS OF THE WORLD.—With all our talk about the decline of American shipping, our merchant marine stands first in the world in number of ships, as we learn from the following, which we clip from an English paper:—In an appendix to a memorandum by the German Government upon its navy is the following estimate of the numbers of the merchant ships of the principal powers in 1869:—United States of America, 26,393; Great Britain, 26,367; Italy, 18,822; France, 15,778; Norway, 6,883; Greece, 5,512; Germany, 5,510; Sweden, 3,357; Austria-Hungary, 3,114; Denmark, 2,853; Russia, 2,648; Turkey, 2,200; Spain, 1,414. The figures since 1869 have if anything raised in our favor.

A LUCKY HIT.—A young man of the name of Hicks, recently conceived the idea of dipping matches, after they were tipped, in paraffine, so as to protect them from moisture. For this improvement, we are told, he now receives from a well-known match manufacturing establishment in New York, an income of about ten dollars per day. Matches thus prepared, are said to ignite readily, after having lain in a basin of water an entire night.

A NEW ALLOY FOR DENTIST'S USE.—According to C. Sauer, a dentist of Berlin, an excellent solder for dentist's use may be prepared by fusing together in a Hessian crucible, 2.9 parts gold, 0.1 part platinum, 2.0 parts copper, and adding to the fused alloy 10 parts of aluminum fused under charcoal. This alloy he claims to be free from the disadvantages of all previously employed compounds of aluminum.

ALABASTAR ORNAMENTS may be imitated by brushing over plaster of Paris models with spermaceti, white wax, or a mixture of the two, or by steeping the models in the warm mixture. Or instead of this process, they may be brushed over several times with white of egg, allowing each coating sufficient time to dry. Only models made of the finest plaster are suited for these processes.

WORKING GREEN WOOD.—A correspondent of the *Scientific American* says: Some of my brother wood-workers may not know that the difficulty of finishing a small piece of green wood, as is sometimes necessary, may be overcome by scorching the piece after it is shaped out. A few lighted shavings will do, and you can then file and sandpaper without trouble.

BLEACHING WAX.—Wax is freed from its impurities and bleached by melting it with hot water or steam in a tinued copper or wooden vessel, letting it settle, running off clear supernatant oily-looking liquid into an oblong trough with a line of holes in its bottom, so as to distribute it upon horizontal wooden cylinders, made to revolve half immersed in cold water, and then exposing the thin ribbons or films thus obtained to the bleaching action of air, light and moisture. For this purpose the ribbons laid upon long webs of canvas stretched horizontally between standards, two feet above the surface of a sheltered field, having a free exposure to the sunbeams. Here they are frequently turned over and covered by nets to prevent their being blown away by winds, and watered from time to time. Whenever the color of the wax seems stationary, it is collected, remelted, and thrown again into ribbons upon the wet cylinder, in order to present new surfaces to the bleaching operation. If the weather proves favorable, the wax eventually loses its yellow tint. Neither chlorine, nor even the chlorides of lime and alkalies, can be employed with advantage to bleach wax, because they render it brittle and impair its burning qualities.

GOOD HEALTH.

The Man of Long Life.

The *Scientific American* describes him as follows: He has a proper and well-proportioned stature, without, however, being too tall. He is rather of the middle size, and somewhat thick set. His complexion is not too florid; at any rate, too much ruddiness in youth is seldom a sign of longevity. His hair approaches rather to the fair than the black; his skin is strong, but not too rough. His head is not too big; he has large veins at the extremities, and his shoulders are rather round than flat. His neck is not too long; his abdomen does not project; and his hands are large, but not too deeply cleft. His foot is rather thick than long; and his legs are firm and round. He has also a broad, arched chest, a strong voice, and the faculty of retaining his breath for a long time without difficulty. In general, there is a complete harmony in all his parts. His senses are good, but not too delicate; his pulse is slow and regular.

His stomach is excellent, his appetite good, and his digestion easy. The joys of the table are to him of importance; they tune his mind to serenity, and his soul partakes in the pleasure which they communicate. He does not eat merely for the pleasure of eating, but each meal is an hour of daily festivity; a kind of delight, attended with this advantage, in regard to others, that it does not make him poorer, but richer. He eats slowly, and has not too much thirst. Too much thirst is always a sign of rapid self-consumption.

In general, he is serene, hospitable, active, susceptible of joy, love and hope; but insensible to the impression of hatred, anger and aversion. His passions never become too violent or destructive. If he ever gives way to anger, he experiences rather a useful glow of warmth, an artificial and gentle fever without an overflow of the bile. He is fond also of employment, particularly calm meditation and agreeable speculations, is an optimist, a friend to Nature and domestic felicity, has no thirst after honors or riches, and banishes all thoughts of tomorrow.

Upon the above the *Science of Health* comments as follows:—"This picture is generally correct. The complexion, however, has nothing to do with it. Brunettes and blondes may be equally long-lived. There are fair-haired races and dark-haired races of equal vitality; nor can it be proved that the one outlives the other. As to 'banishing all thoughts of the morrow,' we must also dissent. A prudent man lays in food and fuel for future use; he also plows and plants to procure crops; but he need not worry over them."

Something New About Oysters.

Most people know that a dozen or two of raw oysters, more or less, very seldom will produce a feeling of satiety or oppression at the stomach. There is a special reason for this, not known commonly to the public, nor indeed to physicians.

It is that raw, almost alive oysters, contain their own gastric juice, ready, in fact to digest themselves.

Recently, I have been trying experiments on the artificial digestion of food, and among other matters, my attention was directed to oysters. They were disposed of with singular rapidity, and, carrying investigation still further, I have been able, by actual experiment, to demonstrate that oysters direct from the shell, when submitted to conditions analogous to that in which they would be placed in the human stomach, and without any addition, are positively able to digest a great portion of their own mass.

While being cooked, however, their gastric juice is destroyed by the temperature, and they are then only like any other light food, but if boiled long, their albumen becomes hard and dense, and less easy of digestion. People with weak stomachs, may hence take comfort in the reflection, that there is one article of diet, which they may usually indulge in without fear of after trouble, namely, fresh raw oysters, which, happily, are provided with an assistant to help them in their solution.—*Scientific American*.

Health of Farmers.

Farmers have unequalled natural advantages for health, strength and longevity. The statistics of disease and the tables of mortality, however, are against them. This is not due to their vocation, but to their misuses of it. No class, as a whole, is probably so utterly reckless of health conditions. So far as our acquaintance with the habits of the farmers is concerned—and it has been extensive—it compels the conclusion that, as a rule, the dietetic habits of the farmers are worse than those of any other class, who have the means of choosing for themselves.

Fried dishes several times a day, with several fried articles at each of the three meals, is one of their common dietetic abominations; dried beef, old cheese, and pickles are among the common relishes, while lard and saleratus make their richer dainties infectious and caustic. We have seen on a farmer's table, fried pork-fried eggs, fried potatoes and fried griddle-cakes for breakfast; fried ham, fried hominy and fried parsnips for dinner, and fried sausages and fried doughnuts for supper—all the frying done in lard.

No class is so troubled with canker, erysipelas, tumors, cancers, and humors, as farmers; and the excessive use of pork, lard, fine flour, rich cakes, and greasy pastry, are enough to account for it. In dietetic habits, our farmers are sadly misled by the agricultural journals, nearly all of which pauper to their prejudices and flatter their morbid appetites by recommending and commending swine-breeding and pork-eating, while they fill their kitchen-column with recipes for making "rich and palatable" puddings, pies, cakes, and other complicated dishes, which no stomach ever carried inside of a human body could long tolerate without death or dyspepsia.

The essential need of our farmers is plain, wholesome food, properly cooked. This would give them much more available power for work, relieve them of many of the distresses and expenses of sickness, add many years to their life, and render old age "green" and normal instead of dry and decrepit, as it is in most cases under existing habits.—*Science of Health*.

Deaths from Poisonous Wall-paper.

The Springfield *Republican* records the recent death of R. v. P. Shehan, of Hudsale, Mass., from poison by arsenic derived from the wall-paper of the sleeping apartment of the deceased. The paper was tinted with Paris green. The use of arsenical colors for such purposes should be by law prohibited.

Cases of poisoning from paper hangings are becoming quite frequent. Great numbers of cases, more or less severe are reported, although but few prove fatal. No doubt many deaths have heretofore occurred from an ignorance of the cause, and a consequent continuous exposure, when now more caution is observed, and proper remedies applied. One case was reported a few years since, in England, where four children died successively within two months, in one family, and the cause was not suspected until after the last death, when arsenic was found in the stomach on a post mortem examination. The wall paper on the house was then carefully examined, and it was found that the color was loosely applied without any protective glazing that it readily rubbed off at the slightest touch and then grains of arsenic were obtained from a square foot of the paper. The children all died with symptoms of having been poisoned.

We are told that greens are not the only colors which contain arsenic, nor wall-paper the only fabric colored with arsenical pigments. A correspondent of the *Chemical News*, who is in a position to know, states that the French use the following named pigments, containing arsenic, in calico printing, and that they are equally suitable, and doubtless used, in the color of paper-hangings: *Light scarlet pigment* contained alumina, arsenious oxide, and aurine; *scarlet ponceau* contained carbonate of lime in addition to the above ingredients; *dark green*, a preparation of aniline green and arsenious oxide; *steam chocolate* and *calchou pigment*, both contained arsenious oxide. Hallwachs has demonstrated the presence of arsenic in red, as well as in green-colored wall-paper.

CHRONIC DIARRHEA.—A lady says that she has succeeded in several instances in curing cases of chronic diarrhea, after many other prescriptions had failed by using the following preparation: Take of good brandy, say half a teacup; burn it off by setting it on fire with a match; let it burn till the cup gets hot; then take half a teacup ground cinnamon; half a nutmeg, grated, and add a very little cloves; pour on them half a teacup of boiling water, and fill up the cup with crushed or granulated sugar; then when each have cooled sufficiently, put in a bottle, and use occasionally, or until you prove its value, or otherwise. I found it the best remedy I ever used, and I am the mother of eight children.

REMEDY FOR CORNS.—A correspondent of *Rural New Yorker* says: Bathe the feet in tepid water, to soften the corns; pare these off very closely with a sharp knife; then rub on well green peach tree leaves; when, after continuing the rubbing once or twice a day, the corns will disappear.

DOMESTIC ECONOMY.

OATMEAL, BONE, AND MUSCLE.—Liebig has shown that oatmeal is almost as nutritious as the very best English beef, and that it is richer than wheat bread in the elements that go to form bone and muscle. Professor Forbes, of Edinburgh, during some twenty years, measured the breadth and height, and also tested the strength of both the arms and loins of the students in the University—a very numerous class, and of various nationalities, drawn to Edinburgh by the fame of his teaching. He found that, in height, breadth of chest and shoulders, and strength of arms and loins, the Belgians were at the bottom of the list; a little above them, the French; very much higher, the English; and highest of all, the Scotch and Scotch-Irish, from Ulster, who, like the natives of Scotland, are fed in their early years with at least one meal a day of good milk and good oatmeal porridge.

Speaking of oatmeal, an exchange remarks that a very good drink is made by putting about two spoonfuls of the meal into a tumbler of water. The Western hunters and trappers consider it the best of drinks, as it is at once nourishing, unstimulating, and satisfying. It is popular in the Brooklyn Navy Yard, two and a half pounds of oatmeal being put into a pail of moderately cool water. It is much better than any of the ordinary mixtures of vinegar and molasses with water which farmers use in the haying or harvest field.—*Boston Jour. Chemistry*.

TO WASH BLACK CALICO.—Make a clean suds of soft water, wash the calico through it; then pour boiling water into sweet, skimmed milk till there are equal parts of each; turn the calico wrong-side-out and rinse through this compound. Dry in the shade; sprinkle, and when moist through, iron on the wrong side, and I think it will give satisfaction.

ANOTHER WAY.—Put the dress in the washing machine or tub and pour boiling hot suds upon it; rub it out and, if necessary, rub again on the washboard; then have some warm, hard water, with a little salt in it; rinse the dress and dry immediately. Let the water cool before rubbing it out. All that is needed to insure success is to have the water boiling hot when first applied.

BOILED INDIAN PUDDING.—A correspondent of the *Rural New Yorker* gives the following and pronounces it "good." One pint Indian meal; one pint thick, sour milk; one cup sour cream; one teaspoonful soda, and salt, unless boiled in pork water, which improves it very much for some—I prefer clear water. Stir into the latter, fruit; raspberries are best—dried or fresh. If sour fruit is used, a trifle more soda is necessary. Put into a bag, and tie firmly, allowing two to three inches for it to swell. Boil one hour; a little over will not hurt, but is not needed. The water should be boiling when the pudding is put in, and he kept boiling. Serve with cream and sugar.

TO CLEAN CLOTH.—Grease may be removed from cloth with a mixture of curd soap dissolved in water and oxgall. This should be well rubbed in till spots of grease, etc., disappear. Then sponge over with warm water, to which a little soap and more oxgall have been added. Rinse in clean water, and when nearly dry press with a hot iron on the wrong side. Fuller's earth may be added to the soap mixture for black cloth, and light clothes may be cleaned by merely covering them with a paste of pipe-clay and water, letting it dry, and then brushing it off with a clean brush.

BRINE FOR PICKLING PORK.—Persons who have tested the following, commend it as giving the best pickled pork that they have ever eaten: 8 pounds of salt, 2 ounces of saltpetre, 3 ounces of soda, 2 pounds of brown sugar, to each 100 pounds of pork or hams. The meat must be kept carefully under the brine. If this is done, the above will be found to be salt enough for keeping the meat well.

HIGH PRICES AT THE DIAMOND FIELDS.—A Cape Town correspondent says: "Talk about high prices of provisions at home! Don't mention them after the almost prohibitive prices for almost every article of food at the Diamond Fields. Had the philanthropic Soyer been living, I think he would have made a trip to West Graqualand, for the purpose of working a gastronomic reform amongst the digging community. Here are a few specimens of the prices (or rather extortions) at the New Rush (De Beers): Turkeys, each £2 4s; ducks, 7s 6d; geese, 10s; fowls, 5s; pork, from 1s to 2s per pound; eggs, 5s per doz; butter, 5s per pound; two small cabbages recently sold for 5s each; but even if they had been drum-head cabbages I think the diggers would have been justified in trying the vendor by a 'drum-head' Court martial. At Dr Toit's Pan, a small dish of green peas fetched 8s, and grapes 1s a bunch! so that you will perceive we in South Africa can rival the London butchers and poulterers for dear meat and poultry, and Covent Garden Market for expensive vegetables and fruit. However, the Diamond Fields form an exceptional case. Even the very fowls seem to live extravagantly, and to be impressed with the greed of gain, in proof of which I may mention that lately a fowl at the New Rush was found to contain a one-carat diamond, a pair of gold earrings, and a number of small crystals. Surely, wringing the neck of such a valuable fowl as that, would seem to be as mad an act as that committed—according to the legend—of killing the goose that laid the golden eggs."

The Horticultural Exhibition.

Every one visiting it is delighted with the floral exhibition now—Thursday, May 15th—in progress at the hall of the Bay District Horticultural Society, corner of Post and Stockton streets. To say that it is a magnificent floral display well worthy the attention of the public, is to convey but a faint idea of its real merit. Here the connoisseur and amateur of beautiful flowers, can find him or herself in the midst of a profusion of the most rare and exquisite floral gems known to flower culturists.

Not only an hour, but a day can be well and interestingly passed in examining into the varieties and beauties of this miniature flower world. And then at evening, the keen and spirited rivalry between these mute beauties and the vocal ones, that seem to be vying with them for supremacy, with the blaze of innumerable gas lights and the refrain of voluptuous music, together make up a scene that no one with the least spark of love for the beautiful or taste for the exquisite should fail to witness.

THE STEVENS' FURNACE at Eureka has been pulled down and re-modelled. It is now very much like the one built in this city for experimental purposes. It will shortly be running, when we expect some details of its practical results. The *Sentinel* says the furnace did not work satisfactorily in the first trial. The heat was a complete one and all that could be desired, but the plan of the amelter was not exactly the proper thing.

COPPER IN JAVA.—Mr. Jonker, a mining engineer, has written an official report concerning an investigation as to the existence of copper in the island of Timor, which he had been commissioned to make by the Government. He has come to the conclusion that in none of the places examined by him is the quantity of copper large enough to induce people to work the mine.

THERE is a firm in St. Louis now building a machine which is designed to cut and take up grain, and at the same time to plow and seed the ground.

Admiral Porter vs. Victor Hugo.

In a late issue we commented on the misplacéd confidence displayed by the advocates of movable torpedoes. We are necessitated to return to the subject by a rather startling report which reaches us from New York, and which proves our assertion in regard to the national state of feeling on the torpedo question to have been well founded.

It seems that there is in process of construction at the Brooklyn Navy Yard an indescribable monster; whose attributes, as feelingly portrayed by a reporter of the *New York Times*, are such as to fill us with a vague, indefinable, hair-on-endish sort of horror. It is the impenetrable mystery that hangs over the future navicide, rather than its intrinsic merits (we are obliged to confess that the latter are somewhat obscure), which compels the reverent adulation of heretofore scoffing unbelievers. Ample scope is thus allowed for the free range of imagination.

Cannot we conceive the *Glatton*, or the *Kron Prinz*, or the *Peter the Great*, to be possessed of consciousness, and to be actually frightened out of existence, (as was the condemned criminal in the famous experiment of the French surgeons), when confronted with the unknown leviathan? With what sentiments of awe, for instance, would a sturdy, common sense English ironclad greet the phantomlike apparition of an unsupported smoke stack, steadily making its way through the pathless deep to the certain destruction of the former? And if the well regulated Britisher were so affected by the dread spectacle, imagine the gloomy resignation of the fatalistic and dreamy German floating battery on noting the ominous presage of a hawk, one hundred and seventy three feet long, circling in terrible majesty about her doomed water-line; or the apprehension that would arise in the excitable mind of the tea-drinking Russian cruiser, when called upon to face an invisible and an invincible foe, surpassing the devil-fish of Victor Hugo's creation, and combining the horrifying qualities of that most respectable monster with the familiar properties of unlimited fulminating silver?

We have ground for the hope that all possible enemies will thus succumb, without a show of resistance, in the fact that the phases described are but specimens of what our kindly demon can do when he lays himself out. There are, however, a few prosaic data, which, with tremulous quill, we will reverently attempt to collect.

Our monster—our own American demon, in whom we are to put our trust, has sprung, Minerva-like, from the teeming brain of Admiral Porter—yet, unlike Minerva, immature. But then, in these matter-of-fact days, infant demons must be nourished on the succulent green leaves grown in the treasury department. These a paternal government graciously gathers, as a matter of course. We submit that the same amount of sustenance could be applied to other and more deserving infants; but probably the very hideousness of this protégé has its charms.

Well, our young demon is expected to arrive at maturity in July. When it comes of age, and is launched on its prospective career of devastation, we may possibly obtain a photograph and full history. Meanwhile, we needs must content ourselves with the meagre intelligence to be gleaned from a course of unsatisfactory interviewing.

Its dimensions are, length, 173 feet; breadth of beam, 28 feet; depth, 13 feet. The material is iron, throughout, and the vessel is built on the compartment and double skin principle. Its outline is that of a shark, only about four feet of the entire length being above water. The propelling power is steam.

But here is the mystery. We are told that a ram projects some forty feet from the true bow. We are told that there are torpedo levers along the sides. We are told that the thickness of the plating is from three-eighths to half an inch. But we are not told how a ram of three-eighths of an inch armor is expected to sink a *Minotaur*, nor how torpedoes are to be exploded in such propinquity with any safety to the manipulators. Is the new vessel a ram or a torpedo boat? Echo answers, "a little of both and a good deal of neither." That seems to be the intention of the constructor. If it is a ram, why is it also an egg shell? And if it is a torpedo boat, where is the necessity for making it at the same time a sea-going steamer? These are precisely the contradictions and manifest absurdities of the

build. And, to add to the perplexity of inquiring foreigners, it is said that there are to be adjustable masts in order to render absolute the universality of the plan; and further, that electricity must come in somewhere. This was to have been anticipated. They will find a place to stow it away—say in the hold. Why, what would it all amount to, in this enlightened age, if there were no electricity about it?

While the "what is it" is yet unfinished; while there is yet time for amendment; while the monster is still in the cradle, we would most humbly submit that there are one or two features not embraced so far as we know, in the design. Why not establish a salt-making or oil-trying business on board, to add utility to beauty? Or a sewing-machine factory of moderate capacity, so that the expense of a cruise to Japan would be provided for? But perhaps these ideas are not new at the Brooklyn Navy Yard. Perhaps even now such alterations are contemplated as shall include the adoption of our suggestions. If we are too late with our advice, we have, at all events, the proud consciousness of having done what we could to complete our last naval curiosity.

The "Salted" Mine Trouble.

If the statement published in the *Salt Lake Tribune*, concerning the sale of the Stafford and Lone Star Mines be true, they have some pretty sharp operators in Utah, as well as on California Street. Much feeling exists in Salt Lake on the subject as more than one "salted" mine swindle is reported. General J. T. Harrison of that city published a card in the *Tribune* in which he develops an alleged swindle, of which he was one of the victims. The story is to this effect. Last December two parties visited New Orleans with two silver bricks which they represented as being taken from mines owned, or bonded by them in Camp Floyd Mining District, Utah. They also brought assays with them of ore purporting to have come from these mines. They succeeded in selling the mines for \$163,000, the payment to be made when the reports of these two persons were verified by a committee of the purchasers, who were to personally examine the mines.

This committee, consisting of three of the would-be purchasers, went to Utah, examined the ore on the dump—which they were assured came from the mines—had the ore assayed, and it was so rich that they reported favorably on the purchase, which was accordingly made. General Harrison, who publishes the card referred to, was one of the committee, and was appointed Superintendent. After returning to the mine and staying two weeks he became convinced that the property was worthless. He took out a number of specimens from the mine, not the dump, which he should have done in the first place, and had them assayed. He says: "J. McVicker's certificate of assay shows 'of no value in lead, gold, silver or any of the heavy metals.' Messrs. Selby and Gunter's certificate of assay shows 'silver not a trace.'" General Harrison says he then traced the silver bricks first exhibited to him in New Orleans, to the Chicago Smelting Works, where they were, he says, purchased by the two parties who sold the mine to them, and then he summoned a party of reliable experts who unanimously agreed that the property was worthless.

General Harrison says that after settling up his business in New Orleans he will return to Salt Lake and try and retrieve what he has lost by becoming permanently identified with the mining industry. He denounces the parties who have swindled him by name and announces his readiness to meet any of them. He stated that schemes of a like character were being practiced by these individuals, who were operating in Galveston, Chicago, Louisville and New Orleans. Since the publication of the card, Major J. D. Wooley, one of the alleged salters, has begun suit for defamation of character against the *Salt Lake Tribune* for publishing the card, signed by Gen. Harrison. He claims \$30,000 damages and expenses of conducting the suit—about \$25,000 more. The progress of this suit will doubtless develop the facts of the whole affair, which will be an interesting one to every one. The *Utah Mining Journal* says there is no doubt the silver bricks were obtained from the Swansea Smelting Works, and struck while the die was hot.

If the mining community of Salt Lake City has no more luck in bringing the guilty parties in this transaction to justice, than San Francisco did in the matter of the big diamond fraud, the result is to be deplored. This thing of salting mines and selling them to unsuspecting purchasers ought to be summarily stopped, and the perpetrators made to suffer and be

made an example of. But while we severely deplore the existence among us of men who would carry on a transaction of this kind, we humbly submit, that it is in a measure due to the carelessness of purchasers. Judging from this card, when the committee visited the mine, they only took ore from the dump to have assayed, instead of getting it from different parts of the vein. Then again three gentlemen from New Orleans came as a committee of the purchasers and examined the mines, reported on them personally, and helped pay \$163,000 in hard cash to acquire the property. In all probability these three gentlemen knew more about a cotton plantation than a quartz mine, and the fact that they swallowed all the assertions of the vendors without taking proper precautions to prove them, shows they were ignorant of the first principles of mining speculations, in which every one thinks the other party, buyer or seller, with whom he is transacting business, is trying to "beat" him, until he finds out to the contrary. This is a good rule to go by after the varied experience of our mining speculators; it is at least a safe one.

If these three gentlemen had done what was proper in their position, not only as investors themselves, but as men upon whose report their friends would base their calculations, they would have employed some man competent to judge of the value of the property, to go with them and estimate it. It does not appear that this was done. They relied on their own judgment in the matter, but the result has probably opened their eyes. They are, perhaps, good business men; the fact of their being able to buy the mine at such a figure is sufficient evidence of that. But would they, if intending to buy a ship or a steamer, of which they knew nothing, have purchased her after casually looking at her lying in the stream, without going aboard. They buying the mine in the manner they did is a parallel case to what the purchase of a ship would have been under the above conditions. Would they pay a man for a crop of grain, wool or cotton, without knowing something about the quality of the staple? If they were not familiar with it themselves, would they not have secured the services of an expert on such matters to give them advice?

Unfortunately, every person who can run a grocery-store, a newspaper, a farm, a ship, or anything else, thinks he is competent to run a mine. Several people who have tried it have found out differently, to their sorrow, but there yet remain a very large number of people who think all they have got to do to make a mine pay is, dig a hole in the ground, hoist up ore, crush it, and put the bullion in their pockets. Geological knowledge is entirely ignored by them in selecting their property. Even common sense, as applied to the concerns of every day life, is put aside by novices in mining operations. A few illustrations like the one in question may save some from similar misfortune, while it is a dear experience to the parties directly interested.

No man ignorant of mines or mining operations has any business to buy mining property, without taking the advice of some well-recommended and honest expert in such matters. Mining engineers of experience and reputation are plenty on this Coast. Their services are always to be had for a compensation commensurate with their labors. It pays better to employ them at first, than lawyers at last—besides it is more satisfactory. Now while we extol the recent occurrences in Colorado, where the honest miners drove several "salters" out of their community, and sincerely regret that such circumstances occur amongst us; we, nevertheless, are quite satisfied that a few such occurrences brought before the people will brush up the public mind, so that they may take warning. Time was when a man could come to San Francisco with 30 pounds of rich ore and a rough msp, and get thousands of dollars for interest in the property he represented, but such times have passed long since. People are too shrewd to invest on such slim chances; they are "too thin" and "wont wash." Perhaps the experience of this city might do for other localities, but if they want to try it themselves, they will find the lesson a dear one. This whole matter will probably be ventilated in the courts, and the origin of these two silver bars be made public.

A FOWLER STEAM PLOW FOR OREGON.—Mr. R. R. Thompson of Portland, Oregon, we are told has ordered one of Fowler's steam plowing apparatus from England, and it is expected to arrive this summer.

WASHOE.—An interesting letter from our correspondent at Virginia City will be found on page 316 of this issue.

Sunday in the Mines.

There is a very large and fine painting by Charles Nahl now on exhibition in a window on Kearny street, in this city, representing a scene entitled "Sunday in the Mines." The accompanying illustration was made from the original drawing from which the picture was taken. The scene is a familiar one to many of the early Californians, who were in the mining camps of "49" and "50," when gold was plenty, and as easily spent as it was earned. Mr. Nahl, who ranks among California's most noted artists, "knoweth whereof he paints," since he has handled a pick and shovel, rocked a cradle and fed a sluice in the red soil of California's golden hills. His portrayals of California mining life are remarkably truthful and natural in all their details. He seized every opportunity to perpetrate scenes with his pencil, that came under his observation; and the result is that he accumulated a vast number of sketches on these particular subjects, for which we would otherwise have had to rely upon our recollection. The figure on the extreme right and the tall man quietly smoking his pipe, as well as the central figure in front of the cabin, are not imaginary persons, but represent people well known in Grass Valley in early days. Mr. Nahl resided there and was personally acquainted with them.

The scene represents "Sunday in the mines." Picks, shovels, rockers and pans are idle, and it is a day of rest. The miners that have them, put on a "boiled shirt," a pair of clean overalls and perhaps black their boots. Some do their writing, some their washing, some mend their tools and cabins, while others give themselves up to horse-racing, gambling, getting drunk or whatever else can amuse their demoralized natures. The Sunday in the mines was not the Sunday of their boyhood by any means, but all enjoyed it in their peculiar manner. It was harvest times for the gamblers and thieves who crowded thickly in such places, and a day of peaceful rest for such as had the inclination to keep themselves apart from the more jovial. The scene is a good one and will be recognized as truthful by those who have ever witnessed similar ones.

The action of the drunken individual with the bag of scattering dust, attacking his pile on a horse race, and the character of the riotous group on the left, fighting over their cards, are portrayals of what is supposed, away from this coast, to constitute the prominent features of life in a mining camp. But the action of the several figures on the right during such scenes of excitement near by shows that not all of California's pioneers were drunkards, gamblers, jockeys, and murderers. The central figure in front of the cabin is reading his Bible to two eagerly listening and interested hearers; the young man in the cabin is writing words of encouragement and hope to those still under the paternal roof-tree or perchance to some waiting maiden, anxiously expectant of words from her roving lover. The individuals on the right are making a washday of Sunday, and one in scanty garments looks dolefully, but with a kind of mirth at the deplorable state of his nether-garments. In the back ground may be seen the hills and gulches whose hidden treasure has drawn this ill-assorted crowd together and in front are some broken miners' tools, the embers of a fire, cans, bottles and all the usual accompaniments of the front yard of a miners' cabin.

Such scenes as this may yet be seen in many camps on this coast; but money is not so plenty now-a-days as it was then, and many of the evil tendencies of our mining population are checked in consequence. Some men will if they have money, "waste their substance in

placer claims were plenty. The parties owning the large hydraulic and gravel claims in this State at present, are, the greater majority of them, steady, hardworking men, who have learned by experience to hold on to what they get and not throw it away on the sharpers and

mistake of supposing that that sort of thing was to last forever. As a consequence of this feeling they became possessed of the idea that they were all millionaires, that if they spent a fortune to-day, they could earn one to-morrow. Accordingly, money was literally thrown away on useless, expensive amusements, gambling, horse-racing, etc.

An excuse for this line of conduct is to be found in the fact that the round of amusements in "49" was then exceedingly limited. Female society, of the right sort, was not there to exercise its healthy influence for good on the community, and round off the rough corners in the characters of the miners. Men placed in the position which they were, suddenly raised from comparative poverty to affluence and even wealth, and at the same time released from the ties and conventionalities of cultivated society, and thrown in with others of lower moral qualifications, with the additional incentive that they were amenable to no laws for their actions, became, in a measure, rough, uncomely, careless, and extravagant.

This state of affairs, with its demoralizing influences, developed naturally the latent tendency of most men to live a fast life and spend their money freely. Others again, although they changed their mode of life, did not change their characters; and these men prospered. Unfortunately, by far the majority of the "49-ers" now amongst us are men who have seen their best days, physically speaking, and whose purses bear no evidence of the sums they once contained.

PATENTS & INVENTIONS.

Telegraphic List of U. S. Patents Issued to Pacific Coast Inventors.

[REPORTED OFFICIALLY FOR THE MINING AND SCIENTIFIC PRESS, DEWEY & CO., PUBLISHERS AND U. S. AND FOREIGN PATENT AGENTS]

By Special Dispatch, Dated Washington, D. C., May 13th, 1873.

FOR WEEK ENDING APRIL 29th, 1873.

FILES.—James B. Johnson, S. F., Cal.
AUTOMATIC GATE.—Joseph P. Ponce, assignor to self and John Miller, Mayfield, Cal.
LUBRICATOR.—John Gates, Portland, Oregon.
ORE WASHER.—Thomas Wren, Hamilton, Nevada.
SASH HOLDER.—Elijah Knapp, S. F., Cal.
VESSEL FOR CONTAINING LIQUIDS UNDER PRESSURE.—Samuel Marks, S. F., Cal.
ROTARY STEAM ENGINE.—William C. Stiles, Nevada City, Cal.
CLAMP FOR DENTAL PURPOSES.—Charles E. Blake, S. F., Cal.
TRACTION WHEEL.—Oliver Hyde, Oakland, Cal.

NOTE.—The patents are not ready for delivery by the Patent Office until some 14 days after the date of issue. NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO. in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with greater security and in much less time than by any other agency.

THE WHITMAN MINE.—This mine is located in Indian Springs Mining District, Lyon County, Nevada. It was sold about three years ago, by the Whitman Gold and Silver Mining Company to the present company who have reincorporated under the name of Whitman Silver Mining Co. They have been sinking on their mine for the past five months, and it is said have found a well-developed ledge of good pay ore ten feet in width at a depth of seventy feet from croppings. Some of the ore is very rich, assaying up in the thousands; the owners have started another shaft to strike the ledge two hundred feet from the croppings, and intend to put up hoisting works this summer.

ARTIFICIAL MEMORY.—We have in hand a pamphlet of some seventy-five pages that purports to give a full and effective method of making a bad memory good and a good memory better. It is gotten up by Wm. Nemos, Prof. of artificial memory. Its study, it is claimed, will enable any one to use the natural memory to wonderful advantage, as well as to perform the extraordinary feats of memory with which Mnemonists astonish the world. For sale by A. L. Bancroft & Company, San Francisco; price one dollar.

COLLIERY EXPLOSION.—A dispatch to the dailies from Halifax, (N. S.), states that a fearful explosion occurred in the Drummond colliery, Pecton county, on the 13th inst. The manager, assistant manager, and 75 other men were in the pit, and the stope being on fire, there was no mode of egress from the mine. The fire was raging up to the time the last dispatch was sent and no further details have arrived up to present writing.

THE EMMA MINE FIRE.—Great excitement was caused last week in Salt Lake over the report of a terrible fire in the Emma mine, and many lives lost. The whole thing proved extravagant and untrue, as only the carpenters' and blacksmiths' shops at the mouth of the mine were burned, no one being injured, the men in the mine having escaped through the Illinois Tunnel; the damage done was slight

SUNDAY IN THE MINES.

riotous living" while if they are in moderate circumstances, they behave themselves like men. The majority of the mining towns of this coast are to-day "quartz camps," where the men work for wages and do not have the amount of money to squander that they did in days gone by, when

blacklegs who infest every community where money is plenty. In "49," men who had plodded wearily on at small salaries in the Eastern States found themselves making more in one day than they accumulated in a year at their old occupations, and most of them made the

Seth Green on Fish.

How the Rivers, Brooks, Lakes, Ponds and Bays of the United States are Stocked.

ROCHESTER, April 22, 1873.—“I want to see every lake in the Union become a fish pond,” Seth Green said to me this morning. “And,” he continued, “as there are 647 lakes in this State of New York, just see the waters we might stock with the people's food.”

“Such a provision would give a lake full to about every six thousand of our population?”

“Yes; those bodies of water are small, but abundantly able to support any demand that may be made upon them.”

Forty Years in the Harness.

“Then you are thoroughly in earnest Mr. Green. You propose to make fish culture a national business?”

“Certainly. Here I have been nearly forty years of my life a pisciculturist, and I am convinced that the old fishermen know literally nothing of the rationale of their art. Fish culture is a subject developing day by day. A few years ago the vast spawning operations now practiced by me at the State hatching house, at Calonia Springs, were unknown. Even now general ignorance prevails among the craftsmen. When I went down to stock the Connecticut River with ehad,

The Yankees

Stood on the banks of the stream and laughed at me. The fishermen derided me because I told them that I was going to cheapen fish; the boys hooted at me, and accidentally on purpose they would let a shad fall on me. Thus I became a martyr. These pleasant little episodes made me laugh at first; but at last I got tired of the circus; but it wouldn't adjourn. Time rolled on and shad fell in price because the spawn had proven fruitful, and they became so plenty that the market values fell from \$18 and \$50 a hundred to as low as from \$3 and \$18 a hundred!”

“Yea,” added Mr. Cooper, one of the former Commissioners of the New York State Fisheries, and who was present in the room, “Seth knows more about fish culture than any man in the world. He is thoroughly practical—an angler by nature, a good shot, fond of the bush and forest, always lingering about brooks and streams, turning over stones and finding what there is new in our creation. If he comes upon a bug generally unknown, he can tell you its habits, age and ways of multiplication. He has been a close observer.”

I glanced towards

Mr. Seth Green

To survey him more critically after this brief description of his character. He appeared to me about fifty-five years of age. His frame is stout, but not large, and he has the carriage and ways of a man who has spent much time in the delightful solitudes of angling. He does nothing enthusiastically; never makes a statement without qualifying it; but will talk fish to you until you feel the scales growing on your back. You have half a mind when surveying Mr. Seth Green, to consider him Mr. Shad Green, to look for his gills and fins. He really talks well, and, so to speak, rather humanizes fishes as he proceeds to recount the routine of their lives, their nourishment, domestic intercourse and final maturity. Here is a man whose knowledge of the piscatorial world is vast, and who from boyhood to the present hour has never ceased to labor for the advancement of fish culture—a man who may be said to have produced more animal life than any one living in the world. Rochester has always been his home, and every citizen knows Seth and honors him as one of Rochester's worthy sons. It is fortunate for the State and Union that Mr. Green is superintendent of the fisheries, for, besides possessing the qualities I have named, he does not believe in mere fancy culture like trout spawning—a luxurious and high-toned pastime—but in filling our lakes and rivers with millions and millions of fish for the benefit of our millions and millions of people. We talked long and earnestly upon this subject, and Mr. Green said:

“I am constantly trying

Bold Experiments.

For instance. I placed in the Genesee River in 1871 over 15,000 young shad, with the object of seeing if they would live in fresh water without going into salt water, as their natural habits incline them. They did live and thrive, and in June, 1872, young shad were caught at the mouth of the Genesee six inches long. So up to this point the experiment has proven a success. We intend to keep on finding out the nature of all fish and if they cannot live in other climates and localities than their own just as well as man does.”

“But, strictly speaking, all fish are local. They do not migrate?”

“Yea, that is true. When I used to fish in Lake Ontario I would exhaust one locality, absolutely catch all the fish occupying and dwelling within a certain square. The fishing grounds then became destitute. But when I removed my nets further down the shore, say eight or ten miles, I found that fish were as plenty as ever.”

“You mean

White Fish?”

“Certainly, white fish are being consumed very rapidly. It is now estimated that every four years the quantity of white fish in our great lakes is being reduced by fifty per cent. You then perceive that it will not take long to

completely exhaust all our waters. If other movements were not in contemplation to spawn and multiply, America would soon have none of the tribe. It is too bad when we have thousands and thousands of miles of rivers and brooks, and vast lakes, to say nothing of the minor ponds, that we should not be, as we are by nature, the greatest fish raising people in the world.”

Cheapening Food.

“It would cheapen all kinds of food, it seems to me.”

“Obviously. If you get all the people of America eating shad, white fish, salmon and bass, and if you breed these fish so that it only costs the trouble to secure them, then a most important and nutritious article of food is on the table for a mere song. People will eat fish instead of beef. Beef being in small demand will thus cheapen, and so will all other meats in comparison. Now what does all this mean? It means the elevation of the laboring classes. It tells one that he can go to yonder lake or brook, catch his fish and have them on his table. Socially and morally fish culture is a blessing and a boon to toiling humanity. I am surprised that people do not see the economy involved in it.”

“But I suppose that some notion of its benefits is getting abroad.”

Educating Pisciculturists.

“In this way I am educating men in my employ in the art of spawning, and by-and-by we will have a profession of experts in the country. Every man cannot be a pisciculturist. It requires many qualities and long experience.”

“That is proven by the number of gentlemen in this region whose trout ponds have failed, I suppose.”

“Oh, it is perfectly natural that trout ponds should fail. The water may be bad; their owners may not be experts or assiduous enough, and many of the seemingly unimportant details may be overlooked, whereas they are of vital consequence.”

Bass.

“It is now only fourteen years,” said Seth Green to me, “that fourteen bass were put into the Potomac River by an Englishman, and to-day it is the greatest bass stream in the world. See how they multiply. Another case: Only twenty-four were put in a lake in Orange county four years ago, and now over a ton of bass has been taken out.”

“What do you call the mature age of the fish, say of all species, Mr. Green?”

“All fish—there are exceptions—arrive at maturity, our *genus homo* twenty-one, when they are three years of age. They should be eaten then.”

“Mr. Green, I have heard that you went out to California.”

Taking Shad to California.

“Yes, I went out there and took with me 15,000 young shad and turned them loose in their rivers delivering in the Pacific. It was a great labor to transport them over the Pacific railway—so many changes of water and so little of it along the route; but I worked with my own hands and succeeded in getting through. This is the first time shad had ever been sent to the Pacific coast. Letters from California inform me that they are doing well. So I have been at work all over the United States carrying hundreds of thousands of small fry to stock the waters of the country. My experience among the Yankees was not so pleasant. What do you think of New England generosity—the States of Massachusetts, Connecticut, Vermont and New Hampshire each made a special appropriation of \$50 to pay my labor in making a perfect success in shad hatching; and they sent envoys who came to offer me the \$200! I set loose 15,000,000 in their Connecticut River in one year.”

“How, then, do you sum up the general result of your labors?”

A Few Figures.

“Shad have been cheapened all over the country. We are stocking streams, lakes and ponds day by day. Orders are coming in from all parts of the Union, and we are satisfied with our work. We encourage fishing with the hook and seek to discourage nets and seines. Politics have left us alone and we have left politics alone. We have put ninety-two bass in Brant's Lake, ninety in Tinsed Pond; sixty black bass, sixty black pike, 400 rock bass in Conesus Lake; 100 Oswego bass and 400 rock bass in Schuylers Lake, and also 8,000 white fish; 10,000 white fish in Oneida Lake, and also 10,000 salmon trout; 3,000 white fish, 1,000 Oswego and black bass, 400 rock bass in Hatch Lake; 3,000 salmon trout in Eaton Reservoir, 1,000 bull heads in Chautauque Lake, and 400 gold fish in Irondequoit Bay. These are only a few examples taken at random. In shad hatching a few entries will show the operations at Mull's Fishery in the year 1872:

May 19—Caught 136 shad; seven ripe; 150,000 spawn; water sixty-one and sixty-two degrees.

May 20—Caught 123 shad; nine ripe; 200,000 spawn; water sixty-one and sixty-four degrees.

June 4—Caught 103 shad; fourteen ripe; 230,000 spawn; turned loose 190,000 young shad fry; water sixty-one degrees.

Hatching

Hardly needs any explanation here, yet the marvelous discoveries that have been made in all the processes of incubation should be remembered by the reader. The female is taken when ripe, and her spawn gently removed by pressure and placed in a tin pan containing

cold water. This spawn is then impregnated by exuding the milk of the male by the same process, after which the eggs are placed in a wooden box, and a stream of spring water is made to pass over them constantly. After three months the eggs have become tiny trout, but they are still burdened, for thirty days by what is called the umbilical sack. They are then fed, sized and gradually matured. Salmon are hatched in the same manner. “Do you know,” said Seth Green, as we were driving back, “that I stayed up in a tree two days to see two salmon spawn in 1838, and I am probably the only man in the world who has seen that evolution?” How characteristic of the man!

Shad are hatched in one week, and need nothing but a plain box with a wire bottom, so inclined to the surface that a constant agitation of the water is going on. Seth Green invented this system. Bass, and, indeed, all members of the perch family cannot be hatched as yet, but we do not know when some process may be discovered.—*New York Herald.*

Our Coal Fields.

The rapid decrease of fire-wood in the Sacramento and San Joaquin valleys, as well as on the slopes about the bay of San Francisco, has caused a growing trade in the commodity of coal. We well remember when there were less than half a dozen coal-yards in the city; when anthracite coal sold for \$45 a ton; when “corners” were put up in that essential generator of steam, by C. K. Garrison and others who made fortunes out of their speculation in a single day. Now the supply of coal in our market is so varied and extensive that anything like speculation seems impossible.

The first production of coal on this coast was in 1852, at Newport, on Coos Bay. The owners of the mine at one time owned and run the old propeller Hartford, between that place and this city; but as the steamer could burn a good deal of coal and carry very little of it, the venture was for a time abandoned as unprofitable. Since then the work has been resumed and the coal brought hither by sailing vessels. The Eastport mines, on the same bay, were opened much later, the capital being furnished by Flanagan, Oliver, Mann, and others. This company now own a fine low-pressure ocean steamer, making semi-monthly trips to their mine, and are paying dividends of five per cent. per month on their capital stock. This is far better than most of the silver stocks on the Comstock ledge. We learn, that, though this Eastport mine is already worked below the sea-level, yet the water in the mine is of so slight a depth as to entail no great expense for pumping, as is the case in most other mines. In some of the mines about Monte Diablo, the shafts fill up so fast that the proportion of water removed to that of coal is nearly two tons to one. This, of course, cuts off a great share of profit. Some idea of the importance of the Coos Bay coal trade may be formed from the fact that the clearance of brigs and schooners from that bay, last summer, averaged forty per month. These vessels always carry lumber as a deck-load and coal in their holds; hence the shipments of coal are not as extensive as one would at first imagine from the number of vessels. Still, the shipments from Coos Bay can not fall far short of 22,000 tons per year.

The mines at Bellingham Bay were opened in 1857, just before the outbreak of the Frazer River hegira. These mines are located near Sehome, and belong to the Bank of California. They yield of “black diamonds” in 1872 amounted to only 4,100 tons against 20,284 tons in 1871. This is due to the interruption of work during the first nine months of 1872. Their facilities for shipment are very extensive, the vessels being large ships, instead of the small brigs and schooners used in the Coos Bay trade. The yard of this company is located at the foot of Harrison Street, where they always have on hand a large supply of coal. R. B. Cornwall is President of the company, as well as its general agent. The average receipts from these mines are over 2,000 tons a month. The present cargo price is \$10.50.

The Monte Diablo mines were first discovered in the year 1859, but for a long time the coal was deemed as worse than useless. All the steamboat engineers inveighed against it for clogging their furnaces with “clinker,” while housemaids condemned it for its decidedly sulphurous smell. But it could not long remain out of use at \$7 a ton while Eastern coals were bringing from \$18 to \$22. At last the steamboats Chrysopolis, New World, and Yosemite remodeled their furnaces especially for its use, and it got into general use on the rivers. The steamships of Hollanday's lines to Mexico and Oregon next took it up, and now it is the great steam generator of the coast, though by no means the best in quality. The principal mines in the Monte Diablo region are the Cumberland and Black Diamond, owned by the Bank of California, and the Union, owned by S. B. Whipple & Co.

On Vancouver's Island, in the British possessions, is the best grade of coal found, the mine being located at the village of Nanaimo, about sixty miles north-east of Victoria. The coal from this mine is preferred for steam purposes to all others found on this coast, for the reason that it makes no clinker, has but little sulphur, and does not burn too rapidly, like the

Seattle coal, of which we will speak hereafter. The only objection that we know to it is that its soot in damp weather becomes a sort of pitch which sticks with great tenacity upon the paint-work where it falls, and can only be removed with potash, which generally carries off paint and all. This mine is owned in Victoria, and its agent in this city is Harbor Commissioner John Roeseveld.

The mines on Lake Washington, near Seattle, King County, Washington Territory, have been worked nearly four years, and will eventually become good property, as the quality of the coal produced is excellent, save for steam. The objection against it is that it burns too freely and makes too hot a fire. The engineer of one of our government steamers was obliged to use it last year, and, being ignorant of its rapid kindling, put in such great quantities that it melted the grate-bars of his furnaces. The steamer went down the Sound with a red-hot smoke-stack. But for household purposes this coal stands at the head, as it is free from sulphurous smell, and answers for all culinary uses. It now brings \$11 per ton, while Nanaimo coal is worth \$12, and Coos Bay \$11. But the Seattle mines are very expensive to work, as they have a lake to cross with their cars on ferry boats before they can put the cars on the railroad track. Coal has been discovered near Point Elliot, eighteen miles north of Seattle, and the newly-found deposit is said to be fully equal to that of the Lake Washington mine.

Going further north, we find a discovery of anthracite coal, on Queen Charlotte's Island, but the lead was too narrow to pay expenses. As for Alaska, it is almost a solid bed of coal, and will one day become the Pennsylvania of the Pacific. As for Washington Territory, it is almost certain that she has a continuous bed of coal seventy-five miles long, commencing on the Skookumchuck and ending near Seattle.

From the present prospects, there is no danger of coal-mines proving a bad investment, if so located as to be practically worked, because our forests are being thinned out so very rapidly that wood must increase in price, rather than diminish, hereafter. As a medium of fuel, coal has supplanted wood on all the railroads and river steamboats, even in the great timber-bearing valleys of the Columbia and Willamette, in Oregon, and they have no coal as yet. We know of no better investment for idle capital than a coal-mine located near tide-water, and recommend our impecunious young friends to go and prospect for coal on Puget Sound, rather than lay around Portland or San Francisco, cursing their bad luck. There is no man who will ever get rich by waiting for money to fall in his lap.—*The West.*

A Perilous Adventure.

A correspondent of the *Truckee Republican*, writing from Blue Cañon, gives the following details of a dangerous adventure and miraculous escape of a young girl who was swept through sluice boxes for half a mile without being killed:

An accident that came near proving fatal occurred at the Lost Camp Mines, about two miles from this place, on the afternoon of the 16th. Millie Cohan, aged about ten years, and daughter of George M. Cohan, general manager of all the mines in and about Lost Camp was assisting her younger sisters over the sluice boxes, in the mine known as the Wood's Ravine, when she missed her footing and fell into the boxes, through which was running at the time about five hundred inches of water. She was swept for a distance of sixteen hundred feet through the sluices as though she had been a feather. It appears that she passed through the boxes in a sitting position, and during her terrible race tried repeatedly to rescue herself from what in ninety-nine cases out of one hundred would have proved fatal to the strongest man. Even while going at the rate of a railroad train the girl exhibited presence of mind enough to let her head fall back into the water, to escape a piece of wood that was nailed over the boxes, and against which, but for the precaution taken, her brains would certainly have been dashed out. After being carried a distance of nine hundred feet she was washed over a “dump,” twelve feet high, falling into another sluice box, seven hundred feet long. Passing through the latter she was swept over another “dump,” twenty feet high, falling among rough, jagged rocks. Here she managed to crawl out a few feet from under the heavy body of falling water, and was shortly after rescued by Mr. Bartlett, foreman of the mine. It was found that she sustained severe injuries on the left knee, hip and side. Her face was also scratched and swelled, but fortunately neither will permanently disfigure her. At present she is improving rapidly, and it is hoped she will entirely recover from her injuries. Her escape from a terrible death is considered by those who understand the peril through which she has passed as something miraculous.

THE AMERICAN FLAT MINING COMPANY have concluded a contract with the Baltimore Consolidated Mining Company for working the mine of the former through the shaft and drift of the latter, which will enable the American Flat Company to take out ore as soon as the Baltimore Consolidated Company get in with the second level. The American Flat is part of the old Baltimore American and joins the Baltimore Consolidated on the south. The development in Baltimore Consolidated is about 150 feet from the line.

Valuable Premiums on Subscriptions.

A Sewing Machine
of Real Value
(Beckwith's)
given for \$40
worth of Sub-
scriptions.

The AMERICAN AGRICULTURIST, in speaking of this Machine, says:

We are prepared to increase the Beckwith Sewing Machine as one worthy of being at once secured by all who cannot purchase the expensive machines.

1st. It is well and strongly made.
2d. It is easily attached to any table or stand having a leaf or edge projecting an inch or so, and can thus be used in any part of the house, near a window, etc.
3d. It makes the elastic loop stitch (the same as the Willcox & Gibbs) and some other good machines, which with a little care in making the elastic stitch is abundantly strong for nearly all kinds of sewing, and less liable to break in washing and wearing, owing to its elasticity.

WE WILL GIVE

For \$12, a Machine and the Illustrated Press, 1 year.
For \$12, a Machine and the Mining & Scientific Press, 6 mos.
For \$12, a Machine and the Pacific Rural Press, 6 mos.
For \$12.50, a Machine and the Mining & Scientific Press, 1 yr.
For \$13.50, a Machine and the Pacific Rural Press, 1 year.
For \$40, we will give a Machine and \$40 worth of subscriptions to either paper or all jointly. Send for Circular.

Express charges must be paid by the purchaser. Address, for further particulars, the PUBLISHERS OF THIS JOURNAL.

The Mining & Scientific Press,

Started in 1860, is one of the oldest weekly journals now published in San Francisco. It has been conducted by its present proprietors for the years, during which period it has been repeatedly enlarged and constantly improved. The active and steadfast efforts of its publishers have gained for it conduct an amount of practical experience greater than any other publishers have accumulated on this coast, of a weekly journal.

The sum paid by us for the best editorial talent obtainable for our special class journal; for engravings, for interesting news and correspondence, and for printing a large-sized, handsome sheet, is unequalled by that of any other American weekly west of the Mississippi. As a PRACTICAL MINING JOURNAL it has no rival on this Continent.

It is the only MECHANICAL, and the only SCIENTIFIC journal of the Pacific States.

Every Miner, Assayer, Millman, and Metallurgist in the United States should take it.

Every Pacific Coast Mechanic, Engineer, Inventor, Manufacturer, Professional Man, and Progressive and Industrious Student should patronize its columns of fresh and valuable information.

Every Mining Engineer, Superintendent, Metallurgist, Mine Owner and Mine Worker in the world should profit by its illustrations and descriptions of New Machinery, Processes, Discoveries and Record of Mining Events.

Every intelligent thinker in the land, in high or humble situation, who would avoid literary trash for genuine information, should SUBSCRIBE AT ONCE.

DEWEY & CO.,

Publishers, Patent Agents and Engravers,
334 Montgomery street, S. F.

Thursday Noon our last forms go to press. Communication should be received a week in advance and advertisements as early in the week as possible.

REASONS WHY THE

PAIN-KILLER

MANUFACTURED BY

PERRY DAVIS & SON

IS THE

Best Family Medicine of the Age!

And why it should be kept always near at hand:

- 1st. PAIN-KILLER is the most certain Cholera cure that medical science has produced.
- 2d. PAIN-KILLER, as a Diarrhoea and Dysentery remedy, seldom if ever fails.
- 3d. PAIN-KILLER will cure Cramps or Pains in any part of the system. A single dose usually effects a cure.
- 4th. PAIN-KILLER will cure Dypepsia and Indigestion, if used according to directions.
- 5th. PAIN-KILLER is an almost never failing cure for Sudden Colds, Coughs, etc.
- 6th. PAIN-KILLER has proved a Sovereign Remedy for Fever and Ague, and Chills Fever; it has cured the most obstinate cases.
- 7th. PAIN-KILLER as a Liniment is unequalled for Frost Bites, Chillsbains, Burns, Bruises, Cuts, Sprains, Etc.
- 8th. PAIN-KILLER has cured cases of Rheumatism and Neuralgia after years standing.
- 9th. PAIN-KILLER will destroy Bolls, Felons, Whitlows, Old Sores, giving relief from Pain after the first application.
- 10th. PAIN-KILLER cures Headache and Toothache.
- 11th. PAIN-KILLER will save you days of sickness and many a Dollar in time and Doctor's Bills.
- 12th. PAIN-KILLER is a purely Vegetable preparation, safe to keep and to use in every family. The simplicity attending its use, together with the great variety of diseases that may be entirely eradicated by it, and the great amount of pain and suffering that can be alleviated through its use, make it imperative upon every person to supply themselves with this valuable remedy, and to keep it always near at hand.

The PAIN-KILLER is now known and appreciated in every quarter of the Globe. Physicians recommend it in their practice, while all classes of society have found in it relief and comfort. Give it a trial.

Be sure and buy the genuine. Every Druggist, and nearly every Country Grocer throughout the land, keep it for sale.

LEA & PERRINS'
Worcestershire Sauce.

Declared by Connoisseurs to be the only good
SAUCE
Caution Against Fraud.

The success of this most delicious and unrivalled
Condiment having caused certain dealers to
apply the name of "Worcestershire Sauce"
to their own inferior compounds, the public
is hereby informed that the only way to
secure the genuine is to ask for LEA &
PERRINS' SAUCE, and see that their names
are upon the wrapper, label, stopper and
bottle.

Some of the foreign markets having been
supplied with a spurious Worcestershire
sauce, upon the wrapper and label of which the name
of Lea and Perrins have been forged, L and P give
notice that they have furnished their correspondents
with power of attorney to take instant proceedings
against manufacturers and vendors of such, or any
other imitations by which their right may be infringed.

Ask for LEA & PERRINS' Sauce, and see name on
wrapper, label, bottle and stopper
Wholesale and for export by the Proprietors, Worces-
tershire: Grosse & Blackwell, London, &c., &c., and by
Grocers and Oilmen universally.

EUCALYPTUS.

The attention of the Medical profession is respectfully
called to the following preparation of this new reme-
dial agent. Eucalyptus and its preparations have been
found useful in obstinate cases of Intermittent and Marsh
Fever, often supplanting the use of Quinine. The
paroxysms of Asthma and Catarrh are greatly controlled,
and in various Kidney diseases and Catarrh of the Bladder
it seems to act like a specific.

FLUID EXTRACT EUCALYPTUS.

This extract represents in a concentrated form the
medicinal effects of the leaves of Eucalyptus Globulus.

THE ELIXIR OF EUCALYPTUS.

This compound presents the properties of the leaves
in a palatable form and elegant appearance. Dose—
One tablespoonful, to be repeated as often as the case
demands.

Cigarettes of Eucalyptus Globulus, useful in
Asthma, Difficulty of Breathing, Incipient Pleurisy, etc.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they

have no equal. No effort has been, or will be spared

to have them constructed in the most perfect manner

and of the great number now in operation, not one has

ever required repairs. The constant and increasing de-

mand for them is sufficient evidence of their merit.

They are constructed so as to apply steam directly

into the pulp, or with steam bottom, as desired.

The Comstock Mines.

The Latest Items—By our Resident Correspondent.

The past week has been a lively one on the Comstock. The gradual unloosening of purse strings by capitalists controlling the financial interests of this coast, in San Francisco, is having the long looked for salutary effect, renewing the confidence of that capricious element, the public, in the stability and permanency of our mines.

Scientists and practical miners know that the work of the past ten years is only the beginning of prospecting on this vast mineral section, and although the failure to produce new developments of importance in any mine last spring, the withdrawal of capital from mines and stock operations following the never to be forgotten crash of a year ago, the long months of despondency, hard work and repeated assessments levied had produced a depression and lack of general confidence equalled only by the verdict of 1865, that the 'bottom had fallen out,' that the Comstock was destined to be henceforth, a failure,—in the face of the enormous collection of assessments and the energetic continuation of exploration by men of nerve and patience who 'never say die.' We know that each day's labor has brought us 3 to 5 feet nearer our destiny,—the satisfaction of establishing our reputation as miners and convincing the world that the Comstock is the autocat of richness and energy.

The Past Year's Work

Shows conclusively that this lode has resources heretofore unlooked for, or even dreamed of. The general impression among the best informed mining men is that Chollar, Hale & Norcross, Savage, Gould & Curry, Con. Virginia and Ophir, can open rich and extensive bodies of ore at pleasure, and adjoining and intervening claims will of course reap the benefit of the results shown by the work of their more energetic neighbors.

The Chollar,

On their 800 feet, near the Hale and Norcross line is outting west through a wall of clay for the purpose of developing the body of ore from which the Norcross has been extracting their milling ore for the past few months near their south line, but which, for some mysterious reason, no effort has heretofore been made on the part of the Chollar Company to develop.

The Savage,

On their 1,700 feet level, is known to have a rich body of ore south of their incline, which, despite the efforts of the management to avoid developing until their "head centre" gives permission, has been cut into at several different points, giving evidence of a deposit of exceeding richness. A good evidence of this fact is that *insiders* being caught out, are doing their best to hear it, but from what is already known, it will not be likely to recede materially below present prices, and before the season is over is bound to take the lead.

The Supt. of Gould and Curry says there is nothing in it. There may be nothing in sight, but wait a little, and we shall see.

Consolidated Virginia

Is driving north to make connection with their main shaft, which is now some 870 feet down, and will connect with their 1,167-foot drift from Gould & Curry in about three months. They will then open up a very extensive body of ore, the value of which can now only be surmised.

It has been the fortune of

Ophir

In the past eight months to find what had been looked for, for seven years previously, in that mine—quartz. Extensive bodies of quartz have been found on all their levels, and although atreacks have repeatedly been found assaying largely, the general average has not been of sufficient value to warrant extracting for milling purposes. They are now sinking a permanent shaft from their 1,500-foot level, 400 feet east of main shaft, from which the ledge will be cut at intervals of 100 feet.

Sierra Nevada

Is slow. They are paying expenses from surface workings, but are not very energetic in deep prospecting. Their shaft showed streaks of quartz which raised their hopes some weeks ago, but thus far these indications amount to little.

This company, before developing anything of value, will find it necessary to sink a new shaft 1000 or 1500 feet east of their present one, when they will probably find a mine as rich as anybodys'.

The Empire and Imperial

Is the key to all the Gold Hill mines north of the Yellow Jacket.

At going rates, the Imperial and Empire mines are cheap for investment with a pound of ore in either mine, as being 1700 feet in depth and on the level of the proposed Suro Tunnel, and of the mines in this section developing a body of ore, will be compelled to pay tribute to this shaft. The machinery is perfect in every respect, and of sufficient power

to work and drain all these mines to a depth of 1000 feet lower than the present level.

The Imperial has a good showing on their south mine, being the same body of ore lately found in Confidence.

Yellow Jacket

Found some ore last week on their 1400 feet level, (south,) which assays about \$30.

The stock is held strong at present prices in consequence of this strike, and also the fine body of ore exposed in Confidence near their north line.

There is nothing being done in Kentucky, but the body of ore on the 1,800 foot level of Crown Point, pitching north, promises well for the future of this mine.

Belcher and Crown Point.

The question is often asked, why Belcher is not as good an investment as Crown Point. The simplest answer, in comparison, that could be given to this question, is, take an egg and cut off two-thirds from the larger end, for Crown Point, and give the remainder to Belcher, and the problem is solved.

The 1,300 foot level, Crown Point looks unusually well. After passing through a horse of 25 feet on the 3d and 5th floors, going east, they have exposed a fine body of ore, now 12 to 15 feet wide, assaying thus far from \$100 per ton, the eastern side of which is not yet reached. The 1,400 foot level has a two compartment drift, south from shaft 150 ft.

They are boring east into the ledge, for the purpose of draining gradually whatever water the ledge may contain between this level and the 1300.

Every indication thus far favors a more extensive body of ore on the 1400 ft. level in this mine than has heretofore been found.

Belcher is taking out its usual number of tons of ore daily through Yellow Jacket and its own shaft.

Segregated Belcher, as usual, is idle, waiting on its neighbors for future action.

Overman and Justice.

West drift from new shaft on the 1000 ft. level of Overman continues in porphyry without change. They have about 1500 ft. further to run to catch the Baltimore Consolidated ledge, which is on the line of their old mine.

Next following the Overman on the line of Comstock mines comes Justice. There is nothing to report from their main works, but from their south works—the old Waller's Defeat Shaft—adjoining Silver Hill on the north they are extracting ore which pays about \$40 per ton.

A mine called the Woodville, about 200 ft. directly east of the Waller's Defeat Shaft is taking out ore of the same character as that of the Justice which also pays about \$40 per ton.

Next south is a

Mill of Ground

Running from this point to Devil's Gate, covered by numerous claims of early days, which have all been absorbed, and consolidated under the name of

Silver Hill.

Their works are situated about 800 feet from their north line. At a depth of 160 feet they drifted direct west 200 feet, outting the vein. Running north and south from this point of intersection 400 feet each way, two chimneys of ore were uncovered. In cross-cutting on the north chimney it has been found to be 20 feet in width, and of great value, five feet of which exceeds in richness anything heretofore found on the Comstock, and resembles the old Gold Hill surface ore, which was worked by rockers for gold in '59 and '60.

CANA.

Virginia, May 13th, 1873.

The Eureka *Sentinel* hears notes of preparation for a forthcoming mining suit, which is to throw in the shade the Raymond & Ely-Hermes fight. The Eureka Consolidated and Richmond Consolidated, of Eureka, are rolling up their sleeves for a struggle in the Courts, which is to shake that young city into an agony of suspense. The *Sentinel* advises the combatants to compromise.

AN APPRECIATIVE SUBSCRIBER in Plumas County sends us ten dollars for the SCIENTIFIC PRESS. It is not often that we are greeted with that amount on a single subscription.

PROSPECTORS are exploring the country west of Highland District between that place and Bristol. As rich rock has been found thereabouts, favorable developments are expected.

Mr. Brown has put a party of prospectors to work to test the character of the coal vein on his property near Lafayette, Contra Costa county, where the outcrop is thought by experts to indicate a valuable deposit of excellent coal.

The Utah Central Railroad has shipped, during the past month, 2,680,000 pounds of ore, 660,000 pounds of bullion, and 660,000 pounds of lead.

THE BLACK SAND MINE, formerly owned by the Cox Brothers, near Port Orford, Oregon, has been lately sold to a company residing on Coos Bay.

ASA W. RAWSON will please communicate with this office.

CONTINENTAL LIFE INSURANCE CO., No. 302 Montgomery street, corner of Pine,

Gravel Mining Development.

Messrs. Yule and Clough, of San Francisco, visited our section of country last week, for the purpose of examining the extensive gravel claim owned by N. Gilmore and Thomas Stapleton near Diamond Springs. Mr. Yule, than whom there is no better informed gravel miner in California, nor any who have had larger practical experience, made a thorough and critical examination of the mine above mentioned, making numerous tests of the gravel, taken by himself from several points remote from each other, examined the facilities for increase of water supply, increase of pressure and of improvement in convenience for dumpage, and as a result of all the investigations by himself and partner—Mr. Clough—they concluded to bond the mine with a view to putting it immediately on the English market, where these gentlemen have enviable connections and we are assured that there is hardly any room to doubt the early consummation of arrangements for the systematic and thorough development of the mine. This, if anticipations are realized, will lead to the introduction of a considerable amount of foreign capital, and we are sanguine that the results of this enterprise will lead to many similar investments in our vicinity.

As a rule, English investments in gravel mining have been much more remunerative of late than those made in quartz properties; which has in that quarter stimulated inquiry for and an inclination to invest in gravel mines. It is familiar to most of our readers that there are hundreds and hundreds of acres of gravel claims in this county, none of which are one whit less richly charged with gold than is this Gilmore and Stapleton mine, and yet Messrs. Yule and Clough, both old Californians and experienced miners, were greatly astonished at the indubitable richness and value of the latter, when coupled with the fact of its non-development at this late day. But it must be remembered that the failure to develop in this and many similar cases has not been due to ignorance or uncertainty, about the richness of the deposits. That these are incomparably richer than the gravel ranges of Dutch Flat, Gold Run and other districts that have been worked with surprising profit, has been long and well known and not open to successful controversy. But adequate supplies and sufficient pressure of water, and proper facilities for dumpage were only to be obtained by an expenditure at which local capital hesitated, with ten and twelve per cent. as the minimum rate of interest for money, which is grudgingly doled out at those or even at somewhat higher rates.

The transaction under consideration looks also to the purchase and enlargement of the ditch; the conveyance of water in iron pipes a sufficient distance to insure a heavy pressure, and tunneling operations that will secure ample dumpage. These preliminaries will cost a considerable amount of money, but the investment will be richly remunerative beyond a peradventure. We are not at all addicted to optimism, but we feel confident that the consummation of this or any other single project of the kind will lead to results that will agreeably astonish its most sanguine projectors, and will lead to an excited scramble for and the rapid development of other locations on the vast gravel deposits of our vicinity. With little of local prejudice and no fear of successful contradiction, we fearlessly express the opinion that the gravel range of this section is the most inviting and the safest field for mining investment to be found on the Pacific Coast. One experiment will satisfy the outside world as to the correctness of this opinion. We doubt whether it is possible to find a better location for trying this experiment than on the property above referred to and by the means above suggested.—*Placerville Democrat*.

The man who went into the woods alone to die, says, after enumerating the symptoms of Catarrh: "Death is at any times preferable to such feelings. Bones came out of my nostrils in November. In January, 1872, lost all sense of smell, and the odor arising from my disease became so offensive that no one would stay near me. Did not care now want to eat at the table with others. Often wished I was dead. Last summer about twenty pieces of bones came out of my head, some pieces being 1 1/2 inches in length. Commenced taking Dr. Evory's Diamond Catarrh Remedy October 31st, 1872. I have now regained my sense of smell, the mucous membrane is healed, the offensive odor has left me, and I have now regained my health and have gone to work, as I consider myself cured. I have suffered death in life. You that have the disease slightly, do not neglect it when a few bottles of this remedy will cure you. You can't wear it out. Seven years ago there was not a healthier or more rugged man in the State, but Catarrh nearly killed me. As a man of principle, I have told you the truth and given you warning."

I am the man that went into the woods alone to die, but did not, for Dr. Evory's Diamond Catarrh Remedy cured me. My name is Peter M. S. Sphers, of Jackson, Amador county, Cal., and am well and favorably known in this country since '49.—Extract from a letter which can be seen at Dr. Evory & Co.'s office, 9 Post st., S. F.

Try Dr. Evory's Diamond Catarrh Remedy. Only 50 Cents.

Says John to Nance, you look so bright, Your eyes they sparkle, like a star. Oh! yes, says Nance, Dr. Evory's remedy Has cured that horrid, bad catarrh.

OUT OF THE FOG AT LAST.—Dr. Evory has discovered the only sure cure for Catarrh and Colds. One bottle gives immediate relief, and a few bottles effect a cure. All we ask is a trial. If your druggist don't have it, send to Dr. A. F. Evory & Co., 9 Post street, S. F. It only costs 50 cts. 14726-3m

WE WILL CHANGE THE ADDRESS FREE for any subscriber who notifies us in writing of his new address, with the OLD P. O. address to enable us to find his name among thousands of others.

THE SIX FOLLIES OF SCIENCE.—The six follies of science are said to be the following: The quadrature of the circle, the establishment of perpetual motion, the philosopher's stone, of the transmutation of metals; divination, or the discovery of secrets by magic, and lastly judicial astrology. It is unwise to say that anything is impossible until the impossibility is demonstrated. It is not at all improbable that the present century may see that one of these so-called follies is a reality.—*Atlas*.

All kinds of Cocks and Valves, Hydraulic Pipes and Nozzles, and Hose Couplings and Connections of all sizes and patterns, furnished with dispatch. PRICES MODERATE. J. H. WREED. V. KINGWELL.

Machinery.

N. Seibert's Eureka Lubricators.

THE HIGHEST PREMIUM

Awarded by the Mechanics' Institute Fair, San Francisco, and State Fair, Sacramento, 1871.

These Lubricators are acknowledged by all engineers to be superior to any they have ever used; feed constantly by pressure of condensed water, supplied by pipe A, regulated under the oil by valve J, and forced out through check valve and pipe B into the steam pipe C; it then becomes greasy steam, passes to all the valves and cylinder at every stroke of the engine; glass valves and cylinder at every stroke of the engine; glass valves amount used per hour. Packing on the I indicates amount used per hour. The rings on the I indicate amount used per hour. The rings on the piston will not corrode. One pint of oil will last from three to six days, according to speed and size of engine; I, sliding gauge; K, valve to shut off when engine stops; H, F, valves to shut off in case of frost; steam does not enter the cup; it is always cool; warranted to give satisfaction. Patented February 14, 1871. Manufactured by California Brass Works, 125 First street, S. F. 24v23tf

CROCKER'S PATENT TRIP HAMMER QUARTZ BATTERY.

The inventor having perfected and tested the durability and capacity of these Batteries to his entire satisfaction, is now ready to manufacture and guarantee them. Parties in want of a Battery cannot find their equal in regard to PRICE, WEIGHT, CAPACITY, POWER TO RUN THEM. State and County Rights for Sale by

G. D. CROCKER,
17v26-tf 315 California street, San Francisco.

Notice is hereby given, that the copartnership heretofore existing between A. J. Severance, Charles W. Randall and J. Gus. Burt, under the firm name of "Severance, Holt & Co.," is this day dissolved by mutual consent. A. J. Severance, having purchased all the interest of his late partners, will continue the business of manufacturing and selling Diamond Drills as before, under the style of A. J. Severance & Co. Dated San Francisco, Nov. 24, 1871. Office, 315 California street. A. J. SEVERANCE, CHAS. W. RANDALL, J. GUS. BURT.

THEODORE KALLENBERG,
MACHINIST,
and Maker of Models for Inventors. All kinds of Dies and Stamps and Punches made. Also, all kinds of Small Gears Cut. Repairing done on very Reasonable Terms and in the best manner. No. 32 Fremont street, S. F. 19v23-3m

Photographs of Locomotives can be seen at the above Number. 12v26tf

PACIFIC BRIDGE COMPANY.

WORKS NEAR SOUTH POINT MILL, BERRY STREET, SAN FRANCISCO, CAL.

Are Prepared, with Superior Machinery, to Manufacture and Build all kinds of Bridges on Smith's, Howe's, and other Improved Plans. Framing of all kinds done by Machinery.

The Smith Bridges have been thoroughly tested in the East for Three Years, and wherever tried have proved superior to any other Bridge in the following points:

Being built of wood entirely, they are not affected by change of temperature.
The timber used is placed so directly in the line of strain, that less material is required to support the same load.
It is not perceptibly affected by shrinkage. It is the most Economical Bridge built. It is adapted to any practicable LENGTH OF SPAN.
Plans, Specifications and Terms will be sent to any County, Township or Person wishing to build a Bridge, and no charge made unless the Plan is used. For all Public Bridges the Plan will always be open to competition.
Smith's celebrated CAST IRON PIER, economical, and adapted to heavy currents, built at low rates.

C. H. GORRILL, Secretary.

W. H. GORRILL, President.

BROWN'S PATENT LAMP.

One of these Lamps, when placed at a distance of 200 feet from the bank, will light up a bank surface 250 feet in length and 150 feet high, and to a much better advantage than any other light heretofore tried, and at an expense not to exceed five cents per hour. Lamps furnished at short notice.

Letter of Recommendation.
Mr. O. B. Brown-Sm: Your Patent Lamp for lighting hydraulic mines, which you sold to me in December last, has given entire satisfaction, and far exceeds my expectations, and I think it the best and cheapest light ever used to light mining claims by night, and am satisfied that I have saved three hundred dollars by the use of it in the last mining season over pitch or any other light of the same brilliancy; and I will also say that if I could not get another lamp, five hundred dollars would not buy it.
Yours,
W. D. APLIN.

Little York, Nov. 5, 1872.
For further particulars, address,
fe22-tf C. B. BROWN, Placerville, Cal.

P. J. PHILLIPS & CO., No. 608 Clay street, near Montgomery, San Francisco, are agents for Brown's Lamp, where it may be seen.

The California Powder Works

No. 314 CALIFORNIA STREET.
SAN FRANCISCO.

Manufacturers and have constantly on hand
SPORTING,

MINING,
And BLASTING
POWDER,

OF SUPERIOR QUALITY, FRESH FROM THE MILLS. It being constantly received and transported into the interior, is delivered to the consumer within a few days of the time of manufacture, and is in every way superior to any other Powder in Market.
We have been awarded successively

Three Gold Medals
By the MECHANICS' INSTITUTE and the STATE AGRICULTURAL SOCIETY for the superiority of our products over all others.
We also call attention to our

HERCULES POWDER.
Which combines all the force of other strong explosive now in use, and the lifting force of the BEST BLASTING powder, thus making it vastly superior to any other compound now in use.
A circular containing a full description of this Powder can be obtained on application to our Office.
16v20-3m JOHN F. LOHSE, Secretary.

DEWEY & CO., American & Foreign Patent Agents

OFFICE, 338 MONTGOMERY STREET, S. F.

Patents obtained promptly; Caveats filed expeditiously; Patent reissues taken out; Assignments made and recorded in legal form; Copies of Patents and Assignments procured; Examinations of Patents made here and at Washington; Examinations made of Assignments recorded in Washington; Examinations ordered and reported by Telegraph; Rejected cases taken up and Patents obtained; Interferences prosecuted; Opinions rendered regarding the validity of Patents and Assignments; every legitimate branch of Patent Agency Business promptly and thoroughly conducted.

Our intimate knowledge of the various inventions of this coast, and long practice in patent business, enable us to abundantly satisfy our patrons; and our success and business are constantly increasing. The shrewdest and most experienced Inventors are found among our most steadfast friends and patrons, who fully appreciate our advantages in bringing valuable inventions to the notice of the public through the columns of our widely circulated, first-class journals—thereby facilitating their introduction, sale and popularity.

Foreign Patents.

In addition to American Patents, we secure, with the assistance of co-operative agents, claims in all foreign countries which grant Patents, including Great Britain, France, Belgium, Prussia, Austria, Victoria, Peru, Russia, Spain, British India, Saxony, British Columbia, Canada, Norway, Sweden, Mexico, Victoria, Brazil, Bavaria, Holland, Denmark, Italy, Portugal, Cuba, Roman States, Wurtemberg, New Zealand, New South Wales, Queensland, Tasmania, Brazil, New Grenada, Chile, Argentine Republic, AND EVERY COUNTRY IN THE WORLD where Patents are obtainable.

No models are required in European countries, but the drawings and specifications should be prepared with thoroughness, by able persons who are familiar with the requirements and changes of foreign patent laws—agents who are reliable and permanently established.

Our schedule prices for obtaining foreign patents, in all cases, will always be as low, and in some instances lower, than those of any other responsible agency.

We can and do get foreign patents for inventors in the Pacific States from two to six months (according to the location of the country sooner than any other agents.

Home Counsel.

Our long experience in obtaining patents for Inventors on this Coast has familiarized us with the character of most of the inventions already patented; hence we are frequently able to save our patrons the cost of a fruitless application by pointing them to the same thing already covered by a patent. We are always free to advise applicants of any knowledge we have of previous applications which will interfere with their obtaining a patent.

We invite the acquaintance of all parties connected with inventions and patent right business, believing that the mutual conference of legitimate business and professional men is mutual gain. Parties in doubt in regard to their rights as assignees of patents, or purchasers of patented articles, can often receive advice of importance to them from a short call at our office.

Remittance of money, made by individual inventors to the Government, sometimes miscarry, and it has repeatedly happened that applicants have not only lost their money, but their inventions also, from this cause and consequent delay. We hold ourselves responsible for all fees entrusted to our agency. The principal portion of the patent business of this coast has been done, and is still being done, through our agency. We are familiar with, and have full records, of all former cases, and can more directly judge of the value and patentability of inventions discovered here than any other agents.

Situated so remote from the east of government, delays are even more dangerous to the inventors of the Pacific Coast than to applicants in the Eastern States. Valuable patents may be lost by the extra time consumed in transmitting specifications from Eastern agencies back to this coast for the signature of the inventor.

Confidential.

We take great pains to preserve secrecy in all confidential matters, and applicants for patents can rest assured that their communications and business transactions will be held strictly confidential by us. Circulars free.

Engravings.

We have superior artists in our own office, and all facilities for producing fine and satisfactory illustrations of inventions and machinery, for newspaper, book, circular and other printed illustrations, and are always ready to assist patrons in bringing their valuable discoveries into practical and profitable use.

DEWEY & CO.,

United States and Foreign Patent Agents, publishers Mining and Scientific Press and the Pacific Rural Press, 338 Montgomery St., S. E. corner of California St., San Francisco.

THE GIANT POWDER COMPANY

Are now manufacturing besides the famous regular

GIANT POWDER, A NO. 2 GIANT POWDER,

Somewhat slower in its Explosion, which we recommend for

BANK BLASTING, COAL MINES,

AND FOR ALL SUCH WORK WHERE THE ROCK IS NOT VERY HARD

It is fully as safe as the other and evolves neither smoke nor noxious fumes when exploded. Price. 50 Cents per Pound.

The sales of both grades increase very fast, which is the best proof of their superiority over other explosives.

BANDMANN, NIELSEN & CO.,
General Agents, No. 210 Front Street.

Valuable Premiums Subscriptions.

A Sewing Machine of Real Value (Beckwith's) given for \$40 worth of Subscriptions.

The AMERICAN AGRICULTURIST, in speaking of this Machine, says:
We are prepared to endorse the Beckwith Sewing Machine as one worthy of being at once secured by all who cannot purchase the expensive machines.

1st. It is well and strongly made.
2d. It is easily attached to any table or stand having a leaf or edge projecting an inch or so, and can thus be used in any part of the house, near a window, etc.
3d. It makes the elastic loop stitch (the same as the Willcox & Gibbs and some other good machines), which with the care in making the closing stitch is abundantly strong for nearly all kinds of sewing, and less liable to break in washing and wearing, owing to its elasticity.

WE WILL GIVE

For \$12, a Machine and the Illustrated Press, 1 year.
For \$12, a Machine and the Mining & Scientific Press, 6 mos.
For \$12, a Machine and the Pacific Rural Press, 6 mos.
For \$12.50, a Machine and the Mining & Scientific Press, 1 yr.
For \$13.50, a Machine and the Pacific Rural Press, 1 year.
For \$40, we will give a Machine and \$40 worth of subscriptions to either paper or all jointly. Send for Circular.

Express charges must be paid by the purchaser. Address, for further particulars, the PUBLISHERS OF THIS JOURNAL.

EACH ISSUE CONTAINS

Sixteen well filled pages.
Original and Choice Engravings.

Polishing and Fluting Iron.

This new invention takes the place of two articles needed in nearly every house. As a POLISHING IRON it has no superior. The part used for Fluting is made of brass, and highly polished. A Receipt for making FRENCH GLOSS STARCH, that gives a superior polish, goes with each iron. The Polishing Iron and Fluter, being in one, are both heated at the same time. We are now prepared to furnish them in quantities to suit. Price, \$5.

HALLIDIE'S

Patent Endless Wire Ropeway.

Covered by Numerous U. S. Patents.

IMPORTANT TO

Mining Companies, Civil Engineers, Contractors, Etc.

The system of transporting material, such as Ores, from the mine to the mill, Earths for bankments, Rock from quarries, etc., by means of steel wire rope, has been well tested and found more economical, advantageous and reliable than any other method of transportation; and to the annexed certificates in connection therewith I beg to call the attention of those interested:

EUREKA, Nevada, July 10, 1872.
T. M. MARTIN My dear sir: On your leaving for San Francisco, it gives me great pleasure to hand you my written acceptance of the HALLIDIE TRAMWAY put up by you upon our mine in Freilburg.

It is a perfect success, discharging ten tons of ore per hour with two men's labor. It is perfectly simple in construction, and, as far as I can judge, there is nothing about it to ever get out of order—nothing to wear out. While ours requires but about two thousand five hundred feet of wire rope, I can see no reason why the line could not be extended almost indefinitely with equally happy results. Again, the carrying capacity might be doubled or quadrupled if desired. After several weeks trial upon our mine, the unanimous verdict of all who have seen it is a complete, unquestioned success. If this can be of any service to you, use it in any way you think proper. Very respectfully, O. C. GOODWIN.

EMMA HILL CONSOLIDATED MINING CO.,

Little Cottonwood, Utah,

Superintendent's Office, Sept. 23, 1872.

T. M. MARTIN, Esq., Sir: The Ropeway constructed by you HALLIDIE'S PATENT for the Emma Hill Consolidated Mining Company, has been built in a most substantial and workmanlike manner, and is at this time in splendid working condition. I most cheerfully accept the work for the Company, and recommend it to others wishing a sure and speedy transit for ores over places impracticable for wagon roads, etc. Respectfully,

L. W. COLBATH, Superintendent.

"The Vallejo works smoothly with the elevated wire tramway, which carries its load as quietly and easily as there was no winter or snow in the world."
"Whatever the objections to wire tramways may be on account of their cost, I have seen nothing yet that even approaches them in the facilities they afford for moving ore at all seasons of the year."—Correspondent Utah Mining Journal, Alta, Jan. 8, 1873.

The Vallejo Ropeway.

The Vallejo Tunnel Company's Tramway in Little Cottonwood, built on the HALLIDIE PATENTED PLAN, is a complete success. It is between 2,300 and 2,400 feet in length, and is supported by thirteen stations. The fall in this distance is about 800 feet, and the wire rope, which is three-fourths of an inch in diameter, will safely and easily deliver one hundred tons in six hours. The machinery is automatic, loading and unloading the ore, and the tramway can be worked all winter long, without the slightest trouble.—Utah Mining Journal, Salt Lake, Sept. 23, 1872.
Mining Companies and others desiring to negotiate for the erection of this system of Ropeway, can communicate with me personally, or through Postoffice Box 964.

A. S. HALLIDIE, Patentee,

112 and 114 California Street, SAN FRANCISCO.

WIRE ROPE

For hoisting from mines, transmitting power, ship rigging, etc., of all kinds and sizes, on hand and made to order. Wire of all kinds and descriptions, furnished at lowest rates. A. S. HALLIDIE, 112 and 114 California St.

THE EMPIRE STATE 16 stamp mill in Seven Mile Cañon, Washoe, after being thoroughly overhauled has started up again.

CORRESPONDENCE.

The Vienna Exposition.

[FROM OUR SPECIAL CORRESPONDENT—GUIDO KUSFEL.]

Easter is over. The celebration of these holy days in the Austrian Empire shows now a different character, compared with that of twenty years ago. The comfortable patriarchal celebration in squandering the precious time of several successive holy days, gave way to a practical life, devoted to industry and the promotion of national prosperity. Austria is not what she was six years ago, and foreign newspaper articles about Austrian affairs, written still from the old point of view, generally concluding with "rotten empire, bankruptcy, dissolution," etc., are phrases not applicable to the present condition. Her former policy was outside the Austrian boundary, in Germany; the home policy was a secondary matter; getting money and keeping down all signs of political life. The year 1866 destroyed the Austrian influence in Germany, and the events, the tyrannical system in Austria. She has now a constitutional government, and a free press full of independent, fearless political articles. The internal political differences, as yet in the diet and chamber of deputies are unavoidable. The fact, that the school books of the empire are printed in not less than nineteen different languages may prove that the interest of different public affairs must be divided more than in any other State, and it may require several years more, before by a skillful regulation of affairs some kind of harmony is effected. But those national conflicts, considered to be critical or dangerous to the existence of the double empire, strange as it seems, did not interfere with the social and industrial development of this people; to the contrary, the general prosperity increased during and with the political troubles. It is surprising to notice, with what energy the advantages of modern science are taken hold of by all nations of the empire, and although only a very short time of political freedom has yet been enjoyed, the present World's Exposition will demonstrate the industrial progress of Austria.

In spite of all exertion, it is impossible to be ready with the Exposition by the first of May. In this respect Vienna has to share the fate of all former expositions. Probably not one of the States will be quite ready at this opening ceremony, for which this rotunda will be fixed up as much as possible. Neither the Japanese nor Chinese, Turks, Egyptians, or anybody else will be through with their respective outside buildings except with some smaller affairs. The German exhibitors seem to be ahead of all others in the palaces as well as in the machinery hall; some splendid German locomotives are already fixed up. This putting up of English machinery is not so far progressed as the German, but they are hard at work in fixing the foundation for engines, etc. Of the American, nothing is to be seen yet, but is expected here to-day or to-morrow. The yard between this gallery, belonging to the United States is nicely covered, admitting sufficient light, and will be finished in a few days. With the many additional exposition buildings, national houses, villas, etc., the exhibition region looks like a town, and it is the last place in the world to "meet you there," unless time and exact plans are agreed upon. The proprietors of the "Neue Freie Presse" erected a splendid building opposite the front of the palace for their newspaper, to be printed there during this exposition.

The monument of King Max I., on which Professor Zumbusch has been at work for the last five years, will be sent from Munich to this exposition here. It is forty-five feet high. It will be the largest piece of German monumental sculpture. Two other notable monuments come from Switzerland; one is the St. Jakob's monument, the other the National monument from Geneva. In the machinery hall, Switzerland is represented by over sixty non-working, and as many machines in operation.

The German telegraph administration will make an exposition in the telegraphic line. The respective objects are ready for shipment. Also products of factories will be exhibited, necessary for telegraphic supply. A Portuguese school house is also added to the others, occupying an area of 63x29½ feet. Belgium has in the machinery hall 32,274 square feet, in the palace, 28,110, in the rotunda, 2,151½, in the palace of arts, 6,451, in the additional department, 1,032½, in the hall of agriculture, 3,765, and a large pavilion of 1,075½ square feet for the exhibition of her art. Turkey puts up a relief plan of the Bosphorus, 46 feet long and 13 feet wide. There is also an iron pavilion in the Turkish yard to receive the Sultan's treasure; the pavilion is 20 feet high. A most remarkable work of art is the stenographic "Iliad" of Mr. Scriber, Professor of Stenography at the Vienna University. All single pages, put together by each other's side, do not amount to half a printing sheet. One page of this work is about a two thousandths part of an ordinary newspaper sheet. It contains 800 pages, and can be placed in a nutshell. The high side of the fountain's basin in the center of the rotunda, at which fifty men

have been employed for a whole month, has been finished just now.

General Van Buren has arrived here, also Professor W. Blake, Col. L. Bridges (in connection with the American school house), John P. Jackson of the New York *Herald*, Mr. Hettman of the New York *Tribune*, etc.

The Orient seems to be much better represented here than in the last Paris Exposition. This Oriental display is so extensive, that, being amongst those different buildings one forgets where he is. The great interest which the Orientals betray in the exhibition is significant, especially for Austrian commerce, which exists already between her and the East. Japan, China, Siam, Persia, Turkey, Egypt, Tunis, Morocco and Roumania are all included in the Oriental department. Greece is for itself, East India with England, but Abyssinia, Central Africa and European colonies in Asia are included in the Oriental department.

Vienna, April 18, 1873.

G. K.

Chips from the Comstock.

[By Our Virginia Correspondent.]

Stress of weather prevented writing last night. Night before last, Savage, in running south-east towards the Hale & Norcross line, again unintentionally cut into their body of ore on 1,700-ft. level. When they get ready to show up they will astonish the world.

Chollar suddenly stopped work on this clay east of their west body of ore—ostensibly—because their main drift had closed up. They are respiring drift and station, making new cars, and evidently preparing to take out ore as soon as the Supt. shall return from San Francisco, in about two weeks. It is believed, by those posted, that they cut through the clay above referred to before the Supt. went below, and found quartz assaying \$60 to \$400.

Baltimore Consolidated is quiet—doing nothing towards the development of their own grounds at present.

Their lower drift is still flooded, and disaffected stockholders will find it difficult to gain access to the body of ore said to have been found at this point, on Judge Rising's or anybody's else order—until it suits the management.

The only work being done here is a drift being run south on their upper level, on contract, towards the American Flat Mine.

CANA.

An Artesian Prospecting Shaft.

We yesterday visited the artesian prospecting shaft, says the *Virginia Enterprise*, which is being sunk by General Williams, Mr. Shultz, Superintendent of the Bullion mine, and others, in the eastern suburbs of this city, a short distance east of the works of the Virginia Gas Company. The company have made a regular mining location in

A Good Mineral Belt.

And their works are in line with a series of croppings which can be traced both northward and southward. Besides, they are in what may be called the flat country lying to the eastward of this great Comstock lode. The ground there being comparatively level, any mineral vein being found it would be likely to lie more regularly than do those on the steep mountain slopes, where they have been subjected to disruptions of various kinds. In short, the ground chosen seems in every respect favorable to the successful issue of the novel prospecting experiment now being tried.

The Boring Apparatus.

Boiler, engine and all, stands on four iron wheels, resembling car wheels, and is a model of compactness. Standing over, and, as it were, astride this machinery, are four posts about thirty-five feet in height. These posts are about twelve feet apart on the ground, and at the top are but three or four feet apart. Boards are nailed to the sides of these posts to the height of ten feet, a roof has been added, and thus is formed a house which incloses the whole of the machinery. The whole thing may be easily taken down and moved when a new hole is to be sunk. They are now at work upon their third hole, and for each new hole the apparatus has been moved a short distance. We yesterday had the satisfaction of witnessing

The Operation of Boring.

Also that of tubing the shaft, as we may call it, though it is a very small one. The boring is done by means of a diamond drill. The boring rod resembles sections of gas pipe, about ten feet in length, which screw together and thus form a rod of any desired length. The drill is but a plug of steel screwed fast to the end of one of these sections of pipe. In this plug are set the diamonds, six or eight in number, which do the cutting. The diamonds are of a dark brown color, and more resemble small pieces of iron ore than anything else. Small holes are out or drilled into the steel plug where they are to be set; they are then put in place and the edges of the steel awaged up tightly about them. The stones do not feel at all sharp, and one would hardly believe they would make any impression on hard granite or quartz rock. By the side of each diamond is drilled a small hole which extends through the plug and into the hollow of the rod. This is done in order that the water

which is forced in at the top of the hollow rod may flow out near the stone, and thus keep it clear of the small chips cut from the rock. The drill used does not produce a core, as do some of the diamond drills. It cuts or grinds all the rock it displaces in a fine powder. During the operation of boring, a strong current of water constantly flows down through the pipe and up on the outside, bringing up with it the borings. The drill makes several hundred revolutions per minute, and thus, despite the dullness of the diamonds, wears out the rock upon which it is operated. The holder in which the drill rod is placed is revolved by cog-gearing, and the feed is regulated by means of a screw cut upon this holder, the working of which we will not undertake to explain, though it is simple enough when seen.

The Reaming Out

Of the whole is done at the same time as the boring. The hole bored is about two inches in diameter, and this is reamed out till it is over three inches in diameter. It must be made this large to admit the tubing, which is three inches in diameter. At first sight it seems strange that a tool can be worked through a tube which will make a hole larger than the tube itself, but this is easily done. On one side of the drill rod is a projection, a sort of bulge, set with diamonds, and this works as an eccentric when it is let down below the tubing, scooping out the rocks on all sides. This is placed on the rod about eight feet above the small drill which goes ahead. Sections of the tubing are screwed on and pushed down as the work progresses. The drill makes very

Rapid Progress.

Boring into the rock at the rate of five feet per hour. It is the hoisting out of the rods and the putting in of the tube that consumes the most time; yet, on the whole, the amount of work done is astonishing. The hole on which they were at work yesterday was only begun the day previous, and yet at the time of our visit yesterday, about 3 o'clock in the afternoon, it had already been bored to the depth of forty-eight feet. Mr. Gore, who has charge of the apparatus, says he can easily sink thirty feet per day when all works well. This is good work considering that the hole made is three inches in diameter. The ground bored through can be tested all the way down by merely catching the dirt which is brought up by and flows out with the water. Good prospects have already been obtained in all the holes bored, but just how good the parties most interested do not care to make public. They are evidently making preparations for sinking

A Working Shaft.

As they are boring the holes in such a shape that they can be used for blasting out a shaft of four compartments of the size usually seen at our hoisting works. Once holes are sunk at all the corners, and a few at proper distances between, the shaft can be blasted out very rapidly. The machine used can be loaded upon a wagon and hauled about the country to any point where it is thought worth while to sink a hole in search of any kind of ore, stone, coal or any other valuable mineral deposit. It requires but very little water, and the labor of but three men, all told. This water used where they are now at work is brought through a small gas pipe from the works of the Gas Company. They are now cutting through a stratum of porphyry. Below this, strange as it may seem, is found about fifty feet of quicksand. This is what they say, but it must be a stratum of rock greatly decomposed. Their deepest hole is down 630 feet, yet no water was found in any of their borings. A visit to these works will repay any person who has never seen any work of this kind in progress.

Coal Measures in the United States.

The commissioner of the census gives in this third volume of the ninth census a map showing the geological formation of the surface of the United States. In connection with it he has written some interesting remarks, and a sketch descriptive of the coal measures in the United States, which, in a very short space, tells us where coal is found in different parts of the country, and the extent of each area of coal lands.

The following are the areas of the coal measures in the United States:

New England basin, in Massachusetts and Rhode Island, estimated to cover 750 square miles. The coal is a plumbaginous anthracite, used to advantage in some smelting furnaces. Perhaps eleven beds may exist; best seen in Portsmouth, Rhode Island. The maximum thickness is 23 ft. The whole carboniferous system is supposed to be 6,500 feet thick, of which 2,500 pertains exclusively to the coal measures.

Anthracite basins in Pennsylvania.—This is the most important coal district in the United States. There are four areas, having an area of 410 square miles, not including the Broad-Top semi-anthracite, which amounts to 24 more. The measures are from 2,000 to 3,000 feet thick. The number of distinct beds varies from two to twenty-five, according to the depth of the basin. The maximum amount near Pottsville is given at 207 feet, while the average cannot be far from 70 feet.—(H. D. Rogers.)

The *Appalachian field* embraces an area of 63,475 square miles, extending from Pennsylvania to Alabama.

In Pennsylvania the aggregate thickness of the measure is from 825 to 2,535 feet. The area of the bituminous coal is 12,222 square miles, with an average thickness of 40 feet of coal.—(H. D. Rogers.)

In Maryland the area is 550 square miles, in three separate basins. The strata are 1,500 feet thick. There are thirty-two beds in all—ones of 14 feet, three of 6 feet each; others from 1 to 5 feet thick.—(P. T. Tyson.)

In Virginia (chiefly West Virginia) the coal area embraces 10,000 square miles. On the Kanawha the strata are 1,250 feet thick, with twenty-four beds of coal, of which eleven have an aggregate of 51 feet thickness. The coals seem best developed on this river.—(S. T. Ridgway.)

In Ohio, Dr. J. S. Newberry states the area to be more than 10,000 square miles, with a thickness of 1,500 feet, and ten workable beds of coal, corresponding in number and thickness to those of Pennsylvania and West Virginia.

In Eastern Kentucky the area is stated to be 10,000 square miles.

In Tennessee, Professor J. M. Safford states the area of the measures to be 5,100 square miles. One characteristic section gives a thickness of 578 feet. There are seven beds of coal, with a total thickness of 14 feet. The beds vary locally in their dimensions, some of them being 9 feet thick, but thinning out very rapidly.

In Georgia the area may be represented by 170 square miles.

In Alabama a hasty measurement would indicate an area of 9,000 square miles.

The *Michigan basin* has an area of 6,700 square miles, with 122 feet of measures and 11 feet (maximum) of coal. In this center the coal is thickest, thinning out to nearly the thickness of paper around the edges.—(A. Winchell.)

The *Illinois basin*, including Indiana, and Western Kentucky, covers an area of 51,700 square miles.

In Illinois the measures occupy 41,500 square miles, from 600 to 2,500 feet thick, and contain ten beds of coal, with an aggregate thickness of 35 feet.—(A. H. Worthen.)

In Indiana the measures occupy an area of 6,500 square miles, are 650 feet thick, and contain thirteen beds of coal, with an aggregate thickness of 31 feet.—(E. T. Cox.)

In Western Kentucky the measures are 612 feet thick, including the millstone grit, and carry eleven beds of coal.—(E. T. Cox.)

The *Missouri basin* extends from Iowa to Texas.

In Iowa, Professor White's maps show an area of 25,000 square miles, which is divided into three parts, each about 200 feet thick. The two lower divisions contain the workable coal, which amounts to 8 feet in the second, but to only 20 inches in the upper. As the highest division is everywhere underlaid by the others, the whole area must be regarded as workable.

In Missouri, Professor G. C. Swallow estimates the coal area at 27,000 square miles, and in Kansas at 17,000 square miles. The measures are 2,000 feet thick, with twenty coal beds, from a few inches to 6 feet thick.

In Arkansas there seem to be only two beds of coal, which lie below the coal measure proper, beneath the conglomerate (Lesquerieux.) D. D. Owen speaks of some beds from 4 to 5 ft. thick, and estimates the area occupied by productive beds at 12,000 square miles.

In this Indian Territory little is known of coal. The officers of the Missouri, Kansas & Texas Railway Company find good banks of coal at several places along their line several feet thick. The area upon the map amounts to as much as 13,600 square miles. Since the completion of the map it has been ascertained that the coal measures are covered by the cretaceous formation for the width of about 30 miles along the valley of the Red River in Texas and the Indian territory, and also that the tertiary area extending southerly from Preston is probably of carboniferous age. These discoveries will enlarge, rather than diminish the size of the Missouri basin, since the two fields are probably connected hithertho the cretaceous beds.

In Texas according to A. B. Roessler, in the "Almanac," the coal measures occupy 6,000 square miles. A bed of coal has been reported near Fort Belknap as 4 feet thick. Estimating from Hayden's map the coal area in Nebraska at 3,600 square miles, the total area of this great basin must be 104,600 square miles.

In Arizona, near Camp Apache, Mr. G. K. Gilbert, of the expedition under the immediate direction of Lieutenant George M. Wheeler, reports a bed of coal belonging to the true carboniferous series. It is probable that future explorations may develop other coal-bearing areas in the Territories.

In this sketch no notice is taken of any coals which do not belong to the carboniferous system. Other coals of commercial importance exist, especially in Eastern Virginia and near the Union Pacific Railway. They usually belong to the triassic or cretaceous formations, and there are lignites in the tertiary.

BUSINESS AT THE STOCK BOARD.—The weekly sales at the San Francisco Stock and Exchange Board, for the past six weeks, have been as follows:

Week ending April 9.....	\$1,685,460
Week ending April 16.....	2,097,700
Week ending April 23.....	2,547,000
Week ending April 30.....	3,037,400
Week ending May 7.....	3,934,000
Week ending May 14.....	4,914,000

MECHANICAL PROGRESS

The Mexican Method of Making Hard Lime Floors.

Gen. T. G. Ellis has recently communicated to the American Society of Civil Engineers some interesting facts with regard to the manner in which the Mexicans make hard lime floors, sidewalks, roofs, etc. We condense from the *Journal of the Franklin Institute* for the present month.—It is well known that the Mexicans, in many localities make floors and pavements of lime and sand over which horses may travel for an indefinite length of time without making thereupon any more impression than would be made upon a smooth surface of granite or slate.

In making these floors the limestone used is a very hard, blue material, calcined and slaked as soon as cool. It may be used immediately after slaking or carefully kept in barrels four or six weeks. In making the floors, a layer of broken limestone, three or four inches thick, is first laid evenly over the surface of the ground. The stone being about the usual sizes for macadamizing roads; over this a mortar of about two parts of sand to one of lime is carefully and evenly spread to the thickness of one and a half to two inches; this is allowed to remain for about twenty four hours, or until the surface has become quite dry.

The floor is then thoroughly pounded all over with a tool composed of a block of wood about a foot square and three inches thick, having a handle rising from the middle, so that a man could stand while using it. The whole surface is beaten over with this ram until it is again as soft and moist as when first laid. This operation of ramming brings the water in the mortar to the surface so as to form a layer of semi-fluid substance on top.

The floor is now again allowed to dry, and again beaten over each day for about a week, or until the operation brings only a slight amount of moisture to the surface.

Immediately after the last pounding the surface is polished as follows:

A smooth, nearly flat, water-worn stone, a little larger than the fist, is selected, and with this the whole floor is laboriously gone over, rubbing down and leaving the surface of the lime as smooth as a piece of polished stone.

In less than a week the floors made in this way are sufficiently hard to bear the weight of a horse without indentation.

Roofs made in the same manner are perfectly water-proof and unaffected in any manner by sun or rain. In the Mexican city of Monterey, the sidewalks in the principal streets are made in this manner, and last for years, wearing through only like blocks of stone.

In making floors, an earthy reddish pigment clay, colored with sesqui oxide of iron is powdered over the lime just after the last pounding and before polishing. The pigment is thus ground into the upper surface of the composition, giving a soft brownish tint.

The great durability and strength of these floors or pavements is said to be entirely owing to the repeated pounding operation to which they are subjected; as the same materials applied and dried, in the ordinary way, without pounding, will not harden so, but that they will be readily indented by the round of a chair or a boot heel.

It is believed that this method of preparing hard surfaces has never been practiced outside of Mexico; although it seems singular that it should be used so generally by a neighboring nation, and be wholly unknown to our builders.

In commenting upon the above, E. A. Fierste, C. E., a member of the Society of Civil Engineers, remarks:

"That the description above given of the method of consolidating the mortar, etc., and even the employment of wooden compressors, explain accurately the process still followed in Spanish countries to form the floorings of plazas, public walks, etc.; and in many cases, immediately before the cement becomes set, its surface is polished with a smooth cobble stone until it acquires a high and lasting lustre."

A cement called "revocado" by Spanish engineers is made by mixing in several proportions fat limes with sand and under-burnt brick dust. The usual proportions are measured by equal volumes of the three materials; but when the cement is to be used for stopping roof leaks, cementing cellars, or where blows upon the cement are not anticipated, the proportion of sand is greatly diminished, and even suppressed altogether.

The Spanish learned the compounding of this cement from the Biscayan probably; and I doubt if the Romans had anything to do with its introduction in Spain, because the ruins of ancient water channels with "revocado" exist in the Basque provinces, where neither Romans nor Moore ever penetrated. The Biscayans, in their turn, are the most ancient people with whom we are acquainted, it being probable that they preceded the Phenicians.

I have seen Spanish "revocado" in Mexico, and it is natural to suppose that the Spaniards introduced the art in that country during the conquest.

The following question is put, and left unanswered by the Society's Printing Committee: Is this "pounding process" of the Mexicans

anything more than a simple yet effectual method of freeing the mortar of its surplus water, and thereby insuring a condition in which the lime can pass to a crystalline carbonate, at the same time compacting the whole mass into the best possible state?

A FAMOUS ARMORER.—Andrea de Ferrara, was the most famous armorer of modern times. He first came into note in the "Highlands of Scotland." It is said that he was the only person who could forge armor that would resist the Sheffield arrow-heads, or make swords that would vie with the best weapons of Toledo and Milan. He is supposed to have learned his art in the Italian city, whence he was called, and, under the patronage of the King of Scotland, to have practiced it in secrecy among the Highland hills, as all his genuine blades were marked with a crown; and before his time no man in Great Britain could temper a sword in such a way that the point should touch the hilt and spring back uninjured. He is said to have worked in a dark cellar, the better to enable him to perceive the effect of the heat upon the metal, and to watch the nicety of the tempering; as well as possibly to serve as a screen to his secret method of working. Many of his blades, with new basket hilts, are to be found in the Scottish regiments of the present day.

IMITATION OF MARBLE.—The preparations of slate in imitation of marble appear to be largely coming into use at the East. The imitation is prepared in the following manner. The slabs of slate are first surfaced by a planer, and brought to the required thickness. Patterns are then laid upon the slabs, and the mallet and chisel work out the required forms and mouldings. The marbleizing is the peculiar feature in the operation. The marbleizing material is prepared in a vat, and the slab is let down on the composition, which adheres to the slate. The slab is next baked in an oven for one night, then gets a coat of varnish manufactured for that especial purpose, and after six repetitions of these processes, it is finally removed and polished, the surface presenting a beautiful appearance. So firmly united to the slate is this coating, that it cannot be scaled or clipped off, without taking the slaty particles with it.

CAMPHOR WOOD.—This wood promises to become, at no distant day, a very valuable and important article of commerce. It grows freely in tropical countries, without cultivation, and especially thrives near the sea coast, where it may be easily obtained for shipment. It attains large proportions, being sometimes found fifteen ft. and upwards in diameter, and of proportionate height. It is very valuable for carpenter's work, being light, durable and not liable to injury from insects. Its aromatic, agreeable perfume is also well known. The wood is strong and very durable, and is especially applicable for ship building, and may be applied to all purposes for which teak wood is used. Camphor wood piles have been known to remain in a good state of preservation over 100 years.

SILICON STEEL. to which we have several times referred, seems to be making its way into practical use. Its manufacture has been patented in England. The *Journal of Iron and Steel* in speaking of it says: "The pig iron from which it is made is melted in a suitable furnace, and when nearly melted an addition of from 15 to 40 per cent of its weight of silicic iron ore, mixed with coke, is made, and well stirred into the metal, after which it is run into pots and placed at the sides of the furnace, holding about half a ton each, in which it is well stirred up until it "balls up," or comes to nature, as it is termed. Silicon steel, when of good quality, is stated to contain 0.600 per cent. carbon, along with 0.552 per cent silicon."

TIDAL POWER MACHINE.—A practical trial recently took place in Brooklyn of Edward W. Morton's machine, worked by the rise and fall of the tide, the power thus derived to be utilized for mechanical purposes. The contrivance was tried at the foot of South Tenth street, East River, before a large number of persons interested. The machine works by means of a "float," which, as it rises and falls with the waves or the tide, propels the machinery to which it may be attached. At the trial it was geared to a saw, and worked with the full rapidity of a circular saw run by steam power, although, perhaps, not quite so uniformly.

WEARING OF CAST IRON SURFACES.—The wearing of cast-iron surfaces exposed to sliding friction can be almost wholly prevented by tempering with a mixture of 21 1/2 pints of water, 30 1/2 pounds sulphuric acid, 1,003 grains of nitric acid. The articles should be heated to a cherry red, and protected from the oxidizing effects of currents of air by a sheet iron box. The process is especially adapted to the hardening of bearings of axles, which while much cheaper than those of the usual alloy, will, when regularly lubricated, last as long, even when there is great rapidity of motion.

ASBESTOS PACKING appears to be still gaining in favor. A late exchange says that this packing in ocean-going steamers, put in more than sixteen months since, is still apparently as perfect as ever. The Anglia one of the Anchor Line Transatlantic passenger steamers, has made fourteen trips to America and back, having steamed on the same packing over 98,000 miles.

SCIENTIFIC PROGRESS.

Quantitative Spectroscopic Analysis.

The special merit of the spectroscope has heretofore been regarded to be the determination of the presence of certain elements in a luminous body, when there is such minute traces as to altogether defy detection by other known methods of analysis. The idea of extending the indications of this method of analysis to the estimate of quantitative values has often been suggested, but the difficulties to be overcome are very great.

Quite recently the subject has received considerable attention in learned circles, in consequence of a communication to the French Academy by M. Janssen, the eminent spectroscopist, who has pointed out very clearly, in a memoir to that society, the principles upon which such an application of the spectroscope might be based.

Mr. Janssen indicates two independent methods of procedure in such investigations, which may be employed simultaneously, and so serve as a species of control upon results obtained.

One of these methods is to measure the intensity of the bright lines afforded by a substance in the spectrum; the other is the measurement of the time required for the complete volatilization of a substance in the flame.

It is said that an apparatus constructed to take advantage of the first named method has been successfully employed to determine the quantity of certain elements in the ashes of plants.

Should further experiment verify the expectation here expressed, the practical value of the spectroscope, which has already achieved wonders, will be greatly enhanced.

ELECTRICAL CONDUCTIVITY AFFECTED BY LIGHT.

A most curious experiment, involving an alteration in the electrical conductivity of the element selenium, an element of very high resistance, has recently been published by Mr. Willoughby Smith. Mr. Smith took several small bars of this substance; each bar hermetically sealed in a glass tube, and had a platinum wire at each end for the purpose of connection. It was found that the resistance altered materially, according to the intensity of light to which the element was subjected. When the bars were fixed in a box with a sealed cover, so as to exclude all light, their resistance was at a maximum, and remained very constant; but immediately the cover was removed, the conductivity increased from 15 to 100 per cent., according to the intensity of the light falling upon the box. The mere interception of the light, by passing the hand before an ordinary gas-burner placed several feet from the bar, increased the resistance 15 to 20 per cent. When the light was intercepted by glass of various colors the resistance varied according to the amount of light passed through. To insure that the temperature had nothing to do with the results obtained, one of the bars was placed in a trough of water, so that there should be an inch of liquid for the light to pass through. The results under these conditions were the same. And again, when a strong light, from the ignition of a narrow band of magnesium, was held about six inches above the sealed tube, the resistance immediately fell more than two-thirds, returning to its normal condition, immediate the light was extinguished.

NEW MODE OF DETERMINING THE AMOUNT OF MERCURY IN ITS ORES.—A German exchange contains a description of Escha's new mode of determining the amount of mercury which may exist in its ores. The discovery is pronounced a very valuable one, and the process is as follows:

The pulverized ore, after weighing, is placed in a porcelain crucible, the edge of which has been ground. It is there mixed with about half its weight of pure iron filings, and the whole covered with a layer of the latter. The crucible is then covered with a weighed concave lid of gold having an even edge, and the depression in the cover is filled with distilled water. The crucible is then heated for ten minutes in a flame which surrounds the lower portion of the crucible. At the end of this period which suffices to volatilize all the mercury, the gold lid, which has amalgamated with the mercury, is taken off, the water poured out, and the mirror of mercury on the convex side washed out with alcohol, dried on a water bath, and, after cooling, weighed. The increase in the weight of the gold cover corresponds to the amount of mercury in the ore—the accuracy of the result depending, of course, on the carefulness of the manipulation attending the process.

AMMONIA IN SNOW.—The amount of ammonia in snow of different temperatures has recently been determined at Munich by Vogel. Freshly fallen snow at 6° C. furnished water that contained 0.003 gramme to the litre; snow at —3° C., 0.002; and snow that fell at —9° to —15° was entirely free from ammonia. Snow that had lain twenty-four hours on a field which had been mowed the previous autumn was found, when melted, to contain 0.012 gramme per litre of ammonia. Other snow that had been for twenty-four hours on the zinc roof of a house had absorbed 0.009 gramme.

TURPENTINE AS AN ANTIDOTE TO PHOSPHORUS.—Turpentine oil has often been recommended as an antidote to poisoning by phosphorus. For this purpose it is essential that it contain oxygen, which is the case of ordinary oil of turpentine not recently rectified. The oil is best introduced into the stomach in gelatinous capsules, 100 grains being required to neutralize one grain of phosphorus.

Some have supposed that turpentine has the power of checking the oxygen-stealing action of phosphorus and phosphureted hydrogen in the blood. Dr. Köhler, however, thinks that at first a genuine chemical compound is formed, by oxidation of the phosphorus, and that this then unites with the essential oil to form a second compound which is harmless.

More recent experiments confirm the latter view of the case. If three-fourths of an ounce of phosphorus be gradually added to two pounds ordinary turpentine oil, warmed to 104° Fah., and the mixture be shaken on the sand bath, there crystallizes out, on cooling, a white solid, which is separated from the excess of phosphorus by crystallization from alcohol. This substance he calls *turpentine phosphoric acid*. When turpentine is administered in cases of phosphorus poisoning, this acid is discharged in the urine, and is found in the alkaline distillate by distilling the urine. This distillate has the power of reducing corrosive sublimate to calomel, and precipitates metallic silver from solutions of its salts.

When the turpentine phosphoric acid is heated in a stream of hydrogen at 104°, inflammable phosphureted hydrogen is involved.—*Am. Artisan.*

SCIENTIFIC PROGRESS.—The practical uses and advantages of science is especially observable in what it has done in introducing into the arts, and gradually developing into manifold use, that compound known as bisulphide of carbon. Up to the year 1850, the only industrial application of bisulphide of carbon was the dissolution and vulcanization of india rubber. Since that time it has been applied to the following uses: 1. The complete extraction of the fatty matter from bones used in the fabrication of bone-blives. 2. The extraction of oil from grain and olives. 3. The removal of sulphur from earth in which it is contained and also oil from bituminous rocks. 4. The scouring and elimination of greasy substance from wool by the Systerth and similar processes. 5. The extraction of the soluble principle of spices. 6. The fabrication of yellow prussiate of potash, and of sulphocyanide of ammonium, for making Pharaoh's serpents. 7. The preparation of Greek fire; a solution of phosphorus in the bisulphide is used for filling inflammatory rockets or shells. 8. For silver-plating; a small quantity placed in the bath increases the brilliancy of the deposit. 9. For the destruction of vermin. 10. For filling glass prisms, on account of the brilliancy of the colors of its spectrum. 11. For diving by its vapor all classes of engines, with or without expansion.

A BEAUTIFUL EXPERIMENT ON SOUND.—The following beautiful experiment, described by Prof. Tyndall, shows how music may be transmitted by an ordinary wooden rod. In a room two floors beneath his lecture-room, there was a piano upon which an artist was playing, but the audience could not hear it. A rod of deal, with its lower end resting upon the sounding-board of the piano, extended upward through the two floors, its upper end being exposed before the lecture table. But still no sound was heard. A violin was then placed upon the end of the rod, which was thrown into resonance by the ascending thrills, and instantly the music of the piano was given out in the lecture-room. A guitar and a harp were substituted for the violin, and with the same result. The vibrations of the piano-string were communicated to the sounding-board, they traversed the long rod, were reproduced by the resonant bodies above, the air was carved into waves, and the whole musical composition was delivered to the listening audience.—*Nature.*

THE STRUGGLE FOR LIFE AMONG PLANTS.—Each plant endeavors, almost consciously, to destroy his neighbor, to occupy his ground, to feed upon his nutriment, to devour his substance. There are armies and invasions of grasses, barbarian inroads and extirpations. Every inch of ground is contested by the weeds; the forest is a struggle for precedence; the Wars of the Roses are a perennial feud. The serenest landscape, the stillest woodland, are the mortal arena of vegetable and animal conflict.

AN IMPROVEMENT IN THE MANUFACTURE OF GLUCOSE has been discovered by Mr. Krothe. By adding a small quantity of nitric acid to the sulphuric acid, in converting starch into syrup (glucose), he is able to save half the time required for affecting the conversion by the use of sulphuric acid alone. In preparing solid glucose the saving of time is much greater.

In view of the great demand for solid glucose (grape sugar), this discovery may be considered a very important one.

THE SUPPOSED PLANET BETWEEN MERCURY AND THE SUN.—The existence of an intra-Mercurial planet has been frequently argued upon astronomical grounds, and no objective proof of its presence has yet been presented. In further evidence of the existence of such a planet, Mr. Cowie has telegraphed from Shanghai an account of a recent observation in which he assumes that a black spot seen on the sun's disk, on March 24th, marked, in reality, the transit of the supposed planet.

Assessments, Meetings, Dividends.

THURSDAY EVE, May 22, 1873.

In view of the large dividends of the month from the Crown Point and Belcher mines the following table showing the dividends paid by them since January 1872 will be interesting:

Totals.....	\$44,000	\$1,577,000	\$39 60	\$3,960,000
-------------	----------	-------------	---------	-------------

The Crown Point commenced paying dividends in June 1871 after not doing so since September, 1868. In January, 1872, the Belcher began to pay dividends. Both these mines combined have paid since January, 1872 the sum of \$8,530,000, of which \$4,180,000 has been paid since January last.

The dividends for May amounted to \$1,872,000 and the assessments delinquent as above are \$616,900. The dividends for the past five months, this year, have amounted to the sum of \$5,165,181, and the assessments amount to \$2,829,730, the dividends exceeding the assessments by \$2,335,451, and the above average of \$1,000,000 per month.

The sales at the Stock Board for the past few weeks sum up as follows:

Week ending April 9.....	\$1,585,466
Week ending April 16.....	2,097,700
Week ending April 23.....	2,547,700
Week ending April 30.....	5,037,400
Week ending May 7.....	5,324,000
Week ending May 14.....	4,914,000

On Saturday stocks were pretty lively, and there was an unusually long session of the Board in the morning, lasting about 2¾ hours.

Yesterday's market showed decided weakness, with few orders and a downward tendency in prices, there being few orders to buy and many to sell.

The following items of interest from prominent mines are collated from letters or telegrams from superintendents on file at the offices of the respective companies in this city.

Aladdin.

Dispatch of the 19th instant says that the new developments in 5th and 6th levels continue flattering. Are sending ore to mill; mill now running on Flag ore. Everything progressing finely and about the mine.

Buckeye.
Letter of the 15th says we have nothing new to or important to report from the mine to-day.

through to the level of the incline. The incline is being sunk as fast as circumstances will permit. The rock in the bottom still continues very hard. The various prospect drifts are being carried forward with all possible energy without having as yet met with any material change. The south drift at 1300-foot level has now reached 137 feet south

yield their usual quantity of fine ore. Those on the 1200 and 1300-foot levels are opening out splendidly and showing a general improvement in the character of the ore. Daily yield of the mine is about 560 tons. Our new hoilers have been received and will be put up at once.

to date, they have shipped 6,850¹/₂ tons of ore, which will aggregate about \$529,112.55. General average per ton, \$77.15. On account of the breaking of the spur wheel of the pump, they have not been able to extract the usual amount of ore. The new spur wheel is being placed in position and will be

running off the isthmus. Think they have struck the east wall of the continuous good ore, which will give an average assay of about \$28.96 per ton. Connection was made yesterday with the fifth floor crosscut of the 1300-foot level, and the winze from the 1200-foot level affords a good circulation of air. The last six feet of the third floor crosscut has been in place, which will assay \$35 per ton, and still good ore in the recess

Letter of the 17th says: For week ending to-day the following is a summary of operations in the company's mine. Ore extracted, 737 tons; forwarded to mill, 747 tons 1,300 pounds. Average assay value of ore from mine as determined from sample \$38.42 per ton. No important changes.

Chief of the Hill.

Eureka, Grass Valley.
Letter of the 17th says the clean-up for the last six days run of ten stamps and the proceeds from thirty tons of quartz is 1,300 ounces of amalgam. There are no change in the bottom. The ledge in the east drift, sixth level, is

Letter of the 15th says they have stopped fifth level drift south. It has worked very hard the last 30 feet. The whole length of drift is 465 feet. The sixth level drift south is an 18 inch vein with some apote and lunchee and rich ore, but it shows so compact body yet. Winze from 7th to 8th is

Gould & Curry.
Letter of the 20th says that in the mine is little change to note. The various shafts and crosscuts have been carried forward day and night, without intermissions. The shaft on 1600-foot level is being run as fast as possible. It

Letter of the 13th says the drift connecting winze between the 1690 and 1700-foot levels show some very fine ore. In the upper portions of the mine there is some chert to be seen.

Letter of the 13th says the ledge continues to look well as we drift west on it. Are now in north drift on ledge 20 feet. The assays taken the last two days go higher. One assay made to-day, from the face of the drift, went \$1,000 per ton.

Julia.

Letter of the 17th says the mine looks favorable this week. Have sunk the shaft eight feet and advanced the south drift twelve feet. The ledge is three feet wide. Looking very well. It is improving as we advance.

Nevada Tunnel.

The Superintendent of this mine, which is situated at American Flat, Gold Hill, Nevada, writes under date of the 20th that the ledge is improving as it is sunk upon. It is now four feet wide, and the average assays, by our samples, give \$27 per ton. They started a new shaft last week and

are grading for new hoisting works, which will be put up as soon as possible.

Ophir.

Letter of the 17th says there is nothing new to report today. All work is going on as usual. No important changes.

yet. **Page & Panaca.**
Letter of the 15th says the face of drift is now 776 feet from shaft. This morning we struck seam in quartz, containing lead and sulphurate of iron which assays \$40 per ton of mill-
like others, through which we have passed.

is pitching into the hill, through face of the drift, which indicates that if they belong to the main lead it must be further ahead. We have now no water in face, and hat little along the drift.

Phoenix Tunnel.

Letter of the 13th says the tunnel has been driven 11 feet on contract. Rock is still of partially decomposed white lime, very hard in spots. Seams of clay filled with ochre, and pockets stained with ochreous material. The appearance of the rock is regular. It has every appearance of being in the vicinity of something and stockholders must wait patiently and feel hopeful. A few feet must determine what is its character.

Raymond & Ely.

Dispatch of the 16th says there is no change in the assays. Assays from the seventh level winze (Meadow Valley West Extension ground) gave \$300 per ton. Do not know how thick the ledge is. Improving in eighth level. Assay from that level gave \$300 per ton. Everything is going on all right.

Silver Hill.

Letter of the 20th says the main drift from the first station continues to improve as it is being run north. The upper part of the mine continues as last report. Assay today gives \$24.21. Ore shipped from mine on the 20th, 35 tons 1,300 pounds.

Senator.

Letter from the Superintendent, under date of the 15th and on the 12th of the sinking of the shaft. The bottom of the shaft shows some very good quartz, and the best indication of being close to ledge. Some of the quartz shows sulphurets of silver. On Monday and Wednesday of next week I will be better informed of the advisability of connecting the drift at this level.

Starr King.

Letter of the 12th says the furnace is a grand success. It is rolling out hullion at the rate of 8,000 pounds daily. Ore contains iron enough to smelt, in parts of the mine. There are some small pieces of bullion in the furnace, and it is in splendid order.

Sierra Nevada.

Letter of the 17th says they cleaned up battery and mill yesterday, and sent to mill 25 pounds of hullion. Amount of ore worked, was 840 tons. The running yesterday and doing good work. Average hullion shows increase. Are using wood for fuel, it is cheaper than coal. Think they can keep up their grade of ore the balance of the month. North vein fully holds its own. The ore is in a single sample are better than usual. Gravel stops about hold their own. The new stopes over the McDonald stopes, does not prospect so well. No change in the other parts of the mine. We produced to date this month, 43 tons, 34 men at work.

Silver Peak.

Letter of the 15th says there is nothing of particular importance to note to-day. Are still pushing the drifts east and west without marked change in either.

Woodville.

Letter of the 20th says: "I will send you one bar of bullion to-morrow and two more on Sunday next. There is more and better ore in sight in the mine than when I first commenced milling. Opening out the vein has shown an improvement. The mills also show the ore paying well."

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned:

California.

ALPINE COUNTY.

EXCHAMBER. Alpine Miner, May 17: We visited this mill on Silver Creek on Monday, and found that only a few finishing touches required to complete ready for turning out bullion. It now has only 8 stamps, but is so planned that the addition of more is a simple matter. It is arranged for wet reduction; Mr. Chalmers estimating that nearly 68 per cent. of the metal can be saved by this method, and that his system of concentration will give him the balance in nearly pure sulphurets, which can be treated by a reverberatory furnace and the whole saved.

M. & N.W. Co.—An assay of rock from the Glance shaft of M. & N.W. Co., made by Mr. Hunter a few days since, gave a 30 ft. level, in 125 ft. where several metal pans. Some rock from the Tarnish mine assayed at the same time gave a much higher value, the figures of which we have mislaid.

TARNISH MILL has been running most of the week but at this writing nothing definite can be arrived at as to the results; a clean up having been made. The experiment will be continued into next week. We hear of good prospects in the way of ore in the north drift from the lower level of the mine.

CALAVERAS COUNTY.

AUSTRIAN. Calaveras Chronicle, May 17. We understand that 3 locations have been made upon the ledge, and that a shaft is being sunk on each. The shafts are respectively at the 300 ft. level, in 125 ft. where several metal pans. Some rock from the Tarnish mine assayed at the same time gave a much higher value, the figures of which we have mislaid.

TARNISH MILL has been running most of the week but at this writing nothing definite can be arrived at as to the results; a clean up having been made. The experiment will be continued into next week. We hear of good prospects in the way of ore in the north drift from the lower level of the mine.

Good HOPE HOISTING WORKS.—We learn that the entire machinery for the new hoisting works to be erected upon the Good Hope mine at Mosquito is on the ground. The foundations are also laid and most of the framing completed.

EL DORADO COUNTY.

CLARKSVILLE Mountain Democrat, May 17: There are now 8 quartz ledges within 2 miles of here that are being successfully worked, viz: The Tong Company, Berry & Oram, and Taylor & McCarty. The Tong is about half a mile east of town; the Oram & Berry is about 3 miles north; the Taylor & McCarty mine is about 1 1/2 miles east of the Tong. This mine was discovered by S. Sponage, who took out in 3 weeks over \$33,000, and then sold out to Taylor & McCarty. Oram & Berry did well last season and expect to do better this year. They have their new shaft down about 70 ft. and have realized good pay out of the shaft the whole time they have been sinking. The Tong mine is now owned by a San Francisco Co. They have on the dump about 125 tons of quartz that will mill from \$12 to \$25 per ton. The shaft is now down about 135 ft., the ledge steadily widening and improving as it descends.

FRESNO COUNTY.

THE FORTUNA COAL Mine, owned by Wm. T. Williams, is situated N. W. from the New Idria Quicksilver Mines about 4 miles. The mine has been worked sufficient to prove its character. The ledge runs east and west and a tunnel has been run in some 200 ft. on the ledge which is opening out nicely. The New Idria Company has burned a large quantity of coal, which gave general satisfaction. About 200 ft. south of the ledge petroleum has been found in considerable quantities and of an excellent quality.

HUMBOLDT COUNTY.

HENNING. Silver State, May 17: This mine has been tolerably well developed by tunnels and cross-drifts a distance of about 200 ft. from the surface. The ledge is enclosed in limestone and is remarkably well defined and uniform in size. The average thickness of the vein being nearly 2 ft. has shipped considerable ore and has supplied the Pioneer mill for several months past. The ore is principally low grade, however, though rich sulphurets ore, in limited quantity, have been found at the greatest depth attained.

ADAMS.—This mine was discovered last Summer, and prospected by a tunnel on the ledge 150 ft. long. There are several tons of ore on the dump, and the ledge appears the entire length of the tunnel. The formation is similar to that of the Henning, though the course of the ledge is northeast, with a dip of about 25 degrees to the south.

GOV. BRADLEY.—This ledge is situated between the quartzite and limestone formations, and is well defined. It is prospected by a shaft 100 ft. deep, which follows the vein at about an incline of 70 degrees. The course of the Bradley is north and south, and the ore is, next the Arizona, the richest in the district.

HARRIS.—The mine is at present leased to Messrs. Harris & Phillips, experienced miners. Four men are employed, and at present the mine is yielding excellent ore the richest of which is shipped and yields from \$300 to \$450 per ton. The second-class is reduced here by the wet process, and yields about 60 per cent. of its assayed value. There was, at the time of our visit, a splendid lot of ore on the dump, which was being sacked for shipment, besides 30 or 40 tons of milling ore.

ARIZONA.—A new tramway, 175 ft. in length is just completed at the mine, to facilitate the removal of ores from the new or upper to the lower works. At the upper end of this tramway the ledge averages about 12 ft. in thickness, the ore-streak near the surface being about 2 ft. wide, much smaller than in other portions of the mine, the rock being harder work, and arriving at a point 300 ft. directly under the upper end of the new tramway, we found miners at work breaking down the ledge, which is from 10 to 14 ft. thick and carries a considerable amount of shipping ore, though the greater part of the large vein is millage ore. Pursuing our course to the extreme eastern end of the mine, 1,500 ft. from the mill, we found the ledge steadily increasing in incline, ft. below the level of the tunnel, the deepest point in the mine, a level is being opened on the ledge. The vein is 3 ft. 4 in. thick, by actual measurement, and sparkling with black sulphurets. It is designed to continue the drift in this direction and prospect the mine as far to the east as may be practicable.

INYO COUNTY.

DEEP SPRING.—Inyo Independent, May 17: As many of our local readers have obtained the impression that Deep Spring Valley and adjacent mines are entirely abandoned, we will take this occasion to correct the error. It is true that the mill stands idle, but there are several miners operating in the surrounding hills. Notwithstanding the fact that a prominent mill man has condemned their "white quartz" as worthless, the miners of deep spring are full in the faith that they have better mines than anybody. One of these mines, the "Berry," at 80 ft., shows a 5-ft. ledge, which we are assured assays from \$1,000 per ton as a body. The vein runs between walls is 8 ft. wide. The "Inyo" ledge, at 50 ft., has 2 ft. of ore assaying from \$100 to \$500 per ton.

KERN COUNTY.

CLARA BELLE DE BILK.—Havilah Miner, May 17: This mine, so named in consequence of its "petering" once, was visited by us last Saturday; 3 shafts are sunk on it. The deepest one has about a foot of water in it, which has caused a temporary suspension of work. The other two shafts are turning out a rich grade of ore, valued from \$40 to \$100 per ton. The ledge is small, averaging about 13 inches in width. Carson & Webb's works, had four tons of rock on the dump, taken out the day before, which we examined, and saw the gold richly sprinkled through it.

Next week, we are informed, the Bigler mill will commence a run on Argus rock, some 50 tons of which is now at the mill.

LAKE COUNTY.

COAL.—Lake Co. Bee, May 17: A correspondent writes, as follows: "I send you herewith a sample of coal discovered by Lake County, about 6 miles south of Lower Lake and 8 miles north of Harbin Springs. The vein was discovered by Nathan Smith, is about 2 ft. in width and has been traced on the surface for a distance of half a mile. It is about 2 1/2 miles from Seigler Springs, near the road between Glenbrook and Lower Lake. The coal is of the bituminous kind."

NEVADA COUNTY.

MINING ITEMS.—Grass Valley Union, May 14th: The Coe mine has struck it very rich. In the shaft there is a ledge about 2 1/2 ft. thick and the quartz is full of the best class of sulphurets and shows also splendidly in fact. The ledge is regular and well defined. The Pileocene Co., at Randolph, between Grass Valley and Rough and Ready, is panning out well. Last Monday \$150 worth of gold was taken out and on yesterday a partial clean up was made and \$80 realized. The bed of gravel is extensive and of course is rich to give such results. The expense of the mine (gravel) is about \$8 a cubic yard for labor. We congratulate Billy Coombs on the result of his persistent labor.

The Eureka made a shipment yesterday; to the amount of \$15,700, taken out of the amalgamators of the mill after running 12 days with 8 stamps.

NAPA COUNTY.

YELLOW JACKER.—Callista Tribune, May 15: This Co. now have a tunnel in 55 ft., and a shaft 24 ft. in depth. Some of the ore taken out is of marvelous richness, and the average quality is much above the first prospects. We have just heard of a rich and extensive coal discovery.

The discoverer is Mr. Nathan Smith, of Cobb Valley, and the mine is situated about 2 1/2 miles from Callista, 2 miles from Seigler Springs, and 5 miles from Harbin Springs. It is in a canon, with high mountains on each side, the coal being found in layers, or strata, a few ft. apart and running into the mountains on both sides of the canon. The first vein opened was but 1 inch thick at the surface, but on going in 4 ft. increased to 2 ft. in width. A gentleman from San Francisco, who has been many years in the coal business, states that it is equal in quality to any foreign coal, and will bring as high a price in the market as the best. It is the only coal yet found in California which can be used at the forge. The extent of the deposit is not yet known.

THE GREAT WESTERN.—This rich quicksilver mine (formerly the Gem) which is located about 14 miles from Callista, over St. Helena Mountain, has been worked with 30 hands for more than a year, and there is now sufficient ore on the ground to occupy 6 months or more in the working. The Co. are about erecting a furnace and the other necessary appliances for getting out the metal, the material for which, amounting to several hundred tons, is now passing through Callista.

NEVADA COUNTY.

BARS OF GOLD.—Grass Valley Union, May 13: The Idaho mine skinned the amalgamators of the mill, not touching the batteries, and got about \$23,500 worth of gold after a 6 days run. The Eureka made a run of 5 days with 10 stamps and got about \$9,000 worth of gold. The Pileocene Co., working in gravel, is taking out something like \$100 per day, with a labor account of not over \$15 a day.

A BIOCLEANUP.—Nevada Transcript, May 18: After a few days run the Nevada Transcript, on rock from their quartz mine on Little Deer Creek, they cleaned up on Friday last, \$10,000. A thousand dollars a day from an 8 stamp mill is not bad to take, especially when it costs so little to take out and crush rock as it does under the system of working their ledges adopted by the Murchies.

CANYON CREEK.—The new mill of the Canyon Creek mine of Lock & Curry is on the ground, and a part of the machinery has been set. It has two heavy batteries and 10 stamps. The mine can be opened by a tunnel from Canyon Creek to the depth of 1500 ft. without machinery.

PLUMAS COUNTY.

WATER RUNNING.—Plumas National, May 10: The Hungarian Hill Co. have finished their ditch to one of the branches of Mill Creek, and have about 100 inches of water running through it at the present time. This

with the aid of their reservoirs, will give them a "big lift" in the water line.

RICH QUARTZ.—Mr. Bell who is working on a quartz ledge near Elizabethtown, has shown us some splendid specimens of quartz, and we should not be surprised if he develops a valuable ledge.

STILL PANNING.—The old Dutch Hill claims continue to "pan." The Co. recently cleaned up 200 ounces for 30 days a run, working 8 men.

PLUMAS COUNTY.

NEW CLARKE.—Plumas National, May 17: Ferguson & Co. have commenced work on a new claim near Little Long Valley, which we are told, promises to be very valuable when fairly opened. Everything indicates a huge old channel, and the pen never fails to bring "the color."

INCREASING.—The water in the Hungarian Hill ditches is gradually increasing, and they now run their giants about 7 hours per day, and are making splendid pay.

PACER COUNTY.

CHIEF PLACER.—May 18: The shaft on which they are now working is down 214 ft., at the bottom of which the ledge is full 2 ft. thick, and shows free gold and sulphurets in greater abundance than any rock yet taken from the mine. For the first 150 ft. the ledge varies from 8 to 12 inches in thickness; from that point they commenced running levels and stopping the rock, the rock being literally interwoven with gold. At the depth of 175 ft. they struck a stringer about 6 inches thick, which is very rich; from that point down the ledge has continued to widen and grow richer. The Co. have now out about 70 tons and are crushing 17 tons a day at their mill.

GONNARD.—On Thursday we were shown some of the richest rock yet taken from the mine in this section, the rock being literally interwoven with gold. The specimens were taken out at a depth of 40 ft., and were on the pay chute. Out of about 150 pounds of the rock, crushed in a hand mortar, they have taken about \$1,500, and they have now out considerable rock that is equally as rich, while the ledge shows the same quality of ore on all sides.

TRINITY COUNTY.

COOPER ORE.—Trinity Journal, May 17: George Rose has discovered some very rich copper ore on the head of Brown's Creek. A small specimen shown us seems to be about two-thirds pure copper.

TUOLUMNE COUNTY.

HILL & MARSHALL.—Inyo Independent, May 17: Quartz at Cherokee continues to pan out well. From 25 tons of rock recently crushed, they realized 75 ounces—equal to \$1,200. They struck a chute of rock last week near 4 ft. wide, which prospects very fine; and have started a tunnel on the outside, which will give them 200 ft. below the surface.

GRAVEL.—A rich deposit has been discovered in the mountains near Helder's sawmill, Sugar Pine district, by Messrs. H. Brendt & Co. It is said to be the regular Table mountain washed gravel and cobble rock, and prospects all the way from one to two bits to the pan. Pieces of coarse gold weighing \$30 and upwards have been found in the diggings.

RAWLINS.—This Co. are getting up two 12-inch pumps, which with their horse power engine will be capable of draining the mine.

Rock from the Duckwell canon, near the Grizzly mine, is on exhibition at Jack Barry's. The vein is 18 inches, and the rock is liberally sprinkled with gold.

The Cordova mine, at Cherokee, looks well. Last week Mr. Prudhomme struck a chute of rock which was extremely rich.

The Table Mountain Blue Gravel Co. are taking out from 18 to 20 ounces of gold per day.

The Alpha is paying from \$2.50 to \$2.75 per car load. The car holds three-fourths of a ton.

Nevada.

BELMONT.

BELMONT.—Reese River Reville, May 17: This Co. is stopping out the finest ore that ever came out of their mines. This is coming out of the big chimney or 180-ft. level of the Canfield. They are still sinking the main incline, and the progress is as fast as three shifts of men can put it down.

ER. DORADO.—The mine claims to be the chief in producing large bodies of fine ore. The body of sulphurets ore north of the main incline seems a mystery to all observers. At the junction of the north chute with the 400-ft. level the breast of ore is over 10 ft. thick. Stopping has commenced at this point, and a 20-stamp mill of the Co. is running steadily on this sulphurets ore mixed with one-third of the Stetefeldt ore from the south body of the same level; the mixing of the different ores helping the reduction of each.

BULLION. The Belmont Co. shipped this morning \$13,350. This is the accumulation of the last 2 weeks. During the same period the El Dorado Co. have shipped \$18,927, making a total for this month of \$34,287.

CENTRAL DISTRICT.

NEWARK MILL.—Eureka Sentinel, May 17: This mine bids fair to become one of the richest mines in the Co. The incline is now down 270 ft. in the ledge, which shows an average width of 3 ft. We have been shown 5 assays taken from different parts of the mine which averaged somewhat over \$128 to the ton.

EUREKA DISTRICT.

NEWARK MILL.—Eureka Sentinel, May 15: We learn that the Newark mill will go into operation on or about the 1st proximo. There is an immense amount of fair grade ore in this section, and it is the opinion of competent judges that the mill when once started will be kept in constant operation. It is proposed to erect a new Stetefeldt furnace during the summer.

RICH ORE.—A prospector displayed some marvelously rich ore here a day or two ago, which he said was a new discovery, but he refused to designate the locality. One assay showed a value of \$2,000 per ton in silver.

BIG LOAD.—A single team, belonging to Pritchard, yesterday, loaded 60,000 pounds of hullion for Fallsdale.

ELY DISTRICT.

ALPA.—Pioche Record, May 11: A very rich body of ore, 2 ft. in width, has been struck on the 164 ft. level, and from 2 to 3 tons of high grade ore are being daily hoisted, with but a small force of men engaged.

We are glad to be able to chronicle the shipment by this Co. on the 9th inst., of 4 bars of fine bullion, valued at \$345, the proceeds of 39 tons of ore. This ore was worked at the Meadow Valley Mill, and great credit is certainly due to Mr. Maynard for working the ore up to so high a percentage.

MEADOW VALLEY.—Pioche Record, May 14: We yesterday spoke of the important strike on the 800-ft level of the Raymond & Ely mine, and we are now with equal positiveness, state that a strike equal to it in richness and extent has been made in No. 3 Meadow Valley. The ore body is many ft. in width, and the ore is all of high grade and much of it almost incredibly rich, and some of the assays reaching a thousand dollars and over to the ton.

CHIEF EAST.—The main shaft is now down 550 ft., showing a 2-ft. vein of ore which assays from \$200 to \$300 per ton. East from the 200-ft level a drift has been run about 40 ft., with an average vein of 18 inches in width—solid ore, and very high grade. The main shaft is still being sunk on the ledge, which keeps on improving a little in size and quality. Between 50 and 50 tons of high grade ore have been raised within the past two weeks.

RAYMOND AND ELY.—May 15. A fever of excitement was created in the city yesterday by the exhibition of large and numerous pieces of ore taken from the late great strike in the 800-ft. level. We have a specimen bearing no. 1, weighing probably 5 pounds, and it is the most beautiful of the kind we have seen, excepting the brilliant vari-colored ore from the Cave mine of Bristol district, we ever gazed upon. It is literally covered on one side with crystallized bromide, crystallized copper and bromide of silver, the whole give the exterior exactly the appearance of heavy green silk plush with indigo-

blue stripes running through it. The crystallizations characterize the ore throughout, wherever broken. Every part of the specimen is pronounced silver bearing, and experts say it will assay from one to five thousand dollars per ton. It seems almost incredible, but it is slated with great positiveness that the deposit from which these beautiful and wonderful rich specimens were taken is of immense extent, and seems to be equally rich throughout.

BOWEN.—Work was yesterday resumed on the mine with full forces, and will be prosecuted with all energy. The indications never looked more promising. Some of the richest ores in the district have been taken from this mine.

LONG VALLEY.—Parties visited us yesterday evening direct from Long Valley district, about 50 miles south of Pioche, on the Meadow Valley Wash. They give a very encouraging account of affairs down there. The main ledge are the Red Jacket, Green Monster and Good Hope, on all of which development is progressing. There is no doubt they are all on the same vein, a great, well defined fissure, being from 2 to 8 ft. between walls. Considerable ore is being brought to the surface, which is claimed to be high grade. There is an abundance of wood within four and water within five miles.

WASHOE.

ALAMO.—Gold Hill News, May 17: The ore gives good assays, which continue to improve as greater depth is attained.

AMERICAN FLAT.—This mine adjoins the Baltimore Co., and the Co. have contracted with the Baltimore for the privilege of working their mine through the shaft that Co. won the local level is fully opened.

ARIZONA AND UTAH.—Drift east for the ledge, progressing at the rate of 4 ft. per day, the rock hard, but blasting and working favorably. About 45 ft. yet to run in order to reach the ledge.

BALTIMORE CON.—Drifting south at the first or 225-ft. level, following the ore body. The ore-deposit of the upper level is 13 ft. wide where it was first cut through and the drift passing upward cut into an evident continuation of the same ore body. The lower face of the drift is in fine ore, and the whole distance from where the body was first cut into to the face of the drift, is about 27 ft. The unexpected finding of the ledge so soon at the lower level shows the ledge to lie at a much flatter angle than was calculated upon. Good ore being found at this point, also indicates that the ore body is continuous between the two levels—a distance of 250 ft., following the dip of the ledge.

BELOCHER.—Daily yield over 550 tons, equally proportioned from the 1,000, 1,100, 1,200, and 1,300 levels, the ore-breasts of which all look splendidly, those of the two lowest especially. The main incline is now down to the level of the bottom of the last level, the 1,300-ft. level, the drift is resumed in the main drifts at the 1,300-ft. level, the drift passing to the west of the ore body, and toward the incline.

BROCKEY.—Daily yield, 25 tons, milling a little over \$11 to the ton. No particular change in the ore producing sections.

CHOLAR.—Nothing new to report. Work going on as usual.

CHOLAR-PORTER.—Daily yield 150 tons from the old ore producing sections; average assays about \$34 per ton.

CON. VIRGINIA.—Slaking the main shaft and prospecting at the 1,167-ft. level going ahead as usual. No new developments.

CROWN POINT.—Daily yield 500 tons from the 1,100, 1,200 and 1,300-ft. levels. The ore stopes and breasts all continue looking and yielding finely, with no sign of giving out in any direction. The cross-cut east from the third floor above the 1,300-ft. level, 40 ft. from the Belcher line, is in good ore, but the face of the cross-cut from the 5th floor has run through into porphyry, which is thought to be the east wall. Drifting progress at this point, also indicates that the ore body for the 1,600-ft. level are ready for the opening of that level. The main incline is down about 10 ft. below the 1,500-ft. station.

CROWN POINT RAVINE.—The main drift at the 250-ft. level cut through the east wall of the ledge day before yesterday, 80 ft. from the shaft. Quartz of a very favorable character was found, but the same ore a heavy body of water was topped, which drove the workmen out.

DANEY.—New shaft down 93 ft. in good sinking ground. A contract is let for the next 100 ft., and another will soon be let for the removal of the hoisting works from the old shaft to this new one.

EMERALD.—This company has commenced sending ore up from the 1500-ft. level of their mine through the Imperial-Empire shaft—enough to keep the Douglas mill running.

GLOBE.—In the winze and raise to connect the old with the new works, very good progress is made considering the extreme heat and difficulty of ventilation.

GOUN & CURRY.—Sinking the incline and prospecting at the 10th and 11th levels progressing as usual, with nothing new to report.

GREEN.—This adjoins the Silver Hill on the south. It was first worked in 1860. A tunnel was run in a distance of 400 ft., with 3 branches, cutting several rich feeders, indicating a body of ore below. This induced the sinking of a shaft 200 ft. below the bottom of the tunnel, which struck a fine blue ledge of silver ore 8 or 10 ft. wide, giving average assays of from \$50 to \$60 per ton. The air being bad and the facilities for working poor and expensive, the company suspended operations. They now propose running another tunnel into the steep hill, which will strike the ledge considerably below the present workings.

GRAND NORTON.—Daily yield about 70 tons. The cross cutting, at the 1700-ft. level, shows improvement in the vein matter. The ore-producing sections hold out as well yet.

IMPERIAL.—The 1700-ft level shows improvement in prospects, but there is no change to report in the other levels.

JACK LITTLE.—Drifting ahead in the upper mine as usual, with most excellent prospects, the ore assaying as high as \$50 per ton. The company has succeeded in purchasing the old Manhattan, Bowen and Martin claims adjoining.

JUSTICE.—The main incline, south mine, is down 45 ft. below the second station, with the bottom working into quartz ore. The main south drift from the old Justice works is in 585 ft., with the face in favorable looking quartz and porphyry. The south mine continues yielding some good paying ore.

MINT.—The east main drift at the 75-ft level has just cut through another fine looking vein 3 ft. in width, pieces of which shown this morning will evidently assay rich.

NEVADA.—Sinking as before in the ore body, and taking out ore for milling as the prospecting is proceeded with.

OPERA.—Some improvement is noticeable in the material crosscut into from the raise from the first level of the north mine, otherwise there is no change to report. Sinking the shaft from the 455-ft level progressing well.

PHIL. SHERIDAN.—This mine situated on Cedar Hill between the Utah and Sierra Nevada, is one of the most promising locations on the north section of the old Comstock. A tunnel has been run 400 ft. in length, which, after passing through one vein of gold and silver bearing quartz 3 or 4 ft. in width, terminates in a large body of the same. An incline following into it goes a distance, and a shaft sunk 90 ft. failed to develop its extent. From the bottom of this shaft a drift was run 50 west and an incline commenced in the ledge, but encountering considerable water, it had to be abandoned. Enough work has been done to ascertain that a large vein of very promising quartz exists there, which assays from \$15 to \$30 and upwards to the ton in gold and silver.

SILVER NEVADA.—The mine shows some improvement in its northern ore sections, and the mill is kept steadily running as usual.

SILVER HILL.—Keeping the Bacon mill steadily running, with plenty of ore in sight. The north portion of

[Continued on Page 324.]

Postal Cards.

The Third Assistant Postmaster-General, has given notice that the necessary appropriation having been made for the purpose, the Department would on the 1st of May commence the issue to Postmasters of the postal cards authorized by the Act of June 8, 1872.

Postal cards will be sold for one cent each. An ordinary printed business card may be sent through the mails when prepaid by a 1 cent postage stamp attached; but such card must contain absolutely no written matter except the address, otherwise it will be treated as not fully prepaid, and refused admission into the mails. The postal cards are 3x5 inches in size, with one side blank for writing purposes.

All cards different from those herein described bearing embossed or printed postage stamps, and purporting to be United States postal cards, are counterfeit; and the manufacturer of such cards or the attempt to use the same, will subject the offender to a fine of \$500 and imprisonment for five years. (Sec. 178 Postal Code).

Postmasters will not, under any circumstances, be permitted to reduce or exchange postal cards that may be misdirected, spoiled in printing, or otherwise rendered unfit for use, in the hands of private holders.

Artesian Wells—Government Work.

Artesian wells are of comparatively recent origin. They flow with a constant stream, and the fountain of water is a subterranean river or lake, upon which a pressure rests sufficient to force water to the surface. It seems certain that the force is in a lake, for these wells are obtained over a greater width of country than any river. Usually the water is nearly soft; some times it is of a mineral character, like that at Sarstoga.

In Northern Illinois are many artesian wells, and some have a bore so large that water power is afforded, as at Chicago. The depth of these wells varies. In Iriquois County they are from 75 to 100 feet deep, and when tubed above the ground the water rises 20 or 30 feet, furnishing an unvarying supply whether the weather is wet or dry, hot or cold. In other places the depth is great, sometimes 1,000 and 1,500 feet. One well, at St. Louis, built for a sugar refinery, is, we think, over 1,200 feet deep, and the supply is constant and the quality excellent.

This is a subject of national importance. There are six Territories in the interior which cover an extent of 360,000,000 acres of land, and the quality of the soil is excellent, but as no rain falls, so to speak, this land is worthless. It is true that remarkably fine crops are grown by irrigation, but probably not more than 10,000,000 acres can be covered with water. A considerable portion is mountainous, but it is fair to estimate that there remains not less than 200,000,000 acres of excellent land which would support a dense population could it be irrigated.

That artesian wells can be obtained in this region there is every reason to suppose, but the expense of the undertaking is too great for private means, and some wise men hold that this is proper work for the Government, and that it might appropriately be assumed by the Department of Agriculture, especially so for the reason that the abolition of the Franchising Privilege destroys the book-making and seed business.

We are happy to announce that Government has appropriated \$10,000 toward sinking an artesian well at Fort Russell, Wyoming, as a military measure, and work is now progressing. As the location is on an elevated plateau, 6,000 feet above the sea level, water may not be obtained as cheaply as at other points. All such experiments on the plains should certainly be made where there are fewest difficulties, and where the prospects are most favorable.

Should the money be expended at Fort Russell before water is reached, Congress should promptly vote more money, that a full demonstration may be had. Boring commenced at Denver, Colorado, some years ago, by private parties, but, after going down some 600 feet, the funds were exhausted and work stopped; but water rose to within 20 feet of the surface. The location is on a high piece of ground overlooking the city. Recently more money has been subscribed, and work has been resumed. —N. Y. Tribune.

RAILROAD IN SANTA CRUZ.—The *Sentinel* says: "We are enabled to announce that there is a fair prospect that the railroad (narrow gauge) will be built, not only entirely through the county, along the coast, but in a brief time to San Francisco. The only thing that can prevent this is treachery on the part of interested parties or of a failure to secure the subsidy and amount already subscribed or promised. The subsidy amounts to—at 41 miles of road—\$252,000, and over \$120,000 have already been subscribed or promised by reliable firms for the road. There remains to be taken, in stock, only \$40,000, of which some have been promised, and many small subscriptions have or will be doubled to make up the deficit. Major R. P. Hammond, an old and experienced railroad man, will offer to build the road for the subsidy and \$50,000 worth of additional stock subscribed. This plan is a good one, provided the stock could be secured. The result would be a wide gauge road, and for the present only to Santa Cruz. We could then go on and build a narrow gauge up the San Lorenzo Creek, and along the coast to our county line, at our leisure, and as convenience or necessity dictated.

Four Valuable Oil Plants.

The three grand kingdoms of nature are all of them largely oil-producing. The earth has its fountains of kerosene, the animal world is full of oil, whilst trees and plants or the vegetable kingdom, yields its full quota, and all for the illumination, lubrication or sustenance of the world. We herewith present miniature engravings of a few of the plants yielding oils.

in the culture of turnips, and raised solely for their value as an oil-yielding plant. The seeds are perfected as with the turnip family, the second year of their growth. The oil is extensively used for machinery and for burning in light-house lamps. The refuse-oil is a well known cattle food.

Fig. 3 is the common pea-nut so well known as to need no description here, where the plant and its culture is so well understood. It was

OIL PLANTS.

Fig. 1 is the well known olive that even far back into the times of scriptural history was a celebrated fruit, used as a condiment, or its expressed oil as an agreeable and wholesome food in itself. It is among the oldest of cultivated fruits of which we have any account; so

originally from Africa, but is now found and cultivated in all warm countries. The fruit, though valuable as an article of food and everywhere eaten, is more valuable for the oil it contains, being good for every purpose for which olive or almond oil is used, and is very fre-

old indeed that its native country is not positively known. The tree is seldom more than twenty feet in height in European countries, is of a spreading habit, easily cultivated and very long lived.

Fig. 2 is the *Brassica Napus*, from the seeds of which—and other species of *Brassica*, all natives of Europe—is expressed an oil known as Rape seed or Colza oil. The plants are extensively cultivated in the manner usually adopted

quently substituted for the former, and very largely used in its stead. In many parts of India it is sold as pure olive oil, and for all alimentary purposes is quite as good.

It is said to keep a long time without becoming rancid, and the nut grown in a California climate, yields more oil than when grown under a less favorable one. The trade both in the nuts and the oil, is very large and rapidly increasing, and is extensively distributed over

the globe. In many places the nuts when roasted and ground are used as chocolate, and are said to make an excellent substitute for that beverage.

Fig. 4. This is the well known Castor oil plant, *Ricinus Communis*, a native of India, but now widely distributed and cultivated in various parts of the world, but nowhere more successfully than in this country. The uses to which this oil is applied are constantly increasing, and its consumption very great. In tropical countries the *Ricinus* grows to a tree-like size, while in temperate climates it is an annual. It is already somewhat extensively cultivated in California, and is destined to hold considerable rank among our exports at no very distant day.

Mexican Mines.

In a late letter a correspondent of the *Bulletin* mentions that a company had been formed in Mazatlan, to work the rich silver mines of the mountain ridges. He says: If we consider the splendid returns of the mining districts of Topia, Tominil, Guadalupe de Los Reyes, Birimoa and Metatitos, and the greater facilities we have now of extracting and reducing the ore, it must strike everybody that a country which yielded at the time of the Spaniards no less than 2,000,000 of silver from its mines, should be reduced now to the most abject poverty. Under the colonial system commerce was a monopoly, agriculture barely enough for home consumption and industrial pursuits entirely unknown, while the working of the mines was at least twice as expensive as now. And, nevertheless, Mexico sent annually twelve millions of dollars to Havana (wanted there to cover the financial budget) and the galliots laden with precious metals went from Vera Cruz to Cadiz and Acapulco to Manila.

The Republic tried to patronize home manufacture, and only succeeded in providing the common people with a coarse fabric made from cotton raised in Durango, Chihuahua, Coahuila, Vera Cruz and Mexico, producing too costly a raw material to compete with foreign markets. Our forests abound in dyewoods, cedar, mahogany, and other precious woods, but they can only be exported when cut close to the beach, and the orchilla gathered in Lower California has become a drug in the market because freights are now too high to export the same with advantage. Indigo and cochineal, which used to be staple articles of this soil, are scarcely asked for, and only of limited consumption since the chemical arts have discovered other and cheaper materials to furnish the same colors.

Thus Mexico, with all its immense natural wealth, is actually now without resources, and will remain so, if the men of capital continue to remit their funds to Europe, instead of promoting mining, which, under present circumstances, promises better returns than ever before. There is now a machine-shop in this city. We are able to get all the needed materials from your port, and with but little delay the exportation of ores is given free; advances can be got on shipments to Europe, and thus everything speaks in favor of the said branch of industry as the only one to re-elevate this Republic and furnish the means to build railroads, which latter must double its productive-ness.

A correspondent of the *Alta* writing from the City of Mexico

says: To create a more general welfare, steps have been taken in the right direction by fostering mining, the only industry to which the Americans have a natural inclination, offering all the excitement of gambling. The Mexican is a gambler by nature from the cradle to the grave, and from the *albur* of monte to the noble game of chess. You will find at San Augustine the monte-stakes from the copper *staco* to the pile of thousands of ounces, and at the Chess Exchange each game played for a consideration, from a cup of coffee to ten or more gold ounces, with numerous blankets if the players belong to the champion ring.

In every part of the country new mines have been taken up, or companies formed to work those which had to be abandoned at the expulsion of the Spaniards in 1823. The late prohibition of all chance games in public, has done a good deal to favor mining, and even a stock exchange has now been established here for this kind of gambling, though much quieter than at San Francisco, and certainly on a much more solid footing, because the price of a share, or a barra, (the 24th part of mine) does not depend on the caprice of the manager, but of its real productiveness.

Stock Quotations.

As a curiosity, I shall give you the latest quotations of our principal stocks: Real del Monte Pachuca, \$1,250 per share; Providencia, \$4,000 per barra; El Puente (Guanajuato), \$8,000 do; Arrevalo (chico) \$10,000 do; Maravillas, San Enguino, \$40,000 do; Bonanza, \$10,000 do; Nuevo Rosario, \$4,000 do; Lobo (Guanajuato) \$3,000 do; Guatemotzin, 75,000 do, and numerous others, at lower rates, besides those which are entirely in private hands.

Many mines had to suspend their works on account of the want of quicksilver, the Mexican cinibar mines yielding but little, and the importations from the old and new Almaden having decreased considerably.

USEFUL INFORMATION.

The Use of Spectacles.

Eyes are not uniform in shape or size. Wonderful in their mechanism and for the purposes for which they are intended, yet they are so often imperfect as to demand both care and assistance.

As there are long, short, lean and fat persons, so there are fit, round, small and large eyes, and each eye as natural to its possessor as his size or weight is to an individual. With a knowledge of these facts, Ophthalmologists have arbitrarily created a standard, or model eye, based upon its power of refraction.

Eyes in a passive state have a common refractive power relative to the individual; and they also have; more or less, a faculty of increasing the common refraction and restoring the eye again to its passive condition.

The measure of perfection in the eyes is their capacity to focus upon the retina, parallel rays. (All rays coming from objects fifteen feet or more distant from the eye, and which enter the pupil, are practically parallel.) All other things being equal, objects at fifteen feet or more distant from the eye, if seen at an angle of five minutes, are distinctly seen without blur, sharp in outline, clearly defined on their borders, by the emmetropic eye in its passive condition.

If objects are nearer than fifteen feet to the eye, their reflected rays are so divergent that the perfect eye cannot focus the rays upon the retina, and the faculty of increasing the refractive power of the eye is brought into requisition. This faculty is called the accommodation of the eye. The nearer an object is to the eye, the more will the entering rays diverge, and of course the greater must be the tax upon the accommodation.

In the model, or perfect eye, this power is taxed to its utmost, and fails to serve us if the object is brought nearer than six or eight inches to the eye. If we persist and bring the object nearer than the accommodation permits, circles of dispersion form on the retina and vision is blurred.

There are several media in the eye through which light passes to the retina, and each medium has its own power of refraction, but the measure of the common refraction of the model eye is the mean of the sum of all the refractions.

The crystalline lens is one, and the most important, refractive medium. By a change in the shape of the lens the faculty of accommodation is manifested. This is accomplished by a small muscle which surrounds its border and thickens it to increase its power to focus divergent rays.

The greater the divergence of rays which enter the eye, the more will they diffuse upon the retina and produce a blur, unless some means are provided to focus them. The lens does this, and the greater the divergence, the thicker must be the lens.

It is still an open question whether the little muscle (ciliary,) or the elasticity of the lens, or some other force, flattens the lens to fit for parallel rays.

It is necessary for good vision, without artificial aid, to have all the conditions herein stated work harmoniously together and singly without fault—in truth, there are four conditions—the integrity of which is essential to insure perfect vision. For any and all the anomalies of these conditions, spectacles, if properly adapted to the need, become important and valuable servants.

First.—Objects must give sufficient light to produce an impression on the retina. Second.—The media through which light is transmitted, either in or out of the eye must be purely transparent. Third.—Both the refraction and accommodation of the eye must be without fault. Fourth.—The retina, to receive impressions, the optic nerve to transmit them, the brain to comprehend them, must be one and all be healthy. —W. W. Chandler, M. D.

A NEW USE FOR CORN.—A friend, to his great chagrin, purchased a pair of boots that were decidedly too small to wear, without great suffering. He had soiled the soles so he could not exchange and could not get them to the shoemaker. He thought of trying a new power on them. He filled the feet and part of the legs with dry corn, filled up with water, let them remain till the corn swelled fully; then rubbed the leather with curriers' "daubing," and they were ever afterward perfectly easy. Ordinary grafting wax, somewhat softened with lard, answers the same purpose. Here was the application of a very simple but efficient agent to stretching boots, and can be done at little cost and at home.

YANKEE IMPLEMENTS FOR JOHN BULL.—We have formerly alluded to the superiority of American agricultural tools to those which we saw in use and on sale in England. It is gratifying to learn that John Bull is beginning to open his eyes to the fact that Brother Jonathan is in advance of him in the manufacture of these and other implements. We see it stated that Philadelphia is sending hay-forks, dung-forks, and pitch-forks to Sheffield—which seems at first "very like" sending coals to Newcastle—while the Ames shovels from Massachusetts supply England and the rest of the world. Now that the tide has once turned, we may expect that the eastward current will soon become a strong one.

Land-Locked Salmon.

We find in a recent number of the *Concord Monitor* the following account of the successful breeding of land-locked salmon:

"Dr. Fletcher planted some eggs of the land-locked salmon in a small spring, under the bluffs on the other side of the river, a few weeks since. Within the past week they have commenced to hatch. On Tuesday he removed 85 to another compartment of the spring, and to-day he removed 31 more, which he had hatched within twenty-four hours. They came into the world provisioned with a month's rations, in the shape of the yolk of the egg which is attached to them. They were not injured by their journey from the British Provinces."

The land-locked salmon, which are found, we believe, in only two or three rivers of the continent, have no equal as a game fish, except the great salmon. They are found in perfection in the Grand Lake Stream, which is a connecting link in the chain of lakes in which the St. Croix River rises. Their average weight is a little less than three pounds, and they give rare sport to the disciples of old Isaac Walton, who cares to go so far as the eastern boundary of Maine. If they can be domesticated in our rivers, as good authorities believe, it will give a new pleasure to many an honest angler.

SENDING LIVE FISH BY MAIL.—Five living sea fish were recently sent by mail from Naples to London, the journey consuming a little over four days. The fish were each about two inches in length, and were packed in damp sea-weed, from which all but one came out in good condition, and, soon after being placed in their natural element, became as lively as ever.

A TOUGH THING TO SWALLOW.—Prof. Voght records an instance of what may be called self-cannibalism. He cut in two a male cricket, and immediately the fore part, probably experiencing a sensation of emptiness in the ventral region, turned upon the hinder part and devoured it!

FORCE REQUIRED TO BURST A BARREL.—A well-made barrel with $\frac{3}{4}$ inch staves, and 1 to $1\frac{1}{2}$ inches heads, of 28 to 32 gallons capacity, will bear 12 to 15 pounds of steam pressure, and from 45 to 48 gallons capacity, from 10 to 12 pounds. Strength is given mainly by thickness of head, which generally bulges out. Hoops, if good, rarely burst.

GOOD HEALTH.

Remedies for a Cold.

A distinguished physician across the Atlantic used to tell his class that there was no more certain remedy for a "cold in the head" than absolute abstinence, for from twenty-four to thirty-six hours, from every form of liquid, and if the suggestion be strictly followed it is good. We have tried it and know. But it requires some degree of moral courage. It is, however, well adapted to professional men who are liable to be called at even the most inconvenient times from a warm bed.

Another eminent physician, Dr. Dobell, says that colds can be stopped without lying in bed, staying at home, or in any way interfering with business—provided the treatment be begun directly the first signs of catarrh show themselves in the nose, eyes, throat, or chest. When the cold has become established it will not answer. The treatment is as follows: 1. Give five grains of sesqui-carbonate of ammonia and five minims of liquor morphia in an ounce of almond emulsion every three hours. 2. At night give an ounce and a half of liquor ammonia acetatis in a tumbler of cold water, after the patient has got into bed and been covered up with several extra blankets; cold water to be drunk freely during the night should the patient be thirsty. 3. In the morning the extra blankets should be removed so as to allow the skin to cool down before getting up. 4. Let him get up as usual and take his usual diet, but continue the ammonia and morphia mixture every four hours. 5. At bedtime the second night give a colocynth pill. No more than twelve doses of the mixture from first to last need be taken, as a rule; but should the catarrh seem disposed to come back after leaving off the medicine for a day, another six doses may be taken and another pill. During the treatment the patient should live a little better than usual, and on leaving it off should take an extra glass of wine for a day or two.

SMALL DOSES.—French medical journals publish the result of experiments to determine how minute a dose of poison will produce decided medicinal effects. The blood of an ox which had been dead ten days was used in the test. Having inoculated a rabbit with this blood poison, the doctor took the blood of that rabbit, and so on to the 25th generation that had died. The result proved that the one-trillionth part of a drop of decayed blood injected subdermally, sufficed to poison a rabbit. From this proving, dissecting surgeons are cautioned that, though the dissecting knife may be clean to the eye, it may yet hold an invisible atom of death poison, sufficient to infect the circulation if the operator should by accident prick his finger.

A French savant says that such results ought to open our eyes to the possible effects of minute doses in homoeopathy.

Ingrowing Toe-Nails.

A correspondent of the *British Medical Journal* takes the ground that no cutting operation is at all necessary for the complete and rapid cure of ingrowing toe-nails. If a small, thin, flat piece of silver plate be bent at one edge into a slight deep groove, and, after the toe has been poulticed twenty-four hours, slip beneath the edge of the nail, so as to protect the flesh from its pressure, and the rest of the thin plate bent round the side and front of the toe, being kept in position with a small portion of resin plaster passed round the toe, a speedy and almost painless cure will take place; and the patient, after the first day, has the additional advantage of being able to walk. This method has been followed in numerous cases with uniform success.

Dr. Blower, of Liverpool, states, in the same journal, that he has, for the past twenty years, employed compressed sponge successfully in the treatment of ingrowing nails. He renders the sponge compact by wetting and then tying it tightly, until it is thoroughly dry. A bit of the sponge, in size less than a grain of rice, is placed under the nail, and secured by strips of adhesive plaster. In this way, the point of the nail is kept up from the toe until the surrounding soft parts are restored to their normal condition by appropriate means.

CURING DISCHARGE FROM THE EARS.—As the cause of such trouble is always constitutional, local applications are of no benefit, and besides may be dangerous for the delicate organs of hearing. Many a patient has become deaf by a treatment which was recommended with the best intentions. The causes may be manifold, a hereditary taint, want of exercise in the open fresh air, sleeping in an ill-ventilated bedroom, improper food, injudicious diet, use of stimulants, indulgence in exhausting passions, vicious habits, etc. It must not be lost sight of that conditions differ, and that what will not harm one man except in later life, will at once affect others. The cure is evident; take out-of-door exercise, sleep with your windows open, only take care not to catch cold in a draft, watch your digestion, and eat only what agrees with you, but indulge in variety of food use no tobacco or liquor of any kind, but if necessary some mild cathartic, and add to this the daily use of some blood purifying decoction of sarsaparilla, assafras, or its equivalent, and—mercy, if you have no wife. Remember that married men are in general healthier and live longer than bachelors. Life insurance companies understand this.—*Manufacturer.*

PHENOMENA OF THE BRAIN.—One of the most inconceivable things in the nature of the brain is that although the organ of sensation, it should itself be insensible. To cut the brain gives no pain; yet in the brain resides the power of feeling pain in any part of the body. If the nerve which leads to it from the injured part be divided, we become instantly unconscious of suffering. It is only by communication with the brain that any kind of sensation is produced; yet the organ is itself insensible. But there is a circumstance more wonderful still. A certain portion of the brain itself may be removed without destroying life. The animal lives and performs all those functions which are necessary to simple vitality, but it has no longer a mind. It cannot think or feel. It requires that the food should be pushed into its stomach; once there it is digested, and the animal will even thrive and grow fat. We infer, therefore, that a part of the brain is simply intended for the exercise of the intellectual faculties, whether of the lower degree, called instinct, or of that exalted kind bestowed on man, called reason.

HOW TO KEEP TEETH IN GOOD CONDITION.—After each meal use soft, wooden tooth-picks, working the tips into fine brushes—then rinse the mouth with water. All that is required to preserve and beautify the teeth, is simple cleanliness.

Ordinary tooth-brushes do not reach the interstices and cavities thoroughly; and, besides, irritate and loosen the gums. Tooth-powder (of every kind without exception) is more or less injurious to the enamel.

The plan recommended is in vogue among the Arabs and Hindoos, both races being celebrated for their splendid teeth (in spite of their odious fashion of tinting them). A friend, who has followed this course for two years speaks very highly of it.

VITAL STATISTICS.—Items of vital statistics recently published in Europe go to confirm the received opinion that the duration of human life is longer than in past centuries. In the city of Geneva, Switzerland, registers have been kept of the yearly average of human life since 1590. In that year it was twenty-two years and six months. At present it is over forty years. The tables compiled by life assurance companies in England, and adopted in this country, show a similar result. In the fourteenth century the average annual mortality in the city of Paris was one in sixteen. It is now about one in thirty-two. In all England in 1690 the rate of mortality was one in thirty-three. Now it is about one in forty-two.

FRECKLES.—The *Druggist Circular* says:—"For the benefit of young persons afflicted with freckles, we would inform them that powdered nitre, moistened with water, applied to the face night and morning, will soon remove all traces of them."

MISCELLANEOUS.

How to Make a Coat.

A lady correspondent of the *Rural New Yorker* gives suggestions that may be useful to our readers remote from tailors or tailoresses, or who from motives of economy desire to do what this lady did. She says:

Having recently cut and made an overcoat, I thought how many women would like to know how to make this garment, as the tailoress does not go around sewing in families as she formerly did. How many boys in stormy weather might learn to make their own clothes on a sewing machine, if they had printed directions in their weekly paper for doing this. We cannot prize those papers too highly that teach us how to do useful work, that all may know how to obtain an honest living, and be useful instead of idle.

Having cut the coat, commence and sew up all the seams except those that join the fronts to the back, and press them. Fit the openings in the canvas to those in the outside; then close the openings with an overstitch over a strip of linen an inch in width; then prepare a double strip of linen, an inch in width, and fasten it to the canvas under the thread-marks for the buttons, with a semi-cross stitch; then carefully overstitch the canvas to the lappel on the body of the coat; then dampen and press and baste the whole canvas to the outside, so as not to cramp it. Then mark and cut the pocket-hole, and insert the pockets, with another coat before you as a guide, then sew the seam in the back of the lining, baste the wadding on the wrong side, and some thin cloth over the wadding to come next to the outside of the coat; quilt this lining according to your fancy, and baste the outside to it. In basting, lay down the lining and place the outside over it so as not to get the lining too close fitting for the outside. Baste the wadding to the front lining with thin cloth between them and the outside, and quilt. Then sew up the seams in the outside that join the fronts to the back and press them; then sew these seams and the lining together, having the front of the lining come under the facings smoothly; baste and sew down the facing, then join the shoulder seams; press and face the inside seams one upon another. Face the sleeves at the hand and sew them in; have the outside or only seam half-way between the seams of the back, and the fullness begin two inches in front of the shoulder seam, and continue to within three inches of the middle of the sleeve; then press this seam on the round end of the press-board; then press the canvas if necessary, and baste with small stitches to the seam of the coat and hem the sleeve-lining to it; then hem the linings on the hand-facings; then baste the stiffening to the lower side of the collar; stitch the lower part in straight lines; then over-stitch on the canvas side the part that turns over; then press and break the collar to its proper shape; then over-baste the cover to the break; baste all around, turn in and hem the collar to it; sew the underside of the collar to the outside of the coat; press, fasten the lining to it, and hem down the cover; stitch around the coat and cut the button-holes, and work them over a cord of linen thread, four double; press and sew on the buttons and a loop at the back on the inside, and hang it up.

TO MAKE A FISH OMELETTE.—There is two ways of making these; one is merely to flake some ready-cooked fish—cold salt cod is very suitable—season it with cayenne, nutmeg, and white pepper; mix it well with six beaten eggs and one dessert spoonful of cream or milk; fry it on one side only, fold it, and serve. The other method of making an omelette is as follows: Chop up what cold fish you have, add a little parsley and shallot shred emell, and a piece of fresh butter and some lemon juice. Place this in an oven to get hot; then beat six eggs, season them, and pour them into a buttered frying pan; put it over the fire, and as the eggs begin to turn opaque, lay the warm fish in the middle of them; roll in the ends of the omelette so as to enclose the contents, and capsize it upon a dish. Garnish with crisped parsley.—*Ohio Journal.*

TO POLISH TINS.—First rub your tins with a damp cloth; then take dry flour and rub it on with your hands; afterwards take an old newspaper and rub the flour off, and the tins will shine as well as if half an hour had been spent rubbing them with brick dust or powder, which spoils the hands.

A BRICK CLEANING MACHINE.—The immense amount of labor required to clean by hand the brick after the great fires at Chicago and Boston, have set inventors to work to devise some means by which such labor may be more cheaply accomplished by machinery. It is now said that a device has at last been invented that will do that work, and that one of the machines has been built and set to work in Boston. The bricks are cleaned at the rate of 35 to 40 a minute, one man being required to feed the machine. The work is also said to be done better and with less injury to the bricks than when it is done by hand work.

NICKEL is to come into general use as a facing for printing type. It is much cheaper and much harder than copper, and makes a better surface every way. The application is one of the discoveries of 1872.

MINING SCIENTIFIC PRESS

W. B. EWER..... SENIOR EDITOR

DEWEY & CO., Publishers.

A. T. DEWEY, GEO. M. STROGO,
W. B. EWER, JNO. L. BOONE.

Office, No. 338 Montgomery St., S. E. Corner of California St., diagonally across from Wells, Fargo & Co.'s.

SUBSCRIPTIONS payable in advance.—For one year, \$4; six months, \$2.50; three months, \$1.25. Clubs of ten names or more, \$3 each per annum. \$5, in advance, will pay for 1½ year. Remittances by registered letters or P. O. orders at our risk.

ADVERTISING RATES.—1 week. 1 month. 3 months. 1 year.
Per line..... 25 .50 \$2.00 \$5.00

Saturday Morning, May 24, 1873.
San Francisco.

Legal Tender Rates.—S. F., Thurs., May 22.—buying 85%; selling 85%.

Table of Contents.

GENERAL EDITORIALS.—Geological Section of Cottonwood Creek, Siskiyou County, Cal.; Coaches for Mountain Travel; Smelting for the precious Metals, 321. Failure of the Arctic Expedition; The Comstock Mines, 328. Academy of Sciences; Improved Roasting Furnaces; A New Stone Cutter; Brooke's Still Life Paintings, 329.

ILLUSTRATIONS.—Section of Cottonwood Creek, Siskiyou Co., Cal.; An Improved Coach, 321. Postal Cards; Four Valuable Oil Plants, 326. Still Life—By S. M. Brooke, 329.

CORRESPONDENCE.—The Vienna Exposition; Chips from the Comstock, 322.

MECHANICAL PROGRESS.—The Mechanical Method of Making Hard Lime Floors; A Famous Armorer; Imitation of Marble; Camphor Wood; Silicon Steel; Tidal Power Machine; Wearing of Cast Iron Surfaces, 323.

SCIENTIFIC PROGRESS.—Quantitative Spectroscopic Analysis; Electrical Conductivity Affected by Light; New Mode of Determining the Amount of Mercury in its Ores; Ammonia in Snow; Turpentine as an Antidote to Phosphorus; Scientific Progress; A Beautiful Experiment on Sound; The Struggle for Life Among Plants; An Improvement in the Manufacture of Glucose; The Supposed Planet Between Mercury and the Sun, 323.

MINING SUMMARY from various counties in California, Nevada, Montana, Washington Territory and Utah, 324-5.

MINING STOCK MARKET.—Table of Daily Sales and Prices; Comparative Prices for the Week; Notices of Assessments; Meetings and Dividends; Review of Stock Market for the Week, 324.

USEFUL INFORMATION.—The Use of Spectacles; A New Use for Corn; Yankee Implements for John Bull; Land-Locked Salmon; Sending Live Fish by Mail; A Tough Thing to Swallow; Force Required to Burst a Barrel, 327.

GOLD HEALING.—Remedies for a Cold; Small Pox; Improving Toe-Nails; Curing Discharges from the Ear; Phenomena of the Brain; How to Keep Teeth in Good Condition; Vital Statistics; Freckles, 327.

MISCELLANEOUS.—An Artesian Prospecting Shaft; Coal Measures in the United States; Business at the Stock Board, 322. Artesian Wells—Governor's recent Work; Railroads in Santa Cruz; Mexican Mines; 326. How to Make a Coat; To Make a Fish Omelette; To Polish Tins; A Brick Cleaning Machine, 327. Highland District—The Highland Company's Mines; Los Angeles Mines; The Sausalito Railroad; The Oroville Mines; Copper Among the Ancients; Trail to Stickeen River; Foundry Business in Sicily, 330.

Coz, the banker and broker, now known as the "Boston Swindler" was connected with the big diamond swindle, as appears from letters and plane found among his papers. He also owned \$106,000 worth of stock in a Copper Mining Company.

NEW HOISTING WORKS will shortly be put up on several mines in Pioche. The Raymond & Ely and Meadow Valley Companies in particular, will soon make important improvements in this respect.

THE GERMANIA SMELTING WORKS, near Salt Lake City, produced over 500 tons of pure lead in April end are expected to turn out 1,000 tons this month.

MINING SALE.—The Silver Hill Mine, Utah, has been sold to some New-Yorkers for \$29,700 and smelting furnace capable of reducing 60 tons per day will be erected at once.

DISCOVERIES of rich silver veins from Four-mile creek, north and west of Sugar Loaf mountain, in the vicinity of the Old Pay lode, Boulder district, Colorado, are reported.

PLACER MINING has commenced in earnest in Montana, and those who have not yet begun to work are making active preparations to do so.

THE Smelting works of the Rocky Mountain Smelting Company in Utah, will be in operation in a few days.

A MICHIGAN COMPANY are going to put up a large quartz mill at Farley's Park.

IRON ore has been found in Marion County, Oregon.

Failure of the Arctic Expedition.

Poor Captain Hall! After all his adventures, troubles and hardships he had to pass to another world without gaining that great object of his life, which was to reach the North Pole. The Polar Expedition was a failure and Captain Hall lost his life. It was believed that this expedition would explore further into the mysteries of the North than any of its numerous predecessors. Dr. Hays, the well known Arctic explorer, expresses an opinion that the vessel was unfit for the service, and the injury done to her was caused by defects in her build. He thinks Captain Hall has done a glorious thing and proved that Smith Sound was navigable and was the true passage to the Open Polar sea, that great goal of all Arctic explorers. He went further north with his ship than any human being ever did before him, although others have gone as far in sledges. Dr. Hays thinks it very strange that Captain Hall died in that region of apoplexy and thinks there is a bad look about the whole affair. The men who deserted, probably, did so because of Hall's death. Nineteen of the survivors of the Expedition have returned. This party, who had been landed from the Polarie were driven from her by a gale which burst her mornings on the 15th of October, 1872 in latitude 72° 35'. When last seen the Polarie was under steam and canvas, making for the harbor on the eastside of Northumberland Island. They had no more boats left. The opinion of the survivors is that the Polarie will not be able to get steam until the coming July.

Captain Hall died on the 8th of November, 1871, of apoplexy, in latitude 81° 38' longitude 71° 44', just after he had returned from the northern ledge expedition by which he attained a latitude of 82° 16'. He was in his usual health, but when he called the crew into the cabin to encourage them to renewed exertion he was taken ill. The Polarie entered winter quarters in September, 1871, and left August 12th, 1872. The sledge party crossed Kene's Open Polar Sea which they pronounced to be a strait about 15 miles wide, with an appearance of open water to the north. The party who left the Polarie suffered very much from exposure but were fortunately met by the Tigress and carried safely to St. John. An investigation will be held in relation to the disaster, and if necessary, a vessel will be ordered to Baffins Bay to look out for the Polarie. The failure of the Expedition is widely deplored as its success would have been attended with beneficial results. A package has been found which Captain Hall left behind him to be opened in case of accident, which contains valuable notes and memorandum with regard to the Arctic Regions. The notes are in the form of a journal and will probably be published.

If we are to judge by the despatches from New York in relation to the subject, there was some foul play going on aboard the Polarie. Joe, the Esquimaux who was with Capt. Hall on the sled trip, gives evidence to the effect that he thinks Captain Hall was poisoned. He says Captain Hall was well when he came on board, and was taken sick soon after drinking some coffee, which tasted strangely. Hans Christian's story is to the same effect. Capt. Tyson and Mr. Meyers are said to be in possession of information which they are unwilling to communicate, but which will doubtless become public shortly. The Esquimaux, Joe, states that Hall himself believed that he had been poisoned. The prevailing impression among the unfortunate nineteen persons who were left in the ice, was that Buddington, the sailing master, had willfully abandoned them to their fate. Captain Tyson thinks the ill-feeling and bad designs of Buddington and a few others of his accomplices had continued from the first. It seems that Buddington ruled the ship after Captain Hall's death, and there was then neither law or system on board. It is probable that the whole truth of the matter will be made public at the proposed investigation.

THE Chrome ore lead in Cow Creek, Oregon, has been leased for a term of years to a party of capitalists who intend reducing the ore at the mine. Improved machinery is to be purchased.

THE LAROE FIRE in the neighborhood of Puget Sound are creating the smoky atmosphere so much complained of that vicinity and along the coast.

The Comstock Mines.

NUMBER II.

Washoe,—the world-wide appellation of early days, so significant to all pioneers—those bloated aristocrats who carried their millions about in their pockets in the shape of stock certificates; confiding adventurers, who, like California '49-ers, in the excitement attending the acquirement of suddenly-found wealth, trusted, thoughtlessly, that the flush times would last forever, but who in the grand collapse of '63 and '64, having neglected to realize, sew their hopes, their fortunes (and in many cases their "sacred honor") dwindle away like morning mist, leaving them but one alternative, to "stare fate in the face" and commence life anew,—a name comprehensive in its application, including at that time all the mines of Nevada, irrespective of location (as Boston is said to include all Massachusetts),—the name Washoe popularly signifying great expectations and blighted hopes, with the advance of time, the change in population and ideas, and the concentration of capital mainly to the developing of and speculation in legitimate and reliable mines, is gradually dying out and giving place to the more sectional name, Comstock.

The Name Comstock.

However, covers an extended area. The limits of this vast lode will probably not be defined by the present generation, for, notwithstanding the astonishing amount of prospecting thus far, its continuation north of the Ophir and south of the Overman is still a matter of speculation, and the uncertainty in this respect is universally welcomed by ambitious locators; outside of these limits nearly all mines for miles in this vicinity complacently flatter themselves as being located on the genuine Comstock. It will be many years before the numerous theories advanced in regard to the continuation of this lead can be possibly established or contradicted. North of the Ophir there are three claimed extensions of the ledge, and south of the Overman the proposition is equally undecided, but the general supposition is that in this vicinity the ledge branches off to the S. E. and S. W., both of which theories have good foundations.

Having described the prominent locations on the supposed east branch as far as Devil's Gate, in previous letter, justified to the

Western Line of Claims

Will necessitate returning to the grand junction of the two southern forks of the lead which thus far appear to concentrate in the gigantic deposit of Crown Point and Belcher.

The first in line in active operation is Caledonia.

The old original North American, by taking in the old Caledonia Tunnel, claiming a number of blind ledges, changed its name to Caledonia S. M. Co., in order to regain its former position on the stock Board, from which it had been erased through the chicanery of its manipulators. The Sapphire Mill is running on low grade ore from this mine, which is taken from the 400 ft. of ground now in dispute for possession by the Overman Co. Their 400 ft level has proved a failure, so far.

Prospects on their lower level are reported favorable.

The Knickerbocker

Is a back location of 1,200 ft., and have a pet for their ground. They have, however, deserted their old ground, and gone 1,000 ft. or more east, where their shaft is now located.

Should they be successful in finding ore from this point it will immediately be claimed either by the Caledonia or Baltimore Consolidated.

South and west of the Knickerbocker Works, on the line of the American Flat road, lies a section, which, judging from the events of the past few weeks, bide fair to become a nucleus for extensive speculation and work in the future. The ground is covered with locations and counter-locations lying in every conceivable shape and direction, which for the past few years have not received much attention, and, with a few exceptions, have been, for the time, deserted. The late strike in Baltimore Consolidated has suddenly awakened in the minds of the owners of these forlorn hopes, an idea that they may yet amount to something.

The Baltimore Consolidated

Consists of the old Baltimore and half of the Baltimore American, covering 2,400 feet of ground and adjoining the south line of Caledonia.

The shaft is down 450 feet, from which two stations are opened at 225 feet and 445 feet from surface. In their upper level, as much to their own surprise as to anybody else, they have lately struck a vein—5 feet thick—assaying extravagantly—and heavily in gold—at a point 360 feet west of shaft. Continuing west they are in a mixture of quartz and porphyry, assaying well. According to street reports, after cutting through a heavy clay, on their lower level, at 50 feet west of shaft they again cut into ore averaging \$68 per ton. Interested stockholders being urgent in their claim for admission to view and prospect this suddenly uncovered prize, and threatening to gain admittance thereto by order of Court; the Superintendent quietly flooded the drift and left for San Francisco. Returning a day of two since,

operations were again resumed, the lower station drained and repaired, and they are now about renewing work of progress, but until a few feet more of ground are cut, Baltimore Consolidated must remain, to the public, an enigma.

The line of the American Flat mine being but a short distance south of the Baltimore Consolidated shaft, a drift is being run on contract from the 225 foot level of the latter, to prospect this claim. Since the Baltimore Cons. strike, nearly every old location in American Flat district has been revived, in hope of finding the Baltimore ledge. Dump piles are showing themselves in every direction, old shafts are being re-opened, new shafts started on the line of where the ledge ought to be, and an appearance of life awakened on this almost deserted section. Should a well-defined, paying ledge of ore be found on this ground, conflict of titles will present the richest field for lawyers yet known, for there will be no end of litigation. The only active work of importance that has been prosecuted steadily during the last few months south of the Baltimore has been on the "Arizona and Utah" and Globe mines.

The Arizona and Utah

Is a west location for a back vein. Their shaft is down 300 feet, from which point they are drifting east for ledge. At 150 feet down they cut through the ledge in their shaft showing good ore. They expect to reach the ledge in their lower drift in about two weeks, and have every reason to look for a good development.

The Globe,

Immediately south of the Arizona and Utah, is being worked by the same management. They are preparing to take out ore from their lower tunnel, stopping out on the incline which is being run 300 feet to connect with their upper workings. With the extensive body of ore they have in sight ready for extracting, a fair development in the Arizona and Utah, which is confidently expected, will restore to American Flat its enviable reputation of early days.

The Rock Island

Is the most southerly location on American Flat, and on a line southwest from the American Flat mine. It is a claim of not much importance at present, as the body of ore peesed through in their tunnel in early days proved to be nothing but a body of base ore 200 to 300 feet in width.

The Mines of Silver City

Are attracting considerable attention from capitalists in consequence of a mine being opened up with success called the Dayton.

This mine is owned and worked by private parties who have never consented to place the stock in the market, having confidence that the mine, on its merits, will eventually afford them remuneration for investment. Their new shaft is down 225 feet, from which point they are running for their ledge which has already been fully prospected by an old incline and shaft showing a well-defined vein of gold-bearing quartz 40 to 50 feet wide, which will pay handsomely.

Adjoining the Dayton on the south is a mine that has been owned and worked quietly during the past year by Messrs. Cantin & Everett, of San Francisco, called the

Kossuth,

Covering 2,700 feet of ground, and which has lately been put on the market. They have a double compartment prospecting shaft worked by a whim, which has been sunk 280 feet, to water level.

From the shaft they have cut the ledge at three different points; 50 ft., 200 ft. and 280 ft. levels showing extensive bodies of good milling ore. The company are about sinking a new shaft on a more favorable site for the permanent working and draining of the mine, machinery for which has already been ordered. Ore for milling is now being hoisted from their present shaft, and will be continued until their new shaft has attained sufficient working depth.

The Daney,

In Spring Valley, below the Kossuth, are now doing what ought to have been done years ago.

Having abandoned their old shaft, sunk on a spur of the ledge, which has never produced anything more paying than a bountiful supply of water, they have now removed to the main ledge, where they are sinking a new shaft with a good prospect of finding something in time.

The fluctuations in stock for the past week have taken operators here somewhat by surprise, knowing of no good reason for the unlooked for depreciations; yet such things will occur spasmodically, and the state of the stock market can easily be read on the street by that never failing barometer—the face of those most interested. As no unfavorable change has taken place in any of the mines the general confidence in the immediate future remains unshaken.

CANA.

Virginia, Nev., May 20, 1873.

COOS BAY RAILROAD.—The railroad connecting with Coos Bay, Oregon, the Coquille will be commenced by the 1st of June, and will be completed this summer as far as the Blue Mountain coal mines.

ALL the quartz mills near Virginia are busy day and night on ore from the Comstock mines. If the work increases there will be a demand for more mills, and good large ones too.

Academy of Sciences.

At the regular meeting of the California Academy of Sciences, held on Monday evening last, D. McClore, E. Malero and Gen. J. M. Schofield were elected members. Among the donations to the cabinet were the following: From Mr. Harford, a finely stuffed specimen of the large California hawk; also, specimens of the small foxes that abound on Santa Rosa Island.

From C. A. Williamson, of Honolulu, a specimen of the box fish, a curious creature, which is found under the edges of the coral reefs of Enderbury's Island, latitude 3 south, longitude 176. The fish is encased in a shell, with fins and tails protruding, in the form of a tortoise.

From Dr. Schlatter, of the Pacific Mail Steamship Co., specimens of the nautilus taken off Cape St. Lucas; also, specimens of a fish, not yet identified, taken off Cape St. Lucas.

From A. W. Chase, of the U. S. Coast Survey, specimens of infusorial earth from Catalina Cove, Santa Barbara channel; also, specimens of gypsum, from Santiago Cañon, Los Angeles county.

Dr. Blake presented specimens of a honey making ant, and read a paper in reference to the digestive function of the insect.

Dr. Kellogg exhibited and described a number of new plants.

Professor Davidson demonstrated a series of problems in mensuration.

Mr. Fullerton exhibited some crustacea found in alkaline water near Green river. He put some of the water in a bottle and corked the bottle up, the water being previously strained. On arriving here he found the water had settled and that it was quite full of living cyclops, just like he had frequently found in ponds near London, under very different circumstances. They are living and evidently multiplying in this strong alkaline water, in which it is supposed there are few living things. Professor Davidson said that in Hayden's expedition, animal life had been found in water of 180° F., at an elevation of 6,000 feet. Dr. Blake had found animal life in alkaline water of 130° at Calistoga, and in alkaline and sulphur water of 108°.

THE POWDER RIVER EXPEDITION.—Colonel Forrester's expedition to the Powder river, on the Yellowstone, has proved a success. The Yellowstone has been found to be more favorable for navigation than the upper Missouri. The object of the expedition was to find out whether supplies could be transported in safety from Fort Buford to the mouth of Powder river, where it is proposed to establish a formidable military post, under the Act of Congress appropriating \$200,000 for it; also two additional military posts to aid in protecting the workmen in the survey and construction of the Northern Pacific road. The supplies for the construction of that railroad can now be transported by this river line to the posts at the mouth of the Powder river, saving some 300 miles of difficult transportation by land.

THE OXYHYDROGEN flame, as used in the Stevens' Furnace, is now being applied for the purpose of generating steam at Park and Bowie's mill, Washoe. It may be stated that the steam used in running the experimental furnace in this city, was generated by the use of this jet, coal tar being used for fuel. If practically successful, in an extended trial, this will be a great boon to the Comstock region, where wood and coal is scarce and expensive.

AN ASSAY OFFICE is wanted in Utah and the *Tribune* urges the establishment of one in Salt Lake city. St. Louis people are trying to have a government assay office established in their town, but the *Tribune* thinks it ought to be in Salt Lake city, if it was the time required to ship silver bars to New York to be assayed would be saved and the bullion could be put in the market in a few days.

Borax has been found in Oregon, 37 miles south of Crescent city. The borate of lime is said to be found in huge boulders, weighing from two to three hundred pounds each, imbedded in the clay and gravel formation from the surface of the ground to the talcose slate bed-rock.

Improved Roasting Furnaces.

Good and cheap roasting and smelting furnaces are more needed on this coast to develop our mining resources, than any thing else we can think of; except, perhaps, more attention to legitimate mining and strictly honest management. The chlorination of silver in powdered ores, has, by the use of the Stedefeldt furnace been brought nearly to perfection. The only objection to be urged against the use of this furnace is the high cost of construction and the large royalty charged per ton. These reasons have of course deterred many companies from putting them up, who would have done so if the charges had been moderate. There are thousands and thousands of tons of low grade ores lying about the dumps of mines, on this coast, that cannot now be utilized, but which, if a saving of \$2 per ton could be effected, would pay to work. Where such great quantities of ore can be made use of, which is now considered useless, a profit of \$2 per ton would amount to a large sum of money.

We understand that the great objection to the Stedefeldt furnace—the expense of construc-

A New Stone Cutter.

Our New York correspondent sends us a glowing account of a new stone dressing machine on exhibition at Newark, N. J. The cutting implement is a gang of black diamond points rotating at a velocity of five thousand to the minute. By a most ingenious system of automatic movements, any design may be traced in relief and intaglio; and, in fact, any description of plain cutting, surfacing or bevelling is within the scope of its powers. The machines are made of different sizes and styles, according to the special purposes for which they are to be adapted. The invention thus combines the functions of the simple stone-saw, surfaeer and lathe, all in one; and, in addition, a polishing rotator, using emery or tannite instead of the carbons, is employed in connection with the cutter. The automatic movements may be so adjusted as to describe any geometric or irregular pattern. The ornamental work that would take a good workman a week to accomplish is performed in a quarter of an hour, and in a far more perfect manner. Specimens of work given to our correspondent were remarkable for the sharpness and exact-

Brookes' Still-Life Paintings.

We present to the readers of the Press this isene an illustration representing one of those admirable still-life pictures by a noted California artist, Sammel M. Brookes, and which have gained for him more than a local celebrity. The original from which the cut was made is in the possession of Mrs. T. O. Larkin, and is 32x40 in size. The painting represents codfish suspended from a hook in the wall, with their tails hanging over in front of the stone; a crawfish, some vegetables, wine and a Lake Tahoe trout. Of course an engraving can not be expected to do full justice to objects which depend upon their color for their excellence, and paintings especially must be seen to be properly appreciated. Nevertheless the cut will give our readers who have not the opportunity of seeing the original, a good idea, not only of the character of Mr. Brookes' specialty, but of this painting in particular, which is much admired.

A salient point in the fish pictures of this artist, leaving aside entirely the absolutely life-like, or rather death-like, perfection of color and accuracy of detail, is the peculiar happy manner in which the supple, pliant figure of a fish just dead, yet still possessing its natural contour, is depicted. The Lake Tahoe trout in the foreground is an illustration of this point. It looks as if it had, after a few useless struggles, given up its life quietly, and remains in the position which it died. In pictures with the characteristics of the one shown, Brookes has no superior, anywhere, and indeed the field is one in which few opponents dare to challenge. To catch the changing colors of a trout, shining fresh from its native element, needs a quick eye and an accurate memory, as well as skill with the brush and knowledge of the art. That Brookes' pictures are faithful portrayals of his subjects is evident at a glance at any one of them.

His forte is particularly "still-life," on which he is excelled by no one. His pictures are easily recognizable in any collection by those who have ever seen one of them before.

DISAPPOINTED AGAIN.—A not her "Gold Bluff Expedition" has tried it and failed. The latest was that on board the steamer *Monterey*, which was provided with all the necessary machinery for pumping up the aniferous sands from the bottom of the ocean. It is stated that the pumps worked well and large quantities of sand and gravel were brought up, but unfortunately the precious metal was extremely scarce. They only found the color and that was all. This expedition prospected along the coast as far north as Rogue river with the same

success. It was equipped by the Gold Bluff Sub-marine Mining Company, a New York incorporation, who spent several thousand dollars in the enterprise. Who comes next?

BISHOP'S DREDGING MACHINE, of which we spoke some time since, has been improved by the addition of a central screw, having on its point a "bit" intended to clean the way for the screw through tough clay, etc. Mr. Bishop has the contract for dredging the Oakland Bar, but has not as yet built any machine to do it.

THE AUBURN MILL is for sale or lease. The Nevada State Journal says the reason given is that the agent of the mortgagee in London has examined the property and is convinced it cannot be run profitably from London, so he has determined to sell the mill, or if no purchaser can be found to lease it.

A NEW TAILINGS MILL.—The Gold Hill News says: "Greeley, French & Co. are building a new mill on the site of the old Pioneer Foundry in Lower Gold Hill for the purpose of working a large amount of tailings which have been collected at a reservoir close by."

OIL COMPANIES in San Fernando are now making extensive arrangements for the collection and shipment of oil from their springs. They are going to bore to thoroughly test the source of supply.

A BULLION team with 750 bars of base bullion for this city arrived in Los Angeles from Corro Gordo on the 20th.

STILL-LIFE-BY S. M. BROOKES.

tion—has been modified to some extent by a new invention, having for its object a somewhat different plan of construction. This alteration, it is alleged, will effect a saving of about 30 per cent, on the cost of a furnace built on the old plan, and that without lessening the quantity capable of being roasted nor the quality of the work. There are at present objections to making the plan public, which will, however, shortly be removed. We hope to be able soon to lay the details of the proposed change before our readers.

SALE OF PATENT.—Mr. J. E. Emerson of Beaver Falls, Pa., owner of the patent for sawing stone with black diamonds (recently illustrated in the MINING AND SCIENTIFIC PRESS) has sold an interest to a company in Missouri, which has used the device for over eight months with satisfaction, for \$125,000. We are informed by Mr. Emerson's brother, of Oakland, that the inventor still reserves the right to manufacture all the saws; and they will before long be introduced on this Coast, together with new and improved teeth for sawing wood and lumber.

The engineers of the San Joaquin and Tulare Railroad Company have located the line to cross the Merced river about one mile above Snellings, and are now engaged in locating the route from the south fork of that river.

A LARGE new water tank is being built by the Imperial Mining Company east of their hoisting works, as a protection from fire.

ness of the angles. Neither chipping nor "deadening," even in executing the most intricate patterns in the most delicate material, were to be seen. The black diamonds were not affected by variation in the texture of the stone and, after having been in constant use for a year and a half, are found to be in perfect condition, not showing wear in the least although such refractory materials as Scotch granite, millstone grit, etc. were treated.

There are plain diamond saws and lathes in abundance, but no machine, as yet, that is capable of such widely extended application as this. The American patent was issued to Mr. Herbert Cottrell, of Newark, in July of last year. The machine is to be manufactured by the Colt's Arms Company—a sufficient endorsement, in itself, of the merit of the invention.

THE MANHATTAN Company of Austin will shortly erect a 20 stamp mill on the Lida Valley. The mines belonging to the company who will erect the mill, are in Gold Mountain from 15 to 20 miles distant. The mill is expected to be in operation by next September. Hiskey & Walkers eight stamp mill is at present the only one in the District. It continues dry and has constructed with it two reverberatory furnaces.

NEW HOISTING WORKS are to be put up on the Koesneth mine, near Silver City, Nevada. The success of the Woodville, Silver Hill and other mines near by has stirred up the owners of this one to renewed confidence and energy.

Highland District.—The Highland Company's Mines.

The editor of the *Pioche Record* has paid another visit to Highland Mining District, which is only five or six miles distant, and joins Ely District on the west. He says the fact that the Mendha Company will soon have their fine new mill in operation makes Highland, at the present time, the center of much interest. Having before referred to the Mendha Company's property and operations at length, we this time went to inspect the mines of the Highland Mill and Mining Company, whose office is at 306 Montgomery street, S. F., one of the wealthiest corporations on the coast, and under official management of gentlemen well known for energy, integrity and financial responsibility, J. N. Williams being the President. The company being organized to develop mines, and not to speculate in stock, bought up twenty-six of the most promising ledges in the district before entering upon extensive development, having determined to make the enterprise successful if there were paying ores in the district. And now, after having made two trips to Highland, each time, note-book in hand, personally inspecting the mines, we feel safe in saying—by which we mean that we believe our judgment will be vindicated by future developments—that it will prove one of the first lullion producing districts of the Silver State.

Out of the 26 ledges owned by the corporation we found time to visit 14, as follows:

Hamburg.

This mine is situated on the west side of Arizona Mountain, about a mile northeast of the Mendha mill. It is developed by a tunnel 200 feet in, and a shaft 40 feet deep. The tunnel is the finest piece of mining engineering we ever examined in the county, being five feet wide at the bottom, 6½ feet high, and it goes into the mountain as straight as an arrow. 175 feet from the mouth a drift is run to the north 22 feet, at which point a vein of rich mineral 18 inches wide is tapped, showing that the tunnel is running parallel with the ledge, but a little to the south of it. But the tunnel being intended to develop a number of mines, the proximity of the ledge is not regarded in its construction. It will be extended right on through the heart of Arizona Mountain. The main shaft goes down on the ledge (which dips but slightly to the north) 311 feet northeast of the mouth of the tunnel, breaking ground 125 feet above the tunnel level. It is now down 40 feet, the ore from top to bottom all being high grade, and varying in width from 16 to 24 inches. We have before us the assayer's certificates of samples got at different depths from the bottom as follows: \$65.98; \$279.04; \$375.20; \$211.17; \$220.67. The vein has been widening the last five feet of excavation, and is 22 inches strong at the bottom of the shaft, where the \$375 assay was obtained. The Hamburg is capped by white limestone, having been found by blossom tracing and cross-drifting; but the tunnel seems now to be entering a sort of quartzite. The course of the ledge is northeasterly and southwesterly.

The Mississippi.

The discovery shaft of the Mississippi is just west and near the crest of Arizona Mountain. The vein exposed is 3½ feet wide and the ore is extraordinarily rich, the assays generally running over \$1,000 to the ton, and never falling below \$50. But the developments, so far, are not encouraging. The vein, the first few feet it is followed by the shaft, (which might with propriety be called a tunnel,) runs in horizontally, lying almost flat, and then it begins to gradually assume a downward dip to the north, the same as the Hamburg. The Hamburg tunnel was started as much for the development of the Mississippi as the Hamburg, and will be pushed ahead until it intersects the Mississippi—if the vein is below to be intersected—at a point nearly 500 feet below the surface. Should the Mississippi "be caught" by the tunnel as favorably as it shows at the surface, it certainly would be worth a cool million or more. We can only hope that Mr. Malone's expectations will be realized.

The Blackfoot.

This is a vein of enormous extent, being from 4 to 10 feet in width. Its croppings are very heavy, and may be traced for 1,000 feet, solid ore masses weighing several hundred pounds jutting out at points. It is situated on the southeast end of Silver Mountain, about two miles a little west of north from the Highland mill. The main shaft is now down 25 feet, the vein being 4½ feet wide, strong at the bottom. We never examined a better defined ledge than the Blackfoot. It can be traced by its croppings for several hundred feet as clearly as if the vein had been continuously hared by surface cutting. The walls are very smooth and regular, going down almost perpendicularly. The assays taken vary from \$7.87 to \$88.90 to the ton. The prospect is fair for the Blackfoot developing into a great, permanent mine.

The Echo.

This, so far as developed, shows itself to be a very rich, but narrow vein, the pay ore not being over 12 inches wide, though the vein matter, or the distance between the walls, average two feet. It is situated on the south side of Silver Mountain, and about a mile from the

Mendha mill. The ore carries a good deal of iron, with considerable lead, but it is of the "free milling class." The company expect much of the Echo.

The Georgia.

The Georgia is a ledge of unusually good indications. It is on the north side of Silver Mountain, and dips a little, very little, to the north. The assayer's returns have never fallen below \$110, and usually go high up in the hundreds. Average width between the walls, 4 feet. A tunnel is being run in to cut the ledge a great distance below the surface; it is now in 80 feet, and will be pushed ahead with all vigor.

The Howarth

Is a ledge of modest showing now, but may improve as development progresses. The vein is nowhere over 10 inches wide, but what there is of it is solid mineral, and very rich. The ore is of the smelting class, much of it being pure galena. Three tons, smelted in Eureka as a test, yielded \$148 to the ton.

The Phil. Sheridan

Is 400 feet above the Howarth, and runs parallel with it. Ore of the same class, though not quite so rich, and the vein is wider than the Howarth. Development not sufficient to form opinions.

The Bengal Tiger

Is northwest of the Phil. Sheridan, and carries the same class of ore; but we consider it much more promising vein.

The Lewiston City

Carries more iron and less lead than any other vein we examined on the northern side of Arizona Mountain. It can be traced 1,000 feet by the croppings, has an average width of 4 feet in the main shaft, and the walls are smooth and regular. The assays run from \$7 to \$40 to the ton.

The Lincoln

Runs parallel with the Lewiston City, is equally well defined, assays about the same, and goes down nearly straight; but the vein, so far, is impracticably narrow, nowhere showing over 13 inches in the shaft; but the heavy and long line of croppings seem to give promise of important developments in the Lincoln.

Black Bess

Is not far from the Lincoln, and shows the same general character of ore; but it is much more promising. The vein in discovery shaft exposes an average width of 4½ feet. It is situated on the north side of and well up on Arizona Mountain.

The War Eagle

Is on the extreme end of Arizona Mountain. The vein is fully 4 feet in width wherever exposed, and ore is of the "free milling class." The average of a number of assays is \$16 to the ton.

The Pocahontas

Is on the northeast point of Arizona Mountain. The vein is 2½ feet wide, and ore very similar to that of the War Eagle. Dips to the northwest. The walls are well defined, and the vein can be traced 1,200 feet by the croppings.

The Yellow Jacket.

This is the company's extreme western location, being a mile west of the Mendha hoisting works.

The above are the ledges personally visited, and the description of each was written on the ground. Of those not visited Mr. Malone mentioned the California, French, Western View, Ida Elmore and Mountaineer as very highly valued by the company.

The Highland Mill and Mining Company is organized on a strong financial basis, and they have no intention to put their stock on the market until the value of the mines is proved by actual development; none of the stock has changed hands at less than \$2 a share, and all sales and purchases have been confined to members of the corporation. If the Mendha mill proves a success, the company will immediately erect a mill of the same model; but the failure of the Mendha enterprise—of which we have no apprehension—would not discourage the Highland Company. The holders of the stock, knowing the silver is in the ore, and, being strong financially, will, if necessary, follow failures with new trials, until success is achieved. But we believe Highland District, within sixty days, will prove itself to be one of the richest silver mining camps in Nevada.

The Highland Mill and Mining Company have secured a most eligible mill-site, having wood and water in abundance.

Los Angeles Mines.

A party of horax hunters, on their return from the Slate Range, says the Los Angeles Express, called by the Placer Gold Mines or Gravel Range, between Santa Clara and Elizabeth Lake. Their report of the extent and richness of the gold deposit in that range is more encouraging than anything we have yet heard. They made several locations, and still there is room for hundreds of enterprising miners to locate on the richest gravel deposits in the State. They prospected extensively, and from the top of the highest hills to the bottom of the canyons they found gold in every pan of earth, averaging from 5 to 60 cents to the pan.

These deposits have long been known, but until recently no one knew that water could be found in the vicinity with which to work them.

Colonel Peel, W. W. Jenkins and others have prospected the mountains back of the gold

range and found that the waters of Elizabeth lake, Peru creek and San Francisco creek can all be brought on to this gold range, with comparatively little expense.

The waters of these streams have been taken up by these parties, and the ditch from the waters of Elizabeth lake is being made, and in a few days a company will go up to begin the construction of other ditches. Here will he work for five hundred men, who must draw their supplies from this valley. A wealthy company have already taken hold with Jenkins and Peel, and other old miners are looked for every day, who are going to view the field. Now, if our horax men will also secure the aid of experienced capitalists to put their enterprise through, our city and county will receive a new impetus.

The Sancelito Railroad.

The work which is quietly going on at Sancelito and beyond, in preparing the track for the ties, the rails, the cars and traffic, is of more importance to the city of San Francisco and to the trade of this coast, than many people probably, have as yet appreciated. The purpose is to complete the line to Walhalla, some forty miles beyond Russian River Valley, to be continued hereafter, doubtless, many miles farther. But the extent indicated as the immediate purpose of the Company is sufficient to create a great change in the route of certain trade, and a vast increase in some others. The road will pass San Rafael, and through a country beyond, one of the finest in the State for the production of certain crops necessary to meet the wants of San Francisco, potatoes and other vegetables, but more particularly through the finest for dairy purposes on the coast. The number of cattle, of milch cows, and the amount of butter and cheese produced would surprise most of our citizens were they informed of the facts. There is a vast extent of grazing country of the best quality within the range of the proposed road, and its construction and completion will furnish an outlet for its produce which it has long needed, and which will prove of incalculable benefit to the settlers in that region.

But beyond this section, and perhaps in some respects of still more importance, will be the facility this railroad will extend for the transportation of lumber. It will tap one of the finest and most extensive lumber regions in the State. The products of this section in lumber have been equal to the demand heretofore, and will continue for many years to come. But the great drawback has been the difficulty of shipment. Only by comparatively small vessels can this lumber be brought to market. The coast is rugged and dangerous, with no harbors, only roadsteads in which small craft may lie, not in safety, but taking great risks of shipwreck. For at any time a heavy sea may commence running in, without any premonition, and the danger of shipwreck at once becomes imminent. Many vessels have thus been wrecked on that rocky coast, without a breath of wind to excuse it. A trade thus dangerous and full of risk, of course adds very materially to the cost of lumber here. But this road will materially change all this. Ships chartered for Chili or Peru, instead of being loaded from small craft from the dangerous heights and months of rivers along the coast, will haul alongside the wharves at Sancelito and take their loads in safety where no summer winds nor southeasters can trouble them.

By extending the railroad to deep water which is found in the vicinity of the present Sancelito wharf, ships may lie and receive their cargo of lumber in safety, no risk of wreck or tornado. It is perhaps too soon to estimate the effects the opening of this road will have upon the little hamlet on this side of the Bay. But that it will become quite a shipping point for lumber is very certain. It is but a short distance across the Bay. A ferry boat of the proper and requisite qualities can make the run across in a short time. Men doing business in the city may have their residences here. The climate, taking the year round, is the most agreeable of any in the State. It is protected pretty generally and effectually from the sea breezes which sweep San Francisco six months every year, and it is never hot and oppressive as in the interior. The views from the town, and from neighboring hills, cannot be surpassed for beauty, and even sublimity; while as for health no location on the coast can surpass it. The value and importance of this little spot has been overlooked by the people generally, but its time will come as surely as that of any other location on this coast.—*Sancelito Herald*.

THE OROVILLE MINES.—The interest in the new placer diggings below town continues unabated. The Greeley Company have nine claims on their claims, and are putting in pumps to drain them. The Globe Company are also progressing with their claims, and all will soon be able to make a profitable showing. The Chinese are still buying everything in sight that has a title that will enable them to hold their purchase. Several claims have been sold at a fair figure during the week. The most extensive sale noted is that of Dr. Jenkins, who has disposed of his fine ranch and forty acres, vineyard, with a fine brick residence and all necessary buildings for the manufacture and storage of wines, to Chinese miners for

\$4,200. This was one of the finest vineyards in the county, requiring irrigation, and producing an extensive crop of grapes. Whether Celestial miners mine upon the vineyard, depends, we suppose, entirely upon the fact whether they can find "one dollar hap" per day beneath it. They readily buy all the ground to which they can find title, and have plenty of money for that. An American mining population could prosper here, but this class do not appear to care for diggings that cannot be worked with sluice and hydraulic, and dispose of their claims for a few hundred dollars in coin. The Chinese population is rapidly increasing, and are overrunning the valley and giving it the appearance of an ant's nest.—*Butte Record*.

Copper Among the Ancients.

The copper operations of the ancients in the Lake Superior regions still remain a mystery, though there seems every reason to believe that they were conducted by the Aztecs who left their haunts in Mexico and the Ohio Valley and made summer pilgrimages to the copper region. There has not been found either bones or implements or any means of identification whatever, except the tools which are occasionally picked up in the ancient pits. And some of these pits and workings are so completely covered with drift and formation that it is impossible to form any estimate in regard to the time when they were operated. The presence of bismuth, lead, mercury and arsenic in this copper enabled these ancient miners to mould it into cutting tools which possessed a finer and tougher edge than pure metal, and answered to some extent the place of iron and steel—though the tools found, after being cleaned of their oxidation do not appear materially harder than the copper itself. Along the courses of some of the veins, old shafts or surface workings have been found which when freed of debris show plainly the methods pursued by their former workers in extracting the ore. So far as can be judged the rock was softened and cracked by means of fire built against it, and kept going for days, then the loosened masses were pried out by ho poles. Remains are found of huge stone hammers, and copper chisels and other cutting tools, and in several cases large masses of metal have been found that have been dug around on all sides and partly underneath, and then left as if the miners had given up all hopes of detaching, and raising it to the surface.

The only reason for inferring that this was the work of the Aztecs is the fact that specimens of this copper, with native silver adhering, have been found in the monads of the Ohio Valley, having evidently been used as ornaments by the mound builders and buried with them. Similar specimens have been handed down for many generations in Mexico as having been possessed by the Aztecs who were said to be cognizant of valuable mineral lands far to the north.

It has been doubted by many that the copper tools of the ancients really possessed the density and cutting power usually ascribed to them. Sir Gardiner Wilkinson, however, remarks that some of the bronze daggers found by him in Egyptian tombs were so beautifully tempered that after having lain buried for 3,000 years, they possessed, when dug up, an elasticity almost equal to that of steel. It is thus definitely proven that the Egyptians really did possess an art, which has been lost, of making bronze of a particular fine temper, capable of taking and keeping a sharp edge.—*Marquette Mining Journal*.

TRAIL TO STICKEEN RIVER.—Captain William Moore, of Fraser river steamboat fame, left by the "Otter," for the Skeena, thence for the Stickeen river, from the head of navigation of which it is his intention to open a good pack trail for horses and mules, into the heart of the country at the head-waters of this great river. He was successful in procuring from the local Government a charter to cut this trail, which commences at Buck's Bar, to connect with Dease's Lake, thereby enabling miners and others who have been long desirous to penetrate a country known to be rich in minerals, gold, silver and copper. The charter is given for five years, during which time the road is to be kept in good repair at all seasons, the consideration being the right to collect a small toll on goods passing over the route. Captain Moore, we all know, is energetic, and he possesses good facilities for carrying out the work. At the month of the Skeena he has a vessel adapted to the navigation of the Stickeen, which he will take thither, together with his pack animals, which have been wintering at the mouth during the past season. We understand also that a portion of the money voted for exploratory purposes during the last session of the Legislature has been set apart toward the prosecution of the discovery of new mining grounds in this hitherto almost unknown section of the Province. *Colonist*.

FOUNDRY BUSINESS IN SICILY.—The foundry business seems to be flourishing in the home of the famous God of fire. The Oretafoundry, in Sicily, is said to employ 700 hands, who work up 2,000 tons of metal a year. The iron is obtained from England, Belgium and Lombardy, and the coal from England. Various kinds of steam machinery, agricultural implements, etc., are made at this foundry, the market for which is mostly found in Greece and Turkey.

DEWEY & CO'S SCIENTIFIC PRESS Patent Agency.

SCIENTIFIC PRESS—Mining and Mechanical.

PACIFIC RURAL PRESS—Agricultural.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others by reasons of long establishment, great experience, thorough system, and intimate acquaintance with the subjects of inventions in our own country. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all civilized countries. The large majority of U. S. and Foreign Patents granted to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most reliable advice as to the patentability of new inventions. ADVICE AND CIRCULARS FREE.

DEWEY & CO.,

Valuable Premiums for Subscriptions.

A Sewing Machine
of Real Value
(Beckwith's)
given for \$40
worth of Sub-
scriptions.

The AMERICAN AGRICULTURIST, in speaking of this Machine, says:
We are prepared to endorse the Beckwith Sewing Machine as one worthy of being at once secured by all who cannot purchase the expensive machines.

1st. It is well and strongly made.
2d. It is easily attached to any table or stand having a leaf or edge projecting an inch or so, and can thus be used in any part of the house, near a window, etc.
3d. It makes the best of loop stitch (the same as the Willcox & Gibbs and some other good machines), which with a little care in making the closing stitch is evidently strong for nearly all kinds of sewing, and less liable to break in washing and wearing, owing to its elasticity.

WE WILL GIVE

For \$12, a Machine and the Illustrated Press, 1 year.
For \$12, a Machine and the Mining & Scientific Press, 6 mos.
For \$12, a Machine and the Pacific Rural Press, 6 mos.
For \$13.50, a Machine and the Mining & Scientific Press, 1 yr.
For \$13.50, a Machine and the Pacific Rural Press, 1 yr.
For \$40, we will give a Machine and \$40 worth of subscriptions to either paper or all jointly. Send for Circular.

Express charges must be paid by the purchaser. Address, for further particulars, the PUBLISHERS OF THIS JOURNAL.

Publications of the Geological Survey of California:

For sale at lowest price by DEWEY & CO., of this office
GEOLOGY, Vol. I, with 525 pages of text, in royal 8vo form, 81 wood engravings and one steel plate; containing a Report of Progress and Synopsis of the Field Work from 1869 to 1871. Price, in cloth, \$5.00. Postage, extra, \$1.00.

PALAEONTOLOGY, Vol. I, with 263 pages of text, and 23 steel and lithographic plates; comprising descriptions and figures of the Cretaceous and Tertiary Fossils, by F. B. MEYER. Price, in cloth, \$5.00. Postage \$1.00.

PALAEONTOLOGY, Vol. II, with 299 pages of text, and 36 lithographic plates; containing the remainder of the Cretaceous and the whole of the Tertiary Palaeontology, by F. B. MEYER. Price, in cloth, \$5.00. Postage \$1.00.

ORNITHOLOGY, Vol. I, 'The Land Birds of California and the adjacent States and Territories, with 662 illustrations, mostly on wood. Price \$10.00. Postage \$1.00.

A NEW BOOK ON MINING.

The Explorers', Miners' and Metallurgists Companion; Comprising a Practical Exposition of the Various Departments of Exploration, Mining, Engineering, Assaying, and Metallurgy. The Most Practical and Comprehensive Work on Mining Subjects Extant. Comprising 640 Pages, and 51 Engravings. By J. S. PHILLIPS, M. E. Price, bound in cloth, \$10 (in 8vo) in leather \$12. Forwarded by mail, in cloth, \$11.40, currency; in leather, \$13.75. Issued and for sale by Dewey & Co., Patent Agents and Publishers Mining and Scientific Press, S. F.

MINING AND SCIENTIFIC PRESS.—This well known and popular mining journal, published by the enterprising firm of Dewey & Co., of San Francisco, is now being printed on a new press—purchased of the Chicago Taylor Press Company—which very much improves its appearance, and renders it an ornament as well as a valuable instructor for all interested in mining and the future development of the vast fields of wealth on the Pacific slope. Every miner should have the Press in his cabin. Give it a trial, and we guarantee that when once subscribed for you will never fail to eagerly welcome its weekly visits.—(Mountain Messenger, Downieville.)

Laws Concerning Corporations.

[Under the New Code—January 1, 1873.]

GENERAL PROVISIONS APPLICABLE TO ALL CORPORATIONS.

WAGON ROAD CORPORATIONS.
WATER AND CANAL CORPORATIONS.
HOMESTEAD CORPORATIONS.
MINING CORPORATIONS.
LAND AND BUILDING CORPORATIONS.
Also, MINING PARTNERSHIP LAW.

A pamphlet containing the above provisions concerning Corporations has been printed from the Statutes of California. It furnishes those who wish these special laws an opportunity of obtaining them for the small sum of 25 cents (post paid). Address, DEWEY & CO., Publishers, and Patent Agents, S. F.

REASONS WHY THE

PAIN-KILLER

MANUFACTURED BY

PERRY DAVIS & SON

IS THE

Best Family Medicine of the Age!

And why it should be kept always near at hand:

- 1st. PAIN-KILLER is the most certain Cholera cure that medical science has produced.
- 2d. PAIN-KILLER, as a Diarrhoea and Dysentery remedy, seldom if ever fails.
- 3d. PAIN-KILLER will cure Cramps or Pains in any part of the system. A single dose usually effects a cure.
- 4th. PAIN-KILLER will cure Dyspepsia and Indigestion, if used according to directions.
- 5th. PAIN-KILLER is an almost never failing cure for Sudden Colds, Coughs, etc.
- 6th. PAIN-KILLER has proved a Sovereign Remedy for Fever and Ague, and Chills Fever; it has cured the most obstinate cases.
- 7th. PAIN-KILLER as a liniment is unequalled for Frost Bites, Chills, Burns, Bruises, Cuts, Sprains, Etc.
- 8th. PAIN-KILLER has cured cases of Rheumatism and Neuralgia after years standing.
- 9th. PAIN-KILLER will destroy Boils, Felons, Whitlows, Old Sores, giving relief from Pain after the first application.
- 10th. PAIN-KILLER cures Headache and Toothache.
- 11th. PAIN-KILLER will save you days of sickness and many a Dollar in time and Doctor's Bills.
- 12th. PAIN-KILLER is a purely Vegetable preparation, safe to keep and to use in every family. The simplicity attending its use, together with the great variety of diseases that may be entirely eradicated by it, and the great amount of pain and suffering that can be alleviated through its use, make it imperative upon every person to supply themselves with this valuable remedy, and to keep it always near at hand.

The PAIN-KILLER is now known and appreciated in every quarter of the globe. Physicians recommend it in their practice, while all classes of society have found in it relief and comfort. Give it a trial.

Be sure and buy the genuine. Every Druggist, and nearly every Country Grocer throughout the land, keep it for sale.

BAIRD'S BOOKS

FOR PRACTICAL MEN.

My now revised and enlarged Catalogue of PRACTICAL AND SCIENTIFIC BOOKS, 96 pages, 8vo., will be sent, free of postage, to any one who will favor me with his address.

LEA & PERRINS'

CELEBRATED

Worcestershire Sauce.

Declared by Connoisseurs to be the only good SAUCE

Caution Against Fraud.

The success of this most delicious and unrivaled Condiment having caused certain dealers to apply the name of "Worcestershire Sauce" to their own inferior compounds, the public is hereby informed that the only way to secure the genuine is to ask for LEA & PERRINS' SAUCE, and see that their names are upon the wrapper, labels, stopper and bottle.

Some of the foreign markets having been supplied with a spurious Worcestershire sauce, upon the wrapper and labels of which the names of Lea & Perrins have been forged, L and P give notice that they have furnished their correspondents with power of attorney to take instant proceedings against manufacturers and vendors of such, or any other imitations by which their right may be infringed.

Ask for LEA & PERRINS' Sauce, and see name on wrapper, label, bottle and stopper. Wholesale and for export by the Proprietors, Worcester, Cross & Blackwell, London, &c., &c., and by Grocers and Oilmen universally.

EUCALYPTUS.

The attention of the Medical profession is respectfully called to the following preparation of this new remedial agent. Eucalyptus and its preparations have been found useful in obstinate cases of intermittent and Malarial Fevers, often supplanting the use of Quinine. The proxemics of Asthma and Catarrh are greatly controlled, and in various Kidney diseases and Catarrh of the Bladder it seems to act like a specific.

FLUID EXTRACT EUCALYPTUS.

This extract represents in a concentrated form the medicinal effects of the leaves of Eucalyptus Globulus.

THE ELIXIR OF EUCALYPTUS.

This compound presents the properties of the leaves in a palatable form and elegant appearance. Dose—One tablespoonful, to be repeated as often as the case demands.

Clearing of Eucalyptus Globulus, useful in Asthma, Difficulty of Breathing, Incipient Pleurisy, etc. Prepared and sold by JAMES G. STEELE & CO., Chemists and Apothecaries,
No. 521 Montgomery St., between Clay and Commercial, San Francisco.

Important to Miners and Mill Men.

Silver-Plated Copper Amalgamating Plates, for Saving Gold.

Of all sizes and in any quantity, furnished to order. Full instructions sent for operating. Particular attention given to plating goods for Builders, Plumbers, etc. Hotel and Restaurant work replated.

SAN FRANCISCO GOLD AND SILVER PLATING WORKS,
655 Mission street, San Francisco.

7v25-3m E. G. DENNISTON, Proprietor.

Varney's Patent Amalgamator.

Best Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared to have them constructed in the most perfect manner and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits. They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows.

The pan being filled, the motion of the muller forces the pulp, to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Sellers made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill-men are invited to examine these pans and settlers for themselves, at the office, 229 Fremont Street, San Francisco.

Nevada Metallurgical Works.

For all Laboratory and Manufacturing Purposes.

H. M. RAYMOND,
25 Bond street, New York.

Platinum Scrap and Ore purchased.

(Continued from Page 325.)

the mine shows better than usual, and gives high assays. A witness is about being started to connect this first and second levels.

STROCK.—Nothing doing at the new shaft. Mill kept steadily running on ore from old shaft.

UNION CO.—Cross-cutting in the ledge shows it to be 40 ft. in width of quartz, which gives low assays. The main north drift is now being driven ahead. **WOODVILLE.**—Daily yield 35 tons, keeping both mills at work. The ore is yielding well, as the bullion shipments have been about \$1,000 per day, but the full returns will not be definitely ascertained until the last of the month, when the mill makes a clean up. The north part of the mine is looking especially well, and there is plenty of ore already in sight to keep the mills running for several months.

YELLOW JACKET.—Drifting east at the 1500-ft. level in good looking quartz and porphyry, also north and south at the 1400-ft. level. No new developments.

WHITE PINE.

ROSE STRIKE.—White Pine News, May 17: We were shown an assay by O. J. Pope, assayer, which read: From 139.70 oz. of sample, 1,538.88 silver. The ore came from the Mammoth Mining Co.'s property.

THE SOUTH ADROVA.—The Peerless Chamber, with its immense deposit of rich ore, seems to be increasing both in quality and quantity as the work progresses. They are now engaged in extracting ore from the Peerless Chamber, to run the Stanford mill of 30 stamps, and also busily pushing through a drift from the Riddale shaft to connect with the ore in the chamber referred to. The daily amount of ore shipped to the mill will exceed 30 tons, and from one shaft. The workings in the Peerless Chamber have now reached a depth of 140 ft., with a width not yet ascertained. Before leaving the Hill we visited the assaying house, where we found a gang of men busily engaged assaying the ore preparatory to its shipment. Much of the mineral here will assay high into the hundreds, but the manager takes all alike, bundles it into wagons, and assures us it works from \$60 to \$70 per ton at the mill.

WARD DISTRICT.—A mining district, situated 18 miles southeast from Robinson, was prospected by Mr. Ward from whom it derives its name. We are informed that considerable work is being done on the location in the vicinity, and among the most promising mines is the Mountain Pride, which has a shaft down 40 ft., all the distance in a fine body of mineral. Assays from this mine show \$200 in silver, with from \$18 to \$23 in gold, and 15 per cent. copper.

Colorado.

CLEAR CREEK.—Georgetown Record, May 11: This county, for the three months ending April 31, 1873, gave a total coin value of \$317,200.17.

J. O. Stewart's shipment of silver bullion in those 3 months amounted to \$45,529.67. The two largest purchasers and shippers of ore were G. W. Hall & Co. (\$58,059.83) and Wm. Dement (\$52,864.42). Then comes the Boston and Colorado Smelting works of Black Hawk, \$42,824.43 worth of ore, principally from Seaton Hill, purchased directly of the miners.

During the three months ending April 31, G. W. Hall & Co. purchased ore from the Colorado Central lode to the value of \$18,257.60 coin value, which showed an average value of silver of 95.6 ounces per ton, or \$1,225.50—higher, we believe, than the average value of any other silver mine in the world, considering the grades calculated upon. The lode was discovered by W. P. Linn last fall, and lies in a deep sag of a seven-foot mountain, the crevice being covered by 70 or 80 feet of drift and boulders. The mine has yielded at times at the rate of \$1,000 per day. The ore is an argenteous galena, containing gray copper, brittle, natural and ruby silver and silver glance. At times the latter is so prominent that the ore will not pass through the crusher, but fattens out like soft malleable metal. The Baltimore tunnel Co. have struck the Baltimore lode, supposed to be the same as the Terrible 150 ft. from the tunnel's mouth. The ore is very rich.

Mining is very active on Seaton Hill, in Gilson and Hukil gulches, and in Virginia canon. The Victor, Seaton, Veto, Queen and Hukil mines are producing considerable ore. The Franklin is under lease. These mines will turn out an average of 100 ounces per ton.

GILPIN.

The product of the mines of Gilpin Co. for the three months ending April 31, 1873, is:

	COIN VALUE.
Bullion.....	\$210,000
Matte and Gilpin County ores, shipped by B. & O. Smelting Co.....	173,215
Ores treated elsewhere.....	4,000

Total for quarter.....\$387,215

The Boston and Colorado Smelting works have shipped matte having a coin value of \$221,812. This was the product of ore from Gilpin, Clear Creek and Boulder counties.

Montana.

ANOTHER GOLD BRICK.—Helena Herald, May 8: Messrs. Keating & Blacker have just made another run and clean-up at their quartz mill at Keatingville, Jefferson county, and the result is 250 ounces of gold retort, which was brought to this city yesterday by them in person, and deposited in the First National Bank. The value of this bullion in currency is about \$12,000.

RICH QUARTZ.—Yesterday Mr. Kemp made an assay of rock from the L tie Emma lead owned by Mr. J. H. Russell, on Upper Ten Mile, which went \$2,560 per ton in silver.

PHILIPSBURG.—New North West, May 10: Frazer and others are at work cleaning out shafts and putting the Speckled Trout mine in order to be received by the Philadelphia Co., who have purchased it. The Co. running the Blay & Bell mill cleaned up 850 ounces of bullion on Wednesday, the result of 2 1/2 days run.

EMERTSBURG.—At this mine every claim is being worked, with excellent prospect of good yield, but as yet few have been cleaned up. Wallwork, Davis & Co. are putting a flume in the lower portion of Henderson Gulch, and have flattering prospects. O'Brien & Henderson, Cartwright, Masserson & Co., and Ferguson & Co.'s ground looks well. Henderson will produce the usual amount of gold this year.

PIONEER.—The companies are at work in the vicinity. Old Bratton Bar is paying big. Allen & Ashland cleaned up \$1,400 Wednesday from 5 days' run. Jos. Allen picked up a 4 oz. nugget on his ground sluice a few days since.

YAMHILL.—The Rock Creek Ditch is now flowing about 1500 inches of water. J. D. Bins & Co. have a large amount of good ground in Independence Dist. Warren & Co., and McManisters & Co. are running telegraph lines 70 to 100 ft. high to carry water to the ground on Thunderbar. Hoover & Co., at head of Squaw Gulch, are opening up new ground that is believed to be rich.

Utah.

SPECIMEN SILVER BAR.—Salt Lake Tribune, May 12: We were yesterday shown a small silver bar weighing 31.30 ounces which was produced from a piece of ore weighing between 8 and 9 pounds, from the Price mine at Dry Canon, which nearly adjoins the celebrated Mono mine. The bar in question had on its face the following certificate of value over the names of Messrs. Sanders & Sprague, of this city:

Price Mine—Silver Bar, 31.30 oz. Value per ton silver, \$8,552.72; gold, \$2,230.90; \$10,783.62—Sanders & Sprague.

MINING ITEMS.—Mining Journal, May 13: \$33,000 worth of bullion has passed of late through W. F. & Co.'s express office for the East.

We have been shown by Col. Lee and Mr. Thos. Bennett a beautiful silver brick from the Queen of the West mine. It weighed 122 1/2-100 ozs.; fineness 974; valued at \$154.45. Several magnificent specimens of ore from the same mine were also shown us. This mine is situated in Camp Floyd district.

Washington Territory.

NEW MINES.—Walla Walla Union, May 10: On last Wednesday, Messrs. Joe Peavy and Chas. Campfield arrived in town with 155 pounds of what is supposed to be argenteous galena. It is very heavy—some large pieces appearing as heavy as so much pure lead. It is quite soft, and can be cut with a knife. When broken, it breaks in square and angular shapes, and is a little darker in color than bar or pig lead. It is mixed with whitish quartz. The specimens that were brought down have more metal than quartz in them. The mine was discovered by Mr. Peavy, about 6 years since, while he was carrying the mail across Pen d'Oreille Lake in a boat. He has frequently had assays of the ore made, and the returns have always shown about 80 per cent. lead and \$30 per ton silver. Last fall some of it was sent to San Francisco, and the above return was had. A few weeks since Messrs. Peavy and Campfield returned from here and went to the mine, which is situated on the south side of the Pen d'Oreille Lake, and after digging through 5 or 6 feet of snow, struck the ledge in two different places about 1,000 ft. apart. They sunk down about 4 ft., and found it very rich all the way, but could go no deeper without blasting; as they had only a pick and crowbar, they were compelled to leave off. The ledge from 8 to 10 ft. thick, between granite walls, and seems to "pitch" at a great angle.

PATENTS & INVENTIONS.

Telegraphic List of U. S. Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS FOR THE MINING AND SCIENTIFIC PRESS, DEWEY & CO., PUBLISHERS AND U. S. AND FOREIGN PATENT AGENTS.]

By Special Dispatch, Dated Washington, D. C., May 20th, 1873.

FOR WEEK ENDING MAY 6th, 1873.

FIRE ESCAPE.—Charles C. Milton, assignor one-half interest to Edward A. Lesnerd, S. F., Cal.

WAVE POWER.—Charles Buckner, assignor to Henry Bruce, John Reiners, J. H. A. Ludwig and Isaac M. Ward, S. F., Cal.

CONDENSER AND REFINER FOR SPIRITUOUS LIQUORS.—William Neil, S. F., Cal.

TREATING GOLD AND SILVER ORES.—Joseph Kallmes, S. F., Cal.

COMBINED SHEARS AND BUTTON HOLE CUTTER.—Alfred Swingle, S. F., Cal.

MANUFACTURE OF SOAP.—Richsd P. Thomas, S. F., Cal.

CANADIAN PATENT.

NEW MATERIAL FOR STUFFING MATTRESSES.—William J. Woodley, assignor to self and Julius Jacobs, S. F., Cal.

"The patents are not ready for delivery by the Patent Office until some 14 days after the date of issue. Note.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with greater security and in much less time than by any other agency."

Notice of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s Scientific Press American and Foreign Patent Agency, the following are worthy of mention:

AMALGAMATING VESSEL.—Fred. Morris, of San Francisco, Cal. Mr. Morris is a practical miner. It takes a practical miner to improve mining machinery, and make it practicable. Mr. Morris patents a settler or amalgamating vessel, the bottom of which is made of wood, placed with the grain vertical. The miller is also made of wood, disposed in the same manner, so that the action in the pan or settler is accomplished without bringing the pulp into contact with metal. Miners will understand the value of this invention. The patent also covers the employing of a siphon for draining off the water and tailings from the settler. One leg of the siphon passes into the vessel at or near the center, where the pulp is less agitated by the miller than at or near the rim, and consequently where it has the best chance to settle. The other leg extends outside of the vessel, so that the siphon will draw off the pulp and water from the surface, leaving the heavier portions.

LUBRICATING SHAFT BEARINGS.—Jerome Haas, Stockton, Cal. A patent for lubricating the hearings of shafts by water or oil applied under the foot or bearing point of the shaft upon the hydrostatic principle. The pump which forces the liquid under the shaft or between the hearing surfaces is operated by the revolution of the shaft. This patent relates more particularly to a plan for lubricating horizontal shafts, but Mr. Haas holds a patent dated in 1869 for lubricating the hearings of upright shafts upon a similar principle.

SWIVEL HOISTING APPARATUS.—Thomas M. Martin, S. F., Cal. Mr. Martin believes in "killing two birds with one stone" (when he can), or in other words he believes in employing only one engine to do the hoisting from several shafts, when the shafts are in close proximity to each other. In order to do this he has invented and patented a swivel pulley, over which the hoisting rope from the engine passes. The swivel pulley can be faced about to any desired direction in order to accommodate the different shafts in which the hoisting is to be done. The plan is economical.

Notes of Travel in Mariposa County.

[By Our Traveling Correspondent.]

ENS. PRESS.—This county at present is extremely quiet as far as mining matters are concerned. The sounds of drills, picks and blasting are heard in the direction of "Hites Cove" located 18 miles above the town of Mariposa, in the direction of Yosemite valley. I did not visit that district, but learned that some 30 men were engaged in working Hites & Co.'s mine, said to be paying splendidly, and known to be very rich. Your readers will probably like to hear something about the "Mariposa Estate" that the inhabitants of this State were excited about several years back, but known only by name.

Las Mariposas Estate,

Owned by the Mariposa Mining and Land Company, and consisting of 44,386, 83-100 acres, was finally confirmed to John C. Fremont in July 1855, at which time it was surveyed by H. A. Higley, Deputy surveyor, by order of the U. S. Government. Full possession was not obtained by Col. Fremont until the spring of 1859; from that time until June 1860, when Trenor W. Park took possession of the same, and successfully worked it until June 1863, when it was bought by the Mariposa Mining Co., and F. L. Olmsted put in as Superintendent and general manager. His management ceased in May 1865, when it passed into the hands of Dodge Bros. (as creditors). Under their management a very large indebtedness was paid off. The indebtedness in 1865 against the estate was something over \$200,000; in December 1866, (at which time a receiver was appointed), the indebtedness was reduced nearly one-half. J. J. McEwen, now postmaster and principle merchant of Modesto, Stanislaus county, was the receiver and manager of the company until the spring of 1868, during which time the suit pending between the Dodge Bros. and the Brumagins was settled.

From 1868, until the fall of 1871 it was managed by T. Goodsell and J. G. Rice who held, and worked it for the company, which company, at this time held it under a "deed of trust." In the Fall of 1871 it was duly advertised, both by the sheriff of the county for taxes, and the holders of the trust deed, and sold to the

Mariposa Land and Mining Co.,

Which now leaves the title perfectly clear and undisputed,—something that did not exist until now, since Fremont first took hold of it in 1855. The capital stock of the present company is \$15,000,000—ten millions of which was set apart as a working capital, the other \$5,000,000 deferred capital.

From the fall of 1871, to May 1st, 1872, it was managed by R. H. Lucas, during which time the present company took possession, as before stated, with an unclouded title.

From May 1872 until the present writing, Mr. E. O. Darling has been superintendent and general manager, and the prospect of his long continuance is good. During the greater part of last year this company worked into the depth of their "Pine Tree Ledge," under the scientific advice of one Prof. O. W. Easton.

After spending some \$40,000 the company ceased this kind of prospecting, and now Mr. Darling has entire charge. This gentleman has filled various positions, from a humble clerk up to superintendent, having been in the employ of the different administrations steadily since the year 1864. He is thoroughly posted upon every ledge on the estate, and with the confidence of the company, which he has, I think, success will crown his efforts.

The River Tunnel

Ground has just been broken, and in a few days (or weeks at most) a tunnel will be commenced at or near a point close by the Benton Mill, near the Merced river. This tunnel is to be 7x7 feet in the clear, and will run nearly east to tap the "Pine Tree" or Linda Mine. It will tap the ledge at a distance from its mouth of about 1,200 feet. When completed the tunnel will be 600 feet in length, and will strike the said ledge 900 feet below its present workings, or about 1,500 feet from the surface. Five months is the supposed time it will take to strike the ledge (1,200 ft.). The object of this tunnel is two-fold—drainage and for easy transportation of the ore. For the more speedy completion of the tunnel a

Burleigh Drill and Compressor

Is now being put in position. Giant Powder is to be used as the blasting agent. A. F. Horn, Esq., is the mechanical engineer. A drill of the same character as above mentioned will also be put up immediately to sink a deep shaft on the Princeton Mine, located at Mt. Bullion, on the estate. This company is at present employing about 60 men. Their intention is now to concentrate all their forces upon sinking the above mentioned shaft, to more fully develop the Princeton Mine, and upon the River Tunnel to facilitate and cheapen the working of the "Linda Mine." At the Benton Mill, the proposed mouth of the River Tunnel, the company have ample water power to run 100 stamps, and can have 64 stamps in running order at 24 hours' notice. The ore of this company runs as high as \$42 per ton, but averages about \$12; the cost of mining and milling has been \$5.57 per ton.

Mount Gains Mill,

Jos. Spagnoli, Supt.; Edward Mockert & J. Spagnoli, proprietors. This quartz mill is run by steam power, has 10 stamps. Its capacity is about 16 tons daily (24 hours); now doing custom work only. It is located midway between Hornitos and Bear valley, five miles from either.

Washington Mine.

This mine is located at or near Quartzburg, about two miles north of Hornitos. The mine belongs to an incorporation, with a capital stock of \$2,500,000, in 5,000 shares. Nathaniel Page, President; T. B. Wingard, Secretary; and G. E. Webber, Jr., Superintendent. This company claim 3,000 feet of a ledge, running northwest by southeast, which pitches south. The ledge varies from five to twenty-four feet in width, and averages about fifteen feet thick. There is no free gold in this company's ore, but is highly charged with sulphurates, and pays an average of \$10 per ton in the batteries, and the sulphurates which they reduce at their own chlorination works, averages \$60 per ton; this mine is being developed by two shafts, one of which is down 520 feet; the other is 380 feet deep. Hoisting works run by steam command both shafts. This company have a 20-stamp mill on the premises, and run it night and day, crushing 25 tons every 24 hours; working in mill and mine 45 men regularly. L. P. Mc.

New Incorporations.

Forest Coal Mining Co., May 10. Object: to carry on the business of coal mining and the purchase and sale of coal and coal lands in this State. Capital stock, \$500,000 in shares of \$100 each. Trustees—John C. Wm. Strader, C. D. Burroughs, M. Bankhead and Geo. H. Smith.

Santa Rosa Coal Mining Co., May 20. Object: Coal mining and buying and selling coal and coal lands in the State of California. The company will begin operations near Mark West Creek, Sonoma County, Cal. Capital stock, \$2,000,000, in shares of \$100 each. Trustees—H. H. Haight, Edward Galpin, S. D. Kreider and O. P. Rand.

Meetings and Elections.

ADAMS HILL CONS. M. Co.—May 20: Trustees.—G. T. Lawton, O. F. Giffin, J. B. Haggis, Joseph Clark and J. H. Williams.

INOMAR M. Co.—May 20: Trustees.—H. O. Kibbe, J. W. Ford, L. Steinhart and W. Easton.

WELLINGTON M. & SHELTON CO.—May 20: Trustees.—G. W. Weaver, C. W. Kellogg, H. H. Allen, O. W. Shild and W. N. Young.

RIENING STAR M. Co.—May 20: Last year's Trustees re-elected.

Leather Market Report.

[Reported for the Press by Dolliver & Bro.]

SAN FRANCISCO, Wednesday, May 21, 1873.
The demand for Domestic Skins and Sole Leather continues light at old prices. The same may be said in reference to French Skins, except that they have an upward tendency.

Try Dr. Evory's Diamond Catarrh Remedy.
Only 50 Cents.

Says John to Nance, you look so bright,
Your eyes they sparkle, like a star.
Oh! yes, says Nance, Dr. Evory's remedy
Has cured that horrid, bad catarrh.
OUT OF THE FOG AT LAST.—Dr. Evory has discovered the only cure for Catarrh and Colds. One bottle gives immediate relief, and a few bottles effect a cure. All we ask is a trial. If your druggist don't have it, send to Dr. A. F. Evory & Co., 9 Post street, S. F. It only costs 50 cts. 14726-3m

Mining and Other Companies.

Due to the time necessary to mail this present large edition of the Mining and Scientific Press, we are obliged to press on. The delay is in the very latest hour we can receive advertisements.

Alpine Gold Mill and Mining Company.

Location of works, Packerville Mining District, Amador County, California. Principal place of business, San Francisco, Cal.

Notice is hereby given that at a meeting of the Board of Directors of said Company, held on the 18th day of May, 1873, an assessment (No. 4) of one dollar per share was levied upon the capital stock of the Corporation, payable immediately, in United States gold coin, to the Secretary, at the office of the Company, No. 438 California Street, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the 15th day of June, 1873, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on the 21st day of June, 1873, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Directors.

JOEL F. LIGHTNER, Secretary.

Office, No. 438 California Street, San Francisco, California. m15

The Central Land Company--Office and principal place of business, 338 Montgomery street, Room 5, San Francisco, California.

Notice--There are delinquent upon the following described stock, on account of assessment levied on the 9th day of April, 1873, the several amounts set opposite the names of the respective shareholders, as follows:

Name.	No. Certificate.	No. Shares.	Amount.
Jacob Hardy.....	36	100	\$50 00
Edward McLean.....	10	50 balance	50 00
Edward McLean.....	11	50 balance	50 00
Edward McLean.....	12	50 balance	50 00
F B Haswell.....	34	100	50 00
F B Haswell.....	35	100	50 00

And in accordance with law, and an order of the Board of Directors, made on the 9th day of April, 1873, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the above named room 5, 338 Montgomery street, San Francisco, Cal., on Saturday, May 31, 1873, at 11 o'clock P. M. of such day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

W. M. HELMAN, Secretary.

Office, Room 5, Nn. 338 Montgomery street, San Francisco, Cal. m17

Dutch Flat Blue Gravel Mining Company.

Place of business, San Francisco.

Notice is hereby given that at a meeting of the Directors, held on the 13th day of May, 1873, an assessment--No. 2--of 50 cents per share was levied upon the capital stock of the Corporation, payable immediately in U. S. Gold Coin, at the office of the Company, Room 11, 401 California Street, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the 15th day of June, 1873, will be delinquent and advertised for sale at public auction, and unless payment is made before, will be sold on Monday, the 14th day of July, 1873, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

W. M. HELMAN, Secretary.

Office, Room 11, 401 California Street, San Francisco. m16

Eagle Quicksilver Mining Company--Principal place of business, San Francisco, Cal. Location of works, Santa Barbara County, California.

Notice--There are delinquent upon the following described stock, on account of assessment levied on the 18th day of January, 1873, the several amounts set opposite the names of the respective shareholders, as follows:

Name.	No. Certificate.	No. Shares.	Amount.
Miner, G. B.....	Unissued	8	\$150 00
Roberts, M. S.....	Unissued	8	150 00
Pauline, Sarah D N.....	Unissued	1/2	25 00
Allyn, John.....	Unissued	1/2	12 50
Allyn, John.....	Unissued	1/2	12 50

And in accordance with law, and the articles of agreement of said Company, and an order of the Board of Directors thereof made on the 18th day of January, 1873, the whole or each undivided part of each delinquent share in said mine as may be necessary to pay said assessment upon each, will be sold to the highest bidder, at public auction, for cash, in United States gold coin, at the office of the Company, Room 5 and 6, No. 302 Montgomery street, San Francisco, Cal., on Monday, the 26th day of May, 1873, at the hour of 2 o'clock P. M. of said day, to pay each delinquent assessment thereon, together with costs of advertising and expenses of sale.

WM. H. WATSON, Secretary.

Office, Room 5 and 6, No. 302 Montgomery street, San Francisco, Cal.

San Francisco, May 22, 1873.

Equitable Tunnel and Mining Company.

Location of works, Little Ootomwood District, Utah Territory.

Notice is hereby given that at a meeting of the Board of Directors, held on the 5th day of May, 1873, an assessment (No. 2) of ten cents per share was levied upon the capital stock of the Corporation, payable immediately in United States gold and silver coin, to the Secretary, at the office of the Company, No. 35 New Merchants' Exchange, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the 15th day of June, 1873, will be delinquent and advertised for sale at public auction, and unless payment is made before, will be sold on the thirtieth day of June, 1873, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Directors.

CHARLES S. HEALY, Secretary.

Office, No. 35 New Merchants' Exchange, San Francisco, Cal. m16

Fear Stone Company of California--Location of principal place of business and works, City and County of San Francisco, California.

Notice--There are delinquent upon the following described stock, on account of assessment (No. 5) levied on the 1st day of April, 1873, the several amounts set opposite the names of the respective shareholders as follows:

Name.	No. Certificate.	No. Shares.	Amt.

Wegner, R. Trustee.....	81	80	160 00

And in accordance with law, and an order of the Board of Directors, made on the 1st day of April, 1873, so many shares of each parcel of said stock as may be necessary, will be sold at public auction at the office of the Company, No. 414 California Street, San Francisco, California, on Monday, the 26th day of May, 1873, at the hour of 1 o'clock P. M., of such day, to pay delinquent assessments thereon, together with costs of advertising and expenses of sale.

R. WEGENER, Secretary.

Office, No. 414 California Street, San Francisco, Cal. m10

Hasloe Mill and Mining Company--Location of works, Gentry's Gulch, Mariposa County, Cal. Principal place of business, San Francisco, Cal.

Notice is hereby given that at a meeting of the Board of Directors, held on the 14th day of May, 1873, an assessment (No. 1) of fifty (50) cents per share was levied upon the capital stock of the Corporation, payable immediately, in U. S. Gold and Silver coin, to the Secretary, at the office of the Company, Room 11, No. 403 California Street, San Francisco, Cal. Any stock upon which this assessment shall remain unpaid on the 15th day of June, 1873, will be delinquent and advertised for sale at public auction, and unless payment is made before, will be sold on the 21st day of July, 1873, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

Office, Room 11, No. 403 California Street, San Francisco, Cal. m11

Heckerdorn G. and S. M. Co.--Stock-HOLDERS' MEETING.

The Annual Meeting of the stockholders of the Heckerdorn G. and S. M. Co., for the election of Trustees and the transaction of such business as may be presented, will be held on Friday, May 24th, 1873, at 2 o'clock P. M., at the office of the Company, No. 510 Jackson Street, San Francisco, California.

LOUIS TERME, Secretary.

May 17th, 1873.

Hardy Coal Mining Company--Location of principal place of business, San Francisco, Cal.

Notice--There are delinquent upon the following described stock, on account of assessment levied on the 26th day of March, 1873, the several amounts set opposite the names of the respective shareholders as follows:

Name.	No. Certificate.	No. Shares.	Amount.

And in accordance with law, and an order of the Board of Directors, made on the 26th day of March, 1873, so many shares of each parcel of said stock as may be necessary, will be sold at public auction at the Company's office, Room 5, No. 338 Montgomery street, San Francisco, Cal., on the 24th day of May, 1873, at the hour of 12 o'clock M., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

JACOB HARDY, Secretary pro tem.

Office, Room 5, No. 338 Montgomery street, San Francisco, Cal. m3

Ida and Rhoda Lewis Consolidated Mining Company--ANNUAL MEETING.

The annual meeting of stockholders of the Ida and Rhoda Lewis Consolidated Mining Company, for the election of Directors and transaction of such business as may be presented, will be held on Tuesday, June 18th, at 1 o'clock P. M., at the office of the Company, No. 10 Webb Street, San Francisco, California.

J. DE STA MARINA, President.

A. O. MORSE, Secretary.

San Francisco, May 19, 1873. m19-1d

Kincaid Flat Mining Company--Principal place of business, San Francisco, Cal. Location of works, Bolinas Mining District, El Dorado County, California.

Notice is hereby given that at a meeting of the Board of Directors, held on the 6th day of May, 1873, an assessment (No. 1) of ten cents per share was levied upon the capital stock of the Corporation, payable immediately, in United States gold and silver coin, to the Secretary, at his office, No. 217 Sansome Street (up stairs), San Francisco, Cal. Any stock upon which this assessment shall remain unpaid on the 15th day of June, 1873, will be delinquent and advertised for sale at public auction, and unless payment is made before, will be sold on Wednesday, the 2d day of July, 1873, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

R. H. CORNELL, Secretary.

Office, 217 Sansome Street (up stairs) San Francisco, Cal. m7

Mansfield Gold Mining Company--Principal place of business, San Francisco, California. Location of works, Kelsey Mining District, El Dorado County, California.

Notice is hereby given that at a meeting of the Board of Directors, held on the 8th day of May, 1873, an assessment of five cents per share was levied upon the capital stock of the Corporation, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the Company, No. 331 Kearny Street, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the 15th day of June, 1873, will be delinquent and advertised for sale at public auction, and unless payment is made before, will be sold on Tuesday, the 1st day of July, 1873, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

WM. SMALL, Secretary.

Office, No. 331 Kearny Street, San Francisco, Cal. m15

Office Newton Booth Consolidated Mining Company--NOTICE TO STOCKHOLDERS.

Some irregularities having occurred in the levying, advertising and collecting the assessment levied on the 10th day of February, 1873, on account of the 25 cents per share on the capital stock of the Newton Booth Consolidated Mining Company, notice is hereby given, that at a meeting of the Board of Directors of said Company, held on the 10th day of February, 1873, said assessment levied on the said 10th day of February, 1873, has been rescinded, and another assessment of 50 cents per share has been levied in lieu thereof. Any one having paid the assessment levied February 10th, 1873, is all credited for the amount paid on account of the assessment levied this day.

LOUIS FRANKONI, Secretary.

San Francisco, May 17th, 1873.

Newton Booth Consolidated Mining Company--Location of principal place of business, San Francisco, California. Location of works, Ely District, Lincoln County, Nevada.

Notice is hereby given that at a meeting of the Directors, held on the 7th day of May, 1873, an assessment of fifty cents per share was levied upon the capital stock of the Corporation, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the Company, No. 314 California Street, San Francisco, Cal. Any stock upon which this assessment shall remain unpaid on the 14th day of June, 1873, will be delinquent and advertised for sale at public auction, and unless payment is made before, will be sold on the 12th day of July, 1873, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

Office, No. 314 California Street, San Francisco, California. m10

Office of the Providence G. and S. Mining Company--Location of Works, Nevada County, California. Principal place of business, San Francisco, California.

The annual meeting of stockholders of the Providence G. and S. Mining Company, for the election of Directors and transaction of such business as may be presented, will be held on Friday, the 26th day of June, 1873, at 3 o'clock P. M., at the office of the Company, Room 37, New Merchants' Exchange, San Francisco, California.

F. T. FOLSOM, President.

J. M. BUFFINGTON, Secretary. m12-1d

Rising Star Mining Company--Location of principal place of business, San Francisco, California.

Notice is hereby given that at a meeting of the Board of Directors, held on the 25th day of April, 1873, an assessment (No. 4) of six cents per share was levied upon the capital stock of the Corporation, payable immediately, in United States gold and silver coin, to the Secretary, Room 31, New Merchants' Exchange, California Street, San Francisco, Cal. Any stock upon which this assessment shall remain unpaid on the 20th day of May, 1873, will be delinquent and advertised for sale at public auction, and unless payment is made before, will be sold on the 1st day of June, 1873, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Directors.

M. BUFFINGTON, Secretary.

Office, 31 New Merchants' Exchange, California Street, San Francisco, California. m3

Schell Creek Mining Company--Location of principal place of business, No. 304 California Street, San Francisco, State of California. Location of Works, Schell Creek Mining District, White Pine County, State of Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 10th day of April, 1873, an assessment of ten cents per share was levied upon the capital stock of the Corporation, payable immediately, in United States gold coin, to the Secretary, at the office of the Company, No. 304 California Street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 14th day of May, 1873, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Monday, the 24th day of June, 1873, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

P. W. VAN WINKLE, Secretary.

Office, No. 304 California Street, San Francisco, Cal. m15

POSTPONEMENT.--The day for demanding shares delinquent on the above assessment is hereby postponed until Saturday, the 24th day of May, 1873, and the sale thereof until Monday, the 16th day of June, 1873. By order of the Board of Directors.

P. W. VAN WINKLE, Secretary.

The Sanderson Gold Mining Company--Location of works, Railroad Flat, Calaveras County, California.

Notice is hereby given, that at a meeting of the Board of Directors of said Company, held on the 5th day of May, 1873, an assessment (No. 4) of 12 1/2 cent per share was levied upon the capital stock of the Corporation, payable immediately, in United States gold and silver coin, to the Secretary of said Company. Any stock upon which said assessment shall remain unpaid on the 24th day of June, 1873, will be delinquent and advertised for sale at public auction, and unless payment is made before, will be sold on Thursday, the 19th day of June, 1873, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

WILLIAM STUART, Secretary.

Office, 113 Leidesdorff Street, San Francisco. m10

Sierra Iron Company--Location of Works, Sierra and Plumas Counties. Principal place of business, San Francisco, California.

BROWN'S PATENT LAMP.

One of these Lamps, when placed at a distance of 200 feet from the bank, will light up a bank surface 250 feet in length and 150 feet high, and to a much better advantage than any other light heretofore tried, and at an expense not to exceed five cents per hour. Lamps furnished at short notice.

Letter of Recommendation.

Mn. O. B. Brown—Sir: Your Patent Lamp for lighting hydraulic mines, which you sold to me in December last, has given entire satisfaction, and far exceeds my expectations, and I think it the best and cheapest light ever used to light mining claims by night, and am satisfied that I have saved three hundred dollars by the use of it in the last mining season over pitch or any other light of the same brilliancy; and I will also say that if I could not get another lamp, five hundred dollars would not buy it. Yours,

W. D. APLIN.

Little York, Nov. 5, 1872.

For further particulars, address,

THE PRALL CONDENSING STEAM PUMP.

The Cheapest, Most Reliable. Most Durable and Most Economical Pump in Use.

This remarkable Pump, though having been used extensively in the Western States for the past year, is now for the first time offered to the trade of the Pacific Coast.

It is adapted to the raising of water or other liquids, under all possible conditions where steam can be obtained, operating absolutely without machinery with more economy and less liability to derangement than any Pump in use. As a MINING PUMP its advantages are most obvious.

The steam is condensed instead of being exhausted into the shaft or tunnel. It is not affected by mud, sand or grit, having no working parts to wear or cut out.

It is economical of steam, because all friction is avoided, and the steam is made to do double duty, that of direct pressure and then by condensation, utilizing the atmospheric pressure to lift the water to the Pump.

It requires no lubrication nor any attention whatever.

For IRRIGATION and raising water for stock purposes, the Prall Pump is vastly superior to anything ever before invented.

It requires less steam to elevate water from 20 to 30 feet than would be necessary to move any other style of Pump doing no work.

It is so simple that any one of ordinary intelligence, however unaccustomed to machinery, can operate it.

They are constructed of seven different sizes, with capacities ranging from two to fifty thousand gallons per hour.

Boilers furnished with the Pumps when desired.

Air Compressors.

The Burleigh Rock Drills, which have stood the test of five years' constant use at the Hoosac Tunnel, and which are now in use in nearly every State in the Union, as well as in Europe and South America, are unequalled in efficiency and economy by any other Drilling Machine. They are of various sizes, and equally well adapted to Tunneling, Shafting, Open Cut or Quarrying, and will drill six to ten inches per minute in granite. They are driven by steam above ground. The Burleigh Air Compressor is the best engine yet devised for furnishing the "air motor" for the many purposes to which it is now being used.

They are to be used on the St. Gotthard Tunnel, Switzerland; Tunnel 13 miles long. We refer to the following gentlemen and works:

Gen. Newton, U. S. A. Hell Gate Tunnel, L. I.
Mess. Shanley Hoosac Tunnel, Mass.
J. Dutton Steele Nesquehoning Tunnel, Pa.
Sidney Dillon Fourth Avenue Work, N. Y.
Col. Roehling East River Bridge Company, N. Y.

The Mining and Scientific Press Marching Onward!

Our careful system of compiling, judiciously condensing, and conveniently arranging into regular departments, has been heartily endorsed. It renders the paper worth more to readers, who can find handily that which interests them most.

The weekly issues of the Press will contain reliable

Information for Practical Miners,

Treating on the Opening of Mines; Mining of Ores; Milling of Ores; Smelting of Ores; Separation and Roasting of Ores; Amalgamation; Saving of Gold and all precious Metals; New Processes of Metallurgy; New Discoveries of Mines; Mining Engineering and Hydraulics.

For Inventors, Mechanics and Manufacturers.

All new and important developments in Scientific and Mechanical Progress; Patents and Inventions of the Pacific States; Progress of Home Industries; Hints for Local Manufacturers; Illustrations of New Machinery; Reports of Popular Scientific and Industrial Lectures.

Our Mining Summary

Gives the progress of mining work from week to week in the various counties and districts throughout the principal mining regions of the United States, arranged in alphabetical order. It is the most extensive record of mining operations published in the world. It affords the intelligent miner a rare opportunity to know and profit by the work and experience of his neighbors. Miners have few sources of practical information in their calling, and should embrace every reliable means for improvement. Mining Operators and Shareholders, at home and abroad, weekly examine our Summary with increased interest and profit.

Our "Domestic Economy"

Embraces new and important facts which should be known in every cabin and household. Short and interesting—the articles under this heading are freely read and practiced with profit and improvement to the readers.

The Press is not strictly a "paper for professional, scientific men," but rather a

Liberal and Popular Scientific Journal,

Well calculated to make practically scientific men from our intelligent masses. This is our stronghold for accomplishing good. Plain, correct and pleasing language, easily comprehended by all, confined mostly to short articles, is our endeavor.

For Self-Improvement,

Every issue of the Press abounds with articles of an elevating character, to stimulate the higher virtues and nature and progressive intellects of both man and woman.

Hundreds of Dollars

Are oftentimes saved to the readers of this paper by a single hint or article of information in its columns. Such instances have been repeatedly reported to the editors and proprietors during their long connection with the Press. Our paper presents

The New and Novel Developments

In the progress of this comparatively new section of the Union (but recently settled and now rapidly increasing with a population of the most intelligent and venturesome people, attracted from nearly every quarter and climes on the globe), enable us, with due enterprise, to display vigor and freshness in our columns not met with in similar journals elsewhere. The same circumstances also render such a paper more especially valuable to its readers in a new, and to a certain measure, untrodden field, where the best methods and processes of industry are not so well established as traditionally known in older communities. Published experiences often save costly experiments and disastrous results.

A Great Variety of Industrial Information,

In brief and fresh form, suited to the wants and tastes of the readers of this coast, which is not obtainable otherwise so timely, or in so cheap and convenient form. As an industrial publication, meeting the wants of so many kindred industries, this journal stands pre-eminent and without a precedent.

Subscriptions payable in advance—\$4 per annum. Single copies, post paid, 10 cents. Address

Published or issued, wholesale and retail, by DEWEY & CO., MINING AND SCIENTIFIC PRESS Office, S. F.

BY GUIDO KUSTEL,

MINING ENGINEER AND METALLURGIST.

Roasting of Gold and Silver Ores, and the Extraction of their Respective Metals without Quick-silver, 1870.

This rare book on the treatment of gold and silver ores without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and explains the why and wherefore.

It contains 142 pages, embracing illustrations of furnaces, implements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his speciality. Price \$2.50 coin, or \$3 currency, postage free.

Concentration of Ores (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arseniurets, and Gold and Silver Ores generally, with 120 Lithographic Diagrams, 1867.

This work is unequalled by any other published, embracing the subjects treated. Its authority is highly esteemed and regarded by its readers; containing, as it does, much essential information to the Miner, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print. It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. It contains 120 diagrams illustrating machinery, etc., which alone are of the greatest value. PRICE REDUCED TO \$5.

Nevada and California Processes of Silver and Gold Extraction, for general use, and especially for the Mining Public of California and Nevada, with full explanations and directions for all metallurgical operations connected with silver and gold from a preliminary examination of the ore to the final casting of the ingot. Also, a description of the general metallurgy of silver ores, 1864.

As its title indicates, this work gives a wide range of information, applicable to all vein miners and workers in precious metals, affording hints and assistance of exceeding value to both the moderately informed and the most expert operator. Price, \$5 in cloth; \$6 in leather—coin.

BY OTHER AUTHORS.

The Quartz Operator's Hand-Book; by P. M. Randall, 1871. Revised and Enlarged Edition. Cloth bound, 175 pages. Price, \$2.

Sulphurets: What They Are, How Concentrated, How Assayed, and How Worked; with Chapter on the Blow-Pipe Assay of Minerals; by Wm. M. Barstow, M. D.; 1867; cloth bound, 114 pages. Printed and sold by DEWEY & CO. Price, \$1; postage free. The best written work, and most complete work on the subject treated.

ANY OTHER BOOKS DESIRED will be furnished at the most reasonable rates by DEWEY & CO., Mining and Scientific Press Office, S. F.

HALLIDIE'S

Patent Endless Wire Ropeway.

Covered by Numerous U. S. Patents.

IMPORTANT TO

Mining Companies, Civil Engineers, Contractors, Etc.

The system of transporting material, such as Ores, from the mine to the mill, Earthen embankments, Rock from quarries, etc., by means of steel wire rope, has been well tested and found more economical, advantageous and reliable than any other method of transportation; and to the annexed certificates in connection therewith I beg to call the attention of those interested:

BUREKA, Nevada, July 10, 1872.

T. M. MARTIN My dear sir: On your leaving for San Francisco, it gives me great pleasure to hand you my written acceptance of the HALLIDIE TRAMWAY put up by you upon our mine in Freiberg.

It is a perfect success, discharging ten tons of ore per hour with two men's labor. It is perfectly simple in construction, and, as far as I can judge, there is nothing about it to ever get out of order—nothing to wear out. While ours requires but about two thousand five hundred feet of wire rope, I can see no reason why this line could not be extended almost indefinitely with equally happy results. Again, the carrying capacity might be doubled or quadrupled if desired. After several weeks trial upon our mine, the unanimous verdict of all who have seen it is a complete, unquestioned success. If this can be of any service to you, use it in any way you think proper. Very respectfully, O. C. GOODWIN.

EMMA HILL CONSOLIDATED MINING CO.,

Little Cottonwood, Utah.

Superintendent of Office, Sept. 25, 1872.

T. M. MARTIN, Esq., Sir: The Ropeway constructed by you (HALLIDIE'S PATENT) for the Emma Hill Consolidated Mining Company, has been built in a most substantial and workmanlike manner, and at this time in the best working condition. I most cheerfully accept the work for the Company, and recommend it to others wishing a sure and speedy transit for ores over places impracticable for wagon roads, etc. Respectfully,

L. W. COLBATH, Superintendent.

"The Vallejo works smoothly with the elevated wire tramway, which carries its load of ore as quietly and easily as if there was no winter or snow in the world."

"Whatever the objections to wire tramways may be on account of their cost, I have seen nothing yet that even approaches them in the facilities they afford for moving ore at all seasons of the year."—Correspondent Utah Mining Journal, Alta, Jan. 8, 1873.

The Vallejo Ropeway.

The Vallejo Tunnel Company's Tramway in Little Cottonwood, built on the HALLIDIE PATENT PLAN, is a complete success. It is between 2,300 and 2,400 feet in length, and is supported by thirteen stations. The fall in this distance is about 60 feet, and the wire rope, which is one-fourth of an inch in diameter, will surely and easily deliver one hundred tons in six hours. The machinery is automatic, loading and unloading the sacks or buckets. About one ton and a half can be sent down at one time. The stations are about two hundred feet apart, and the entire apparatus is strong and safe. As the wire rope is elevated about forty feet above the surface of the hill, the Tramway can be worked all winter long, without the slightest trouble.—Utah Mining Journal, Salt Lake, Sept. 22, 1872.

Mining Companies and others desiring to negotiate for the erection of this system of Ropeway, can communicate with me personally, or through Postoffice Box 944.

A. S. HALLIDIE, Patentes,

112 and 114 California Street, SAN FRANCISCO.

WIRE ROPE

For hoisting from mines, transmitting power, ship rigging, etc., of all kinds and sizes, on hand and made to order.

Coleman's Sulphuret Saver.

The accompanying illustration represents a sulphuret saver, the invention of Charles C. Coleman, who obtained his patent some time since through the agency connected with this office. The apparatus is used for saving sulphurets and separating them from the light sand and debris which escapes from the molds, or it can be used for saving the fine gold from sluices in ordinary placer or hydraulic mining. It consists of a large hollow revolving vessel, which may be cylindrical in shape as the cut shows, or may be made slightly tapering so as to be somewhat smaller at one end than the other. This cylinder lies on its side revolving on a horizontal axis, and has its interior made in the form of a screw, the threads of which are of considerable depth. The sand and water are carried into the cylinder and deposited near its lower end. Another pipe extends entirely through the cylinder, and is perforated so as to discharge clear water against the side of the cylinder, and this washes the sulphurets clear, and also keeps them at the bottom of the same, so that, as the machine turns they advance along the bottom until they reach the upper end of the cylinder, where they are discharged clean, while the lighter debris is washed out at the lower end.

The supporting standards shown are placed on a frame. The cylinder is supported in the standards as shown, so that it turns on rollers, doing away with the use of an axis, leaving the interior entirely unobstructed. Friction rollers are employed, so as to allow the cylinder to revolve with ease. This cylinder may be made of wood or iron, but in either case the interior is formed into screw threads of considerable depth. The hopper conducts the tailings into the lower end of the cylinder, where they fall between some of the threads of the screw. The cylinder is kept slowly revolving in such a direction that the sulphurets and particles of gold remaining at the bottom and between the threads of the screw, will advance toward the upper end of the machine, and are finally delivered at that point, falling into any receptacle placed for them. In order to prevent the sulphurets from clinging to the cylinder and being carried up the side, a pipe passes through the machine which has several outlets, through which jets of water are constantly thrown against the side between the threads. This washes everything down and keeps it at the bottom between the threads, while it at the same time carries off the lighter particles, to be discharged at the lower end.

The cylinder may be driven by a chain or belt from a pulley, or by any of the ordinary appliances used in such cases. And the whole machine forms an economical and cheaply constructed device for the purpose described. Mr. Coleman is taking steps to introduce the machine extensively among the quartz mills throughout the Coast, and will manufacture them at a figure placing them within the reach of all. He may be addressed care of Dewey & Co., 338 Montgomery Street, San Francisco, Cal.

PATENT SUIT.—R. R. and Joseph Craig have commenced suit against W. H. Raymond *et al* to enjoin them from using a patent nozzle for hydraulic mining purposes, and for damages for having used it. The nozzle in question is well known.

SUTRO TUNNEL.—It is proposed to increase the capital stock of the Sutro Tunnel Co. to \$20,000,000 in 2,000,000 shares of \$10 each and the special meeting called for June 23d is for the purpose of taking the matter into consideration.

EUREKA VS. RICHMOND CON.—This mining suit is now going on at Eureka and is attracting considerable interest. During the examination of Mr. Stodfeldt, he was questioned at some length concerning the difference between a deposit and a fissure vein. He gave it as his theory of the mineral formations in Mineral Hill, that mineral springs containing dissolving agents had percolated the limestone, and, during the course of ages had carried away the rock and formed caves; that the character of the thermal springs, changing in the course of time, metalliferous deposits were deposited in these caves.

W. T. Davidson also testified that he never saw a vein in a limestone country, and he does not think there is a ledge in the district. His knowledge of mining was procured from experience entirely, and not from the study or theory of any author. Thomas Cohn also testified that in his opinion the ore in Ruby Hill was in deposits. B. S. Buckmunster, according to the *Sentinel*, swore as follows: I have been in

the superintendency of mines and have been mining manually more or less for the past ten years; through some of the mines at Virginia City, Gold Hill and in Utah; have been through the mines of the Eureka Consolidated and Richmond Companies in Ruby Hill, and saw no evidence of vein formation at all; in fact, I saw less indication of such a form in these mines than in any I ever visited. I saw no evidence of fissuring in Ruby Hill whatever.

TRINITY COUNTY has had an excession of population in a number of miners from Yuba, Nevada, and Placer counties, who express the opinion that the basin of the Trinity will contain some of the most profitable deep gravel mines in the State, when water is brought in.

THE Gold Hill tailings mill, now being built, has on hand some 60,000 or 70,000 tons of tailings ready to begin upon. The large park pan will work 30 tons per day.

THE INAHO (Grass Valley) mine has made a partial clean up, not touching the batteries of \$25,000 from 6 days run with 35 stamps.

FUEL AT VIRGINIA.—Nut pine wood retails at Virginia and Gold Hill for \$16 per cord and coal sells at \$20 per ton.

THE EVERLASTINO mine, according to the *Calaveras Citizen* is having new machinery put upon it, capable of hoisting 1,500 feet.

Raising and Moving Brick and Stone Buildings.

We presume that very few of the thousands of persons who daily stop to examine the work now in progress for raising the brick building on California street, in this city, formerly occupied by Mooney's bank, are aware of the fact that the apparatus by which this work is done is a California invention; yet such is the fact, and a most valuable one. It was invented and patented in 1853, by Messrs. Steen and Torquet, and built at the Vulcan Foundry. In December of the same year it was employed, for the first time, in raising the brick building on the northwest corner of Montgomery and Commercial streets, then known as King's Banking House.

Since that time it has been employed in raising over 500 buildings of various dimensions, in this city—more than two-thirds of which were brick or stone. The largest block of buildings ever raised by it was that on Montgomery

in the final elevation of the most distant portion of the most extensive range of buildings to which the apparatus has been applied. There is not only a perfect uniformity of motion, but an entire absence of friction, so that there can be no jar as is always the case with the screw process.

The principle on which the machinery is worked is that of hydraulic pressure. The rams are placed in connection with the presses, which stand at intervals of twelve feet, beneath the walls of the building to be raised, all being connected by a continuous copper pipe of great strength, through which the water is forced into the presses, which is again connected with a battery pump, worked by gearing in such a manner that the labor of four men will produce a power equal to ninety-five tons to each press. The number of presses may be indefinitely increased, the same labor sufficing for them, and serving to elevate the most extended range of buildings, the only difference being in the rate of speed at which the block is raised. Any slowness in this respect may be readily obviated by increasing the number of pumps, and with them, of course, the amount of labor.

It will be readily understood that the pressure of the water in the various presses raises the rams, and with them, gradually and simultaneously, the entire building. Nothing can be more uniform or steady in its action than the gradual raising of water to its proper level, and hence it is impossible that any power can be brought to bear upon the elevation of foreign bodies, which shall raise them with less friction or eccentric motion than this.

This invention, which is now the property of the Messrs. Stratton Brothers, is purely the result of California ingenuity, and was never taken out of this city until it had been employed on something like 100 buildings. The original machinery, we believe, was shipped to Chicago, at which city it was first introduced outside of San Francisco.

COMSTOCK YIELD.—Wells, Fargo & Co's agent at Virginia, tells the *Enterprise* that the shipment of gold and silver hulsion from the Comstock mines to this city, New York and elsewhere, through the Virginia agency alone, amounts to the sum of \$2,500,000. Where are the croakers who say there is no money in mining operations.

THE BELOHER mine with its big dividends has a chance to increase them still more. Recently some exceedingly rich ore has been struck on the 1300 ft. level, well to the south of the mine. The ore is extremely rich in silver and free gold. Surely the Comstock beats any other in ever found or likely to be found.

BORAX has been found in Oregon, 37 miles south of Crescent city. The borate of lime is said to be found in huge boulders, weighing from two to three hundred pounds each, imbedded in the clay and gravel formation from the surface of the ground to the talcose slate bed-rock.

WEST MOUNTAIN DISTRICT.—Utah is the locality of a late strike of an immense body of copper ore. It is in the Confidenoc mine, from which three men have taken 50 tons of ore in three weeks, which runs from 14 to 56 per cent. copper.

NEW HOISTING MACHINERY for the Raymond & Ely mine has been shipped from this city. Owing to the great depth of the late strike in the mine now works are necessary before ore can be hoisted from it.

GALVESTON, TEXAS, is making a fuss over the fact of sending to England direct some \$75,000 in Mexican silver, which was received from Chihuahua via San Antonio and Austin.

CLARKVILLE MINERS, in Oregon, anticipate a good season and a large amount of gold dirt has been shipped. Times are reported as being lively.

street, known as the Braunan Buildings—125 by 175 feet in dimensions, and two stories high. These buildings were raised so as to admit of putting another story underneath. The loftiest building ever raised was the American Exchange, which was five stories high, and 60 by 80 feet on the ground. During the time it was being raised over 300 persons were constantly lodged in the hotel.

The greatest elevation to which any building has been raised will be reached by the one upon which they are now at work, which will be raised 26 feet, admitting of one full story and a half story basement. Several buildings have also been moved short distances from their original foundations—one, the Prescott House, corner of Pacific and Kearny streets, 65 by 75 feet on the ground, was moved back, 32 feet. Some 20 or 25 buildings have been raised to a sufficient height to admit a full story underneath; but most of the buildings, to which the invention has been applied, have been raised to conform to the changed grades of the street, etc.

Among all the buildings that have been raised not one has sustained even the slightest injury. This is attributable, in addition to the care exercised, to the perfect regularity of the movement,—so uniform that the most accurate regulator could not show a second's difference

Mining in Central Nevada.

A correspondent of the *Bulletin*, writes from Mill City, Humboldt county, as follows: The country adjacent to this place comprises nearly all the active and productive mining districts in Humboldt county. From what I have been able to learn during a late visit to many of the leading camps I should judge that this pursuit, without the excitement and mistakes that formerly attended it, is now fairly prosperous throughout this region of country. It is everywhere noticeable how different this business is being conducted at present from what it was during its earlier stages. The miners, after the subsidence of the speculative mania, being left to their own resources went to work and have since accomplished far more than when money was furnished them in the most lavish manner. It is true few mills are now being erected or towns built up, while population counts less than half of what it did ten years ago. But this reduced number are scattered through the mountains and all at work, not crowding into the town idling away their time or running over the country locating worthless claims, as was the case then. With the collapse that came about eight years since these non-producers were compelled to abandon the country and the towns prematurely forced into existence, soon after hastened to ruin. Then followed a few years of general inaction, after which the miners, finding they could no longer get money to help develop their claims, set to work and began opening them up in a small way themselves.

Industry and Economy Better than Capital.

Persisting in these efforts the miners soon found themselves working into an easy and even independent position, their lodes well prospected and sometimes quite thoroughly opened without the sacrifice of the major part to secure pecuniary aid. Being forced to help themselves the men have become good practical miners and placed the business on a permanent and self-sustaining basis. If never another dollar should come from outside, this industry would go on and flourish in the Humboldt region. Through the schooling they have had, the most of these men know how to open their claims properly, are good judges of ores and understand the best methods for reducing them.

What is Done With the Ores.

The larger companies have their own mills or furnaces and, of course, reduce the most of their ore at or near their mines, only those of an extremely high grade being shipped elsewhere for sale or reduction. Among the miners of limited means the richer portion of the ore being selected, some send them to Reno or other mill in the neighborhood to be worked on owner's account, or sell them outright to the millmen, the smelting ore going to the furnaces, of which there are a number in this part of the State. In some cases they are shipped to San Francisco to be sold to the Selby Smelting Works or to the agents of English or Eastern buyers, or perhaps sent directly to Swansea for sale on commission, an advance having first been obtained. Occasionally a company of miners will have found having a small mill or furnace of their own with which to reduce their ore on the ground, or a set of arrastres for crushing the gold-bearing rock. As it is only the high grade material that will pay for being disposed of by the above methods, considerable quantities of low and medium quality ores have accumulated at some of the mines, there to await more mill or cheapened transportation and reduction. The most of the ore here is of a refractory character, carrying lead, antimony and sometimes iron, copper and other base ingredients. Much of it therefore requires to be smelted or to be thoroughly roasted if managed by amalgamation. That from the Arizona, Rye Patch and other leading mines is sufficiently free however to be reduced by the Washoe pan process. A number of smelting works, some of them on an extensive scale, have been erected in this vicinity, but nearly all failed of success at first owing to the inexperience or mismanagement of those undertaking to run them. Generally the crude furnaces put up and operated by the miners themselves have done better than the largest establishments, though the latter, under improved management, are, for the most part, doing better now than at the start. Of the ore extracted the large companies, who take out a good deal, about one ton in thirty is shipped away, the proportion with the small companies being at the rate of one ton in four or five. In value this shipping ore ranges from \$150 to \$500 per ton, and will average perhaps \$250. Under this economical mode of proceeding the miners of Humboldt are gradually getting their claims into good working shape, while the most of them are at the same time making fair wages, and the practice of running into debt abroad or raising money by the sale of their ground, once so common, is now generally avoided. For the past year or two the aggregate wealth as well as the population of the country has been slightly on the increase.

In the Battle Mountain District,

Lying on the eastern border of the county, the prevailing ore is an argentiferous galena, much of it rich in both lead and silver. There are also many free ore-bearing lodes and a number of rich cupriferous veins in the district, the latter carrying carbonate, oxides and native metal. Two or three English companies own and have been operating there for several years

past, smelting and shipping the ores. Baffled by the many obstacles incident to the country, they have heretofore met with but a moderate success, though their condition has been steadily improving and their prospects are now considerably excellent. There are a number of mills and furnaces at Battle Mountain, some of which have remained unemployed most of the time since they were erected; but the entire number are likely to be run with profit this coming summer.

Other Districts in the Humboldt Country.

Lying adjacent and on either side of the Humboldt river is a tier of mining districts, all of which abound with gold and silver-bearing lodes. Some of these have been thoroughly prospected and a few quite extensively worked, the exploration made proving a large percentage of them to contain valuable deposits of the precious metals. On the north side of the river we have the Central and the Winnemucca Districts, each containing two or three well-opened and promising claims, while on the south side lie the God Run, the Oro Fino and the Sierra, the last two lately consolidated, and further west the Santa Clara, Star and Buena Vista Districts stretching south in the order named along the easterly slope of the Humboldt range. In the Star District are the Sbeha and the Da Sota mines, worked in a limited way with a view to prospecting the lodes and the extraction of the more accessible ore, the best of which is sent to market, the bulk being retained for future concentration or reduction. Near these mines is a deposit of gray antimony that has been worked for the past two years, the ore being sent in small quantities to San Francisco.

A few miles further south is located the Arizona mine, which for the past three years has been turning out bullion at the rate of over half a million per annum. The ore from this mine and that of the Silver Company, consolidated three years ago to avoid further litigation, employ three mills carrying ten stamps each, and crushing an aggregate of thirty-five tons per day. The ore is worked in pans, and without roasting, the use of the Aiken furnace, erected here some time since, having been discontinued. This ore yields at the rate of about \$35 per ton besides the sulphurets, and the mine is yielding large and steadily increasing profits. Lying in the same neighborhood are the North Star, Iuskip, Potosi, Crystal, and Eclipse lodes, all more or less developed, and the most of them now being worked with good results. These mines are all in the Buena Vista District, to the south of which, in the same chain of mountains, are situated the Sacramento, Relief, and several other districts, in which a good deal of money has been spent without any satisfactory returns. At present but little is being done in that section of country. Lying on the westerly slope of this range is the Echo District, one of the earliest organized in this region, and the locality of

The Rye Patch Mine,

Attracting more attention just now than any other in the Humboldt country, or perhaps, in Western Nevada, outside of the Comstock group. The property is a promising, and, in fact, a valuable one, whether developments made warrant the late advances in the price of its stock, being another question. As a paying investment it would seem preferable to anything on the Comstock, except Crown Point and Belcher, though less available, perhaps, for speculative purposes. This mine is situated near the base of the mountain, whence the plain slopes gradually west to the railroad, four miles distant. The lode, or rather ore belt runs N. E. and S. W., pitching to the N. W. at an angle of 45°. The foot-wall is porphyry and the hanging-wall calcareous slates. They are widely separated, standing over 100 feet apart. The space between them is filled with clay, porphyry, quartz, and ore; the latter being distributed in chutes or chimneys throughout the vein matter, and not, as smaller lodes, occurring in a continuous and unbroken stratum. The ore bodies stand near the hanging-wall and barely reach to the surface, undergoing in all cases rapid linear expansion below. The croppings are slight, and carry but little ore, but can be traced for a long distance. The mine has been opened by an inclined shaft sunk in the vein matter to the depth of 100 feet, the hoisting being done with a horse-wheel. A little below the surface a mass of ore was met with which proved to be 150 feet in length, and holds in depth as far as the shaft has been carried downwards. This was mostly a chloride ore and ran under the stamps from \$50 to \$60 to the ton. A drift carried with the lode from the bottom of the shaft, opened up another ore chute of still higher grade and of about 15 feet in thickness, neither the length nor depth of which has yet been ascertained. Another drift started near the northerly end of the stoping and pushed west, encountered, when in some twenty feet, another heavy stratum of ore, of the black sulphureted variety, and in a much higher grade than either of the others, milling from \$90 to \$115 per ton.

This bonanza has been cut into latterly for a distance of 12 ft. without wholly intersecting it, nor has its extent in any direction yet been determined. Minor bunches of ore have been struck at other points between the walls, though the three described, are the only important bodies yet met with. That others of still greater magnitude will be reached when the lode comes to be opened up in depth is probable, many affecting to believe that explorations will show this to be another Comstock. That the ore occurs here under conditions very similar to what they do in the great Washoe ore belt, there is no denying, and should these

bonanzas prove persistent in depth, or he followed by others in case they are cut off, the analogy would be sufficiently strong to raise great hopes for this mine.

At present two mills are engaged and preparations being made for running a third on the Rye Patch ores. One of these establishments, belonging to the present company, is located on the railroad, four miles from their mine. It is nearly new, having been erected on the site of the mill owned by the former proprietor, burnt up two years ago. It carries ten stamps, and has attached to it a Stetefeldt furnace, not now in use, the ores having lately become so pure that roasting is dispensed with. They are crushed dry, and worked up to 80 per cent. of the pulp assay, the bullion turned out being from 975 to 985 fine. At this mill are worked the second class ores, running about \$80 per ton, the higher grade being sent to Genaca's mill at Winnemucca, with whom a contract has been effected for reducing 200 tons per month. The ores reduced here are roasted in an Aiken furnace, and average something over \$100 per ton. The Oroana mill, near Rye Patch, will soon commence running on these ores, after which the product of bullion from this mine will exceed \$2,000 per day.

But sixteen men are employed here under ground, the ore being easy of extraction. A tunnel has been started, which will intersect the ledge at a considerable depth, securing drainage and further facilitating ore extraction.

Sage Brush for Fuel.

Sage brush fuel is used here for generating steam, it being found much cheaper than wood, though the Railroad Company deliver the latter at the rate of \$7.50 per cord. Sage brush is also used in the mills at the Arizona mine, there being enough of this material both here and in the vicinity of the Rye Patch to last for many years.

BENICIA CEMENT WORKS.—The Benicia Tribune is indebted to the courtesy of Mr. Gilmora of the Benicia Cementworks, for a sight of the interior of those huge smelting furnaces, etc., etc. We lack space to give our readers, at a distance, even a crude idea of this manufacturing establishment. Suffice it for the present, to say, that the site covers 10 acres of ground immediately on our bay. Vessels of large tonnage load at the wharf, at all stages of the tide. The mill is propelled by a 16-horsepower steam engine; six huge furnaces and two runs of stones, turn out 125 barrels of cement daily of 300 lbs. each, when running. Each ton of rock produces six barrels of cement. Six tons of coal and coke are required daily to run the works. The cement, when ready for shipment, is placed upon a railway leading from the mill to the warehouse and wharf. A huge warehouse 300 feet or more in length, is used for storing empty barrels, and another of nearly the same size is used for a shipping warehouse. When in full blast fully one hundred men are employed in the works and in the quarries. The reported sale of the works to a San Francisco Company for \$25,000, has not yet been consummated.

HOESAO TUNNEL—CURIOUS OBSERVATIONS.—The direction of the draft through the Hoesao tunnel and the central shaft has been changed by the warm weather. During cold weather the draft was through the tunnel and up the shaft. On April 29th, as the thermometer reached a temperature of 62°, the circulation decreased to nothing and reversed its course, passing down the shaft and out at the portal east. This change is taking place according to temperature every day. During the night the draft is upward through the shaft, and during the day, as the air becomes warm, the same process takes place as above mentioned. The results of a downward draft give interesting information. A light can be seen the entire length of the shaft, a depth of 1,030 feet. The timbering is visible one-half the distance down, giving a more frightful cast to the notorious place than ever before. The daylight always penetrates to the bottom of the shaft, a fact which has never before been recorded. The progress made at the central shaft, west heading, for the month of April, 1873, was 163 feet, the best work ever done on the tunnel.

THE OLD SPOONROCK MINES.—We are glad to hear say the *Virginia Enterprise*, that the old Spoonrock gravel digging at Spoonrock gravel diggings at Johnstown, on Gold Canyon, are panning out well. Two miners who have been prospecting about these famous mines for some weeks, last Monday sent to the Carson Mint 2½ pounds of gold as the result of their labors. Old Washoeites will remember that in these diggings in the early days the miners there used to take out handfuls of gold—with spoons. Spoons were the only tools required. Any man who went there with plenty of spoons and set to work was sure of a pile. It was from this fact that the diggings took their name "Spoon" and "oro," meaning literally spoon gold.

THE COST OF BUILDING STEAMERS.—According to a recent article in the *Philadelphia Ledger*, the cost of building steamers in this country of our own iron has lately been reduced from fifteen to twenty per cent., so that the additional expense of such vessels over British ones of the same capacity is only between ten and fifteen per cent. Cases are cited to show that this difference is more than made up by the superior strength of the vessels. There is no doubt that in the quality of their iron, our shipbuilders have an advantage over those of England; and in view of the disasters that have lately occurred, the extra price ought to be cheerfully paid to insure greater strength and safety.

The Calistoga Mines.

Gold, silver, quicksilver and coal are now mined near Calistoga. The *Tribune* of May 17th has the following: During the past week the work on the various mines in this vicinity has been vigorously prosecuted. The Yellow Jacket Company now have a tunnel in 55 feet, and a shaft 24 feet in depth. Some of the ore taken out is of marvelous richness, and the average quality of it is much above the first prospects. We have just heard of a rich and extensive coal discovery, which was made some two or three weeks ago, but which has been kept quiet until the present time, until the discoverer could take steps to secure a title to the land on which the mine is located. The discoverer is Nathan Smith, of Coho Valley, and the mine is situated about twenty-two miles from Calistoga, two miles from Siegler Springs, and five miles from Harbin Springs. It is in a cañon, with high mountains on each side, the coal being found in layers, or strata, a few feet apart, and running into the mountains on both sides of the cañon. The first vein opened was an inch thick on the surface, but soon increased to two feet in width. The coal is easily worked, being soft and much resembling Welch coal. Some of it has been tested in a forge and found to weld iron as well as any coal in the world, and after hurrying leaves little or no slag. A gentleman from San Francisco, who has been many years in the coal business, states that it is equal in quality to any foreign coal, and will bring as high a price in the market as the best. It is the only coal yet found in California which can be used in the forge. The extent of the deposits is not yet known. Mr. Smith has secured one hundred and sixty acres, according to the special Act of Congress in relation to coal lands, but the veins doubtless extend far beyond the limits of his claim. The Lower Lake road runs within two miles of the mine, and the means of transportation to Calistoga are comparatively easy. At the present time, without additional facilities, it is estimated that the coal can be hauled to Calistoga by freight team for eight dollars per ton. As the present price of a like quality of coal is twenty-two or twenty-five dollars per ton, by the cargo, this will leave a handsome margin. We consider this discovery more valuable than any gold or silver mine in California. The coal is easily worked, it being estimated that from four to six tons per day to the hand can be taken out, and when once out it is ready for the market—no machinery, no crushing, no smelting, or any other expensive or laborious process. We have several specimens of the coal, which may be seen at this office.

The Great Western quicksilver mine (formerly the Gem), which is located about fourteen miles from Calistoga, over St. Helena Mountain, has been worked with thirty hands for more than a year, and there is now sufficient ore on the ground to occupy six months or more in the working. The company are about erecting a furnace and the other necessary appliances for getting out the metal, the material for which, amounting to several hundred tons, is now passing through Calistoga. Buildings are being erected at the mine for officers and men, and, when the furnace and other machinery is ready for operation, which will be in about sixty days, the working force will be increased to 100 men. The mine is now in the hands of men of wealth, who are abundantly able to develop it to the fullest extent. The stock is not in the market. The numerous other mines in this vicinity are making good progress.

MINING IN THE VICINITY OF BOZEMAN.—Prospecting in the foot-hills around and contiguous to Bozeman has demonstrated the fact that we are now surrounded by the precious metal, and we have no doubt that the success of the miners engaged in developing the mines of Bridger cañon will induce others to thoroughly prospect the foot-hills, which have produced fine colors, and that it will lead to the opening of mines that will pay better wages than the laborer can obtain from the usual employments found in an agricultural community. The low price of grain produced last season, has to some extent crippled the farmers, so far as to the employment of help at the wages then demanded by laborers, and we are satisfied that the laborer can find more remunerative wages in the mines near Bozeman. The placer mines of Bridger cañon have been thoroughly tested, and the result has been highly satisfactory to those engaged in their development.—*Courier*.

A SINGULAR FORMATION.—A singular formation was struck in the Burns' mine, now being worked by Bruce Lee on Gold Flat, a day or two since. They have a fine ledge and are taking out good rock. The other day a workman, seeing a streak of rich looking sulphurets in the top of the drift, thought he would follow it a short distance. In a few moments he struck into a cavity which was lined on the inside with the most beautiful quartz crystals, and at the base of these crystals the sulphurets found to be very rich. The little cave which he struck glitened as though its walls were wrought in diamonds.—*Transcript*.

Such cavities in quartz lodes are not of very frequent occurrence, but they are not so uncommon as to be singular. Several crystallized cavities have been struck in the Eureka mine and one or two, we believe, in the Idaho. Our quartz expert says that the striking such cavities is a good sign, and that in the case described by the *Transcript*, Mother Nature has simply left a letter down in the bowels of the earth for Bruce Lee telling him that he has a true vein.—*Grass Valley Union*.

MECHANICAL PROGRESS.

Going Back on Compound Engines.

A large amount of "naval science" has lately been expended in scientific journals, on both sides of the Atlantic, to prove the great economy of compound engines for use in sea-going steamers; but after all that has been said and written, and notwithstanding the many costly experiments that have been made, there seems to be a growing disposition to go back to non-compound engines with expansion gear capable of a very high cut-off. A writer in *Engineering* asks—"If such good results are obtainable from using two vessels for expansion, why is not the number increased?" The same writer further says: "In my little experience I have found that in nearly every case where great economy was attained by substituting new boilers and engines, the result may be invariably traced to the adoption of a higher pressure of steam, and consequently to a greater expansion of the work done; and I question whether such economy might not have been obtained by merely having new boilers."

The *Engineer* of April 25th, in speaking editorially upon the same subject, says: "For some years we have persistently pointed out that the economical results obtained at sea with compound engines were not due to the fact the engines were compounded, but solely to the use of high pressures and a fair amount of expansion. Experience has proved that a pressure of about 60 lb. is the highest that is advisable to use at sea, because no boiler which is safe with higher pressures has as yet established for itself a character which will warrant its general adoption on ship board. It has been abundantly shown that 60 lb. steam cannot be expanded with advantage much more than five times. A ratio of expansion to six and even ten times has been tried with this boiler pressure, without any benefit as regards saving in fuel, and with a direct loss as regards the increased size and weight of engine required."

Bearing these facts in mind—and they are facts, as proved by hundreds of engine-room log-books—we have over and over again asserted in these pages that just as good results can be obtained from non-compounded marine engines as from compound marine engines, if only the makers will design their engines with due regard to the necessity for strength of parts, and will take proper care to proportion and set the propeller properly. In the face of all this the building of compound engines has progressed apace, and we have not been backward in illustrating and describing the best compound engines made by the most eminent firms. We feel certain, however, that the compound engine is used now only because it is the fashion to use it. It is essential to its permanent success that boilers should be worked at sea with pressures of at least 120 lb. on the square inch, rendering a ten-fold expansion possible. But such boilers, and the engines which will suit them, will be found very different machines from the ordinary modern compound engine. They will be found to require extremely delicate manipulation to get a first-class result out of them commensurate with their cost and the perfection of design and workmanship which they must possess. Whether such engines will ever meet with fair treatment, or be popular with sea-going engineers, time alone can prove. Mean-while, we hold to our opinion that compounding is unnecessary, and a source of direct loss, while the available practical pressures and rates of expansion are retained. For a long period we have stood almost alone and unsupported. Our views have been denounced as old-fashioned, and we have been accused of holding opinions subversive of true progress. At last, however, the tide begins to turn, and we have no little pleasure in calling the attention of our readers to the fact that the Montreal Steamship Company (the Allan line) have determined to give a fair trial to high-pressure steam expanded in one cylinder.

The British Admiralty are still, however, continuing their experiments, and the latest proposition is to substitute the compound, three-cylinder engines of the *Junina*, with a single cylinder, within which shall be trunks for the center cylinders; the inner one to be worked with full pressure, and the two outer ones to receive the exhaust, the one from the other. It is suggested by the opponents of the compound engines that it would be more economical to fit an expansion gear to each of the original cylinders, capable of a very high cut-off.

LIMIT TO EXPANSION OF STEAM.—At a late meeting of the Manchester, (Eng.), Scientific and Literary Society, as reported in *Engineering*, a discussion took place on the practical limit of the expansion of steam and the Society pretty generally agreed upon the proposition offered by Mr. McNaught that it was possible for the expansion of steam to be carried too far. When we have expanded steam to six times its volume we have got all out of it that will be of any benefit. Beyond this point there was no economy, because the back pressure not only lost its value, but operated against any economical result. If more expansion was wanted, the piston should be enlarged, and that would increase the prejudicial operation of the back pressure.

Comparative Tests of English and American Rails.

A number of experiments have lately been made at Joliet, Ill., to test the comparative strength of American and English rails. A "John Brown" (Eng.) rail taken from this Chicago and Alton railroad after it had been in use only 13 months, and rejected as being too soft, was taken, with one of the Joliet Iron and Steel Company's rails, to the steam hammer in their works (the blow of the steam hammer being equal to fifteen tons) and the following test made:

The "John Brown" rail was placed under the steam hammer, on bearings twelve inches apart, and struck three blows, when it cracked on the head, the crack diverging from each side of the point where it was struck. A Joliet rail was then placed under the hammer, in the same manner as the other, but with the head (or T) downwards, and was struck two blows on the flange, then turned over and struck eight blows on the head. The deflection was considerably more than that of the "John Brown" rail, but not a crack was visible.

The length and weight of the two pieces mentioned above were equal, and can be seen in the company's office at Joliet.

This test shows the great superiority of the American rail. Another test was made between the rails made by this company and those of several English companies, with the following results:

"John Brown" (Sheffield)—First piece struck one blow on top and turned, and broke first blow on the flange.

"John Brown" (Sheffield)—Second piece broke first blow on the top.

"John Brown" (Sheffield)—Third piece broke first blow on the top.

"Atlas" (Sheffield)—First piece broke first blow on the top.

"Enderdale" (Sheffield)—First piece broke first blow on the top.

"Joliet" (American)—First piece struck two blows on top, then turned and struck twice, bending it 3 1/2 inches in 24 inches of length, and broke it with the 3d blow on flange.

The same hammer with which the former test was made was used in this test. The steel of the Joliet rail was found to be very fine and close, entirely free of checks.

The great superiority of the American made rails, if those of Joliet are a type, must inevitably secure their general use, in preference to rails of inferior quality, and it is to be hoped that ere long every American manufacturer of rails will attain to that high state of perfection which will not only enable them to successfully compete with foreign manufacturers, but to gain for themselves a high reputation, and secure railroad companies against the heavy loss of property which they have sustained in many instances, together with the wholesale slaughter of human beings, whose names have been recorded in the many lists of killed and wounded by railroad accidents caused by "a broken rail." Let us have no more broken rail accidents. Railroad companies, test the rails you intend to run your trains over, and be sure you have such as will secure you from heavy losses of property and public indignation, then we will be able to say truthfully that railroading is a success. Passengers, it is your business to know what kind of rails you trust your lives upon.

THE FRACTURE OF CAST IRON PIER CYLINDERS.—Mr. J. C. Trautwine, in a communication to the *Journal of the Franklin Institute* on the fracture of cast iron pier cylinders, says: It is not, perhaps, generally known to the profession that cast iron cylinders, composed of sections bolted together through inside horizontal flanges and filled with concrete, as is usual when employing them for bridge piers, etc., have, in several instances in the United States, split or cracked asunder, entirely around their circumference, under the influence of severe cold weather. The reason of this, I presume, is that the outer and more exposed cylinder tends to contract to a greater degree than the inside and more sheltered concrete, and that the hold which the inside flanges have upon the solidified concrete in which they are imbedded prevents the contraction from taking place without rupture of the cylinder. Unless suitable means be applied to prevent this, the efficiency of such cylinders may be much impaired. It has been suggested that an inside lining of vertical wooden staves, projecting inward as far as the flanges do, will be an effective remedy. Other methods will no doubt present themselves. My object is merely to give greater publicity to an important fact.

HOW TO PUT IN BOLTS.—If there is a thing which is utterly detestable to look upon, by a strict observer and one who has a general knowledge of what is right, it is to see the heads of bolts driven down below the surface of the wood. The bolt has a certain duty to perform, and where that duty is the securing of a piece of iron to wood, or wood to iron, if the head of the bolt sets firmly upon the wood, and the nut is firm upon the iron, it is all that is required; but when we commence to draw upon the bolt until the head sets below the surface of the wood, that moment we commence destroying the fiber of the wood and aid the premature rotting at that one point, for no matter how nicely painted, or how neatly put up, there will soon be a cavity for the retention of a few drops of water. This alone would be enough to condemn the practice to say nothing of the other results it produces.—*Carriage Journal*.

SCIENTIFIC PROGRESS.

Changes in River Beds.

In a report on the subject of a water-supply for the village of Yonkers, New York, published in the January number of the *American Chemist*, Prof. J. S. Newberry furnishes some interesting facts on the geology of river-beds, that will be of general interest. He says: "It is probably known to you that most of the draining streams of all the region between the Mississippi and the Atlantic are now running far above their ancient beds. This fact was first revealed to me by the borings made for oil in the valleys of the tributaries of the Ohio. All these streams were found to be flowing in valleys, once deeply excavated but now partially filled, and in some instances, almost obliterated. Further investigation showed that the same was true of the draining streams of New York and the Atlantic slope. For example, the valley of the Mohawk, for a large part of its course, is filled with sand and gravel, to the depth of over two hundred feet. In the Hudson the water surface stands now probably five hundred feet above its ancient level—the old mouth of the Hudson and the channel which leads to it being distinctly traceable on the bottom nearly eighty miles south and east of New York. The excavation of these deep channels could only have been effected when the continent was much higher than now. Subsequently it was depressed so far that the ocean-waters stood on the Atlantic coast from one hundred to five hundred feet higher than they now do. During this period of submergence the blue clays in the valley of the Hudson—the 'Champlain clays'—were deposited, and the valleys of all the streams were more or less filled."

AUREOLA, OR THE BRAIN ATMOSPHERE.—A new theory is propounded to explain why one happens to think of persons he has not seen for years just before meeting them. A similar phenomenon often happens, when one has impressions of the death of friends, who may be thousands of miles away, and subsequently learn that they died at that particular moment. A writer in the London *Spectator* thinks that there is a brain atmosphere extending through space, more subtle than the air or even the interplanetary ether. [May it not be that the theory is true?] As the undulations of the air occasion sound, and the undulations of the ether give the impressions of light, so the undulations of this brain atmosphere may convey impressions between sympathetic minds.

The theory is a very ingenious one, and there are certainly many facts which it will explain satisfactorily, but these different atmospheres must be curiously constituted, if so many different vibrations moving from so many different directions, do not interfere with one another.

INVESTIGATION IN SPECTRUM ANALYSIS of the Bessemer flame, by Prof. Roscoe, evidences that when the blow begins the flame is scarcely luminous, a mere glare of red, giving a very faint spectrum, if any. In about four minutes from the time the blast is let on, a flashing through the spectrum of the sodium line may be noticed. In about a minute and a half after this change, we discover lithium, and then potassium. As the process continues, the flame becomes intensely luminous, owing to the silicon becoming incandescent. Then it gradually changes, and becomes slightly purple, and in a few seconds passes to nearly the same color as at first. The first spectrum is an exceedingly simple one, but the last is complex, containing as many as thirty-three lines. The lines disappear in the inverse order of their appearance, and when the green band becomes invisible, the blast should be shut off, and the metal cooled.

THE MYSTERY OF POLISHED SURFACES.—The polish of which the surfaces of certain bodies, such as steel, the diamond, and other precious stones are susceptible, is an evidence at once of the limited sensibility of our organs and the unlimited divisibility of matter. This polish, is produced, as is well known, by the friction of emery powder or diamond dust, and, consequently, each individual grain of such powder or dust must leave a little trench or trace upon the surface submitted to such friction. It is evident, therefore, that, after this process has been completed, the surface which presents to the senses such brilliant polish, and apparently infinite smoothness, is, in reality, covered with protuberances and indentations, the height and depth of which cannot be less than the diameter of the particles of powder by which the polish has been produced.

SUBSTITUTE FOR QUININE.—A French apothecary has discovered an excellent and very cheap substitute for quinine, in powdered laurel-leaf. The leaves of the laurel (*Laurus nobilis*) are slowly dried over the fire in a close vessel, and then powdered. One gramme (15 1/2 grains) is a dose, and is taken in a glass of cold water. The drug so taken produces no bad effects, and soon, it is said, breaks up the most obstinate intermittent fevers.

PROF. VOGHT records an instance of what may be called self-cannibalism. He cut in two a male cricket, and immediately the fore part, probably experiencing a sensation of emptiness in the ventral region, turned upon the hinder part and devoured it!

Electric Theory of Boiler Explosions.

An explosion occurred some time ago at one of the most celebrated manufactories in the world, the Hardmanschen works, in Chemnitz, Germany. The causes which led to this disaster are very mysterious; the boilers were entirely new, and burst on the second day of their use, with such violence that the whole building was blown to pieces, causing the loss of many lives. The calamity happened, also, immediately after the fires were started, and before there could have been a very high pressure in the boilers.

The phenomena of a thunder storm, which are well understood, may throw some light upon the subject. The warmer the day the greater is the evaporation of water from the earth, and consequently the more violent are the flashes of lightning. If we consider what a mass of water evaporates in a day, in a large boiler, the volume of water while undergoing this change, increases seventeen hundred fold in bulk, we may easily infer that large quantities of electricity are also set free, and the boiler becomes filled with the fluid.

The coating applied to the external surface of the boiler generally consists of oil colors, or else some kind of varnish, and when first applied is very bright, but soon tarnishes from the deposit of carbon or soot from the flames. If the paint or varnish is accidentally scraped off, there still remains this carbon deposit, which prevents the electricity from connecting with the earth. As soon, however, as the fireman carelessly removes this loose film, a full electrical connection is made with the earth, which occasions such a rapid production of steam that the exhaust pipes are unable to convey it from the boiler fast enough, and an instantaneous explosion follows, as was seen in the case of the boilers of the Hardmanschen works.

MINERALS IN LAVA DEPOSITS.—It is a remarkable fact that the lavas of Vesuvius contain a greater number of minerals than, perhaps, all others in the world. Haüy mentions that, of three hundred and eighty simple minerals known to him, no less than eighty-two have been found on Vesuvius; of these several are peculiar to the locality. Sir Charles Lyell expresses the opinion that those have not been thrown up in fragments from some older formations, through which the gaseous explosions have burst, but have been sublimed in the crevices of lava, just as several new earthy and metallic compounds are known to have been produced by *fumeroles* since the eruption of 1822.

IS A WHALE A FISH?—Prof. N. S. Shaler furnishes some notes on the habits of the whale, founded partly on information furnished by Captain John Pease, of Edgerton, Mass. In the course of the notes, the Professor says that the Captain is positive that a trace of hair is to be found within the skin of the right whale; for if the fresh skin were scraped, the inner section will show such a trace. If this whale, remarks the professor, is the descendant of a land mammal, we should expect to find just such a trace. Then, too, a sperm whale's tooth is shown in Nantucket, which has two fangs, and it is stated that the other teeth of the whale to which this belonged, had, also, two fangs. The Professor suspects here a case of reversion.

CAPILLARY ATTRACTION.—At a recent sitting of the Academy of Sciences, M. Chevreul gave an account of some experiments illustrating what he calls capillary affinity. He made a paste of white lead and water, and another of white lead and linseed oil, and placed them in separate tubes. Above the oily paste he placed water and above the watery paste oil. The oil in the latter case displaced the water, but water did not displace the oil in the former. In corresponding experiments with clay and pure kaoline it was found that water would in each case drive out oil, but oil would not drive out water.

PHOTOGRAPHIC EFFECTS BY PRESSURE ALONE.—Another remarkable experiment of M. Carey & Co., is the production of latent photographic pictures by simple pressure. He prepared and sensitized a plate, and then having written upon a sheet of paper with a style, so that the letters may stand in some relief in the dark, presses this paper on the sensitized leaf; turning this on the application of the ordinary iron developer, he obtains a picture of the words. Here mechanical pressure alone (the light being excluded) effects the result. The experiment seems to support the erasive theory of light.

THE POISONOUS ACTION OF METALS.—That the metals have a poisonous action in proportion to their "atomic" weights, and, inversely, as their atomic heats, was enunciated as a law by M. Rabuteau, a few years ago. This was verified in a large number of instances. He has recently experimented with calcium and potassium, the atomic weights of which are forty and thirty-nine respectively, and finds, as he expected, that the effects of injection of these substances into the veins of animals are very nearly equal.

A SENSITIVE PLANT.—Weltwitsch tells of a plant, an oxalis, growing in Angola, Africa, which is so sensitive that it closes its leaves on hearing (so to speak) a footfall in its neighborhood.

MINING SUMMARY.

[California Mining News on page 352.]

Nevada.

ELY DISTRICT.

MEADOW VALLEY.—Pioche Record, May 25: This noted lode, old mine—more properly speaking, 3 mines, with 3 distinct bolting works, has again come to the front to establish her claim to the first rank in the rich mineral interest of Ely District. Persistently have her shafts been sunk until each have obtained depths far exceeding the expectations of the community, and from the respective stations drifts have been run to prospect every foot of the extensive vein owned by the company. Number 3 shaft is 328 ft. deep, number 5 nearly 700, and number 7 approaching 1,000. The lay of the country rock at these great depths is uniform and the formation quartzite. The first recent strike in No. 3 was made in the cross-cut from the shaft at the 8th station, and within 14 ft. of the latter; but the most important was at a depth of about 60 ft. below the 8th station immediately in the shaft, at which point the dip of the ledge and the angle of the vein on the opposite side. Thence down the vein ore has continued in the shaft, showing on its east and west sides, and giving reasonable assurance of permanency in depth and extent. But another and very important strike has just been taken in what is favorably known as the Old Black shaft ground, from which, in times past, the richest ore ever found in the district was taken out. This ground is nearly about mid-way between No. 3 and No. 5 (Summit) on the 7th level, (630 ft.,) and the strike promises to rival the richest ever before made in Ely District. Our authority for the foregoing is perfectly reliable. She is shipping now about 35 tons of ore per day.

RAYMOND AND ELY.—This great mine is now being run with reduced force, there being at present time about 200 men employed. Development on the 8th level is being prosecuted with energy, and the indications are extremely promising. Some rich ore has been taken from the 8th level, but no great amount will be hoisted from it for some time, or until certain necessary connections with the 7th level are completed. Ore is now being hoisted from the 7th level principally, but some comes up from the 5th and 6th, in which there are still good ore bodies. The main shaft is now 63 ft. below the 8th level.

PIOCHE.—Full forces are engaged in this well-known mine and 4 to 5 tons of good ore are being hoisted daily. An average of 30 car sample taken during the month of April is \$266.77. The developments are highly satisfactory. There are now 150 tons of No. 1 ore on the dump.

PORTLAND.—The drift from the bottom of the main shaft to connect with the winze is being pushed ahead vigorously. A few ft. more drifting will make the connection, but the rock is very hard and progress is slow.

BOWERY.—Main shaft 325 ft. down. The drift east from the bottom is in ledge matter, with improving prospects. The drift from the second station is looking splendid and improving fast.

CHIEF EAST.—The drift east from the main shaft is looking exceedingly well. Have been compelled to suspend the work, as the air is very bad. Now sinking the main shaft to connect with the Chief of the Hill, which will take about ten days. This connection will give both mines good ventilation.

ALPS.—Continued improvement is the report due this mine this week. The ore bodies are strong, and the richness of the ore is unquestioned.

FRACKER.—The main shaft is down 120 ft. and the west drift is now in 60 ft. The mine looks well in all parts, and is improving fast.

EXCELSION.—No particular changes to note. A drift is being run from the bottom of the new shaft, 280 ft. down, to connect with the winze from the old works. The indications are fair.

CHARMAN.—Work continuing with satisfactory results. No particular change to note, excepting that the indications are improving as depth is attained.

MAZEPA.—Work will soon be resumed in this mine. Fine and rich ore bodies were exposed when work was suspended, a few days ago.

AMADOR TUNNEL.—Some good ore is being run through the tunnel, and the ore breasts are strong.

PACIFIC TUNNEL.—The tunnel is now in over 1,100 ft., and drifting is being prosecuted on the last ledge struck, or ledge No. 3. Ledge No. 3 promises, without exaggeration—and we have personally inspected it—to be one of the richest and most extensive mines in this district. The ledge is now 4 ft. between the walls, and both walls are as smooth as a planed board. The ore is coming in very rich, one certificate of assay before us, given by John Cahill, returns \$1,278.11 to the ton. The average of about \$900. From 6 to 7 tons of ore found in the tunnel will not fall far short of \$250 to the ton.

SILVER PEAK.—Ore is being extracted, 210 ft. down on the incline, from east and west drifts. The ledge matter is 4 ft. in width, of which there are from 18 to 20 inches of very rich ore. The walls show regularly wherever exposed. Car sample assays average about \$150 to the ton.

WASHINGTON AND CREOLE.—The east and west drifts from the 540-ft. level are both in ore. The west drift has been run about 25 ft., and the east about 35. Both drifts are run on the ledge, which varies from 18 inches to 2 1/2 ft. in width. The ore assays from \$1,000 to \$4,000 to the ton—the majority of the certificates before us showing an average of about \$900. From 6 to 7 tons of ore are being hoisted daily. We were shown a large number of specimens with horn silver all through them. The prospects of the Washington and Creole are more brilliant than ever before. There are now about 300 tons of very rich ore on the dump.

BROOKLYN.—There is a new mine near the Portland, which is attracting much attention at the present time. A fine body of ore has been struck, which as much resembles the richest ore of the Bowery as one pea does another, and the assayer's returns of its ore are invariably high.

MONTANA.—Still sinking the main shaft, which is now 160 ft. deep. It is expected that the shaft will cut the vein at about the depth of 225 ft., and from the character of the vein exposed in the 100-ft. level, it is probable that the developments at that depth will not be second in importance to anything yet struck, even in this richest of silver-bearing districts.

HUMBOLDT COUNTY.

BOLIVIA DISTRICT.—Silver Star, May 24: Frank German, who is engaged in mining in Bolivia District arrived in town on last Saturday, and gives the most flattering reports of that district. Several companies are engaged in mining in that district, and each and all of them are extracting ore which assays from 35 to 60 per cent. of metal. The Baker Company, on the Tidal Wave mine, have developed an immense mass of ore, and with a limited number of miners can produce 150 tons of 40 per cent. ore monthly. Work has been commenced on the lead over the mountains to Oreana, and is being prosecuted vigorously. It is expected that in 60 days wagons can reach the mines and load at the dumps. Bolivia is, beyond all doubt, the richest and most extensive copper region yet discovered on the coast, a fact which its ore shipments will prove to the skeptical as soon as communication is opened with the railroad.

MONTANA.—We learn from C. W. Scheidel, of the Marysville (Cal.) Foundry, that the Rye Patch Company have agreed to supply the Montezuma mill, near Oreana, with ore from the Butte mine, and that it is the intention of the owners of the mill to increase its capacity from five to ten stamps. Mr. Scheidel visited the mill and examined it with a view of ascertaining what machinery may be necessary for making the proposed enlargement. The mill and smelting works are

owned by General Connor, of Salt Lake, by whom they were purchased last fall.

GOON YIELD.—The average yield of ore from the Botte, worked at the Rye Patch mill, during the last month, was \$118 per ton. This mine looks splendidly, and large bodies of ore are in sight. The Superintendent, Charles Hoffmann, started to Reno last Wednesday, for the purpose of leasing the Auburn mills, at that place, to work ore from the Butte mine.

HENNING.—G. W. Holt, who recently leased the Pioneer mill, has also leased the Henning for one year. Work was commenced on the mine on last Tuesday, under the new management, with a force of fourteen men. J. D. Gelselman, formerly Night Foreman in the Arizona, and an experienced miner, has charge of the Henning.

TRINITY.—Wm. Woolcock, who for several years has been Foreman of the Manitowish, has commenced work on his own hook on the Trinity mine, in Star District, of which he is one of the principal owners. Bill is a good miner, and as he entertains a good opinion of the Trinity, we shall expect to hear of good results from that mine shortly.

WASHOE.

ALAMO.—Gold Hill News, May 24:—The shaft is 100 ft. deep, and still sinking in the ledge, making good progress. A drift north is started 80 ft. from the surface, to prospect the ore body in that direction.

ARIZONA AND UTAH.—The east drift is now in 64 ft. from the shaft. The rock is hard, but works well, and considerable water is encountered. It will take about 2 weeks yet to reach the ledge.

BEZELER.—Daily yield 600 tons from the 1,000, 1,100, 1,200, and 1,300-ft. levels. The 1,200-ft. level, connecting with the main incline, being properly graded, and the car-track laid, ore commenced passing out that way for the first time this afternoon. The main incline is now down 135 ft. below the 1,200-ft. level, and sinking with fair progress in hard, dry rock; 35 feet farther will take it far enough to open a station for the 1,300-ft. level. The main drift south at the 1,300 ft. in 174 ft. from the Crocker point line, and has over 400 ft. to go in or to reach the incline.

BUCKEY.—Daily yield about 20 tons, keeping the Hope mill running. The ore sections continue to look well, and at the south portion of the upper level especially.

BALTIMORE CONSOLIDATED.—Drifting both north and south is being done at the 225-ft. level in the ore, which holds out well, and promises considerable extent. The timbers for the construction of a dump, are on the ground, and as soon as the dump can be built, ore extraction and milling will commence. The water is out of the lower part of the mine, and the drift west at the lower or 450-ft. level is being driven ahead for the main ledge, to which the good ore found a couple of weeks ago, are evidently belongs.

CROWN POINT.—Daily yield, 500 tons, principally from the 1,300-ft. level, which holds out splendidly and gives promise of continuing its present yield for many months to come. The face of the east cross-cut from the 3d floor above this level, is still in fine ore. The ore in the fifth floor cross-cut is 27 ft. in width, and a raise from the cross-cut with the winze from the level above, giving a good circulation of air. Both winze and raise have passed through first-class ore all the way.

CON. VIRGINIA.—Main shaft down 435 ft. Rock works well, allowing of good progress. The main drift north at the 1,167 ft. level from the Gould & Curry is also progressing well. When connection is made with the shaft and drift the mine can be worked to advantage; not before.

CHOLLAR-PORTER.—Daily yield 140 tons from the old ore sections, assays averaging \$35 per ton. Prospecting going ahead as usual. Ore sections show no particular change.

CALDENIA.—Drift and winze connections completed, giving good circulation and work goes ahead advantageously. No particular change to note.

FRANKLIN.—Work was commenced at the south end of this mine day before yesterday with the view to ascertain if the Baltimore deposit at the north end extends through to that point. The old tunnel, which was run ten years ago, is being cleaned out and retimbered for that purpose. It is 600 ft. in length, and cut a body of low grade ore 12 to 15 ft. in width, and assays as high as \$30 or more to the ton. That ore can be made to pay at present wages and cost of milling.

GOULD AND CURRY.—Work going ahead actively in this mine at present, about 80 men being employed. The main incline progresses slowly, owing to much water, giving the pump all it can do. The incline is very hot. The south part of the old mine, several levels down, shows considerable low grade ore, favorable to better developments eastward. The main drift south at the 1600-ft. level is driving toward connection with the Savage as fast as possible. Some promising low grade ore is met with in cross-cutting from the north drift of the 10th level.

GLOBE.—Work in the winze progresses slowly on account of the great heat and lack of ventilation. Some very good ore is encountered within the last day or two, which promises to develop into a valuable deposit.

HALE AND NORRIS.—Daily yield 45 tons, all from the lower mine. The repairs to the shaft are completed. At the lowest level the ore breasts show improvement, and cross-cut east from that level are being driven ahead to reach the east vein.

IMPERIAL.—The drift in the incline is completed, and deeper sinking progresses well. Some very good bunches of ore have been met with the last few days in the winze between the 1600 and 1700-ft. levels.

INDUS.—North drift in the ledge, progressing as usual. The ore shows a greater proportion of silver than heretofore, containing more silver than gold.

JUSTICE.—The winze at the south portion of the mine is still sinking and the incline ore. The main incline at this point is down 75 ft., the quartz encountered showing improvement, and some water coming in. The main south drift at the 400-ft. level is driving along as fast as possible toward connection with the south mine.

JULIA.—Sinking the main shaft for another station, and running the south drift, progressing very well. The ledge widens and the south end is better developed, and the general prospects of the mine are very favorable.

NEVADA.—The proposed new working shaft east of the present workings is commenced. Meanwhile work goes ahead in the incline, sinking in good milling ore, the ledge being 4 ft. in width. Hoisting works will be erected over the new shaft as soon as the incline, and the grading is in progress down that purpose.

OPHIR.—New shaft below the 1465-ft. level sinking at a satisfactory rate of progress, the ground met with being soft porphyry. The faces of the cross-cuts at the 700 and 1300-ft. levels show improvement.

OVERMAN.—The main drift west as well as the north and south branches of the same, are progressing fine in grand and good quality, with occasional seams of quartz. The level corresponds with 100-ft. level of the Belcher mine and will prospect the southern portion of the Comstock about 400 ft. deeper than any other mine does at present.

WOODVILLE.—Daily yield nearly or quite 40 tons, which is more than enough to keep the small 40 and 100 mill and the road over the mountains running. A fine body of ore is accumulating on the dump and at the mill. The ore sections are looking finely, and north of the shaft especially so.

YELLOW JACKET.—Drifting east at the 1600, and north and south at the 1400-ft. levels progressing as usual, with no particular change to note.

SILVER HILL.—Daily yield about 50 and 60 tons. Average assay about \$40. The main north drift at the first level shows considerable improvement in the quality of the ore, and plenty in sight in the mine to keep the mill running for many months.

SIERRA NEVADA.—The northerly ore section and the gravel stopes show improvement, otherwise no change to note. The mill runs steadily and does very good work.

SEQUESTERED ROCK ISLAND.—The Co. recently purchasing this old established mine, have started in actively to develop it. They have commenced cleaning out the old tunnel and shaft preparatory to erecting first-class bolting-works, and opening out the mine properly. Years ago, when the mine was being worked, a drift east from the shaft, 100 ft. from the surface, at a distance of 75 ft. cut through a ledge of silver ore of the regular Comstock stamp, 28 ft. wide, and assaying \$30 per ton on the average.

WHITE PINE.

GOOD NEWS FOR ROBINSON.—White Pine News, May 24: We are credibly informed by D. T. Elmore, that renewed activity will be the order for the coming summer at Robinson District in the mining interest of that section. Negotiations are now being made for the purchase of the fine, new mill owned by this English company, at Mineral Hill, and, as soon as the bargain is closed the work of boring down and removal will be commenced. We also learn from the same source that our old friend, Thomas Cahill, formerly an assayer in this place, has been appointed superintendent of the company, vice Mr. Elmore resigned.

HIDDEN TREASURE.—This remarkable and erratic deposit of ore has been the means of adding thousands of dollars of wealth to the world, and is far from being exhausted yet. There are some 30 or 40 men employed on the different cuts, shafts, and inclines, and a fine quality of mineral is being constantly extracted. Now, a vein of quartz is being worked near the old shaft, from which so much valuable mineral has been extracted, which seems to be going down in an easterly direction. Some 300 tons of good ore is lying on the dump at this mine, and the cost of raising it to the Wheeler tunnel, with indications of soon striking an ore body 600 ft. below the surface workings described above.

EDGAR.—This valuable mine is steadily producing its quota of fine milling ore, from which the Maubatten mill is being supplied. The drift, mentioned by us some time ago, as being run to connect with the main ledge, has been completed, and the cost of raising it to the surface is much lessened by the fact. Thirty-six tons are being hauled from this mine daily, which is sufficient to keep the mill running continuously. The rock is of high grade, and will mill from \$60 to \$80 per ton.

WARD HATCHER.—This mine is not being worked at present, as the ore is slight having been extracted, and no prospecting going on.

REBERT AND AUBURN.—A force of 130 men are in the employ of this company, all of whom are working on it, in various portions of the property. The Peers Chamber is still showing finely, and a shaft is being sunk revealing ore continuously. The Stanford mill is constantly being run on ore from this chamber alone, and prospecting pushed ahead in other localities owned by the company. The tramway is laying idle, Captain Drake preferring to employ teams until alterations of some kind are made for the better on the former.

MANRATTAN MILL.—This serviceable and bullion producing institution appears to run as well as any mill ever erected. It has been in operation, years ago, it was purchased and put up at its present site, where it seems to do just as good and complete work as ever before. It consists of 22 stamps, is adapted either to wet or dry crushing. The ore being run through at present is from the Edgar, belonging to the company, and is said to be of splendid quality.

PERSISTENT EFFORT.—We know of a man who has been constantly employed for the last 3 years and over, driving a tunnel into a hill near Swanses, about 2 1/2 miles from this place, and, unaided by any one, has completed over 400 ft. into the solid rock. During the course of the work he has extracted a large quantity of valuable smelting ore, which goes high in gold.

SUNBEAM.—On the occasion of our visit to this mine, of which we have reported before, we were impressed with the extent and grandeur of the surface croppings. The ground is stripped a distance of 300 ft., running due east and west, and the croppings are traceable the same distance, and are from 4 1/2 to 7 ft. in width. A shaft has been sunk some depth in the ground, but we did not descend it, there being no work going on at the present time. From surface showing we are confident it is one of the biggest mines in that locality.

Montana.

COAL.—Deer Lodge City Independent, May 17: Several hundred tons of excellent coal have been taken from the banks near the summit between Blackfoot and Helena during the past winter. These mines are now sufficiently developed to demonstrate their value. The veins are of good width, and the quality of coal equal to any found west of Pennsylvania. As yet the demand is light, but it is increasing, and will soon reach several thousand tons per annum.

MOOSE CREEK.—Laping & Moreau started up their arastras last week on the ore from the Canada ledge. They have several hundred tons of quartz on their dump and over 100 at the arastras. Dickey & Parks are also running a set of arastras on the ore from the Canada ledge. Both of these companies will make money rapidly this summer, as they have splendid quartz, and plenty of it. Their machinery is also first-class and of great capacity.

PIONEER.—The Pioneer Co. cleaned up the sum of \$3,200, last Saturday, the proceeds of 9 days' work. This Co. will start on one or two times next week, and will take out an average of \$5,000 per week during the summer. Several cleanups were made last Saturday, but we have not learned the proceeds. By the first of next week nearly all the claims will be running, and Pioneer will turn out more gold and more in proportion to the number of men employed than any other mining camp in Montana.

OUR PLACE.—New North-West, May 16: New discoveries have been made within a mile of the place which go 3 cents to the pan. Several new claims have been staked, and we understand a company, representing capital sufficient to thoroughly prospect and successfully work the large bar on the northeast of town, will be organized in a short while, when work will be commenced in earnest. Experienced miners here already predict that the new mine will be one of the richest in the Territory, as soon as sufficient developments are made to prove the richness and extent of the mines. The miners in Bridger canon are actively engaged on their water ditches, and will soon be prepared to wash out the precious metal. We understand that a gentleman owning an interest in one of the claims on Bridger bar last week sold out for \$500 in cash, the purchaser being new also one of the owners in the claims.

QUARTZ CREEK.—New North-West, May 17: The McKinney Brothers & Co. own and work the flume at the mouth of the creek; the claim is worth \$4,000. Boh Miller is "going it alone," one mile above them, on Long Bar; has good ground, if it was opened. Ruston Biggs has been prospecting on the south side of the creek, below McGrath's store, with strong symptoms of pay until the water run them out. The new flume company put in 50 ft. of flume this week, and have 100 ft. more to run to reach bed-rock. "Buffalo Bill" & Co., on 34, are hunting another \$32 nugget. Bart & Co., on 41 have got 4 or 5 dollar diggings on high rock.

GOVERNMENT CLAIM.—W. W. Jones, one of the owners of the claim in Gold Canon informs us that they have commenced washing the ground drifted during the winter and cleaned \$700 in the first 2 days. They have yet about 2 weeks washing of winter drift dirt not probably as rich as this. This company, consisting of W. W. and T. W. Jones and John and David James, of the Government, have been prospecting on the Gold Canon four years now and doing well all the time, the ground averaging about \$25 to the set of timbers. The streak is 45 ft. beneath the surface.

THE CABLE LEAD.—Col. W. F. Chadwick and L. H. Hershfield, Esq., of Helena, were in town this week and made a proposition to Mr. S. Cameron of the Cable Lead, asking to the development of that property by a San Francisco company. We learn from Mr. Cameron the

proposition contemplated the bonding of the lead to the San Francisco for one year from January 1, 1873, during which time the company would expend an amount up to \$50,000 in opening and working it, with the privilege of purchase at a stipulated sum if they deemed it desirable. Mr. C. did not accept the proposal as he has arrangements made which he deems more favorable. In 10 days he will commence sluicing the surface of the lead with hydraulics and expects to bare and take out sufficient ores to at least keep the mill employed one third of the time.

GERMAN GULCH.—Mr. Foster, merchant in German Gulch, was in town Thursday purchasing goods for the spring business. No mining of any consequence has yet been done, the nights being so cold as to freeze the water. It is anticipated all will get to work by the 25th inst. There are 14 companies (4 Chinese) in the gulch, owning from 2,000 to 5,000 ft. of ground each and the ground is good for 10 years more as profitable mining as in the past.

Utah.

WELLS, FARGO TUNNEL.—Alta City Independent, May 19: This tunnel is intended to strike the lead, and is within 30 ft. of it; the ore in the Pyatt is of a fine quality, and still getting better. The mine is owned by the Tunnel Co., and J. A. Varnes the gentlemanly Superintendent, informs us that work will be resumed by the 15th of June. The showing of ore being so good, there is no indication of the ore they strike in the tunnel will far exceed anything produced for some time, in this camp.

HERMAN.—This tunnel has been pushed forward by energetic men, until their labor was rewarded on Friday last, by striking 3 ft. of ore, which assays well and is growing fast.

WELLSFORD.—Which shows an 8 ft. vein of ore going \$100 in silver and 70 per cent. lead. This mine is gradually getting better and there will be a large amount of high grade ore extracted as soon as shipping facilities increase to their summer dimensions.

AMERICAN FORK DISTRICT.

GOLDEN GATE COX.—Alta Independent, May 22:—The Mammoth Golden Gate Consolidation, which is 2 1/2 miles distant and separate mines, all situated in American Fork Canon, except the Golden Gate proper, which is located in this district, and has a tunnel in 30 ft. on the ledge, in limestone; shows a crevice of 5 ft. between walls of porphyry, ochre, and galena ore, with every indication of opening into a large body soon. Cutting formation shows croppings for 1,500 ft. This mine is being vigorously worked.

HARRIET LANE LONE.—In limestone, 4-ft. crevice, 25 ft. down; shows chlorite ore assaying as high as \$500.

MARIETTA LONE.—Also in limestone, 2-ft. crevice, 20 ft. deep. Shows chlorite and decomposed ore, some of which has assayed as high as \$1,130 to the ton.

MONTANA LONE.—Between lime and yellow clay. Pyrites and galena were coming in when the work stopped. Deep, crevice 18 inches, blue and yellow clay. Pyrites and galena were coming in when the work stopped.

ROSE OF JUNE.—In limestone 100 ft. down, crevice 14 inches. Chlorite and decomposed ore.

LONE STAR.—In quartzite, 2-ft. crevice. Burnt brown, decomposed ore, 12 ft. down.

MARY LONE.—In quartzite, 18 ft. deep, 6 ft. between walls; shows good milling rock and burnt brown crevice matter. Splendid prospects.

ROSE LONE.—This mine is down 14 ft. in limestone, and shows 4 ft. of a crevice of brown, decomposed ore, and some heavy galena. The walls are well defined.

New Incorporations.

The following companies have filed certificates of incorporation in the County Clerk's Office, S. F.:

CONSOLIDATED REFORMA LEAD AND S. M. Co., May 26. Object: To mine in the Reforma Bolebrano Lead and Silver Mines in the Santa Maria Mountains, District of Mexico, Territory of Lower California, Republic of Mexico, and to smelt, and dispose of its ores and metal. Capital stock \$200,000, in shares of \$100 each. Trustees: J. T. Atwell, Jacob Schuber, Wm. G. Badger, Wm. Mocker and Samuel Irving.

OCCIDENTAL IRON MINING AND SMELTING CO., May 24. Object: To mine for iron and other metals in the State of California, smelt the same and manufacture iron and steel. Directors—James H. White, Joseph Trench, A. H. Stout, A. R. Gunnison, A. Everett Ball, George W. Metzler, and George Treadwell. Capital stock, \$3,000,000. Amount of stock actually subscribed, \$200,000.

ARIZONA PROSPECTING AND MINING CO., May 24. Location: Pictorial, Arizona and New Mexico, and in the States of California and Nevada. Directors—C. J. Hutchinson, John O. Morrison, Jr., Robert Cushing, Louis Franconi, and M. P. Sinton. Capital stock, \$15,000, which has been subscribed.

GOLDEN SWAN CO., May 24. Object—Gold Hill Mining District, Storey County, Nevada. Directors—J. D. Fry, A. K. P. Harmon, Robert F. Morrow, Benjamin F. Sherwood and J. H. Robinson. Capital stock, \$50,000.

SAMANTA GOLD AND SILVER M. Co., May 26. Location: Ely Mining District, Lincoln County, Nevada. Trustees—J. M. Van DeMark, J. F. Atwill, John Middleton, George W. Lincoln and Wm. Pihott. Capital stock, \$1,000,000, in shares of \$50 each, of which \$100,000 has been subscribed by the Trustees.

MOUNT ST. HELENA G. & S. M. Co., May 26. Location: Napa County, Cal. Trustees—O. S. Buckley, John Evans, J. L. Sanford, Alexander Badlam, Jr., and Richard Swift. Capital stock, \$800,000, in shares of \$100 each, of which the amount actually subscribed by the Trustees is \$50,000.

ARMY DAOMAR S. M. Co., May 26. Location: Little Cottonwood District, Utah Territory. Trustees—F. P. Beach, James Hetchens, Harvey S. Brown, J. G. Severance, and E. Cass Stickney. Capital stock, \$3,000,000, in shares of \$100 each, of which amount \$100,000 has been subscribed.

MOUNT ST. HELENA G. & S. M. Co., May 27. Location: Gold Hill Mining District, Nev. Trustees, H. Rosekrans, O. P. Hutchinson, H. F. Williams, Charles W. Rand and Isaac Edmund. Capital stock, \$3,000,000, in shares of \$100 each, of which \$50,000 has been subscribed.

Meetings and Elections.

PACIFIC SHELTING AND MINING CO., May 27. Trustees: R. N. Shackelford, (President), Thomas N. Holt, (Vice Presidents), H. F. Williams, C. R. Gresthouse and A. Craig. Secretary, J. M. Knight.

SILVER HILL M. Co.—At the annual meeting of this company at its office 419 California street, on the 26th inst., the following gentlemen were elected Trustees for the succeeding year. A. K. P. Harmon, W. S. Hobart, J. D. Fry, Martin White, and Chas N. Felton.

TIN ORE.—ANOTHER REPORTED DISCOVERY.—The Eureka (Nevada) Sentinel reports an alleged discovery of tin ore some 25 miles distant from that place. The discovery is said to have been made by "a leading scientist," who knows whereof he speaks. Full particulars, precise location is promised as soon as preliminary matters can be adjusted.

The Raymond & Ely mine has shipped during this month \$175,000.

Notes on the Honey-Making Ant of Texas and New Mexico.

(*Myrmecocystus Mexicanus*.—Westwood.)

[By HENRY EDWARDS.—California Academy of Sciences.]

The natural history of this very curious species is so little known, that the preservation of every fact connected with its economy becomes a matter of considerable scientific importance, and the following observations, gleaned from Capt. W. B. Fleeson of this city, who has recently had an opportunity of studying the ants in their native haunts, may, it is hoped, be not without interest.

The community appears to consist of three distinct kinds of ants, probably of two separate genera, whose offices in the general order of the nest would seem to be entirely apart from each other, and who perform the labor allotted to them without the least encroachment upon the duties of their fellows. The larger number of individuals consists of yellow worker ants of two kinds, one of which of a pale golden yellow color, about one-third of an inch in length, acts as nurses and feeders of the honey-making kind, who do not quit the interior of the nest, "their sole purpose being, apparently, to elaborate a kind of honey, which they are said to discharge into prepared receptacles, and which constitutes the food of the entire population. In these honey-secreting workers the abdomen is distended into a large, globose, bladder-like form, about the size of a pea." The third variety of ant is much larger, black in color, and with very formidable mandibles. For the purpose of better understanding the doings of this strange community, we will designate them as follows:

- No. 1.—Yellow workers; nurse and feeders.
- No. 2.—Yellow workers; honey makers.
- No. 3.—Black workers; guards and purveyors.

The site chosen for the nest is usually some sandy soil in the neighborhood of shrubs and flowers, and the space occupied is about from four to five feet square. Unlike the nests of most other ants, however, the surface of the soil is usually undisturbed, and but for the presence of the insects themselves, presents a very different appearance from the ordinary communities, the ground having been subjected to no disturbance, and not pulverized and rendered loose as is the case with the majority of species.

The black workers (No. 3) surround the nest as guard or sentinels, and are always in a state of great activity. They form two lines of defence, moving different ways, their march always being along three sides of a square, one column moving from the southeast to the southwest corners of the fortification, while the other proceeds in the opposite direction. In most of the nests examined by Captain Fleeson, the direction of the nest was usually towards the north; the east, west and northern sides being surrounded by the soldiers, while the southern portion was left open and undefended. In case of any enemy approaching the encampment, a number of the guards leave their station in the line and sally forth to face the intruder, raising themselves upon their hind tarsi, and moving their somewhat formidable mandibles to and fro as if in defence of their foe. Spiders, wasps, beetles and other insects are, if they come too near to the hive, attacked by them in the most merciless manner, and the dead body of the vanquished is speedily removed from the neighborhood of the nest, the conquerors marching back to resume their places in the line of defence, their object in the destruction of other insects being the protection of their encampment, and not the obtaining of food. While one section of the black workers is thus engaged as sentinels, another and still more numerous division will be found busily employed in entering the quadrangle by a diagonal line bearing northeast, and carrying in their mouths flowers and fragments of aromatic leaves which they deposit in the center of the square. A reference to the accompanying sketch will give a more clear understanding of their course; the dotted line (a) representing the path of this latter action, while the mound of flowers and leaves is marked (c). If the line (a) be followed in a southwest direction, it will be found to lead to the trees and shrubs upon which another division of the black workers is settled, engaged in hitting off the petals and leaves to be collected and conveyed to the nest by their assistants below. On the west side of the encampment is a hole marked (d), leading down to the interior of the nest, which is probably chiefly intended for the introduction of air, as in case of any individuals carrying their loads into it, they immediately emerge and bear them to the common heap, as if conscious of having been guilty of an error. A smaller hole near to the southeast corner of the square, is the only other means by which the interior can be reached, and down this aperture, marked (h), the flowers gathered by the black workers are carried along the line (e), from the heap in the center of the square, by a number of smaller yellow workers (No. 1), who, with their weaker frames and less developed mouth organs, seem adapted for the gentler offices of nurses for the colony within. It is remarkable that no black ant is ever seen upon the line (e), and no yellow one ever approaches the line (a), each keeping his own separate station and following his given line of duty with a steadfastness which is as wonderful as it is admirable. By removing the soil to a depth of about three feet, and tracing the course of the galleries from the entrance (b) and (d),

a small excavation is reached, across which is spread in the form of a spider's web, a net work of squares spun by the insects, the squares being about one-quarter inch across, and the ends of the web fastened firmly to the earth of the sides of the hollow space which forms the bottom of the excavation. In each one of the squares, supported by the web, sits one of the honey-making workers, (No. 2), apparently in the condition of a prisoner, as it does not appear that these creatures ever quit the nest. Indeed it would be difficult for them to do so, as their abdomens are so swollen out by the honey which they contain, as to render locomotion a task of difficulty, if not to make it utterly impossible.

The workers, (No. 1), provide them with a constant supply of flowers and pollen, which, by a process analogous to that of the bee, they convert into honey. The fact that the remainder of the inhabitants feed on the emphy thus obtained, though it is surmised, has not been established by actual observation; indeed with reference to many of the habits of these creatures, we are at present left in total ignorance, it being a reasonable supposition that, in insects so remarkable in many of their habits, other interesting facts are yet to be brought to light respecting them. It would be of great value to learn the specific rank of the black workers (No. 3), and to know the sexes of the species forming the community, their season

DIAGRAM OF THE EXTERIOR OF THE NEST OF MYRMECOCYSTUS MEXICANUS.

and manner of pairing, and whether the honey-makers are themselves used as food, or if they excrete their saccharine fluid for the benefit of the inhabitants in general, and then proceed to distil more. I regret that at this time I am only able to bring before the notice of the Academy, specimens of the honey-makers (No. 2), the other members of the community, except from Captain Fleeson's description, being quite unknown to me. It is, however, my hope that at a future meeting I may be enabled to exhibit the other varieties, and to give some more extended information upon this very interesting subject. The honey is much sought after by the Mexicans, who not only use it as a delicate article of food, but apply it to bruised and swollen limbs, ascribing to it great healing properties. The species is said to be very abundant in the neighborhood of Santa Fé, New Mexico, in which district the observations of Capt. Fleeson were made.

THROUGH FREIGHT.—During the month of April nearly 4,000,000 pounds of through freight went East from this State by the Central Pacific Railroad. Among this was 19,000 pounds of quicksilver, 45,020 pounds of borax, and 21,934 pounds of lead bars; ninety per cent. of all this went from this city.

The Virginia and Truckee Railroad Company are putting up telegraph poles on the line of the track, and through all the tunnels between Gold Hill and Virginia, for the new telegraph wire of the Company.

The Willamette Woolen Factory, Oregon, is running full-headed and finds good sale for the articles manufactured. They buy all the wool they can get.

The Phoenix and K. K. Mining Companies are said to be about effecting a consolidation.

Borax.

There are now three sets of borax works in operation in Fish Lake Valley, and this number is to be increased by another set which Mr. Nadeau is about to erect, and run by steam. Mott & Piper are doubling the capacity of their works, now equal to 4,000 pounds daily, by the addition of four new vats. These works are said to produce the best borax in the country, it being fit for all ordinary purposes when boxed for shipment. Though all of Nadeau's teams and many others are employed in transporting this product of the several borax works about Columbus to the railroad, many more are needed to supply the demand.

Besides considerable quantities at other works, Mott & Piper had on the 1st of the present month, some 12 tons on hand, which, with a large daily addition, will have to remain there several weeks before the present force of teams can remove it.

The borax business has proved extremely profitable, and in consequence prospectors are keenly on the lookout for new fields. Extensive deposits have recently been found and located at two or three different points in Death Valley, some 70 miles and more south of Gold

The Largest Clyde-Built Merchant Vessel.

On Saturday afternoon, says *Iron*, a magnificent screw steamer, named the *City of Chester*, built for Messrs. Inman, of Liverpool, was launched from the shipbuilding yard of Messrs. Caird & Co., Greenock. The vessel is the largest merchant steamer that has ever been built on the Clyde, and she is farther said to be the largest afloat, with the sole exception of the *Great Eastern*. The *City of Chester* is to be engaged in the Liverpool, New York, and Philadelphia service, and will take her station during the summer. Her dimensions are as follows: Her length, over all, is 458 feet; at water-line 425 feet; breadth (moulded), 44 feet; depth, extreme, 38 feet 8 inches; moulded, amidships, 36 feet, 4 inches; hold, 34 feet 9 inches; saloon deck, 7 feet 4 inches; lower deck, 7 feet, 6 inches; height of bulwarks, 4 feet; tonnage, gross, 4,800; under gear deck, 4,500; builders' measurement, 4,156. Engines, compound, high and low condensing, 800 horse-power. Boilers, 15 in number, with 30 furnaces. Accommodation is provided for 132 first-class passengers, and 1,310 third-class. No provision is made for second-class passengers. Her ship's company, properly so called, will consist of 44 seamen, 42 engineers and firemen, and 49 officers (navigation and engineering), and ship's servants, bringing the whole number up to 135. Her store of fuel will amount to 1,400 tons, and her cargo space will be sufficient for about 2,000 tons of merchandise. The speed desired to be obtained on the ocean service is about 17 knots per hour. The vessel is ship rigged. The keel of the *City of Chester* was laid in December, 1871, and the construction of a vessel of such large dimensions was so unusual in Greenock, that great interest was felt in her progress. When toasting "Success to the *City of Chester*," after the launch, Mr. J. T. Caird referred to the great and rapid advance which has taken place in shipbuilding and engineering science on the Clyde within the last forty years.

When his firm settled in Greenock, at that time they built a vessel of 500 tons, and were unable to find a purchaser for her for some years, owing to the general objection that she was too large. That vessel was the largest that had till then been built on the Clyde. Many years afterwards his firm built the *Atrato*, also larger than any of her predecessors on the Clyde, and now his firm had the honor of turning out the *City of Chester*, the largest yet built. It would be vain, however, to expect that she would remain for any length of time the largest vessel, for, at the farthest, two years would see her quite eclipsed in size. Messrs. Caird will immediately commence the construction of another screw-steamer for Messrs. Firmen, which will be 50 feet longer, and have 600 hundred tons more burthen than the *City of Chester*.

SPRUCE MOUNTAIN DISTRICT.—A correspondent of the *Elko Independent* writes as follows: "The furnace of the Starr King Mining Company is completed, and turning out hullion. It started up on the 5th inst., just three weeks from the date of laying the foundation. The furnace is running with every evidence of being a complete success; while the first two days' run has produced eighty bars of bullion, which is pronounced by experts to be of excellent quality. This, with the fact that this district has many excellent mines, guarantees to us a permanent and prosperous camp. The Starr King Company is making arrangements to put an extra force of miners in their mines (Grecian Bend and Home Stake), and will commence taking ore from the large bodies of fine gray carbonate which are in sight. There are now some twelve hundred tons of good paying ore on the company's dump.

The miners are anxiously waiting for the snow to disappear from the mountain sides that they may renew with vigor their prospecting and developing, as they are feeling more confident than ever.

The town of Starr King is increasing steadily, the houses being substantially built, which gives it an appearance of permanence.

When the new road, being graded, is completed we will have a daily stage direct from Wells."

The Caribou silver mine and reduction works, situated in Boulder County, about 40 miles northeast of Denver, considered to be one of the richest silver mines ever opened in the United States, has been sold to the Netherlands Mining Company, of Holland, for \$3,000,000. The net profits of the mine for several months past have averaged \$1,000 per day. The new company will immediately double the capacity of the mill. Experts from Holland and England reported from \$2,000,000 to \$4,000,000 worth of ore in sight, and the mine was worth \$6,000,000. M. A. Shaffenburg, of Denver, has taken possession of the mine, mill and tunnel, as agent of the Netherlands Mining Company.—*Ex.*

The Segregated Rock Island Mine, Gold Hill, has been sold, according to the *News*, for \$35,000.

COLORADO COAL MINES, it is stated, turned out over 100,000 tons last year.

COPPER ore has been found in the head of Brown's Creek, Trinity Co., Cal.

Mountain. There it is said to lie on the ground from one inch to a foot in depth, but containing a large percentage of borate of lime and other impurities.

One of these deposits is in the immediate vicinity of the spot where those '49 emigrants abandoned their wagons, which were subsequently burned by the Indians. It is doubtful whether these new and extensive deposits will prove of any immediate value to the locators, as besides their reported inferior quality, their location is in or near the center of a most inhospitable region and distant from any practicable thoroughfare.

However, we are inclined to think that many of the supposed obstacles in the way of the successful working of these deposits will disappear by actual trial. Notwithstanding the fact that so many unfortunate have perished of thirst in the terrible desert of Death Valley, we have it from good authority that water can be obtained almost anywhere in the valley within three feet or less of the surface.—*Inyo Independent*.

VIRGINIA CITY still gives employment to many large teams of ten to fourteen mules each, notwithstanding the railroad facilities for transportation.

COAL has been found in Lake County, Cal., six miles from Harbin Springs. The vein is said to be two feet wide and can be traced for half a mile.

A COMPROMISE of the suit between the Richmond and Enreka consolidated companies, at Eureka, was not effected as was anticipated and the case is now being tried.

ELY DISTRICT is just beginning to be prospected, an unusual number of new locations having recently been made.

USEFUL INFORMATION.

Spiritual Photographs.

Photographers are acquainted with several different ways in which secondary images, sometimes called "spiritual photographs," may be made. If a double picture is desired, take a sensitive glass-plate which has served its turn as a negative—as many paper positives as may be needed having been taken from it—the film of collodion or other prepared surface is removed from it, and it may then be used for a wholly new photograph. But it is found that unless great care be used, some faint traces of the former picture still remain, and these may appear as a sort of ghostly attendant upon the figure forming the second picture.

One photographer in endeavoring to utilize an old plate which had fulfilled its duty as a negative, could not wholly erase the image, wash or rub as he might; there was always a faint ghost of the person accompanying any subsequent photograph taken on the same plate. Dr. Phipps relates that a friend of his received at Brussels a box of glass plates, quite new and highly polished, each wrapped in a piece of newspaper; a lady sat for her photograph, taken on one of these plates, and both the photographer and lady were astonished to see that her likeness was covered with printed characters, easily to be read—the ghost of a political article, in fact. In this case, actinic rays had done their work before the glass was exposed to the camera.

By another mode of manipulation, a photographer may produce a ghost-like effect at pleasure; a sitter is allowed to remain in the focus of the camera only half the time necessary to produce a complete photograph; he slips quickly aside, and the furniture immediately behind him is then exposed to the action of the light; as a consequence, a faint, or imperfectly developed photograph of the man appears, transparent or translucent, for the furniture is visible, apparently through his body or head. With a little tact, a really surprising effect may be produced in this way. As a third variety, one negative may be placed in contact with another, and a particular kind of light allowed to pass through it for a time; there results a double picture on the lower negative.

Curiosities of Water.

There is no material substance whose transformations are more marvelous, and whose relations are more complex and extensive, than those of water. A recent writer says:

"You take in your hand a bailstone, and it rapidly changes into a transparent fluid, which gradually vanishes, only to reappear, during frosty weather, in dew-drops upon your window, where it resumes, in delicate ramifications, its former crystalline solidity. You place another under a bell glass with thrice its weight of lime, and it soon melts and disappears, leaving behind it four parts instead of three of perfectly dry earth.

You subject an opal to chemical analysis, and find it but a combination of flint and water, the latter being to the former as one to nine.

Of the alum, the carbonate of soda and soap which you purchase of your grocer, the first contains forty-five, the second sixty-four, and the third, from seventy to seventy-three and a half parts of solidified water.

The clay field which you plow contains a ton of water to every three tons of soil; nay, the very air you inhale in ordinary weather holds diffused throughout every cubic foot of its bulk fully five grains of rarified water, which no more wets the air than the solidified water wets the lime or the alum in which it is absorbed."

If beefsteak be strongly pressed between two sheets of blotting paper, it will yield nearly four-fifths of its own weight of water, while the experiments of Berzelius and Dalton prove that of the human frame, not excepting the bones, one-fourth only is solid matter, the rest being water.

Delton found, by experiment on his own person, that five-sixths of the food taken by day to repair the human frame is also water.

Of potatoes, again, no less than 75 per cent. is water, and of turnips, at least 90—a fact which, as has been remarked, "explains the small inclination of turnip-fed cattle and sheep for drink."

ARTIFICIAL CORAL.—This may be employed for various kinds of ornamentation. It is made as follows: To two drachms of vermilion add one ounce of resin, and melt them together. Have ready the branches or twigs peeled and dried, and paint them over with this mixture while hot. The twigs being covered, hold them over a gentle fire; turn them round till they are perfectly smooth. White coral may also be made with white lead, and black, with lamp-black mixed with resin.

When fuel is burned in an open fireplace, at least seven-eighths of the actual or potential heat passes up the chimney unused. About one-half is carried off with the smoke, one-fourth with the current which flows in between the mantel-piece and the fire, and the remaining loss is represented by the unburned carbonaceous matter in the smoke.

REMOVAL OF THE CEREBRUM FROM THE LOWER MAMMALIA.—Notwithstanding the fact that any serious injury to the cerebrum (the upper portion of the brain, and that of the reasoning faculties and will) in man is attendant with instant death, if the same portion of the brain of fish, reptiles, birds, even common domestic fowls, and all the lower mammalia, be removed they experience but very little diminution in their powers of movement. Carp and frogs continue to swim as well as before; a pigeon when abandoned in the air flies to the ground, setting lightly on its feet; whilst a rabbit runs away when irritated, performing these movements with no appreciable difficulty, and with only a slight evidence of weakness. The weakness becomes much more noticeable when the operation is performed on a dog, though it is less marked in proportion as the animal is a young one. An adult dog deprived of its cerebral hemispheres is, however, no longer capable of maintaining the erect position, though it can still move its legs freely whilst lying down.

A case of this kind attracted much attention at Woodward's Gardens, in this city, a few years since, where a what was called a "headless rooster" was exhibited for some months, for the gratification of the morbidly curious.

SCIENCES AND THEIR USE.—Where screws are driven into soft wood, subjected to considerable strain, they are very likely to work loose; and many times it is very difficult to make them hold. In such cases we have always found the use of glue profitable. Prepare the glue thick; then immerse the screw, and drive it home as quickly as possible. When there is some article of furniture to be repaired, and no glue is to be had handily, insert the stick, then fill the rest of the cavity with pulverized resin, then heat the screw sufficiently to melt the resin as it is driven in. Chairs, tables, lounges, etc., are continually getting out of order in every house; and the time to repair the break is when first noticed. If neglected, the matter grows still worse, and finally results in the laying by of the article of furniture as worthless. Where screws are driven into wood for temporary purposes, they can be removed much easier by dipping in oil before inserting. When buying screws, notice what you are getting; for there are poor as well as good kinds. See that the heads are sound and well cut; that there are no flaws in the body or thread part, and that they have good gimlet points. A screw of one make will drive into oak as easy as others into pine, and endure having twice the force brought against it.—*Ohio Farmer.*

GOOD HEALTH.

How to Make Fat Folks Lean.

One of the most corpulent persons ever known was Daniel Lambert, of the county of Leicestershire, in England, who weighed five hundred and twenty-eight pounds. Persons whose normal weight is from one hundred and thirty to one hundred and sixty pounds, not infrequently attain to the weight of two hundred and fifty to three hundred pounds or more. Barnum had a young girl on exhibition some years ago, whose weight exceeded four hundred pounds. But this increase of weight is not growth. Bulk is not necessarily development. Obesity means, simply, an accumulation of fat in the areolar tissue. Fat persons are often spoken of as being "very fleshy." Flesh and fat are very different articles; nor does flesh increase because fat accumulates. On the contrary, all abnormal accumulations of fatty matter are attended with corresponding diminution of flesh. Even the viscera—stomach, liver, heart, lungs, kidneys, etc., are smaller in fat than in lean persons or animals.

The immediate cause of obesity is defective excretion. Sedentary habits and constipating ingesta are the remote causes. Vital temperaments are more liable to accumulate fat than mental or motive ones; for the reason that the viscera of organic life are larger and nutrition more active. For this reason, also, women are more inclined to obesity than men, other things being equal.

A fat person cannot be a perfectly healthy person, for the reason that the process of fattening is merely the accumulation of effete matter. For this reason, too, very fat animals—which bring the very highest prices in the market, and are preferred by epicures—are much inferior to lean flesh in nutritive value.

Among the articles which predispose to corpulency are broths, soups, sugar, and all starchy preparations; the latter being the principal ones. It is for this reason that carnivorous animals are never fat. Malt liquors are conducive to plethora, and thus indirectly conduce to obesity.

The remedial plan is as simple as are the causes. Drink only water, and that only according to thirst. Drink nothing at meals. Avoid all thirst-provoking condiments. Use no animal food except lean meat; nor fine flour in any form whatever. Bread should be made of unbolted meal, and without any yeast or rising of any kind. Fruits may be partaken of freely. Milk, butter, cheese and sweet-meats should be avoided.

Equally important is abundant exercise; not irregular and fitful, but steady and persevering. Occupation is better than play, for the reason that it is apt to be more systematic and

persevering. Plain simple food and exercise will gradually work off the accumulated adipose matter, increase the volume of blood, restore the wasted muscles and viscera, and recover the normal state and size.—*Science of Health.*

Health.

Among our individual acquaintances, how few there are that appear to be in regularly fair health! Inquire of him who boasts that he "never had a sick day in his life;" this paragon, to find whom you must seek through hundreds, confesses to occasional "biliousness," or rheumatism, or coros. My experience, as medical examiner to the Craftsman's Life Insurance Company, daily shows to me what a hollow mockery is the six feet, and brawny shoulders, and rosy face, and "round belly with good capon lined." One is shaky with his two or three cigars a day, which he is not man enough to omit; another seems bursting with rosy cheeks and health, which numerous glasses of brandy daily for years has but heightened; and his neighbor is pale and sodden and shaky from his meagre beer, or his sour wine, or his comparatively infrequent whiskey drinks.

This one eats no meat, and that one no vegetables; one works in dark and stifled rooms, and, after years of toil, is healthy and vigorous. The other lives in the sunlight, and draws fresh air from heaven with pain and anguish. And the sturdy, who seems to defy death, falls dead in the street, while the puny lives to boast of his superiority! Vanity of vanity.

But notwithstanding that it is apparent that we know but little in comparison with what may be known, is it not well without any vain assumption, or pluming ourselves upon this little—will it not be well to see what we do know, and, by recognizing the general laws of things, to aim at obtaining some particular rules for our own guidance? Shall not the chemist render useful service by carefully analyzing the objects before him, even if his "ultimate principles" are still lying before, like "new worlds to conquer?" Shall not the optician strive to increase the power of his instruments, even though the increased power of the glass but discovers two stars where but one was noticed before, and far beyond the furthest brilliant point before seen in the distant heavens the doubled lens but shows new worlds still stretching further from man's earth, and yet as near to God's heavens?

May not we, straining our eyes, not with the telescope at distant worlds, but with the microscope at the wondrous formations in our own frames—more wonderful because made in the image of God and containing an indwelling spirit, which the largest race, and, in some respects, the most educated upon earth, consider to be part and parcel of the great Creator of all—may not we, reverently and happily, aim to benefit our race somewhat, by gathering up some of the few recognized laws of our being, and by looking at health, strive to see what it is, and how it can be best obtained?

REMEDY FOR CHOKING.—A correspondent writing from Mission San Gabriel, in referring to a method which we lately published, for removing an obstruction from a child's nose, by blowing through the mouth, sends the following experience in removing obstructions from the throat: Last fall a child in that neighborhood got a peach-stone into her throat, and was fast choking to death, when her mother took her up by the heels, held her head downwards, and almost instantly the obstruction dropped out upon the floor.

ANOTHER CASE.—But a few days previous to the date of the above-mentioned note, a lady came rushing into the post-office, at El Monte, with her child in her arms, and choking with a piece of meat in her throat. The wife of the Postmaster, recollecting the case of the peach-stone, immediately caught the child by the heels, gave it a pretty severe shake, when out came the meat, to the great relief of the agonized mother, and the saving of the child's life. Our correspondent very properly thinks such incidents are worthy of a cord in the Health Department of the Press.

THE PHILOSOPHY OF DEATH.—According to the Spiritualist, spirits and mediums, clairvoyants and seers, all agree very closely in the descriptions they give to the natural process called death. The vital forces first quit the feet and lower extremities of the body, and those who have the power of spirit vision see a luminous haze slowly forming above the head, and connecting with it by a shining cord. Gradually, as the vitality of the body diminishes, the cloud above assumes a distinct shape, and the spirit form of the departing individual is seen lying in a state of insensibility above the prostrate body. At last the spirit awakes to consciousness, the silver cord still connecting it with the body is severed, and the newborn spirit quits the house in company with spirit friends and relatives who awaited his arrival. The spirit friends are often seen before life has entirely quitted the body, which is the reason why the dying so often talk of seeing departed friends around the bed.

DOMESTIC ECONOMY.

STRAWBERRIES.—The best use to make of this delicious first fruit of the year, is to pick and serve them on the stems, if possible, letting each one bull them for himself as he puts them one by one into his mouth. This is the nearest thing possible to eating them in the field or garden, which, of course, everybody knows enough to do when he gets a chance. These plans will be mostly available only to those who raise their own fruit. Much of this fruit which is brought to market is coarse and sour, and really needs cooking to make it palatable. Still, this cooking should be very slight, as the flavor is evanescent. Remember this in making pudding sauces of strawberry juice.

Whether for cooking or not, they should never be washed, if it can be avoided. When it must be done, pour them, a few at a time, into a bowl of water, stir carefully with the fingers until as clean as necessary, skim out and lay on a sieve to drain, being careful not to muss them. They will hardly do to serve *au naturel* now. If for "sauce," hull them, putting them at once into the dish in which they are to be served, and sprinkling sugar upon them as you proceed. Handle them as little as possible, and that little as near to the time of serving them as may be. They are better picked before the sun is hot in the morning; but after that they should stand, with out being disturbed, until time to put them into sugar. The time they will need to stand in sugar depends on their sourness. The best kinds need little, if any, sugar, and that put on after they have been dished out—each one serving and suiting himself.—*Science of Health.*

WHAT WE DRINK.—The Hollanders are credited with being the largest consumers of coffee in the world, and, next to them, the Belgians; but we can furnish statistics to show that neither of them compare at all with California in this particular. The annual consumption of coffee, per head, in the various countries named below is thus given by Dr. Schlosser, a Holland statistician: England, 1½ pounds to each person; France, 2¼; Germany, 4; Denmark, 5½; Switzerland, 6; Belgium, 8½; Holland, 10½; United States, 7 pounds to each person. In 1868, we consumed in California 8,300,000 pounds of coffee. Estimating our population then at 500,000 it gives 16 3-5 pounds to each individual. But we have more than 100,000 Chinese and Indians who do not drink coffee; this leaves 400,000 consumers, with an allowance of 20½ pounds to each person; or nearly twice the quantity, per head, consumed in Holland, and nearly three times as much as in other portions of the United States. The English are notoriously a tea-drinking people, preferring it to coffee. So far, this year, England has imported from China no less than 140,000,000 pounds of tea. Besides, the extent to which coffee is adulterated in England is almost unreliable. The daily allowance of coffee per capita to each person in the United States is about half an ounce, and in California one and a half ounces.

THE BREAD OF LIFE.—The London *Dietetic Reformer* shows, by scientific data, that wheat meal, which is cheaper than bolted meal (fine flour), contains one-third more nutriment than flour does from which the bran has been sifted. The adoption, therefore, of wheat meal instead of fine flour, as bread-making material, would be an immense saving, amounting to hundreds of millions of dollars annually. But this is an insignificant matter when compared with the sanitary aspect of the question. Fine flour is not food at all, in the proper sense of the term. The elements of the grain which are separated in the process of bolting, are essential to perfect nutrition; hence, those who use fine flour are obliged to subsist mainly on other things, or lose their health; so that nearly all they expend for a fictitious "staff of life" is worse than thrown away. No one who makes baker's bread a principal article of diet can long maintain health, while all who use wheat-meal bread (unless it is fermented or adulterated in some way) can always maintain health with a very little addition of other foods, either fruits or vegetables. As we said, therefore, in our last issue, the laboring population will become independent whenever they learn to "eat to live."

A CHERRY PUDDING can be made by boiling one-half pint of rice half an hour in five times as much water, and then pouring it boiling hot into one pint of wheat-meal. Mix thoroughly, and place it in small spoonfuls in a nappy, interlaying it with one pint of cherries (or more, if not very juicy), and then steaming half or three-quarters of an hour. Serve warm in the nappy, trimming it with melted sugar, or sweetened cherry juice, or some other sweet sauce. This recipe can be used for other such small fruits in their season, as will bear cooking enough to do the wheat-meal. Half an hour is the least that will answer for that purpose; three-quarters of an hour is better.

WHITE WAX.—To convert yellow wax into white wax, the former is boiled in water, spread out into thin layers, and exposed to the light and air. This is repeated until all the color is gone, and the wax remains pure and white.

INK FROM FLOORS.—Ink spots on floors can be extracted by scouring with sand wet in oil of vitrol and water. When the ink is removed rinse with strong pearlash water.

Table of Contents.

GENERAL EDITORIALS.—Coleman's Sulphuret Saver; The World of Atoms, 337. An Endless Wire Rope-way for Little Cottonwood Canon; Raising and Moving Brick and Stone Buildings, 344. The Vienna Exposition; Atmospheric Pressure in Mines, 345.

ILLUSTRATIONS.—Coleman's Sulphuret Saving Machine, 337. Notes on the Honey-Making Ant of Texas and New Mexico, 342. Plans of the Vienna Exposition, 345.

MECHANICAL PROGRESS.—Going Back on Compound Engines; Limit to Expansion of Steam; Comparative Tests of English and American Rails; The Fracture of Cast Iron Pier Cylinders; How to Put in Bolts, 339.

SCIENTIFIC PROGRESS.—Changes in River Beds; Aureola, or the Brain Atmosphere; The Mystery of Polished Surfaces; Substitute for Quinine; Electric Theory of Boiler Explosions; Minerals in Lava Deposits; Is a Whale a Fish; Capillary Attraction; Photographic Effects by Pressure Alone; The Poisonous Action of Metals; A Sensitive Plant, 339.

MINING SUMMARY from various counties in Nevada, Montana and Utah, 340-1.

MINING STOCK MARKET.—Table of Daily Sales and Prices and Comparative Prices for the Week; Notices of Assessments; Meetings and Dividends; Review of Stock Market for the Week, 340.

USEFUL INFORMATION.—Spiritual Photographs; Curiosities of Water; Artificial Coral; Removal of the Cerebrum from the Lower Mammalia; Sciences and their Use, 343.

GOOD HEALTH.—How to Make Fat Folks Lean; Health; Remedy for Choking; The Philosophy of Death, 343.

MISCELLANEOUS.—Mining in Central Nevada; Bonanza Count Works; Hoosac Tunnel—Curious Observations; The Old Spoonora Mines; The Cost of Building Steamers; The Callisto Mines; Mining in the Vicinity of Bozeman; A Singular Formation, 338. Borax; The Largest Clyde-Built Merchant Vessel; Spruce Mountain District, 342. Cinnabar in Solano County; The One-Ledge Theory; English Coal; The Dry Concentration Process; A New Concentrating Process; Big Blast; The Brooklyn; Coal Discovery; An Extensive System of Reservoirs; New Furnaces, 346. The Comstock Mines; New Incorporations; Meetings and Elections, 348.

THINK TWICE before you stop your paper, because just now your funds are low. If you stop a valuable paper you will not cut yourself (and may be others too) down in that which will be the most irreparable, that which will lessen you in the very highest qualities of your possessions; that which would give you greater power for accumulating for yourself and for usefulness to others? Had you not better dispense with some expenses that contribute merely to your lower wants; that will merely entail your pecuniary possessions; something that can be made up to you again by good fortune in any future day? Remember that a good newspaper helps you grow as well as your crops. You cannot make up lost time on live newspaper reading. Can you apply the sunshine of yesterday to the growth of to-day or to-morrow?

CORRECTION.—Our correspondent, "L. P. Mc.," wishes to state that the idea he intended to convey in his letter last week, in the first few lines, was that mining operations were not being carried on to any extent in Mariposa County, in the direction of Hitee Cove. Also that the "River Tunnel" will be 6,000 feet in length when completed, not 600 feet, as printed.

RICH PAY.—Quartz has been found in the Excelsior mine in Tuolumne County and is now being taken out.

The EUREKA mine cleared up from the amalgamators \$8,500 from six days run, with 10 stamps, a few days since.

PROSPECTING in the vicinity of Virginia City is more actively carried on at present than it has been for some years past.

The ANNUAL election of the Mechanics' Institute will take place on Monday, June 2d.

TUOLUMNETES are to have a reunion at Oakland on the 17th of June.

An Endless Wire Rope-Way for Little Cottonwood Canon.

Cheap and rapid transportation of material, particularly argentiferous ores from the Little Cottonwood mines to the railroad station at the mouth of the cañon, is a matter of grave importance to the mining interests of that region, especially during the long winter which is the rule in that locality. This well-known cañon is a deep gorge in the Wahsatch Range of mountains, 25 miles southeast of Salt Lake City, Utah, and is the only outlet to an extensive and exceedingly rich silver region, whose yield during the past season was about 400 tons of ore per day. All this ore had to be hauled over a narrow rugged mountain road at an expense of some \$7 per ton. The road referred to runs the whole length of the cañon, 8¼ miles, and is free from snow only about five months in the year. At the upper end of the cañon is Alta City, 3,200 feet above sea level and at the lower end is the town of Granite, 4,270 feet above sea level, or 3,926 feet below Alta, being an average grade of 476 feet to the mile. The snow lies at Alta for about seven months and has a depth of from 8 to 20 feet deep for a distance of five miles below Alta. It is a region of avalanches and snow slides which, as is well known, have several times occasioned serious damage and loss of life. The heavy grade in the cañon is unfavorable to the construction of a narrow-gauge railroad, and the depth of snow would necessitate snow sheds, etc., all attended with great expense. Several parties in this city having seen the advantages of the endless wire rope system in other localities, are now forming a company in this city for the purpose of putting up a wire rope road elevated on towers high enough above snow and other obstructions to carry its load free from all interruption at all seasons of the year.

Everyone who has been there knows that the locality is peculiarly favorable for a line of this kind, while at the same time no other system can compete with it in economy, and not at all during the winter months. There is little doubt, if it were erected, but that it would have all the carrying trade during the winter, and, if the company were reasonable in their charges, all of the summer trade also, then the mines could be worked during the winter and there would be no need of the great accumulation of ore in the dumps. The character of the seasons, depth of snows, points exposed to avalanches, etc., are all explained at length in the report of the engineer employed to look into the matter. During the winter months the charge for transportation down the cañon is from \$10 to \$20 per ton and up the grade is from \$20 to \$40 per ton and often for many weeks it is impossible to haul at all. In this cañon are the famous Emma, Flaggstaff and Vallejo mines with some 90 other mines more or less developed, the majority only partly so. The ore from these mines is argentiferous galena, yielding from \$16 to \$500 per ton in silver and from 12 to 60 per cent lead.

The high charge of transportation through the cañon precludes the possibility of shipping any very low grade ores. During the few summer months the ore is hauled in wagons, charging under favorable circumstances about \$5 per ton. Considerable money and time have been expended on the road to make it passable, but the experience of the past winter shows that its passage is still a difficult operation. It is frequently blocked by streams of loaded wagons. A fine stream of water runs throughout the year in the bed of the cañon at a point two miles below Alta, carrying about 1,000 inches of water in the driest season, and furnishing an abundant water power.

The engineers' report specifies the following as the ascent per mile from the town of Granite up the cañon, ¼ mile, 76 feet; first mile, 396 feet; second mile, 550 feet; third mile, 650 feet; fourth mile, 434 feet; fifth mile, 470 feet; sixth mile, 604 feet; seventh mile, 410 feet; eighth mile, 336 feet; total, 3,926 feet; average grade per mile, 476 feet, or 1 in 11. The advantages of the system set forth, are that the endless wire rope-way will run by gravitation, the loaded buckets descending, carrying back the empty ones with a grade of 1 on 8; hence, with the addition of a small amount of power on the line of route, furnished by the water privileges referred to, the line can be run with facility. The heaviest grade which a locomotive can propel itself is

300 feet to the mile. This is nearly reached at the Pittsburgh railway, Mount Diablo Coal Mines in this State, which, on a grade of 296 feet to the mile, carries coal down grade from the mine to the depot on the river. The American Fork, three feet gauge railroad, in Utah, has a grade of 296 feet to the mile for 1,700 feet, using a Fairlee engine. On this proposed line the angles are to be small, and the parts sustaining the bearing pulleys 150 feet apart. These, in order to carry the ore clear of the greatest depth of snow, will have to be 40 feet high for the upper four miles; below Tannersville their height can be materially reduced.

The small cost of constructing the endless wire rope-way system of transportation in comparison with any other; the facility with which it can be repaired in the event of a break from a heavy avalanche; the economy of its working; its ability to work under all conditions of weather and the rapidity and low cost at which it conveys its load, recommend it particularly for the purpose proposed at this particular locality. The undertaking if carried out will be of great benefit to the mining district of Little Cottonwood and will be the means of developing the mines more systematically and continuously than has been done before. The estimate of cost of construction of an endless wire rope-way of Hallidie's patent with a capacity of 500 tons per day and a length of 8¼ miles, places the total cost at \$150,755. This estimate provides extra arms to the posts throughout. So that in the event of the business requiring it, an additional line could be erected at very little cost. A very handsome profit could be made on the capital invested if they carry ore down at \$3 per ton and the company could afford to carry it for even less than that.

To construct this proposed ropeway it will take 3 grip pulleys, costing \$2,100; 8 plane pulleys, \$2,000; 580 sets of bearing and guide pulleys, \$1,500; 870 sets of carriers, steel clips, brackets, etc., \$26,100; two turbines, \$1,475; lumber, \$35,000; labor on construction \$20,000; 16½ miles of steel rope hardened and tempered, \$55,500. This in addition to freight of material to the cañon will amount to over \$150,000. It is probable if the company perfect the arrangements they expect to, work will be commenced on this road as soon as possible.

Atmospheric Pressure in Mines.

It is only until quite recently that any elaborate experiments have been made to find the laws of temperature and moisture at any considerable depths in the mines. Mr. Simonin, however, has recently published the results of a series of experiments for the purpose of ascertaining the increase of atmospheric pressure in deep mines, and especially such as go below the surface of the ocean. Mr. S. says as this increase has generally been found to be 1 millimetre for every metre as we descend, it remains to be seen whether the same would be the case in the shafts of mines where the air, confined in a narrow space, is at the same time exposed to the action of a powerful draught, and more or less impregnated with steam, and at variable temperatures. Operating in very deep shafts, our author had the opportunity of bringing the barometer below the level of the sea.

His experiments were conducted in the basin of the Saone and Loire, where the coal pits of the Crenoz and Epinae are situated. Two shafts are here 400 metres deep, and since the average reading of the barometric altitudes at the orifice is about 355 metres above the level of the sea, Mr. Simonin operated at a clear depth of 45 metres below that level. From his observations, it appears that at Epinae, as regards temperature, there is an increase of 10 Centigrade for every 50 metres of vertical descent; and, as regards pressure, a rise of 1 millimetre in the barometer for 11° of vertical descent. At the Crenoz there was an increase of 1° in the temperature for every 40° of vertical descent, and an increase of pressure of 1 millimetre for every 10 metres.

The averages, therefore, are: For temperature, 1° for 45 metres; and for pressure, 1 millimetre for 10½ metres. Mr. Simonin has taken care to operate only on shafts through which pure air enters; for the air that leaves the mine is vitiated, and unduly heated from various causes. The shaft should also be water-tight, and the wood work as much as possible free from decomposition by fermentation.

"A CARD" from O. W. Easton, in relation to the letter of our Mariposa correspondent last week, is unavoidably laid over. It will appear next week.

A \$40,000 strike is reported at the Mono mine in Dry Cañon, Utah.

BORAX from California is selling in New York at 24 cents, and that from Nevada for 20 cents.

A NUGGET weighing over eight ounces was taken out of a claim at Deer Valley, El Dorado County, last week, by E. N. Smith.

The World of Atoms.

It is quite impossible for the human mind to conceive of the minuteness of chemical atoms. M. A. Gusdin, an eminent French physician, has recently been investigating the molecular and atomic constitution of bodies, and has published the result of his researches. He holds that the distance from centre to centre of individual atoms does not exceed the 2,500-millionth part of an inch. To give some idea of this excessive minuteness, the Doctor states that there are as many atoms of oxygen and hydrogen in a single drop of water, as there would be grains of sand covering the entire surface of the earth to a depth of over one mile! These atoms are held to be spheroidal agglomerations of particles, each perfectly distinct from the other.

His theory of combination is, that an atom of one kind is always placed between two others of a different kind, and always exactly on the lines joining their centres. With these atomic files or lines he arrives at all the molecular arrangements indicated by chemical formulae, in which the atomic systems are invariably found perpendicular to the axis. The phenomena of crystallization is also referred to this parallel and symmetrical disposition of atoms. In square or hexagonal prisms, and in the rhomboid, the atoms preserve their invariable parallelism, perpendicular to the axis; while in the doubly oblique they observe two unequal distances; and it is this inequality that produces the phenomena of double refraction in crystals of unsymmetrical systems. These theories are novel and interesting, particularly in reference to their bearing on crystallization.

The extreme minuteness of the original particles of matter may help explain the wonderful transparency exhibited by most cometary bodies, many of which, though millions of miles in diameter, scarcely affect, to any appreciable extent, the brightness of the faintest star when they pass between it and the earth. That most comets do thus exist in this most extreme degree of divisibility, is known from the immense disproportion which exists between their actual mass or weight and their known diameters. A comet which, in its gaseous condition, has a diameter of many thousand miles, would, if brought to the density of earthly matter, be reduced to a diameter of only a few rods, or perhaps, even feet. The law of repulsion, by which all gases are governed, when applied to those gases existing in the condition of original atoms, would give us a form of matter so attenuated that it is only by some such illustration as is given above, in relation to a drop of water, that the human mind can conceive of it.

It is only through a knowledge of the possibility that a single drop of water may, by being separated into its ultimate atoms, be made to cover the entire earth, that we can form any idea of the probable fact that the heavenly bodies, although now separated by such immense distances, once absolutely filled all space, so that afar touched star throughout the immensity of the universe.

This ultimate or rather original extreme divisibility of matter will also explain the possibility of that highly attenuated, interplanetary ether, which is supposed to pervade all space, and all matter as well, and to actually separate each particular atom, as above described from every other, so that no one is in actual contact with its neighbor on either side. Such is the world of atoms as indicated by chemistry and philosophical research.

AN EXCELLENT PRACTICE.—An exchange complains of the "tendency in this country toward placing scientific men, rather than those of exclusive literary acquirements, at the head of our more prominent collegiate institutions." We deem it a matter of congratulation, rather than otherwise, that such a change in public sentiment, with regard to our educational institutions, is rapidly gaining ground. Practical education is the kind of learning that the country and the world is now most in need of.

THE SURVEY of the Colfax and Grass Valley narrow gauge railroad has been completed, and Engineer Watson's report as to the route is favorable.

COPPER ORE is selling at Salt Lake City as follows: Fifteen per cent. ore \$25 per ton; 25 per cent. ore \$45; thirty per cent. ore \$55; forty per cent. \$110 per ton.

The Vienna Exposition.

(FROM OUR SPECIAL CORRESPONDENT—GUIDO KUSEL.)

A week from now the Emperor Franz Joseph and the Empress will be received at the pavilion by the Protector, Archduke Carl Ludwig; the President, Archduke Rainer; and the Director, Baron Schwarz. The present princes and dukes will be greeted by the Emperor, and the high company will then proceed into the rotunda of the palace. At the same moment the national hymn will be sung by several "Sing-vereins," accompanied by Strauss' Orchestra. The Emperor and Empress take a place on a throne-estrade, where there is room for the prominent high guests and the archdukes. After the hymn the Emperor will deliver the opening speech, declaring that the Vienna Exposition of 1873 is opened. Archduke Carl Ludwig will answer as Protector, and Archduke Rainer as President of the Imperial Exposition Commission. A speech by the Mayor of Vienna will conclude the ceremony. The commissioners of the different countries go to their respective galleries to meet the Emperor in his rotunda.

To the present day, however, in the American department not a single box has been opened, except in the machinery hall, as our commissioners will probably keep away from their gallery. The Russians are just as far in their "putting up" as we are, occupying the extreme eastern end of the building. I send you

A Plan of the Different Buildings and pavilions as situated within the limits of the Exposition.

The numbers and letters on the accompanying cut signify: I. Palace of Industry; II. Machinery Hall; III. Art Hall; IV. Pavilion of Arts; V. Exposition of Art Amateurs; VI. Western Agricultural Hall; VII. Eastern Agricultural Hall; VIII. Pavilion of the Jury; IX. Emperor's Pavilion; X. Office of the Directory; XI. Post, Telegraph and Customs-House Offices; XII. Casino; XIII. Exposition of Horses; XIV. Railroad Station; W. Watch-Houses; A. Water Closets.

In the First Zone.

1. American Tavern; 2. Bier Halle of the Pilsen Brewery; 3. Bier Halls; 4. Hungarian Wine House; 5. American Bar-Room; 6. Pavilion of the "Nieu Presse"; 7. Swiss Confectionery; 8. Pavilion of Music-Boxes; 9. Bier Halle; 10. French Tavern; 11. Pavilion of the Duke Monaco; 12. Pavilion of the Domain Finepunk; 13. Swedish School House; 14. Swedish Army Exposition; 15. Swedish Hunting Pavilion; 16. Gothic Maneoleum; 17. Boiler Room; 18. Kiosk of the "Snedhehn"; 19. Kihhn's Dissectable House; 20. Pavilion of the "Erste Oesterr Sparbank"; 21. Sterk's Pavilion; 22. Pavilion of Little Children; 23. Restauration d Freres Provencean; 24. Salad Lettura; 25. Tavern; 26. Winehouse; 27. "Eisenhof" Exposition Hall for Metal Industry; 28. Pavilion for Austrian Medicinal Springs; 29. Pavilion of Tobacco and Cigar Specialties; 30. Pavilion of Perlmoseer Cement Wares from Nussdorf; 31. Russian Tavern; 32. Styrian Wine House; 33. Rnean Dwelling House; 34. Exhibition of the "Oesterreichischen Lolyd"; 35. Indian Tent; 36. Iron Hot-House; 37. Palace of the Viceroy of Egypt; 38. Japanese Buildings; 39. Circle Oriental; 40. Turkish Dwelling House; 41. Turkish Bazar; 42. Turkish Coffee House; 43. Persian Dwelling House; 44. Exhibition of the Imperial Royal Marine Ministry; 45. Light-House; 46. Photographic Association House; 47. Farm House of the Imperial Agricultural Society; 48. Sanitary Pavilion; 49. Building Yard; 50. Italian Tavern; 51. Exposition of the Horticultural Society; 52. Iron Furniture Pavilion; 53. Gardener's House.

Second Zone.

1. Light-House; 2. Ahmed Fountain; 3. Tri-

nump Port of a Brick Factory; 4. Russian Farm House; 5. Pump House; 6. Iron Church; 7. Swedish Farm; 8. Pavilion of Hungarian Forestry; 9. Pavilion of Styrian Forest Owners; 10. Saxonian Peasant House; 11. Szekler Peasant House; 12. Austrian School House; 13. Vorarlberg Farm; 14. Austrian Turner House; 15. Pavilion of Glase Paintings; 16. Slavakian Pleasant House; 17. Croatian Peasant House; 18. Rumanian Peasant House; 19. 20. Peasant Houses from near Prehurg.

Third Zone.

1. American Tavern; 2. Vienna Bakery; 3. English Working Mens House; 4. Pavilion for Seeds; 5. Water Tower for the High Pressure Water Conduit Pipes; 6. Iron House; 7. Swedish Tavern; 8, 9. Norwegian and Swedish Fisher Houses; 10. Norwegian Garden Kloeke; 11. Germany's Pavilion of Instruction; 12. Germany's Pavilion of Industry; 13. Germany's Exposition of Mining Industry; 14. Boarding House; 15. Pavilion Duke's Cohurg Gotha; 16. Duke's Sotmarzenberg Pavilion; 17. Pavilion Manthner; 18. Stahl Building; 19. Curtis' Ohelisk of Cement; 20. House of Artificial Stone; 21, 22, 23. Verderberg's, Innerberg's and Carinthia's Mining Industry; 24. Brewery; 25. Machine Shop Company's Building; 26. Tar and Aephntam; 27. Building Ornaments of Zinc; 28. Heffen's Machines Exposition; 29, 30. Rothschild's Bridge and Machine Exposition; 31. State Exhibition; 32. Wood Ware; 33. Pavilion of the "Staats Bahn"; 34. English Tavern; 35. Bridges and Road Building Association; 36. Tyrolian House;

France, is now produced in Germany up to 10 cwt. a day. It replaces the iodine-violet, the production of which, on account of the high price of iodine, is no more practicable. This change reduces the quantity of poisonous residue of the aniline factories, which, until now, consumed daily up to 30,000 cwt. of arsenical acid. This will be limited now only to the production of fuchsine; but even in this direction a favorable result is expected from the experiments made in all laboratories of the German factories to produce fuchsins without the use of arsenical acid. Two German chemists, Gracher and Lieberman, discovered (1868) that the dyeing matter of "madder" originates from carburated hydrogen, which appears also in the coal tar. Following up this discovery, they succeeded in making artificial alizarine from anthracene. Since 1870 this method, in producing alizarine from coal tar, is adopted by the most of the ten or twelve German aniline factories; only one factory is in England and one in France. The total produce of alizarins in 1873, amounts already to 22,000 cwt., of which, 15,000 are made in Germany.

Of the anthracene, the raw material for alizarins, there is for the present consume, an abundance of it in the five millions of cwt. of tar, produced in the gas works. The artificial alizarins dispense with all madder preparation, and the cultivation of madder is rapidly decreasing. At a lower price of alizarins, the import of log-wood will also considerably decrease.

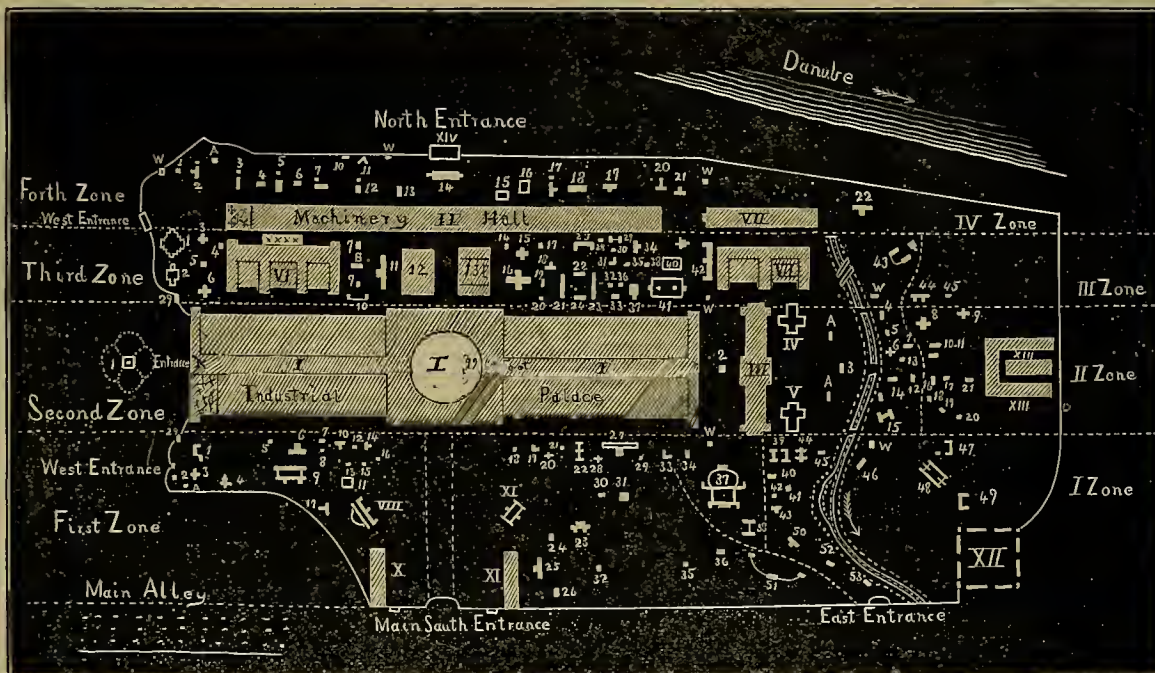

Since the above was in type our correspon-

popular hymn was sung by several "Vereins" accompanied by a selected band of music. The Emperor stepped up the estrade, on his arm the crown princess Victoria, of Germany, and the crown prince of Germany with the Empress, followed by the princes of Walles of Denmark, the arch-dukes, etc. It was a brilliant company in which, amongst the ladies, the Empress was the handsomest; but there is no need of writing much about this affair as the particulars of the whole ceremony were telegraphed the next day to the *New York Herald* at the expense of about \$7,500. For this purpose an American reporter, a French one, and Mrs. L. Mulbach from Berlin were engaged by the paper names.

In a clear, suphonic voice the Emperor declared the exposition of 1873 opened. After the ceremony the most of the visitors remained in the exposition rayon till six o'clock, p. m. The exposition is open, but several weeks of hard work is at hand yet, before all will be arranged. The English, Belgian, French, German and Austrian exposition is the most advanced, but it is premature to describe anything of this sort.

There was a strike here by the *factors* or hackney coachmen, lasting, however, only two or three days, but which created, nevertheless, the utmost consternation among those, who imagine that walking on foot is an impossibility. The end of the strike commenced on the 30th of April, so that everything went on smoothly on the 1st of May. This strike was humorous, considering the short time, but the other, that pounced on

our Commissioners here, was a very humiliating affair to all Americans. The Europeans, especially after several of the late public swindling in the United States were published, are very much inclined to point out the United States as the hot-bed of corruption, without taking any notice of their own. One can read almost every day a swindling story in the newspapers, in which Counts and Barons, as well as common people, are implicated. Nevertheless, this event with the United States Commissioners at the World's Fair, in which the whole world is represented, was a very bitter pill, and it is now with the new Commissioners Meers LeGrend and B. Canon, to avoid confusion, and to make "something" out of our

Ground Plan of the Exposition Rayon, at Vienna, with all Extra Buildings, Pavilions and Separate Expositions, 1873.

37. Additional Exposition for History of Inventors and Industry, and Pavilion for Ladies' Work; 38. Pavilion; 39. Danube Steamship Company's Pavilion; 40. Alien Peasant House; 41. Exposition of the Imperial Agricultural Ministry; 42. Wine Hall of all Countries; 43. Tavern; 44. Pavilion for Forest Industry; 45. Pavilion of arch Duke Albrecht.

Fourth Zone.

1. Bakery; 2. Boiler Room; 3. American Boiler House; 4. English Workmens House; 5. English Boiler House; 6. English Workmans House; 7. French Boiler House; 8. English Gas Factory; 9. Gas Company, Limited; 10. Belgian Workmens House; 11. Machine Shop; 12. Swiss Boiler House; 13. Belgian Boiler House; 14. Pavilion of the World's Trade; 15. German Boiler House; 16. Germany's Pavilion for Brick and Ice Machine; 17. Austrian Boiler House; 18. "Nord Bahn" Pavilion; 19. Nord-west Bahn Pavilion; 20. Boiler House for Water Conduit; 21. Pavilion Ring Hofer.

The German Aniline Exhibition.

In 1867 the German production of aniline oil was equal to 10,000 cwt. per year, but to the present time it increased to 25,000 cwt. The consumption of this article in the German color factories, however, is larger, so that 10,000 cwt. more is imported from outside. About a hundred pounds of fuchsine is produced daily, besides other dyeing matter. Also methyl-aniline, heretofore fabricated only in

deut writes as follows under date of May 2d: "The opening of the Exposition was effected yesterday, in the way I described in my last letter. The weather was not favorable for the occasion. It rained at intervals through the day, and damaged many elegant dresses of ladies who were caught on foot. The palace itself was opened at nine o'clock, but a great many visitors started out before six, in the morning, visiting the different buildings in the rayon. The programme was to close the palace at 11 A. M., but at this time one end of the carriages was at the portal of the Exposition, the other in town; There were many invited guests; free cards were also given to exhibitors and reporters of the press, of which there were over a thousand. The regular tickets for the 1st of May were sold at \$12.50 a piece, season tickets at \$50, and for ladies \$25. These season tickets are good also for the 1st of May. After the fourth, each single ticket costs 50 cents, and on Sunday 25 cents. The Prater alley was crowded with splendid carriages; a large force of police was busy to preserve order and to regulate the movements of carriages, etc. In the rotunda of the palace at half past twelve nearly all the places were taken up. The diplomatic corps were present all in gala array and a great variety of brilliant military uniforms were seen, amongst them the Hungarian magnates in their rich national costume. At 12 o'clock the Emperor and his guests entered the rotunda, while the

exposition, and to save the Union from being ridiculed. It is very lucky that Mr. McElrath was left in his place.

A Vienna correspondent of the *Daily News* exaggerates in an article about the expensive living in Vienna, stating that a "moderate" dinner costs from five to six shillings, and thinks that from the 1st of May a dish of soup will cost fifty cents. A moderate dinner, including wine or beer, costs two shillings, or fifty cents, in a decent, but second-class restaurant. Even on the 1st of May, in the exposition rayon, a moderate dinner amounted only to seventy-five cents.

CORUNDUM—EMERY.—An exchange reports the discovery of "a mine of corundum, an substance harder than emery," in Chester county Pennsylvania. It is said to be the only continuous deposit of the kind in the world, corundum generally being found in nodules. "Corundum harder than emery" is good, considering that emery is nothing else than corundum itself. Whatever is found in commercial emery that is not corundum, is an adulteration either added or not removed. A mine of pure corundum, of a character suitable for the manufacture of emery would be valuable.

THE SUTRO TUNNEL.—A meeting of the stockholders of the Suto Tunnel Co. is called for the 23d of June, to act upon a proposition already submitted, to increase the capital stock to twenty million dollars.

Cinnabar in Solano County.

A range of hills traverses the centre of the peninsula in Solano county, lying between the bays of Napa and Suisun. The Sulphur Spring Mountain, in which extensive deposits of cinnabar have long been known to exist, forms the southern limit of this range. The *Vallejo Chronicle* furnishes a complete history and an elaborate description of the mines. It says

The First Explorations for Cinnabar

And other minerals in the Sulphur Spring mountain were made by John Neate in 1852. In 1858 Mr. Neate placed before the late W. E. Barron, specimens of the cinnabar and coal taken therefrom. Barron discouraged the opening of any new quicksilver mine, stating as a reason, that the supply was greater than the demand. In 1862 Neate having become discouraged in the hope of obtaining the help of capitalists, determined to start himself in the attempt to develop a mine, and engaged some miners to help him, when the Sussol grant was rejected, the uncertainty of titles now prevented him from making any developments. In 1863 the titles being quieted, Neate obtained rights and privileges from the land owners and got fairly under way. The first actual mining done for quicksilver was upon the Brownlie ranch; here Neate mined with the help of six or eight miners for eighteen months and during that time extracted a quantity of rich ore, some of it going as high as eighty-five percent. About \$30,000 has been taken from the surface of this mine. It has not been explored to a greater depth than forty feet, and that in only one place. The mine is in the hands of the executors of the late W. E. Barron. After leaving this mine in 1870, he commenced prospecting

The St. John Quicksilver Mine,

Which is now attracting much attention. This mine and works are located on the Wilson Hill Ranch, which is situated five miles directly north of Vallejo, in the range of high hills that form a portion of the coast range. It is reached by three routes from Vallejo—all good wagon roads. The best and most pleasant, however, is via the Brownlie and Surveyor Rowe ranches; the next is via the Vallejo White Sulphur Springs; the third is via the Hunter Ranch. Though the first is by far the most agreeable and shortest route, it is only by the courtesy of Messrs. Rowe and Brownlie that it can be traveled, being their private property. A beautiful drive of a mile or so through the hills, passing on the right near the road the quicksilver mine and splendid furnace on the Brownlie Ranch, brings the visitor to the grounds of the St. John's Company, and within a few yards of the ledge or lode that gives such great promise of immense value, and has made the mine an object of many visits of quicksilver experts and geological celebrities. Character of the Ledge and Progress of the Explorations.

The ledge runs southeast and northwest, near the summit of one of the highest hills in the range, and dips to the north at an angle of about forty degrees; it was opened by a drift twenty feet below the out-crops, developing a width of thirty feet for the ledge with fifteen per cent. Ore all the way through; at the end of the tunnel or drift or at the "wall" on the east side the workmen have gone down with an incline for a distance of fifty feet; and it is in this latter mentioned excavation where the largest deposit of rich ore has been found. Our reporter descended the incline and saw a sight of wealth and riches pleasing to look upon. From the mouth of the incline, every foot down, the rock grew richer and richer, and the bottom of the incline was one solid mass of 50 to 60 per cent. ore; and out of the last twelve feet, the Superintendent informed us that he had taken five thousand dollars, and from, of the whole excavation, between seven and eight thousand had been taken out. It has been estimated by experts that there is something like forty or fifty thousand dollars in sight there. It is considered by nearly all who have visited the mine that the entire ledge contains as large, if not the largest and richest deposit of cinnabar possessed by any mine in the State at the present time. The Superintendent, acting on this belief, and to thoroughly test the matter, is running in a tunnel to tap the ledge on a level one hundred and seventy feet below the outcrop. This tunnel is already in one hundred and fifty feet, and it is expected that the workmen will strike the ledge in two or three weeks. Should they find the metal there, as in every probability they will, the richness of the mine will be fabulous, and its value as salable property immense. Another drift was pushed in on the ledge further east and at a higher level than the drift just described, to tap the metal already in sight, at a distance of twenty five feet below the bottom of the incline. The workmen here have struck the ledge, and a large body of water was drained off, and they are fast approaching the ore.

At a distance of two or three hundred feet west of the location of the above described operations, near the summit, a little prospecting has been done, developing a vein six feet wide, containing a leader of very rich metal six inches in width, with a foot and a half of paying ore on each side, which, when first discovered, was only the thickness of one's hand, growing wider as the workmen went down upon

it. Out of excavation, which is not of sufficient dimensions to screen a yoke of oxen, over \$800 has been taken out. The lode of this portion of the mine has been traced and explored for a half mile, and at intervals of twenty or twenty-five feet, shows the outcrop of metal of exceedingly rich character.

When Mr. Neate first commenced prospecting on this ranch, he ran a two hundred foot tunnel in a hill adjoining, and north of the last mentioned eminence, in which he found quite a large body of a low grade of ore. At three or four other places he has opened on considerable bodies of low grade rock, which will pay to work, especially at this point, where a mine can be operated so economically.

A mining expert thus speaks of the St. John's ledge: The Sulphur Spring mountain has an altitude of twelve hundred feet from the bay, and can be drilled to a depth of eight hundred feet with an easy tunnel. The development is in a ferruginous clay slate and sand stone. The clay slate lode is twelve feet wide having well defined walls of blue talcose slate. This lode, for fifty feet, has produced paying ore. The lode is in sandstone thirty feet wide with two well defined walls. The metal crosses the lode, being about one foot upon the foot wall and runs to four and five feet upon the hanging wall. This has been explored to a depth of forty feet, the ore and its matrix having that soft, rich, sugary appearance that cinnabar delights to live in. Other explorations upon the lode is showing a splendid out-crop, and is considered by all quicksilver miners who have examined or worked in it, as unparalleled in richness, and bids fair to out-rival the famous Almaden mines.

The Brownlie Mine.

The Brownlie mine is two miles southeast of the St. John's. The ore occurs in clay slate (metamorphic) which changes to Jasper, having a well-defined wall of talcose slate of cream color.

Quicksilver Smelting Works.

The superintendent of the St. John's mine is rebuilding the furnace, making it of much greater capacity and adding two more condensing chambers. The furnace torn down was too small for general use; it was built as an experiment in carrying out an idea of Mr. Neate's. It being a success, Mr. N. has applied for a patent, and is having the new one built on the same principle; it is now about completed. They have a furnace partially constructed, which can be completed very quickly whenever the occasion requires its use. We will endeavor to give the reader an idea of the manner of securing the quicksilver from the ore with the Neate furnace. The furnace proper is constructed of brick in a circular form between nine and ten feet in diameter and about thirteen feet high; the largest diameter of this furnace inside is four feet and six inches; it has a depth of twelve feet; the chamber is charged by filling it with ore and coke—a layer of each, one above the other; and its capacity is eight tons of ore every twenty-four hours; the fire is started in the chamber or furnace with an exceedingly heavy draught, the quicksilver raises in a vapor and passes with the smoke through a large flue about twenty feet long into the first condensing chamber, which is of brick, about twelve feet square. By the time the vapor finds the egress to the second condensing chamber, the principal portion of the vapor has cooled off, precipitating the liquid silver, which is run off into proper receptacles through small iron spigots from the bottom of the chamber. There are five condensing chambers altogether, situated about ten feet apart, connected by a long brick flue, each chamber gathering some quicksilver, but in the fifth chamber little if any is found, about all the vapor having condensed before reaching that point; the smoke then passes off into a chimney, thence into the atmosphere.

Thirty men are now employed by the Company, but accommodations are being made for one hundred.

The Company was incorporated on the 27th of April and the following officers were elected: President, E. J. Wilson; General Superintendent, John Neate; Secretary and Treasurer, L. C. Fowler; Trustees, E. J. Wilson, John Neate, L. C. Fowler, S. G. Hilborn, and J. W. Batcheller.

THE ONE-LEDGE THEORY.—Recent developments in the Pioche mines tend to prove as correct the one-ledge theory—that is, that in any mountain characterized by numerous argentiferous veins, those veins all tend, like small veins running to the main arteries in the human system, to one grand central deposit. The ledges on the south side of Spring mountain generally dip to the north, those on the north side to the south, and the bodies of ore have increased in extent as depth has been attained. If development continues in the future as they have in the past, we will yet be able to boast as great an extent of ore as have been exposed in the Comstock mines.—*Record*.

ENGLISH COAL.—The evidence so far taken by the select committee appointed by the English House of Commons to investigate the cause of the extraordinary advance in the price of coal tends to establish the fact that the increase in the price of the article is much larger in proportion than the increase in wages. There are serious complaints respecting the effects of high wages in diminishing the labor of workmen. It is stated that the men can now earn as much money in two or three days as they formerly did in six, and as they have more money they waste more time in idleness and drinking.

The Dry Concentration Process.

We have already referred to a dry concentration process employed by a company in Star Cañon, Humboldt county. It is called the "Krom process," and is said to work admirably. It concentrates the rebellious ores of Humboldt county to a tenth part of their bulk and at small expense and small loss of their assay value. The Salt Lake *Tribune* has been furnished with the following items in relation to the operations of the process in Star Cañon:

Work was commenced in March, 1873, on ores from the De Soto mine, in that district. The ore consisted from three to five per cent. of base metal, principally antimony, also some lead and zinc; the silver mostly occurs as a black sulphuret. The assay value in silver was about \$54 to the ton.

The following results of the treatment of the ore by three different methods are of interest to the mining and scientific world:

First—By amalgamation (stamp mill) process, the loss was to such an extent as not to leave any margin at all for the expenses of working.

Second—By the most approved method of wet concentration, 75 per cent. of all the silver was lost, and the 25 per cent. saved for final treatment, was not sufficient to pay expenses.

Third—By Krom's dry crushing and dry concentrating process over 95 per cent. of silver was saved, and the result produced was over \$1,000 in silver to the ton of concentrated ore from the original which contained in bulk only \$54 of silver to the ton.

If correct, these statements are important. Works on this plan are about to be started in Utah, and the *Tribune* says:

We shall look forward to the erection of these works with a great deal of interest, for, if the Krom process proves to be what is claimed for it. Mr. Nichols will prove a benefactor to every poor miner in Utah, by enabling him to utilize every pound of ore now so poor in silver as to be absolutely worthless; and when it is considered that we have millions of tons of such low grade ores which, if utilized and made to yield a good profit, as claimed by Mr. Nichols, the great importance of his process of concentration will be at once apparent. The problem of working low grade ores in the West economically has not yet been satisfactorily solved, we therefore hope the Krom process of concentration will prove the boon we need in Utah.

A New Concentrating Process.

Some reference has already been made in these columns to the new concentrating works on Star creek, in Humboldt county. In these works a new process for the concentration of ores has been introduced, and, from all accounts, is operating with success. It is well adapted to the rebellious ores of Humboldt county, and the Silver State promises for it wonderful results. The ores are concentrated by a dry process, we believe. The works were erected by an Eastern company at a large expense, and similar works, we understand, are in contemplation elsewhere. It reduces thirty tons of ore daily, at a light expense, to less than one-twentieth its original bulk, saving the valuable metals to within five or ten per cent. of the assayed value. This is what is claimed by the Silver State, and if the statement be true, the process must prove of great value. That journal says: "It is at present reducing inferior ore from the De Soto mine, hitherto valueless, with profit, the concentrating ore assaying from \$4,200 to \$2,000, according to the percentage of base metal it contains. This can be easily handled and shipped to San Francisco or elsewhere at a comparatively small expense."

These results, which we have received from a reliable source, indicate what can be accomplished in mining here with this concentrator. It is just the thing needed, and if it continues to work as represented it will stimulate the mining interest of the Humboldt range to activity. The ores of the range referred to are of a peculiar character. They abound in base metals and are exceedingly difficult to work. They cannot be profitably reduced by the ordinary wet processes of crushing and amalgamation, nor do they, as a rule, contain sufficient base metal to make the smelting of them profitable. This Star Creek process, therefore seems to be just what is required, and might be introduced with advantage in other portions of the State.—*Va. Enterprise*.

BIG BLAST.—A blast of 250 kegs of powder was, 15th inst., put into the Excelsior Gravel Claim, at Placerville, El Dorado County. According to the *Republican* more than \$4,000,000 in gold has been taken from this claim since 1850, from about 60 acres of land. They took out nearly \$100,000 last winter from the second washing—or the tailings—on which they have been at work for the past eight months. The effect of the blast will aid materially in future hydraulic operations.

Iron ore has been found in Marion County, Oregon.

THE BROOKLYN.—The Brooklyn mine is one of the latest developments of the district, and, as it is attracting considerable attention at the present time, we yesterday paid it a visit, to report on it from personal observation. It is situated about a mile east of Main street, and a short distance from the Bowery hoisting works. The main shaft was begun by a party of practical miners the first of last November. When the shaft was down 78 feet, they drifted 32 feet to the north, but without finding the ledge; they then drifted southward 25 feet and cut a vein of good ore 18 inches wide. The vein was then followed 25 or 30 feet to the west, widening considerably in this drift, from which some very rich ore was extricated. A winze was then started down on the ledge from the bottom of the shaft, which had been sunk 13 feet when we visited it yesterday. The ore body at the bottom of the winze is four feet wide, strong, and both walls are as smooth and well defined as any walls we ever examined, the dip from where the vein was first struck to the bottom being at an inclination of about 36 degrees, and very regular. The ores are all of the chloride class, not a tracing of lead having been found in a number of assays. Five assays were taken of ore at different places in the winze from top to bottom, not one of which showed less than \$100 of silver to the ton. The strike of the ledge is easterly and westerly, the dip to the south, and the formation is quartzite. The vein is still improving as depth is attained. On these facts the reader can form his opinion as to the Brooklyn. It certainly promises to become one of our most important mines. The fortunate locators and owners are A. W. McDonald, C. Wagoner, J. A. Forbes, L. A. Bull and Levi Levitt—all industrious and intelligent practical miners. They are pushing developments with all energy.—*Pioche Record*.

COAL DISCOVERY.—The *Virginia Enterprise* says the natural supply of wood fuel in that region is rapidly becoming exhausted, and the enormous prices which the citizens of Virginia are annually compelled to pay for firewood, renders any indication of a coal discovery hereabouts an important event. For several years past it has been known that coal exists in the vicinity of Verdi on the line of the Central Pacific Railroad. Several attempts have, at various times, been made to develop the mineral in paying quantities, but until quite recently nothing has been found to warrant the existence of a permanent coal bed. During the past two months Mr. Lewis Wentworth, of this city, in company with some other gentlemen, has been prospecting the Verdi mine.

Wentworth has just returned with an ample supply of samples of coal and the accompanying rocks. At the depth of twenty feet from the surface, the shaft which the party has been sinking, passes through an eight-foot layer of gray sandstone and bituminous shale, under which lies an apparently well defined seam of shaly coal of unknown thickness. The seam lies in a horizontal position, and has been penetrated to the depth of three feet without reaching its nether side. The coal, when free from shale and sandstone, is, for croppings, unusually good, and burns readily when ignited. The accompanying rocks in the vicinity of the mine are those usually accompanying a coal measure, such as tertiary sandstone, gray sandstone, shale and conglomerates. The Wentworth party are vigorously at work on the claim, and we earnestly hope their labors may be crowned with success.

AN EXTENSIVE SYSTEM OF RESERVOIRS.—Messrs. Parke & Bowie, says the *Enterprise*, have filled Seven-mile Cañon from their large tailings mill up as far as the Winfield Mill with a complicated system of reservoirs for catching tailings and slimes. Of some of these the tailings themselves form the walls, their outer edges being built up as the tailings accumulate, while others are constructed of lumber or are excavations in the hill sides. They stand one above another, terrace fashion, and while one is being filled another is drying out, in order that its contents may be removed. The contents of all these reservoirs are almost incalculable, and as long as the mills above continue to reduce ore the accumulation goes on. The tailings which find their way down Six-mile Cañon are also caught and saved. Even after they have once worked the tailings, Parke & Bowie catch them in reservoirs below their mill, and so work them again and again until they have worn them out and they float off with the water to Carson River, refusing to be again caught or further tortured. In looking at all these traps for saving the nimble silver, and in reflecting upon the former wasteful modes of working, one cannot but sigh when he thinks of the millions in gold, silver and quicksilver now forever lost in the sandy bed of Carson River, and the broad marshes of its sink.

NEW FURNACES.—The *Arizona Citizen* says that two new furnaces are nearly completed at Sierra mines, and the work of smelting silver and lead ores will soon commence. Samuel Hughes & Co. sent some experienced smelters this week to examine the mines, with a view to putting up works as soon as possible. About thirty men are at work there now, and if the ores pay as assays and tests indicate, this will soon become one of the most populous, prosperous camps in the Territory. Mr. Hughes has had from the commencement great confidence in this district, and has kept men steadily at work there for a year and a half. We hope and believe he will receive a rich reward for his enterprise.

DEWEY & CO.,

American & Foreign Patent Agents,

OFFICE, 233 MONTGOMERY STREET, S. F.

The best, speediest, and surest method for you to obtain patents, file caveats, or transact any other important business with the Patent Office at Washington, or with foreign countries, is through the agency of DEWEY & CO., PUBLISHERS OF THE MINING AND SCIENTIFIC PRESS, SAN FRANCISCO, an able, responsible, and long-established firm, and the principal agents on this side of the continent. They refer to the thousands of inventors who have patronized them, and to all prominent business men of the Pacific Coast, who are more or less familiar with their reputation as straightforward journalists and patent solicitors and counsellors. We not only more readily apprehend the points and secure much more fully and quickly the patents for our home inventors, but with the influence of our carefully read and extensively circulated journals, we are enabled to illustrate the intrinsic merits of their patents, and secure a due reward to the inventor, besides serving the public who are more ready to give a fair trial, and adopt a good thing, upon the recommendation of honest and intelligent publishers.

To Obtain a Patent,
A well-constructed model is generally first needed, if the invention can well be thus illustrated. It must not exceed 12 inches in length or height. When practicable, a smaller model is even more desirable. Paint or engrave the name of the article, and the name of the inventor, and his address upon it.

Send the model (by express or other reliable conveyance), plainly addressed, to "DEWEY & CO., MINING AND SCIENTIFIC PRESS OFFICE, SAN FRANCISCO." At the same time, send a full description, embodying all the ideas and claims of the inventor respecting the improvement describing the various parts and their operations.

Also send \$15 currency, amount of first fee of the Government. The case will be placed on our regular file, the drawings executed, and the documents made up, and soon sent to the inventor for signing.

As soon as signed and returned to us with the fees then due us, it will be sent straightway to the Patent Office at Washington.

When the invention consists of a new article of manufacture, a medicine, or a new composition, samples of the separated ingredients, sufficient to make the experiment (unless they are of a common and well-known character), and also of the manufactured article itself, must be furnished, with full description of the entire preparation.

For Processes, frequently no model or drawings are necessary. In such case, the applicant has only to send us an exact description, and what is desirable to claim.

For designs no models are necessary. Duplicate drawings are required, and the specifications and other papers should be made up with care and accuracy. In some instances for design patents two photographs, with the negative, answer well instead of drawings.

For further information, send a stamp for our illustrated circular, containing a digest of PATENT LAWS, 112 illustrated mechanical movements, and HINTS AND INSTRUCTIONS regarding the RIGHTS AND PRIVILEGES of inventors and patentees, which will be furnished post paid. Also a copy of NEW PATENT LAW of 1870.

Address DEWEY & CO.,
PUBLISHERS, PATENT AGENTS AND ENGRAVERS,
No. 233 Montgomery street, S. F.

Valuable Premiums and Subscriptions.

A Sewing Machine
of Real Value
(Beckwith's)
given for \$40
worth of Subscriptions.

The AMERICAN AGRICULTURIST, in speaking of this Machine, says:
We are prepared to endorse the Beckwith Sewing Machine as one worthy of being at once secured by all who cannot purchase the expensive machines.
1st. It is well and strongly made.
2d. It is easily attached to any table or stand having a leaf or edge projecting an inch or so, and can thus be used in any part of the house, near a window, etc.
3d. It makes the elastic loop stitch (the same as the Willcox & Gibbs and some other good machines), which with a little care in making the closing stitch is abundantly strong for nearly all kinds of sewing, and less liable to break in washing and wearing, owing to its elasticity.

WE WILL GIVE
For \$12, a Machine and the Illustrated Press, 1 year.
For \$12, a Machine and the Mining & Scientific Press, 6 mos.
For 12, a Machine and the Pacific Rural Press, 6 mos.
For \$13.50, a Machine and the Mining & Scientific Press, 1 yr.
For \$13.50, a Machine and the Pacific Rural Press, 1 year.
For \$40, we will give a Machine and \$40 worth of subscriptions to either paper or all jointly. Send for Circular.

Express charges must be paid by the purchaser. Address for further particulars, the PUBLISHERS OF THIS JOURNAL.

WE WILL CHANGE THE ADDRESS FREE for any subscriber who notifies us in writing of his new address, with the OLD P. G. address to enable us to find his name among thousands of others.

REASONS WHY THE

PAIN-KILLER

MANUFACTURED BY

PERRY DAVIS & SON

IS THE

Best Family Medicine of the Age!

And why it should be kept always near at hand:

- 1st. PAIN-KILLER is the most certain Cholera cure that medical science has produced.
- 2d. PAIN-KILLER, as a Diarrhoea and Dysentery remedy, seldom if ever fails.
- 3d. PAIN-KILLER will cure Cramps or Pains in any part of the system. A single dose usually effects a cure.
- 4th. PAIN-KILLER will cure Dyspepsia and Indigestion, if used according to directions.
- 5th. PAIN-KILLER is an almost never failing cure for Sudden Colds, Coughs, etc.
- 6th. PAIN-KILLER has proved a Sovereign Remedy for Fever and ague, and Chills; it has cured the most obstinate cases.
- 7th. PAIN-KILLER as a liniment is unequalled for Frost Bites, Chilblains, Burns, Bruises, Cuts, Sprains, Etc.
- 8th. PAIN-KILLER has cured cases of Rheumatism and Neuralgia after years standing.
- 9th. PAIN-KILLER will destroy Bolls, Felons, Whitlows, Old Sores, giving relief from Pain after the first application.
- 10th. PAIN-KILLER cures Headache and Toothache.
- 11th. PAIN-KILLER will save you days of sickness and many a Dollar in time and Doctor's Bills.
- 12th. PAIN-KILLER is a purely Vegetable preparation, safe to keep and to use in every family. The simplicity attending its use, together with the great variety of diseases that may be entirely eradicated by it, and the great amount of pain and suffering that can be alleviated through its use, make it imperative upon every person to supply themselves with this valuable remedy, and to keep it always near at hand.

The PAIN-KILLER is now known and appreciated in every quarter of the Globe. Physicians recommend it in their practice, while all classes of society have found in it relief and comfort. Give it a trial.
Be sure and buy the genuine. Every Druggist, and nearly every Country Grocer throughout the land, keep it for sale. m3-4t

LEA & PERRINS'

WORCESTERSHIRE SAUCE.

Declared by Connoisseurs to be the only good SAUCE

Caution Against Fraud.

The success of this most delicious and unrivalled Condiment having caused certain dealers to apply the name of "Worcestershire Sauce" to their own inferior compounds, the public is hereby informed that the only way to secure the genuine is to ask for LEA & PERRINS' SAUCE, and see that their names are upon the wrapper, labels, stopper and bottle.

Some of the foreign markets having been supplied with a spurious Worcestershire sauce, upon the wrapper and labels of which the names of Lea and Perrins have been forged, L. and P. give notice that they have furnished their correspondents with power of attorney to take instant proceedings against manufacturers and vendors of such, or any other imitations by which their right may be infringed.

Ask for LEA & PERRINS' Sauce, and see name on wrapper, label, bottle and stopper.

Wholesale and for export by the Proprietors, Worcester; Cross & Blackwell, London, &c., &c., and by Grocers and Oilmen universally. 15v24-tf

Useful Inventions

FOR THE

House, Field and Farm.

- A safe and perfect FIRE KINDLER.
- A HORSE RAKE that has no equal.
- PARSHALL'S LUBRICATORS for Locomotives and Stationary Engines.
- SHEARS for cutting grapes and flowers.
- A NEW ROLLER SKATE that is superior to all others.
- Self-Regulating DRINKING FOUNTAIN for fowls.
- A superior ROAD SCRAPE.
- The cheapest and best FARM FENCE ever built.
- A POST DRIVER that every farmer should have.
- A SASH TIGHTENER that keeps out all dust, takes the place of weights, and keeps the windows from rattling.
- A BED SPRING that never gets out of order.
- A POTATO DIGGER that will dig a row as fast as a man can walk.
- A HOUSEHOLD TOOL needed in every family.
- A GAS LAMP that costs only half a cent per hour to burn.
- The best SELF-OPENING GATE ever invented.
- A PLOW on a new principle—it works to perfection in adobe.

Betts's Capsule Patents.

To prevent infringements, notice is hereby given, that Betts's name is on every Capsule he makes for the principal merchants in England and France, thus enabling vendor, purchaser, and consumer not only to identify the genuineness of the capsule, but likewise the contents of the vessel to which it is applied.

The LORD CHANCELLOR, in his judgment, said that the capsules are not used merely for the purpose of the ornament, but that they are serviceable in protecting the wine from injury, and insuring its genuineness.

TO BUILDERS AND ARCHITECTS.

Brooklyn Freestone Quarries,

Three miles from the Brooklyn R. R. Depot and Landing, and 4 1/2 miles from Oakland City Hall.

Having just completed a good road to these quarries, we are prepared to furnish large or small orders for either dimension stone, or rubble stone, in San Francisco, Oakland, or Brooklyn, at such prices as cannot be competed with, for equal quality of stone; for base and elevation walls, for public and private buildings, monuments, fence walls, coping, window caps and sills, doorway trimmings and steps, curbing stones, curbing for streets and sidewalks, pavements for streets and street-crossings, bases for grave-stones and plain and ornamental work for cemeteries, etc.

We can furnish cellar and basement walls of rubble stone of superior quality in San Francisco at about the cost of brick work for the same.

The gray freestone from these quarries is considered far superior to that of any other within practical distance of San Francisco. It is readily worked and impervious.

For samples we refer to the first story of the City Hall, Oakland, erected four years since, and the window caps and sills, and other finished work in the Deaf and Dumb Asylum, Oakland; in the Oakland Cemetery around the lot of J. S. Emory. Also small specimens in the offices of Augustus Laver (Architect of the S. F. City Hall) Kearny St., J. H. Day, (Architect, Cor. Kearney and California St., S. F.)

Orders may be left with George W. Thompson, on the premises, or A. T. DEWEY, SCIENTIFIC PRESS office, No. 23 Montgomery St. S. F., where samples of the stone may be seen.

2v25-3m E. G. DENNISTON, Proprietor.

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared to have them constructed in the most perfect manner and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the miller forces the pulp to the center, where it is drawn down through the rollers, and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Others made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill-men are invited to examine these pans and settlers for themselves, at the office, 229 Fremont Street, San Francisco

best manner. No. 32 Fremont street, S. F. 19v23-3m

BURLEIGH ROCK DRILLS

—AND—

Air Compressors.

The Burleigh Rock Drills, which have stood the test of five years' constant use at the Hoosac Tunnel, and which are now in use in nearly every State in the Union, as well as in Europe and South America, are unequalled in efficiency and economy by any other Drilling Machine. They are of various sizes, and equally well adapted to Tunneling, Shaffing, Open Cut or Quarrying, and will drill six to ten inches per minute in granite. They are driven by steam above ground. The Burleigh Air Compressor is the best engine yet devised for furnishing the "air motor" for the many purposes to which it is now being used.

They are to be used on the St. Gothard Tunnel, Switzerland; Tunnel 13 miles long. We refer to the following gentlemen and works:

Gen. Newton, U. S. A. Hell Gate Tunnel, L. I.
Mess. Shanley, Hoosac Tunnel, Mass.
J. Dutton Steele, Nesquehoning Tunnel, Pa.
Sidney Dillon, Fourth Avenue Work, N. Y.
Col. Roebbing, East River Bridge Company, N. Y.

SELL YOUR PATENTS

Through WIESTER & Co., 17 New Montgomery street,
SAN FRANCISCO, CAL.

BROWN'S PATENT LAMP.

One of these Lamps, when placed at a distance of 200 feet from the bank, will light up a bank surface 260 feet in length and 160 feet high, and to a much better advantage than any other light heretofore tried, and at an expense not to exceed five cents per hour. Lamps furnished at short notice.

Letter of Recommendation.
Mr. C. B. Brown—Sir: Your Patent Lamp for lighting hydraulic mines, which you sold to me in December last, has given entire satisfaction, and far exceeds my expectations, and I think it the best and cheapest light ever used to light mining claims by night, and am satisfied that I have saved three hundred dollars by the use of it in the last mining season over pitch or any other light of the same brilliancy; and I will also say that if I could not get another lamp, five hundred dollars would not buy it.
Yours,
W. D. APLIN.

Little York, Nov. 5, 1872.
For further particulars, address,
fe22-1f C. B. BROWN, Placerville, Cal.

P. J. PHILLIPS & CO., No. 608 Clay street, near Montgomery, San Francisco, are agents for Brown's Lamp, where it may be seen.

The California Powder Works

No. 314 CALIFORNIA STREET.
SAN FRANCISCO.

Manufacturers and have constantly on hand
SPORTING,
MINING,
And BLASTING
POWDER,

OF SUPERIOR QUALITY, FRESH FROM THE MILLS. It being constantly received and transported into the interior, is delivered to the consumer within a few days of the time of its manufacture, and is in every way superior to any other Powder in Market.
We have been awarded successively

Three Gold Medals
By the MECHANICS' INSTITUTE and the STATE AGRICULTURAL SOCIETY for the superiority of our products over all others.
We also call attention to our
HERCULES POWDER.

Which combines all the force of other strong explosive now in use, and the lifting force of the BEST BLASTING POWDER, thus making it vastly superior to any other compound now in use.

A circular containing a full description of this Powder can be obtained on application to our Office.
16v20-3m JOHN F. LOHSE, Secretary.

NEW ENTERPRISE.

KEELER, HINE & THOMAS COMPANY,

New York and San Francisco.—Manufacturers of

The Celebrated Sluithour Pump.

We offer this wonderful Pump on this coast, confident that it surpasses any other in use when the amount of water discharged, the power required and the cost are compared; also the simplicity and durability of its working parts add to its great merit. It rarely getting out of order, and when it does, requiring no skill to repair it. It has no equal as a Windmill Pump.
Farmers, stock raisers, miners, ship owners, captains of vessels, dry-dock owners, irrigating companies, railroad men, or any one interested in Pumps, come and see its wonderful operations. This Pump has been approved (as a Fire and Bilge Pump) and adopted by the Supervising Board of Inspectors of Steam Vessels, and by the Secretary of the Treasury, as appears by Circular No. 4, issued from the Treasury Department February 21, 1872. This Pump can be seen at practical exhibition and for sale at our warehouse, No. 727 Market street, San Francisco. This Pump was exhibited and tested, with wonderful results, at the last State Fair in Sacramento.

MINING SUMMARY.

California.

ALPINE COUNTY.

Alpine Miner, May 24: Tarshish mill is still running, and has made no definite clean-up yet. Mr. Hunter says he has about 60 tons more to run through before arriving at any thorough understanding of the experiment.

AMADOR COUNTY.

KENNEDY—Amador Ledger, May 24: It has been several weeks since we have mentioned this mine, but as it has run along so smoothly and satisfactorily under the superintendency of Mr. P. Reichelt, we could only speak well. We now find that the new shaft has reached a depth of 386 ft., and that it has been decided by the Co. to run a level from this point west until they strike the main lead, which will be done within 20 or 30 ft. From the old shaft the Co. are taking out some splendid rock, and the mill grinds out its regular monthly allowance of precious gold. The rock taken from the present level is improving in richness, and has every indication of lasting for years to come.

ALPINE—We are informed by a gentleman from Plymouth that the workmen in this mine have already struck some exceedingly rich ore, and that the Co. feel highly elated.

CALAVERAS COUNTY.

GWIN—Calaveras Chronicle, May 24: The contract for sinking the south shaft 100 ft. below the 600-ft. level is nearly completed. Only about 18 ft. remain to be sunk. We learn that another contract has been let to the same parties now engaged in the shaft to sink it 100 ft. below where the completion of their first contract will leave it, making 800 ft. in all. The ledge shows remarkably well in the bottom of the shaft, and the mine is paying largely. Immense quantities of ore are being taken from the various stopes, and the batteries are all kept in constant motion.

OKLAN UP—Simpson & Co., proprietors of the great hydraulic in Tunnel Ridge, partially cleaned up this week. How much gold was obtained we don't know, but we hear the amount stated all the way from \$5,000 to \$20,000.

AUSTRIAN—We understand that some of the richest ore ever discovered has lately been found in this mine near Jesus Maria. Our informant states that a single sack of quartz taken from the bottom of the shaft was estimated to contain \$3,000 in gold.

WORTH'S HILL—Prindle & Martin are making huge strides in their hydraulic claim. They have probably better facilities for working their claim to good advantage than most miners. They have already made a "face" of 200 ft. wide, 80 ft. high and 160 ft. deep. The company have two "runs" of sluices, the main run being 1,000 ft. in length. The dump will accommodate any amount of tailings, and the claim is good for twenty years to come.

PETER DAVIS has hung up his hydraulic for a season, and is now operating upon a quartz ledge above Lattimer's store. The vein shows up middling well, is about 7 ft. wide, and carries well defined walls.

ALEX. BROWN is putting the Epizootic shaft down as fast as picks and muscles will permit. He expects to find pay dirt at the depth of 60 ft., and rich at that. Jack Barker has 200 ft. of bed-rock tunnel to run before he can drain the hill. The claim, at the last working, hung to the tune of \$3 and \$4 per day. The ledge pitching into the hill, and the great amount of water encountered necessitated the running of a tunnel before the ground can be worked.

SQUIRES & Co., near Worth's Hill, still continue bringing the yellow stuff to light. The tunnel is in about 80 ft. They have a steady and even paying claim.

EVERETT—Calaveras Citizen, May 23: The machinery necessary for working this claim is being rapidly put in position. In the management of this mine, the Co. have felt their way carefully, and now feeling certain that it is a good investment, have determined to erect nothing but permanent improvements. With this view, they are erecting machinery capable of sinking 160 ft.

RODASINO—This claim has been paying about as usual for several months past, and the rock still continues to increase in richness. From a deficiency of water, however, the mill will be stopped in 2 or 3 weeks.

ODONABURO SOUTH EX.—Last Saturday there was struck a highly encouraging prospect. They are running a tunnel to cross the ledge, which they expect to strike in less than 300 ft. from the mouth of the tunnel. The tunnel is now in something more than 100 ft. After drifting a short distance they found some beautiful specimens of quartz, studded with bright sheets of plate-gold, quite similar to some of those from the Cedarberg, which have become so familiar. The strike has caused considerable excitement in Greenwood and vicinity.

EL DORADO COUNTY.

ST. LAWRENCE—Placerville Democrat, May 24: Ten new stamps have been added to the battery of the St. Lawrence Mill, and on Saturday last the whole were set in motion, so that now the product of that first class ledge is being crushed to powder by 30 stamps at the rate of over 40 tons in each 24 hours. The shaft is now down to a depth of 500 ft. with a thickness and ore of a better quality than any heretofore opened. Drifting is to be immediately commenced in both directions at the 500 ft. level, while at the same time work will be continued in the upper levels and the work of sinking the shaft will be vigorously prosecuted.

AT GEORGETOWN, last Sunday we were shown a beautiful specimen of gold which had been taken out during the previous week, by Mr. Sliney, at his claim on Wilton Hill, about 8 miles above Georgetown. This specimen was 4 1/4 inches long, nearly an inch wide, perhaps over 1/4 of an inch thick, remarkably regular in form and shape, bright, washed gold, pure, of great fineness, and weighed a trifle over 3 ounces.

The Mining & Scientific Press,

Started in 1860, is one of the oldest weekly journals now published in San Francisco. It has been conducted by its present proprietors for nine years, during which period it has been repeatedly enlarged and constantly improved. The active and steadfast efforts of its publishers have gained for its conduct an amount of practical experience greater than any other publishers have accumulated on this coast, of a weekly journal.

The aim paid by us for the best editorial talent obtainable for our special class journal; for engravings, for interesting news and correspondence, and for printing a large-size, handsome sheet, is unequalled by that of any other American weekly west of the Mississippi.

As a PRACTICAL MINING JOURNAL it has no rival on this Continent.

It is the only MINING, and the only SCIENTIFIC journal of the Pacific States.

Every Miner, Assayer, Millman, and Metallurgist in the United States should take it.

Every Pacific Coast Mechanic, Engineer, Inventor, Manufacturer, Professional Man, and Progressive and Industrial Student should patronize its columns of fresh and valuable information.

Every Mining Engineer, Superintendent, Metallurgist, Mine Owner and Mine Worker in the world should profit by its illustrations and descriptions of New Machinery, Processes, Discoveries and Record of Mining Events.

Every intelligent thinker in the land, in high or humble situation, who would avoid literary trash for genuine information, should SUBSCRIBE AT ONCE.

DEWEY & CO.

Publishers, Patent Agents and Engravers,
338 Montgomery street, S. F.

GIANT POWDER.

Patented May 26, 1873.

THE ONLY SAFE BLASTING POWDER IN USE.

GIANT POWDER, NO. 1.

For hard and wet Rock, Iron, Copper, etc., and Submarine Blasting.

GIANT POWDER, NO. 2.

For medium and sesmy Rock, Lime, Marble, Sulphur, Coal, Pipe Clay and Gravel Bank Blasting, Wood, etc.

Its EXCLUSIVE use saves from 30 to 60 per cent. in expenses, besides doing the work in half the time required for black powder.

The only Blasting Powder used in Europe and the Eastern States.

BANDMANN, NIELSEN & CO.,

General Agents, No. 210 Front Street.

EACH ISSUE CONTAINS

Sixteen well filled pages.
Original and Choice Engravings.
Editorials on Home Industries.
On various kinds of Stock-rearing.
On Horticulture and Gardening.
Correspondence from Farming Districts.
Answers and hints to Correspondents about Local Farming.
Good Health and Useful Information.
Reports of Farming Clubs.
Mechanical and Scientific progress.
Agricultural Notes from all quarters.
Domestic Produce Markets.
Home Circle.
Domestic Economy.
Mechanical Hints and Domestic Receipts.
Home and Farm Matters.
Affording, in all, more of real instructive and profitable matter for general readers than any other weekly on this side of the Continent.

Subscription, in advance, \$4 a year. Single copies 10 cts. Four single copies, of late dates, sent postpaid for 25 cts.

DEWEY & Co.,

Publishers, Patent Agents and Engravers, No. 338 Montgomery street, S. E. corner California, S. F.

Laws Concerning Corporations.

[Under the New Code—January 1, 1873.]

GENERAL PROVISIONS APPLICABLE TO ALL CORPORATIONS.
WAGON ROAD CORPORATIONS.
WATER AND CANAL CORPORATIONS.
HOMESTEAD CORPORATIONS.
MINING CORPORATIONS.
LAND AND BUILDING CORPORATIONS.
ALSO, MINING PARTNERSHIP LAW.

A pamphlet containing the above provisions concerning Corporations has been printed from the Statutes of California. It furnishes those who wish these special laws an opportunity of obtaining them for the small sum of 25 cents (post paid). Address, Dewey & Co., Publishers, and Patent Agents, S. F.

THE NEW U. S. MINING LAWS.

The new Laws of 1872, governing the location and purchase of Placer and Quartz Mines and Agricultural Lands in Mining Districts of the U. S., printed in circular sheet, for sale at this office. Single copies, 25 cts. Usual discount to the trade.

C. P. R. R.

COMMENCING

Sunday, May 4th, 1873,

And until further notice, Trains and Boats will

LEAVE SAN FRANCISCO.

7.00 A. M. (Daily). Atlantic Express Train (via Oakland) for Sacramento, Marysville, Redding, and Portland, O. Colfax, Reno, Ogden and Omaha

7.30 A. M. (Daily). Cal P. R. R. Steamer (from Broadway Wharf) Connecting at Vallejo with Trains for Calistoga, Knight's Landing and Sacramento; making close connection at Napa with stages for Sonoma.

2.00 P. M. (Sundays excepted). Stockton Steamer (from Broadway Wharf), touching at Vallejo, Benicia, and Landings on the San Joaquin river.

3.00 P. M. (Daily). San Jose Passenger Train (via Oakland), stopping at all way Stations.

4.00 P. M. (Sundays excepted). Passenger Train (via Oakland) for Lerop, Merced, Visalia, Tipton, and Los Angeles, Stockton and Sacramento.

4.00 P. M. (Sundays excepted). Cal. P. R. R. Steamer (from Broadway Wharf) connecting at Vallejo with Trains for Calistoga, Knight's Landing and Sacramento.

4.00 P. M. (Sundays excepted). Sacramento Steamer (from Broadway Wharf), touching at Benicia, and Landings on the Sacramento river.

6.30 P. M. (Daily). Overland Emigrant Train (via Oakland)—Through Freight and Accommodation.

OAKLAND BRANCH.—Leave San Francisco, 7.00, 8.10, 9.20, 10.10 and 11.20 a. m., 12.10, 1.50, 3.00, 4.00, 5.15, 6.30, 8.15, 9.20 and 11.30 p. m. (9.20, 10.20 and 3.00 to Oakland only).

LEAVE OAKLAND, 7.40, 8.50, 9.10, 10.00, and 11.10 a. m., 12.00, 1.40, 2.50, 3.50, 4.05, 5.20, 6.30, and 10.20 p. m.

ALAMEDA BRANCH.—Leave San Francisco, 7.20, 9.00, and 11.15 a. m., 1.30, 4.00, 5.30, and 7.00 p. m. (7.20, 11.15 and 5.30 to Fruit Vale only).

LEAVE FRUIT VALE (for San Francisco), 7.30, 7.00 and 10.45 a. m., and 3.30 p. m.

LEAVE FRUIT VALE, 7.35, 7.55, 9.00 and 11.20 a. m., 1.30, 4.05 and 5.30 p. m. *Except Sundays.

THE TANITE COMPANY.

Manufacturers of SOLID EMERY WHEELS. From 1 inch to 3 feet in diameter. EMERY GRINDERS for Stove Manufacturers, Foundries, Machine and Rail Road Shops, Planing Mills and Saw-Mills.

Emery Wheels and Saw Gunning Machines for sharpening and gumming GANG, MULAY and CIRCULAR Saws. A judicious use of Tanite Emery Wheels and Grinding or Gunning Machines, will more than repay the cost in this year's work.

Write for Circulars and Photographs to THE TANITE CO., Stroudsburg, Monroe co., Pa. 9726-6m16p

Mine for Sale at Michigan Bar.

A one-half interest (1,300 feet) in the mine is offered for the sinking of 60 additional feet—the present depth of shaft being 60 feet, well timbered throughout. Parties will have to furnish everything connected with working the mine. Assay value at depth of 48 feet, from State Assay Office, \$10 in gold; silver, \$5 per ton making \$13 per ton.

For further information apply to m15 8td-3ts JOHN J. COLLINS, Lodi, Cal.

PURCHASERS please say advertised in Scientific Press.

W. T. GARRATT & CO.

CITY Brass and Bell Founder,
Corner Natoma and Fremont Streets,
MANUFACTURERS OF

Brass, Zinc and Anti-Friction or Babbet Metal CASTINGS,
Church and Steamboat Bells,
TAVERN AND BELL, GONGS,
FIRE ENGINES, FORCE AND LIFT PUMPS.

Steam, Liquor, Soda, Oil, Water and Flange Cocks, and Valves of all descriptions, made and repaired. Hose and all other Joists, Spelter, Solder and Copper Rivets, etc. Gauge Cocks, Cylinder Cocks, Oil Globes, Steam Whistles, HYDRAULIC PIPES AND NOZZLES for mining purposes, Iron Steam Pipe furnished with Fittings, etc. Coupling Joints of all sizes. Particular attention paid to Distillery Work. Manufacturer of "Garratt's Patent Improved Journal Metal." Highest Market Price paid for OLD BELLS, COPPER and BRASS.
W. T. GARRATT, JAMES HILLMAN, W. T. LITTLE.

N. W. SPAULDING, Saw Smithing and Repairing ESTABLISHMENT.

Noe. 17 and 19 Fremont Street, near Market.

MANUFACTURER OF SPAULDING'S

Patent Tooth Circular Saws. They have proved to be the most durable and economical Saws in the World.

Each Saw is Warranted in every respect.

Particular attention paid to construction of

Portable & Stationary Saw Mills.

MILLS FURNISHED AT SHORT NOTICE

At the lowest Market Prices.

HALLIDIE'S Patent Endless Wire Ropeway.

Covered by Numerous U. S. Patents.

IMPORTANT TO

Mining Companies, Civil Engineers, Contractors, Etc.

The system of transporting material, such as Ores, from the mine to the mill, Earths for embankments, Rock from quarries, etc., by means of steel wire rope, has been well tested and found more economical, advantageous and reliable than any other method of transportation; and to the annexed certificates in connection therewith I beg to call the attention of those interested:

EUREKA, Nevada, July 10, 1872.
T. M. MARTIN My dear sir: On your leaving for San Francisco, it gives me great pleasure to hand you my written acceptance of the HALLIDIE TRAMWAY put up by you upon our mine in Freilburg.

It is a perfect success, discharging ten tons of ore per hour with two men's labor. It is perfectly simple in construction, and, as far as I can judge, there is nothing about it to ever get out of order—nothing to wear out. While ours requires but about two thousand five hundred feet of wire rope, I can see no reason why the line could not be extended almost indefinitely with equally happy results. Again, the carrying capacity might be doubled or quadrupled if desired. After several weeks trial upon our mine, the unanimous verdict of all who have seen it is a complete, unquestioned success. If this can be of any service to you, use it in any way you think proper. Very respectfully, O. O. GOODWIN.

EMMA HILL CONSOLIDATED MINING CO., Little Cottonwood, Utah.

T. M. MARTIN, Engineer. The Ropeway constructed by you (HALLIDIE'S PATENT) for the Emma Hill Consolidated Mining Company, has been built in a most substantial and workmanlike manner, and is at this time in splendid working condition. I have seen nothing yet that I have seen it is a complete, unquestioned success. If this can be of any service to you, use it in any way you think proper. Very respectfully, O. O. GOODWIN.

W. W. COLBATH, Superintendent.

"The Vallejo works smoothly with the elevated wire tramway, which carries its load of ore as quickly and easily as if there was no winter or snow in the world."

"Whatever the objections to wire tramways may be on account of their cost, I have seen nothing yet that I have seen it is a complete, unquestioned success. If this can be of any service to you, use it in any way you think proper. Very respectfully, O. O. GOODWIN."

Correspondent Utah Mining Journal, Alta, Jan. 8, 1873.

The Vallejo Ropeway.

The Vallejo Tunnel Company's Tramway in Little Cottonwood, built on the HALLIDIE PATENTED PLAN, is a complete success. It is between 2,500 and 2,600 feet in length, and is supported by thirteen stations. The fall in this distance is about 600 feet, and the wire rope, which is three-fourths of an inch in diameter, will safely and easily deliver one hundred tons in six hours. The machinery is automatic, loading and unloading the sacks or buckets. About one ton and a half can be sent down at one time.

The stations are about two hundred feet apart, and the entire apparatus is strong and safe. As there is no winter or snow, the tramway is about forty feet above the surface of the hill, the Tramway can be worked all winter long, without the slightest trouble.

Utah Mining Journal, Salt Lake, Sept. 24, 1872.

Mining Companies and others desiring to negotiate for the erection of this system of Ropeway, can communicate with me personally, or through Postoffice Box 904.

A. S. HALLIDIE, Patentee, 112 and 114 California Street, SAN FRANCISCO.

WIRE ROPE For hoisting from mines, transmitting power, ship rigging etc., of all kinds and sizes, on hand and made to order.

Wire of all kinds and descriptions, furnished at lowest rates. A. S. HALLIDIE, 112 and 114 California St.

Send this paper to your friends abroad.

VOLUME XXVI.
Number 23.

Public Breathing Places.

The attention of the Eastern press has been directed of late to the question of economy in laying out public pleasure grounds. We do not speak of the moral and sanitary benefit of such reservations—long admitted and needing no further argument—but of the real monetary economy, as conclusively proved by recent reports of the Park Commissioners of New York, Brooklyn and Philadelphia. In these three cities a large minded, liberal policy has been attended with the most satisfactory results. When millions of money were called for in behalf of the Central Park of New York, the press, while advocating moderate expenditure, derided the idea that anything but pecuniary loss would follow the execution of the project; and the proposed plan was considered to be little better than actual sinking of funds, so far as any return was concerned. But to the surprise of everyone, and far exceeding the most sanguine hopes of the Board, the Central Park has paid for itself ten times over in the improvement of adjacent property and consequent proportionate increase in taxable real estate. The more extravagant the plan, apparently, the higher the ratio of returns.

To review briefly the history of the Central Park: In 1858 the tract of land lying between Fifty-ninth and One-hundred-and-tenth streets, and Fifth and Eighth avenues, now celebrated as the most beautiful of all artificial pleasure grounds, was a barren waste of unsightly rock varied only by stagnant swamps. A less inviting field for the landscape gardener could hardly have been imagined. To initiate the movement, large prizes—\$10,000, \$5,000 and below—were offered for the best plans submitted to the board. In this competitive examination the leading engineers, architects and landscape gardeners, representing the highest taste and skill of the nation, proffered their various schemes.

That adopted, took advantage of the very difficulties and defects of the site to secure the most pleasing effects. As a work of engineering skill, the park now surpasses anything of the kind. Under the notorious ring management, the department in charge suffered least of all in reputation. Each of the smaller squares was improved during this period, at exorbitant figures; but even with such extravagance and waste the city is more than repaid.

Following the noble example set by the New York commissioners, Philadelphia appropriated large sums in beautifying the Schuylkill and West Philadelphia parks. And now Brooklyn, in perfecting Prospect Park, emulates even the metropolis. In Philadelphia the work was

rendered less difficult by the natural advantages of the situation; and the two parks, on opposite banks of the Schuylkill river, are a source of well founded pride on the part of every citizen of that somewhat conceited village.

In New York and Philadelphia, especially, the managers have shown sound sense in affording every possible facility for advancing the cause of athletic sports. The Schuylkill board, freely gave sites for boat houses on the sole condition, that these should be of stone, and required only that the plans should be inspected before building was commenced. By this policy the park has been ornamented with tasteful and well constructed club houses and, as a matter of course, the boating interests of the city largely promoted. In every way, in each of the three cities we have mentioned,

only thing that in our artificial state of existence cannot be supplied at so much the on-bio foot; but by judicious effort it may be made free as air to all—that is, bad air—even in the most unhealthy manufacturing place.

To refer to a cognate matter, while we are on this topic—the naming of parks. There are two extremes in nomenclature, equally out of taste—the use of such common-place names as Central, South and the like; and the adoption of such high-flown, unmeaning and oftentimes inappropriate terms as Lindon, Wood-lawn, etc. There is no imperative call for imitating the vulgarity of Jersey real estate agents, and there is no necessity for falling back on names befitting railway stations. Let us have either good local names, provided these be well selected, or let us name in honor of our best and most deserving pioneers.

The Park laid out—the Golden Gate—bears a most appropriate and beautiful name, and is now surely but slowly advancing in improve-

Borax.

The last Nevada Legislature passed a law authorizing the taxing of proceeds of borax and soda mines. An Aurora, Nev., correspondent of the Sacramento Union, states that for the first quarter, ending March last, three companies made returns as follows: M. A. Bearn reports gross proceeds, \$12,318; total expenses, \$8,785; net profits, \$3,533, or about \$143 per ton. Mosheimer & Engelke report the net profits of ten tons \$210, or \$21 per ton. The Pacific Borax Company reports the net profits on 113 tons \$1,137.50, or about \$10 per ton.

Judging from this showing, either the borax companies do not make so much money as has been represented, or some rather tall swearing has been done.

There is a very great discrepancy also in the net profit per ton; one company making \$143, and another \$10 per ton. Are their returns intended to discourage the formation of other companies, or to avoid heavy taxation; or do they really represent the correct figures of borax mining and manufacture. It is stated that the borax industry is quite an important one in Nevada, and that all the assay offices, factory and mining companies use the domestic product. The crude supply is said to be inexhaustible. A newspaper scrap before us informs us that one company is putting

YOSEMITE VALLEY, CAL.

base ball, foot hall, skating and model yacht racing have been encouraged, and in no case has this liberality been taken advantage of to injure in any respect the beauty or utility of the grounds.

Such should be the policy of San Francisco. By far-sighted and liberal management our city should be, from its natural advantages, the finest in the world. With our variety of situation, our commanding elevations and gentle declivities, we have all that could be desired. It only needs the careful attention of the citizens to secure the fulfillment of our wishes. And it is evident that to succeed the work should be mapped out far in advance and so allow for our rapid growth. We are glad that some interest is felt in this cause and that at any rate we are not utterly deficient; but yet it can hardly be claimed that we have reached anything really practical. We still have abundant scope for improvement.

If we look at the matter from a sanitary point of view, our conclusions are still more apparent. By reliable statistics it is shown that in the neighborhood of parks the death rate is much decreased, while for the overworked, stifled denizens of the poorer and crowded districts some refuge from foul air and choking dust is all the more necessary. Truly has it been said that open squares are the lungs of towns. Fresh air is about the

ments. After it reaches a state to interest our citizens more than it does at present, more money will probably be spent upon it to the manifest advantage of our city.

Yosemite Valley.

The Yosemite Valley has obtained a world-wide fame for the magnificence and variety of its scenery, and any description of its beauties within our limited space would be impossible, leaving aside the additional objection that the subject is a somewhat hackneyed one, as far as "writing it up" is concerned. The Valley has almost become the Mecca of tourists of the present day, and no one of "traveled" reputation can afford to content himself at home until he has "done" Yosemite. It is to the modern tourist what Rome, the Nile, the Rhine, and the Alps were to tourists a generation ago. In fact, the scenery in this Valley is more magnificent and sublime than in any other part of the United States, or even in Europe, the Alps only being compared to it in these particulars. The illustration shown herewith gives a general view from the Mariposa trail, a favorite point of observation from which to obtain a view of the whole Valley. The prominent landmarks are sufficiently familiar, from the abundance of photographs and pictures extant, to warrant us in omitting any detailed description. A new trail has just been opened, which will afford additional facilities for pleasure-seekers to enter the Valley.

up new works, which will enable them to make four tons per day, which will be worth \$2,000 if it realizes only 25 cents per pound. Judging from the above figures it will not do any such a thing. Will some one who is posted on the subject send us some notes concerning the cost of working one of these claims, with details of expenses and profits. If there is no profit in them they will confer a favor on many individuals in giving this information; and if profitable, there is little danger of overstocking the market with the production. If cheaper than it is, there is little doubt but that more varied uses could be found for it and a fair price paid.

DEER LODGE MINES in Montana show encouraging prospects of a favorable season for miners. There are more claims opened than last year, and water will be more abundant during the mining season than ever before. The gold yield from these mines last year was a heavy one, but it is expected that it will be even more prolific this season. While the placer mines in other counties of Montana have declined in extent and value, the Deer Lodge mines are as productive as usual. As labor, provisions and tools are cheaper than they were, mines can now be worked which were worthless five years ago.

CORRESPONDENCE.

Notes of Travel in Stanislaus, Mariposa, and Tuolumne Counties.

[By our Traveling Correspondent.]

La Grange, Stanislaus county, is located some thirty-two miles east of the county seat of the county, Modesto. It contains at this writing about 400 inhabitants. The principal interest here is mining; but some eight or nine vineyards are located near La Grange, having an aggregate of 200,000 vines, which produce half as many gallons of wine annually. La Grange contains two hotels, and some five mercantile establishments. The mining of this district is gravel or hydraulic diggings. One claim, known as

The Light Claim,

Is located at Patrickville, some three miles distant from La Grange, and owned by H. Light. It contains 120 acres of mining ground; is favorably situated for fall and dump. The improvements of this claim consist of 300 feet of eight-inch pipe, and some 900 feet of bed-rock flume, working an ordinary goose-neck nozzle under a pressure of 80 ft. They expect to use 400 inches of water on this claim within a few weeks. At present it is lying idle. Some two years ago, by working three men and using 250 inches of water, \$100 per day was cleaned up.

The Poley Claim.

Is similarly situated to the above, and the owners are only waiting the action of the Dam Co. to furnish them with water, to proceed to work.

La Grange Ditch and Hydraulic Mining Co.

This is an incorporation of \$5,000,000 capital stock, in 50,000 shares, of \$100 each. Richard Abhey, President; R. E. Brewster, Secretary; and John H. Effinger, Superintendent. The location of the works are La Grange.

This Corporation own a ditch 17 miles in length, of a capacity to carry 3,500 inches of water; their supply of water is taken from the Tuolumne River, at the head of Indian Bar; no dam is used; the ditch starts at a point on the river, where a deep pool or eddy exists; the first 3,000 feet, after the water leaves the river, it is carried in a sunken flume below high water mark, thence through a cement ditch, for a fourth of a mile; the cañon, through which it is carried after leaving the river, is one of the roughest in this State. In some places a stone wall is built to heights varying from 50 to 75 feet. In one place this company have a flume $1\frac{1}{4}$ miles in length. In addition to this company owning a water privilege which cost originally about \$250,000 and employed 1,000 men ten months to complete, they own four different sets of

Hydraulic Claims,

Covering an area of about 900 acres, for which U. S. Patents have been applied for. They are using 8 Monitors and 1 Little Giant Hydraulic apparatus, with nozzles varying from $4\frac{1}{2}$ to 8 inches and using from 400 to 700 inches of water through each, with a pressure varying from 52 to 115 feet, employing about 75 men. The last clean up of this mine after a

Thirty Days' Run

Was a little rising of \$21,000; the average runs of one month each, are expected to average \$25,000. The gold runs from 934 to 942 fine, averaging them over \$19 per ounce.

A peculiar incident occurred during the construction of this corporation's ditch, that is worth mention: A blast known as a

'Seam Blast,

Where some 50 kegs of powder were poured into a seam in the rocks, threw one piece of rock weighing about 10 tons, some half mile distant, on the opposite side of the river, and cut a green pine tree, 18 inches over, off almost as smooth as though it had been sawed down.

Bondurant Minns,

Consisting of two ledges, are located 10 miles nearly east of Coulterville, on the north fork of the Merced river, and are owned personally by Mr. James Shimer, blacksmith and wagon maker of Coulterville. These mines are original locations, one of 1,200 feet and the other consisting of 2,500 feet. These ledges run nearly northeast and southwest, and as far as developed show a ledge of from $1\frac{1}{2}$ to 3 feet thick. The mine is being developed by tunnel and open cut; some 600 feet of tunnel in all; working from 4 to 8 men regularly. The rock is highly sulphuretted, and has for the last 3 years paid from \$12 to \$105 per ton.

Located some 300 yards from this mine, Mr. Shimer has erected an

Eighth-Stamp Mill,

Run by steam power, the capacity of which, is about 8 tons every 24 hours. A good wagon road exists to this mine from Coulterville. There is plenty of timber in the vicinity and a fine spring near by, furnishes the water.

Crystallized Cinnabar.

A ledge located about 5 miles southerly from Coulterville, near what is known as Horse Shoe bend on the Merced river, is one of the strangest formations known in this State, where a

regular quartz ledge exists with well defined walls and containing little or no other mineral than cinnabar, and every atom of it crystallized. It is owned by some parties residing at South San Juan in this State.

Every section of this country has its geins of some sort; Coulterville, Mariposa Co., this State has one in the person of

Adolph Sinning,

Who has manufactured in the past, and has now on hand some most remarkable specimens of workmanship in inlaying and putting together of the fine woods of this county. The following will give a partial idea of some of them: One is

A Beautiful Box,

Manufactured out of the wood of the Big Tree (25 feet in diameter) of the Mariposa Grove, inlaid with twenty-four different kinds of wood, from the Yosemite Valley and its vicinity selected by Mr. Jno. Mizr the Botanist of the Yosemite Valley, viz: Manzanita, Fragula, Black Oak, Red Oak, Live Oak, Laurel, Ceanothus, Big Tree, Buckeye, Alnus Revidus, Madrona, Nutmeg, Alder, Mountain Mahogany, Chemical, Granite, Maple, Box-folia, Chestnut, Oak, Juniper, Poplar, Silver Fir, Willow, Two Leaf Pine. A chest table two feet square inlaid with shading, stars, stripes and gothic panels containing the same number of the different kinds of wood. Also a handsome case of Alnus Revidus wood, selected by Mr. Percy, of Tuolumne County, Cal., containing gold mounting, a Yosemite view, (the cap of liberty,) and silver ferns, and presented by him to Mr. Henry Wilson, Vice President of the United States.

The Patton Mins.

Is located $\frac{1}{4}$ of a mile west of Tuttle town, Tuolumne Co., and about $5\frac{1}{4}$ miles west of Sonora, the County Seat. This property is owned personally by J. J. Corrigan, Esq., resident of your city.

The ledge of this mine runs N. W. by S. E. and pitches to the N. E.; the vein runs from 4 to 50 feet in width, and both the hanging and foot walls, are the most perfectly defined of any mine I have had the pleasure of visiting in the state. D. T. Hughes, Esq., is the Superintendent, and through him I learned the following facts. The extent of the lode, is a fraction less than 1,900 feet, and is being developed by two tunnels run in on the level of the mill, to which the rock is brought in cars. One of these tunnels is run in on the vein, and is now in 450 feet, and 131 feet from the surface. The other tunnel, (No. 2), starting at a point 150 feet south of tunnel No. 1, is now in 240 feet, about 100 feet of which is upon the ledge.

The character of this rock in this mine is peculiar. It consists of quartz, slate, dolomite and calcareous matter; is highly sulphuretted, and everything between the walls pays something. The rock is generally lowgrade, but as the vein is large, easily taken out and reduced, it will undoubtedly pay a handsome profit; the rock in the past has run from \$4 to \$20 per ton. This rock will average about \$10 per ton without counting the sulphurets. This company have just erected a fine

Twenty Stamp Mill,

Which is run by water power. It started up for the first time on May 26th, this year. This mill has a capacity of crushing thirty tons per day (twenty-four hours). Daniel Seiber & Son, of Sonora, are the architects and builders of this mill, which is very complete in every part, and does credit to its designers. Twenty-eight men find regular employment at this mill and mine. One of the most perfect

Self-Feeders,

I should judge, extant, is employed at this mill. It is known as the Cockrane Self-Feeder, and for which letters patent were obtained through your office. It is the most complete feeder, for the reason that it will feed clay, rock, sand or anything from mud to rock. The amalgamation is done by copper plates, silver-plated, and the ordinary riffle. The sulphurets are estimated to go about \$100 per ton.

The Rawhide Quartz Mine,

Or what—for years has been known by that name—now bears another (incorporated name) and is owned by parties in London and New York. It is located at Rawhide Ranch, on the west side of Table Mountain, and distant about 5 miles West from Sonora, Tuolumne Co., California. It is superintended by R. H. Haydock, Esq. and F. Greiner, foreman and superintendent of construction.

This company claim a ledge running N. W. by S. E., which dips to the N. E., and is about 1,700 feet in length. Their claim has been laying idle for over six years, for reasons best known to its owners; but they have now determined to go ahead and thoroughly open it up. Some time in April last the first work was done upon it this last time; by the time this is in print they will put upon their principal shaft a

Large Knowliss Steam Pump,

Which will be worked by the present fine steam hoisting works over their principal shaft which is 280 feet deep. In years past this mine on the average paid well, at times very rich. This Company also own a fine

Twenty Stamp Mill,

Run by steam power, which has a capacity of crushing about 30 tons of ore daily; at present they are only working 5 men, but as soon as the mine is pumped out a large force will be put to work.

L. P. MC.

The Vienna Exposition.

[FROM OUR SPECIAL CORRESPONDENT—GUIDO KUSTEL.]

To commence a systematic description of the exhibited articles at present is impossible. All that one can do, is to walk around for many days and try to acquire a general view, or a total impression of all, before going into a detailed examination. Up to this time about 3,500 railroad cars loaded with goods amounting to more than half a million of hundred weights have arrived. Numbers of these boxes are as yet untouched, in and outside the different buildings, but mostly between the machinery hall and the palace; and that is not all, as there are 2,000 car loads announced to come. The discharging of these cars takes time; there are amongst others, heavy boxes, difficult to handle, so that hardly more than a hundred cars can be emptied per day. By this calculation it will take twenty days more, to place the new arriving goods where they belong.

Nothing was neglected on the part of Baron Schwarz to hasten the work, no hocking occurred during the whole time; there was also plenty of time for the exhibitors to the first of May to have their articles in Vienna, and still everything is behind. It is very likely that, from past and present experience, future "world's exhibitions" will be better arranged and regulated if possible, but it seems also, that there is limit as to the extent of our International Exposition, beyond which a failure may be anticipated.

It is singular, Switzerland excepted, the three great Republics, the United States, France and Spain are most behid with their exhibitions.

In the American Department

"Colt's patent arms" and those of Smith & Wesson's are exhibited in the gallery, in very elegant cases, but nothing else. In the still larger covered yard only one thing is displayed, a picture on the wall of the building, over 50 feet long, from "Pork Packer's Association" of Cincinnati, representing the total procedure, from killing the hogs to making hams. But there is a great amount of American goods in boxes here, and perhaps just as much between Vienna and Trieste, which is expected to arrive in a week or so. The American exhibitors are not satisfied with the present "temporary" commissioners; they had a meeting yesterday, which resulted in the election of a committee of five, as acting medium between the expositors and commissioners. A motion was also made to telegraph to the President, the request to reinstate those of the old commission, who proved to be blameless; but there prevailed good sense enough to discover that is "not our business." All will clear up in a short time, and the American department, as it seems, will make a formidable representation after all.

There is from the 1st to the 10th of May

A Flower Exposition,

To which Austria, Belgium, Italy and Germany, contribute. For this purpose a tent was fixed up, 600 paces long. About 2,000 blooming roses dried up in the station house at Hamburg. A carload of the finest "camellia" was ruined by the frost while on the railroad from Dresden. Nevertheless the Exposition is a magnificent one. Predominant are the splendid varieties of "Azalea" and "Rhododendron." A new specimen of a Japanese rose was exhibited, but there is no use of enumerating the kinds of flowers, there are too many of them. Some exotic plants and palm trees give to the collection a charming aspect. Several more exhibitions of this kind will follow at intervals. Fruit and vegetables were also represented, but at this time not much can be expected; of strawberries, however, (from hot-houses) there were just as large specimens as found in California.

Of Agricultural Machinery

In the English department a nearly complete exposition can be seen now. The large area of 4,500 square meters—equal to 48,700 square feet—is all taken up by luxurions, tastefully equipped machines of all kinds. There are quite a number of different threshing machines, corn-dressing machines, corn screens, hay-making machines, straw elevators, hand seed drills, beet and manure drills, corn-grinding mills, crushing and kibbling mills, moving and reaping machines, etc. There are several huge plows and complete steam plows, some already sold; agricultural road locomotive engines; steam engines, fixed and portable; and a great many other agricultural machines and implements.

The American Agricultural Hall is a separate building, but it will take yet a few weeks before this exposition is ready. In the Machinery Hall all nations are very busy fixing up their departments, but many weeks are yet required to finish the job. In the industrial palace, the glassware is already now well represented, most of it in the Austrian department. In this is also a jeweler's case of limited size, containing only a few articles, but amounting in value to \$650,000. Every night this case, by means of a crank, disappears under the ground in a "tight place." The Crown Prince, of Germany, in the hall of arts, was met by a Yankee, who accosted him in the following way, in English: "Will you do me the honor, sir, to shake hands with me?" "With pleasure, sir," he said so. "Where are you from, sir?" "From New York, sir." "I thought so," said the Prince. "Here is my friend, sir, would you confer the same honor on him?" "Certainly, sir." "Thank

you, sir." The Crown Prince went on smiling. The New Yorkers were satisfied and one of them remarked in a careless way: "He is a pretty good fellow." The London Times is also complaining of extravagant prices in Vienna. There are only a few articles here dearer this year than the last one. The high charges in the restaurants have therefore no excuse whatever, but it is singular that these skimming institutions are principally established by foreigners. The most impudent charges are made in the Russian restaurants, then in the Italian and American, French and English. In the Liesinger Bierhalle they charge 5 cents for soup; in the Italian ironhouse, 25 cents; Roast meat with potatoes in the former, 35 cents, in the Italian 87½ cents, and so on. In the Pilsner Halle, a Frankfurter-sausage and a glass of wine, 20 cents, and the same thing in the American restaurant, \$1. The U. S. Rear Admiral James Alden, commander of the U. S. fleet in European waters, has arrived in Vienna, to visit the Exposition. A large barrel of oakwood will be exhibited, 21½ feet long, and 19 feet diameter in the middle; 35,000 persons visited the Exposition on the 1st of May; of the \$12.50 tickets, about 6,000 were sold. It was a cold and rainy day. For the Hall of Arts, two mammoth paintings arrived to-day, one is from the Belg painter, Wiertz, and has an area of a hundred meters, the other is from Cabanel, 80 square meters. The most of the paintings exhibited by France are the property of the State. Vienna, May 10th, 1873. o. x.

A Card.

EDS. PRESS:—Your correspondent from the Mariposa estate, in his personal allusion, in your issue of May 23d, does me great injustice, and I think that an examination of the correspondence will show that the seemingly innocent shaft was by some one evidently mischievously intended. Had your correspondent been permitted to study the archives of the office of the Mariposa Land and Mining Company, on the estate, of whose affairs he assumes to speak as with authority, he would not have permitted himself to circulate opinions so erroneous. Were the company at hand to speak officially I would not need any personal defence. My reputation is safe in their hands. But as they are not, I must be permitted by you to make my own defence. I was connected with the estate ten months; at the expiration of five months, the company wrote to me from New York for a project of operations upon the estate for the coming year. I sent to them a report of fifty pages, with diagrams, etc., with which they were so well pleased that they published it almost entire—together with extracts from previous reports upon the estate by Silliman and others, in book form for distribution to stockholders and others.

For that month they raised my salary 25 per cent., and for all the subsequent time 50 per cent., removed and subordinated the man who up to that time had held the office, by appointment, as Mining Engineer, and who had made an inglorious failure of everything up to that time, Jan. 1, 1873, and appointed me to the office of "Geologist and Mining Engineer of the Mariposa Estate"—the grandest mining property upon the face of the earth.

They expended no "\$40,000" under my counsel or direction, but less than \$10,000, for which they found one mine, for which they would not take \$40,000, nor any other sum—the great mother ledge of the estate, for which they had never at any point seen, nor any man previously seen able to point out or find—opened it 50 ft. deep, 3 to 5 ft. wide, of \$20 ore, at least; nearly opened it 25 feet deeper at two other places; nearly opened it at two other places on another chimney, 200 and 400 feet deep; laid out elaborate plans for developing the estate, which plans are now being carried out, and at length, when unknown to the Company, the gratuitous embarrassments of my position no longer permitted me to remain, in honor to myself, or in proper usefulness to the Company, I voluntarily resigned on the 4th of April, to take effect on May 1st, at which time I left—May 2d.

On May 1st, a letter was read from the Co., by the manager, in which the Secretary writes: "The President believes Mr. Easton to be, one of the ablest mining men, that has been connected with the Estate for years, and you can say to him, that should circumstances with him so change, that he would again desire the position on the Estate, the President will be happy to receive an application from him. If Mr. Easton has left before receiving this, you will please inform him, of that part of the letter referring to him."

Further comments or defence is needless.

Yours, etc.,

O. W. EASTON.

Geologist and Mining Engineer.
San Francisco, May 26, 1873.

MELTING PLATINUM.—The melting of platinum in a common furnace has been accomplished by M. Violette, of Lille. It is expected that various kinds of precious stones may be artificially produced by melting alumina with borax.

THE BULLIONVILLE narrow-gauge is nearing completion. Gen. Page is busy giving finishing-up orders and superintending the final work.

MECHANICAL PROGRESS.

Grinding Edge Tools.

Edge tools are fitted up by grinding, very much as a plank would be reduced in thickness were a large plain employed, in which were set a hundred or more very small gonges, each cutting a narrow groove. The sharp grit of the grindstone being harder than the iron or steel, cuts very small channels in the surface of the metal, and the revolving disc carries away all the minute particles that are detached by the grit. If we were to examine the surface of a tool that has just been removed from a grindstone, under the microscope, it would appear, as it were, like the rough surface of a field which has recently been sacrificed with some implement which formed alternate ridges and furrows. Hence, as these ridges and furrows run together from both sides, at the cutting edge, the newly-ground edge seems to be formed of a system of minute teeth, rather than to consist of a smooth edge. For this reason, a tool is first ground on a coarse stone, so as to wear the surface of the steel away rapidly; then it is polished on a wheel of much finer grit; and finally, in order to reduce the serrations as much as possible, a whetstone of the finest grit must be employed. This gives a cutting edge having the smallest possible serrations. A razor, for example, does not have a perfect cutting edge, as one may perceive by viewing it through a microscope. And yet the serrations are actually so much smaller than the human hair that the minute teeth cut the hair in twain; but when the serrations on the edge of the razor become so battered up and dull that they will not sever a hair, or cut a man's beard off, the edge must be honed and strapped until the system of minute teeth will be so much smaller than a hair, that several of them will take hold of the smallest hair at once. These suggestions will furnish something of an idea of the operation in grinding and whetting edged tools.

Beginners are sometimes instructed, when grinding edge-tools, to have the stone revolve toward the cutting edge, and sometimes from it. When the first grinding is being done, it is a matter of indifference whether this is done or not; but when the finishing touches are applied near and at the very edge; a grinder can always complete his task with more accuracy if the periphery of the grindstone revolves towards the cutting edge, as the steel that is worn away will be removed more easily; whereas, when a stone runs in the opposite direction, the grinder cannot always tell exactly when the side of the tool is fully ground up to the edge. This is more especially true, when the steel has a rather low or soft temper. The stone, when running from the edge, will not sweep away every particle of the metal that hangs as a "feather;" but when the stone revolves toward the edge, there will be no "feather edge" to deceive the eye of the grinder.

IRON FOR SPECIFIC PURPOSES.—"The quality of bar-iron may differ according to the purpose for which it is to be employed. Wire-iron is manufactured in the charcoal forge, and the double puddling furnace with iron boshes. Easily welded iron is made by allowing a small portion of carbon to remain in the metal, and by expelling, as far as possible, foreign matter. But this, by destroying the fire, will make iron cold short. If we want fibrous railway or heavy bar iron, we must employ a metal from which the carbon is easily expelled, as that from the run-out fires. This is to be puddled in a very warm furnace. Wire-iron should be of the same quality, but the puddling by which it is produced would be inapplicable for railway iron, for the latter would become cold-short. Iron for small rods, hoops, gas-pipe, and wire, ought to exhibit a crystalline fracture, a steel-like grain, which is produced by carbon. But of all other foreign matter it should be free. Silica and phosphorus will not evaporate like carbon on repeated exposure to heat; and the iron which contains either in a non-vitrified state will be cold under all circumstances, and will be useless for wire or any other purpose for which strength is required.

STRENGTH OF MATERIALS.—It is a remarkable fact that the most abundant materials in nature—iron—is the strongest of all known substances. Made into best steel, a rod one-fourth of an inch in diameter will sustain 9,000 lbs.; before breaking; soft steel, 7,000 lbs.; iron wire, 6,000; bar iron, 4,000; inferior bar iron, 2,000; cast iron, 1,000 to 3,000; copper wire, 3,000; silver, 2,000; gold, 2,500; tin, 300; cast zinc, 160; sheet zinc, 1,000; cast lead, 55; milled lead, 200.

Of wood, box and locust the same size, will hold 1,200 pounds; tonghest ash, 1,000; elm, 800; beech, cedar, white oak, pitch pine, 600; chestnut and maple, 650; poplar, 400. Wood which will bear a very heavy weight for a minute or two, will break with two-thirds the force acting a long time. A rod of iron is about ten times as strong as hemp cord. A rope, an inch in diameter, will bear about two and a half tons, but in practice it is not safe to subject it to a strain of more than about one ton. Half an inch in diameter the strength will be one-quarter as much; a quarter of an inch, one-sixteenth as much; and so on.

Compounding Common Steam Engines.

A correspondent of *The Engineer* asks, in view of the manifest saving in the use of the compound engines: "What shall we do with our old engines?" After alluding to some proposed modifications brought forward by the engineers, in answer to this query, he gives his own as follows:

"My idea would be rather to attach a very small cylinder to each side of the large one, and connect them to the large one by a cross-head, let the steam into both of them at once, and the exhaust into the large one; proportion them so that with steam, say, at 50 pounds, the same strain, and no more than what was before, for no more is needed, would be on the beam and connecting rod. Have no cut-off for small cylinder, but follow the steam to the end of the stroke. By this means the old cylinder would be left as it is; perhaps an extra eccentric would be required to move the small valves. By this means I see no limit to the pressure that could be used. The greater the pressure the smaller the cylinders would require to be; the regularity of the engine would not be affected—the power would be applied exactly as before. No doubt the pressure would fail in the large cylinder as the piston neared the end of the stroke, but the steam following at full pressure in the small ones would help to balance the loss.

I have given my idea roughly it may be, and I will conclude by stating this: I have a cylinder 14 in. which will drive the machinery at the proper speed with 25 pounds, but at this pressure the stroke ratio requires to be pretty open. I am of opinion a 10 in. cylinder with 50 pounds would do the same work with a third less coal, or by fitting a slide to cut off in the 14 in. cylinder, say with a third off at the stroke, would come to the same purpose. Were I needing to put up the machinery I would be inclined to put in a small cylinder, and use high pressure; the only thing I would lose I would be unable to increase the power of the small cylinder."

Analogies of Art and Nature.

In casting artillery, the particles of iron over lap each other, horizontally, from breech to muzzle; but the heat wear of the powder soon turns them in towards the chamber of the gun, and it becomes what is called honey-combed—and loses its cohesion, and finally bursts, destroying itself and often gunners. It is only a question of time when each and every piece of artillery will burst, and "no man knoweth the day nor the hour." Any one who can counteract this tendency of the iron to dip towards the heat wear will save the nation vast expense and valuable lives.

Ice forms in a minute triangles horizontally on top of the water, "but when in the sky the spring sun glows," the particles of ice dip from the sun as if to cool their heads in the water—not perpendicularly, but at an angle corresponding to the slanting of the rays of the sun, and gradually approaching the perpendicular as the earth swings southward in her orbit. Thus the iron dips towards the heat; the ice dips from it. The ice is then called "pen-icilling," and is dangerous to walk on. Nor is this all; the sun dip can be seen in the rocks all around us, and the day is not far distant when some one of wealth and leisure will take up this key, clear geology of most of its vast internal fires, of its floods, earthquakes and dark, indefinite periods and unfold the record of the rocks in all their grand simplicity, until the wayfaring man can read them.

CHURCH SPIRES.—Towers and spires have been for centuries appendages to churches; and they are certainly ornamental. Their great expense, however, has caused, in this country at least, foolish attempts at economy in their construction at the risk of their stability. Whereof, of course, to wooden structures. Melancholy illustrations of this occurred in the great blow on the 8th instant, when many church spires were prostrated in New England; the losses in many cases falling upon parishes poorly able to bear them. Now, is it not a pertinent inquiry, whether such catastrophes can be prevented? and if so, how? Spires properly constructed, will sustain a greater wind-pressure than houses built of the same material; why, then, are they so often blown down, endangering life and property? Three causes may be assigned, and these being attended to, spires will be secure.

First, then, there should be a sufficiency of timber of good size and of good quality; second, there should be sufficient fastenings; third, there should be frequent examinations to see that all parts of the spire are free from decay. No timber should be used in church spires except it be of the very best quality and of ample size, and care should be taken that all the main timbers—I speak of those especially in an upright position—are fastened together with heavy iron clamps and bolts, which can be screwed up when slackened from any cause. Builders must not be afraid of expense in the beginning, for it is the highest economy in the end. The tall spire of the Elliot church in Newton, which was watched carefully during the late gale, stood perfectly firm, and why? Because it was built as above described; and it will be found on examination that all the spires which have withstood the storms of the past fifty years in New England, have been erected in essentially the same manner, while those which have fallen before the gales have been cheaply and weakly built.—*Ed.*

SCIENTIFIC PROGRESS.

Scientific Revelations—What is Iron?

Science is a great commoner. He bows down men's cherished opinions with the energy and force of a nine-piuit. In his presence religious notions, which have been nursed for centuries, disappear at his approach, as dew before the rays of the morning sun. With the telescope, microscope, spectroscope, blowpipe, voltaic battery and chemical solvents, he has unsettled things sacred and profane, earthly and heavenly, and left the unschooled and unthinking in a fearful condition of doubt and uncertainty. He as ruthlessly knocks down all scientific pretenders wherever he finds them, and scatters their assumptions with a heavy hand, as readily as any other class. Scientific schools after long years of laborious chemical analysis and laborious dividing, sub-dividing, pulling apart separating, and picking to pieces, entering into the very empire of atomic sovereignty have assured the world that earth, air and water, the elements of the ancients are mere compounds that contained more than three score of elements, among which are gold, silver, platinum, copper, iron, etc.

We have been taught that iron was a pure metal and no mistake. This was an unchallenged and undisputed fact of science; something that could be relied on as definite, fixed and certain—something good to fall back upon in this world of ceaseless changing. But if there be truth in the following, and Prof. Jacobi is not a deceiver or a self-deluded humbug, our iron, the glory of our civilization, the lever of progress and the fulcrum of the arts, is after all but a compound—an hydrate of iron, and it is possible by the time Prof. Jacobi or his disciples shall have thoroughly cooked this ferric dish, a chemical element may be discovered, that is common to all metals, the base of all the existing metallic salts, which are now scientifically regarded as pure metals. Here is the article:

"Professor Jacobi, of Russia, has succeeded for the first time in producing specimens of pure iron, that which hitherto has been considered the pure metal being in reality a compound. The pure iron deposited by the action of the galvanic battery, and which is always rich in hydrogen, being placed by him under the receiver of an air-pump, and heated to redness, disengaged hydrogen in torrents, increased in volume, and changed to a silver-white metal (the true iron), very malleable and ductile, and so soft as to be readily cut with a pair of scissors. Iron thus prepared oxidizes rapidly in the air, and decomposes water below the boiling point. It is probable that hydrogen combines directly with iron, increases its hardness and density, and diminishes its malleability and ease of oxidation.

THE SUN.—Mr. J. Norman Lockyer, in a late lecture on the sun, laid down the following principles as to the absorption and radiation of certain substances. Glass, he says, absorbs and gives out a great deal of dark heat. Rock salt absorbs and gives out very little dark heat. Opaque glass absorbs and gives out much light, whilst transparent glass absorbs and gives out little light. Carbon absorbs and gives out much light and dark heat. Air absorbs and gives out very little light and dark heat. He then went on to explain that the common candle-flame has a chromosphere and photosphere, and that when the flame is disturbed gases are thrown out from its interior towards its exterior, just as is the case with the sun. Moreover, when an image of the candle-flame is thrown by a lens upon the end of a spectroscope, and portions of the flame are then emanated through the slit, many of the phenomena presented by a spectroscopic examination of portions of the sun are likewise seen by the examination of the flame of the candle. When the blue part of the flame of a candle is thus examined, a tolerably fair bright-line gaseous spectrum is seen, projected upon a faint continuous spectrum. When examining sun spots, a general and a selective absorption is visible, especially in the sodium lines, which thicken in proportion to the abruptness of the declivity of the sides of a spot. The greater the pressure the thicker the absorption lines. In the course of this lecture he said that there are bright lines in the solar spectrum, and that these bright lines are far more unchangeable than the dark ones. He concluded by saying that if we accept the theory of Laplace, that the sun is nothing but the condensation of a tremendous nebula, there is evidence that it is a hot globe now cooling, which, after the lapse of untold ages, will roll as a cold, dark ball through space.

THE MILKY WAY.—Eighteen million suns furnish the light for the milky way, which is the greatest feature of our heavens. How far separate these suns may be we know not, but they are so distant from us that light, traveling with its incredible speed, is ages in reaching the earth. One astronomer said he had gone back in the milky way so far as would require 330,000 years for the transmission of its light. Whether the telescope has allowed the human eye to gauge it more or less, the fact stands that the bounds of creation are as immeasurable as their eternal Creator.

CHEAP FURNACE FOR CHEMICAL EXPERIMENTS.—An amateur chemist, who justly takes pride in making a large portion of the tools and implements with which he works, has improvised a furnace and which he has used successfully for two years, and which he describes as follows:

He takes a piece of eight inch stove funnel, twelve or fourteen inches high, and furnished with a cap at the top, which can be removed at pleasure. At the bottom a small hole is cut in the side to receive the pipe from a blower, and the whole funnel is lined inside with pipe clay mixed with clay. Three inches from the bottom the lining is increased in thickness and receives some bits of wire, which form a grate. The blower is eight inches in diameter and three wide, having four fans made of sheet iron, tin, or even pasteboard, as is also its case, and is driven by a small pulley belting from a larger one designed to be turned by hand. The whole arrangement can be secured to a board, that portion under the furnace being protected by sheet iron. In such a furnace he has melted iron and manganese in a few minutes. He prefers coke to coal, as giving a more intense heat. His suggestions appear to be valuable to amateurs who do not wish to incur the expense of a complete apparatus.

WONDERS OF THE SPECTROSCOPE.—That wonderful instrument, the spectroscopist, continues to enlarge our acquaintance with the composition of our solar system, and even of the fixed stars and the comets. Father Secchi has made the astonishing discovery of the vapor of water in the vicinity of the sun spots, and we now know that our luminary contains also in its atmosphere hydrogen, sodium, iron, magnesium, calcium, copper, cobalt, barium, and nickel. The same observer has recently ascertained that the planet Uranus has an atmosphere of considerable extent, and generally transparent. The spectrum of a comet, corresponds exactly with that given by ignited carbon vapor, so that a comet is a little more than a barrel of petroleum on fire; and the variable star *p* Gemini is found to be surrounded by an envelope of burning gas. As regards some of them, at least, we can no longer, therefore, "doubt that the stars are fire."—*Lippincott's Magazine.*

AIR.—An interesting paper on the examination of air, taken from various localities, was lately read by Dr. Sigerson, at Dublin, before the Royal Irish Academy. In air from an iron factory he found carbon, ash and iron. The iron was in the form of little hollow balls, each about two-thousandths of an inch in diameter, and the iron so thin that the light passed through it. In "shirt factory" air were found filaments of linen and cotton. Antimony—from the type metal probably—was discovered in the air of printing rooms. Stable air was shown to contain floating air and scales; and in the air through which tobacco smoke was passing, nicotine, the poison of tobacco, was found in little globules.

CENTRAL HEAT.—Mr. G. D. Symons, of London, Eng., recently made some interesting experiments on the earth's temperature, in an artesian well, 1,300 feet deep. The results show an increase of 20° of heat at 1,100 feet, so that water would boil at a depth of a mile and a half; at a depth of 3 1/4 miles the temperature is 3,000°. As iron melts at 2,800° it is plain that the problem of a central furnace heat at no great distance below the surface of the earth is becoming more and more settled—in fact has already reached what may be considered absolutely certain.

A NEW REAGENT.—Professor Bottger recently announced the discovery of a new reagent which, he asserts, is highly sensitive to the alkalies. It is a coloring extract of the *coleus verschoffelti*, and is produced by digestion, for twenty-four hours, in pure alcohol, to which a few drops of sulphuric acid have been added. The hue is a brilliant red, which turns green on contact with the alkali. It is not affected by carbonic acid, and will detect the slightest trace of ammonia in illuminating gas if moistened and placed against an open jet. The presence of the minutest quantity of a carbonate of any of the alkalies is detected by it.

METEORITES NOW AND THEN.—The meteorites which now arrive upon earth are not of the same mineralogical nature as those which fell in past ages. Formerly iron fell; now stones fell. During the last one hundred and eighteen years there have been in Europe but three falls of iron, whereas there have been annually, on an average, three falls of stone. Perhaps it may even be said that stones of a new kind are beginning to arrive, for falls of carbonaceous meteorites were unknown before the year 1803, and four have been observed since then.

ARTIFICIAL AND SUN LIGHT.—According to Landeberg, a German chemist, artificial light contains 90 per cent. of caloric rays, while sun light contains only 50. To this predominance of heating power as compared with illuminating power in artificial light, he attributes the disagreeable sensation produced upon the eyes. Very thin sheets of mica will intercept the caloric rays, and render the light more agreeable.

PHOTOGRAPHERS' BATES. which have become disordered from the presence of organic impurities, may be restored by placing in champagne bottles, and, after freezing them solid, allowing them gradually to thaw, until only a small lump is left unmelted, which contains, it is said, all the organic impurities.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior in proximity to the mines mentioned:

California.

AMADOR COUNTY.

KENNEDY.—Amador Dispatch, May 31: We were shown a specimen of some very rich rock, which has recently been struck in the new shaft.

GOOD HOPE.—Amador Ledger, May 31: We are pleased to learn that Mr. Charles Deane is about to commence work next week. This mine gives promise of being one of the best, but has remained idle for a long time for the want of financial help to open it up.

CALAVERAS COUNTY.

LOWE STAMP.—Calaveras Chronicle, May 31: Rock of unexampled richness is being taken from this mine at West Point. The product of a small piece of ore of which no gold was visible before crushing, was given us the other day, the value of which was 40 cents. The ledge is immense in size, varying from eight to 20 ft. in width, and every particle of the rock contains gold. Two tunnels are being run upon the lode, both of which are about 200 ft. The Calaveras rock is being obtained from each. Work is being prosecuted with vigor, and the results are of the most flattering character.

AUSTRIAN.—We have been shown some very rich specimens of quartz taken from this mine, near Jesus Maria. It was almost completely covered with yellow metal, and the gentleman exhibiting it, Mr. O. C. Knecht, informed us that when broken in pieces the ore showed richer than the surface. The shaft will now be led down the ledge has been thoroughly prospected for a distance of 300 ft. in length, disclosing the same quality of rich rock throughout. The ledge is wide, and the ore will pay largely for milling.

NEVADA TRANSCRIPT.—June 3: STARTED UP.—Arrangements have been completed for resuming work on the Gold Run quartz mine, near this city, and the machinery was set in motion yesterday. The shaft will now be sunk until the old works, where rich quartz was being taken out, are reached.

U. S. GRANT.—Truckee Republican May 31: The owners of this mine, near Meadow Lake, are making active preparations to work the mine the present season. They have an eight-stamp mill ready for business. The mine is to be worked by the chlorine process and arrangements are being made to erect 2 running furnaces, as soon as possible. There are 7 men at work at the mine at present, and the owners have sent below for additional men, and also for teams for hauling ore, wood, supplies, etc. Parties in Truckee who own ledges near the U. S. Grant are also preparing to develop the mine, and test the ores at the smelting works in this place.

STRUCK IN.—North San Juan Times, May 31: We are informed that Messrs. Carr and Cowles have located a claim of 1500 ft. upon the old "Ferrava" or "French" lead, 1 1/2 miles west of Enreka South in this county, which was abandoned when Ferrava was murdered in 1853, and generally believed to be of no value until struck by the present owners. The gold in the rock is in decomposed sulphurets and is so covered with rust, or oxide of iron, that the ordinary process of crushing and washing does not separate it. Their ledge is 2 1/2 ft. wide, well defined, in the slate formation and admirably located for working.

INYO COUNTY.

BIG STRIKE.—Inyo Independent, May 24: In the whim shaft, from the level of the Omega tunnel, Cerro Gordo, at a depth of 160 ft., a very rich strike of soft carbonate has been made during the past week. From only a seam the vein or pocket opens to a width of from 4 to 6 ft. and is of the best quality. It is a heavy, heavy, gray sand, and smelts about as rapidly as it can be put into a furnace. The Omega is the property of the Swansons Co., and runs into ground covered by the original Front location.

LIDA.—A friend writing from Lida Valley under date of May 7, says that the contractors on the Lida Belle shaft would have the shaft down 50 ft. below the tunnel level in ten days, and that they are taking out considerable quantities of very good ore. The Blue Dick was now 50 ft., with 4 inches of the highest-grade ore and plenty of second-rate. The developments at these depths in these mines are considered generally encouraging.

BULLION.—12,000 bars of silver lead bullion have been accumulated at Beatty's furnaces, and some 8,000 at Belmont. The Corra, the largest daily production at the first-named is now 148 bars, each 30 lbs. weight. Should no accident occur to prevent, the run during the present month will result in 4,000 bars; the highest heretofore made in this same time being 3,000.

KERN COUNTY.

HAVERLY MINER.—May 24: At present Long Tom, No. 2 is to be the leading mine, and it has been worked to a depth of 70 ft. with an average ledge of 2 ft. in thickness and a yield of \$30 per ton. A shaft will immediately be sunk on this mine and levels run, which will take but a short time, then it, in connection with another mine already open, will keep the mill running for a year.

PARPOSEE.—A run of 70 tons of good rock is now being made at the old 5 stamp mill of the Bright Star mine.

MARIPOSA COUNTY.

STORY OF A HIDDEN MINE.—Mariposa Gazette, May 30: The Mariposa Land and Mining Company, last week, leased to Stephen Partridge and another Mexican, a tract of ground on Missouri gulch for the term of one year. The story upon which this transaction is founded is of a very rich quartz vein discovered in 1854 by 3 Mexicans, who, ascertaining that the grant confirmed to Fremont inclosed the premises, attempted to procure a lease from the parties at that time and on several subsequent occasions. Failing in this they covered up their discovery, and declined to reveal its locality. Two of the parties have since died and the third revealed the secret to Partridge. Negotiations were reopened a few weeks ago and the result is a lease to the applicants for one year.

NAPA COUNTY.

QUICKSILVER.—Napa Reporter: There are many new locations made in Napa, Sonoma, and Lake counties; besides, the older mines are being developed to a considerable extent, and now and then a sale made. The Stewart mine, near Calistoga, is being worked with flatter. Thompson, near Pine Flat, are finding splendid cinabar, and is reported sold for \$30,000. The Gem mine, in Lacanoma valley, is reported rich, and on the same range are many late locations made. The Missouri claim is being prospected; also the Lost Ledge. I learn that at the Lost Ledge they have made some late discoveries of very fine 30 per cent. ore, and will in a few days be at work in earnest with smelting works. This mine at one time could have been bought at a small price, but at this time it cannot be had at less than \$30,000, which is a small price for such a mine. There will, no doubt, in less than 12 months, be no less than 1,000 men at work in these new mines. I think there are not less than 75 claims of quicksilver in Sonoma county, of course all will not pay, but who will be the lucky ones?

NEVADA COUNTY.

COE.—Grass Valley Union, May 23: Work in this mine has been suspended for some time. The suspension will continue for a few days. The stoppage is not caused by any bad appearance in the mine, for on the contrary there is a large and rich ledge in the bottom of the shaft.

EMPIRE.—Grass Valley Union, June 3: The Empire yesterday shipped gold bars to San Francisco of the value of \$18,000. The gold was taken out of the mill

after a run of 21 days with 20 stamps. Sulphurets saved will give still more money for the rock crushed. **IDAHO.**—Grass Valley Union June 1: This mine has been constantly at work and in 4 weeks, or 24 working days, took out gold to the value of about \$85,000.

EUREKA.—The Co. cleaned up about \$34,000 worth of gold after 24 days run with 10 stamps. **THE PACIFIC MINING CO.**—They struck the West Idaho ledge in the tunnel about 100 yards ago. The ledge is small at the point at which it was cut, but the character of the quartz is good.

KENTUCKY.—This mine is situated 200 yards northeast of the Idaho. It is a new enterprise and it has very favorable appearance. Machinery has recently been set up, and they are now preparing to prosecute work vigorously. The shaft is down 45 ft., and they are working on it. A great deal of specimen rock has been taken out, and it has the indications of being on the same ledge that its illustrious neighbors, the Idaho and Eureka, are working.

GREENHORN.—The 315-ft. level is driving north and south and 230-ft. level is driving to the south. The ore is of the best quality and the ore mills in the neighborhood of \$18.

NEW YORK HILL.—This is one of the rich mines of Grass Valley, on which operation was suspended about 4 years ago, owing to a combination of circumstances in no way chargeable to the character of the mine. It is situated on Wolf Creek, and rises at a sharp angle to about 400 ft. above the bed of the creek, and can be worked by a tunnel 100 ft. deep, and the shaft had been taken from the mine before its suspension; the ore averages by accurate account \$15 per ton, (not load). The working shaft on the top of the hill is down 700 ft. on the incline with a large ledge of ore all the way, and a fine ledge of rich ore at the bottom of the shaft, from 15 to 20 inches in thickness. The new company is about to run the tunnel to the side of the hill, when it will strike the ledge 150 ft. deep, and immediately under what is known as Jo Wild ground, which yielded rock paying \$100 per ton. The tunnel will be about 250 ft. in length, 130 of which is completed, will drain all the old shafts and will be 75 ft. under the old workings, thus opening ground for at least 2 years' work.

STATE LEDGE.—This mine is looking well and is paying well. In the east drift there is a 4 ft. ledge, and in the west a strong ledge, gold-bearing in all its parts. The supply of ore is improving rapidly in quality, while the free gold of the ore maintains itself. **NORTH STAR.**—The new shaft has a rich but small ledge. Good ore is being taken out of the 8th level, 600 ft. west of the shaft.

OMAHA.—This is situated south of town, on Wolf creek. The famous Lone Jack was located as an extension of the old mine. The Co. is erecting a new overshot wheel, with hoisting gear for a shaft 300 ft. long. The claims were located as early as 1854 by parties who sold them to the present owners. The ledge is about 8 inches thick, and the ore is estimated at \$50 rock.

GREEN MOUNTAIN.—This mine is about to suspend operations. The pumps have all been taken out of the shaft, and the mine will be abandoned. The Green Mountain paid very largely for quartz and ore, but the pay streak seems to have been completely exhausted.

INDEPENDENCE CON.—This Co. will soon have completed 400 ft. of tunnel, and a new contract will be given out if the present contractors should not take the privilege of another 100 ft., which will bring the tunnel under the summit of the hill and to the first parallel ledge. The last 100 ft. of the ore is unusually hard, but a change for the better is noted.

DESERET TUNNEL.—This Co., consisting mostly of French citizens, give an occasional push to a tunnel commenced at the foot of a high range of hills skirting Penn Valley, about 2 miles south of the Independence Tunnel. They will have 150 ft. of hacks at a length of 200 ft. and are now working.

BRANCH CON.—The Co. receive proposals for shaft 4 by 8 ft. wide and 75 or 100 ft. deep on the ledge. Work will commence immediately after the opening of the bids. **GRASS VALLEY NEW MINING CO.**—They are still sinking, but have some very hard ground to contend with, and consequently progress is slow. The ledge is small and the ore is not so rich as the old mine. It is to reach the level of the drift from the old shaft where they have a fine looking ledge of 2 ft.

ROUGH AND READY TOWNSHIP.—The gravel claims of Bagley and Hentress, at the junction of Slate and Deer creeks, are being profitably worked this season. Washing off the accumulated tailings in Deer creek to get at the ledge, they are cleaning off \$10 a day to the hand on the average. These claims cover one mile of the creek, have been worked for a number of years and are good for years to come.

The Coombs Pinyone Company's claims on Randolph continue to yield well. They have a bed of gravel in the tunnel 150 ft. in width from rim to rim of the channel, and are making preparations to work the claim.

On the Reese claims on Randolph Flat a tunnel is being run for draining purposes, and also to wash the surface dirt through it. The rich pay in this claim is found in a seam or ledge of decomposed quartz. A number of claims on the Flat have been located and recorded in Nevada city recently.

PLACER COUNTY.

RICH MINE.—Placer Herald, May 31: From the favorable reports circulated in reference to the Grater Hill Quartz Mine, owned and worked by the St. Patrick Co., we were induced to make a visit to said mine, recently, for the purpose of learning whether all that we heard was true or not. And, as a result, we are forced to believe that much of it is not true. The mine is not so rich as the reports have led us to believe. Through the kindness of the foreman, Mr. Wm. Werry, a gentleman of life-long experience, and a skilled and practical miner, we were shown through the mine from top to bottom, receiving a full explanation of the modus operandi of working the same.

The Co. bought this mine some 6 months ago for a little over \$10,000, and after making the purchase, immediately began work on the same. When they commenced work the shaft was down some 80 ft., and now it is down 214 ft. At the former depth the ledge was from 10 to 12 inches thick and at the latter depth it is about 2 ft. thick, and that every inch of the ledge is good milling rock, averaging, so far, about \$60 per ton. There are drifts run in a short distance at the 60-ft. level and below that, and the rock is of the best quality. The mine has been taken from the main shaft, while sinking, and the time the company have owned this mine they have taken from it over \$30,000, and are now, with a force of 30 men, taking out, basing our calculations on the last clean-up, about \$1,000 per day. The rich strike, reported last week from this mine, was in what is known as the foot-wash ledge, in which at 40 ft. they struck rock that pays \$100 per ton, on a ledge of over 10 inches.

IOWA HILL CANAL.—Placer Argus, May 31: We learn from Judge Spear that the Iowa Hill Canal Co. have now about 160 men at work on the line of their canal, between the Fish and Brown ranch and Iowa Hill, and they will be ready to work completed as far as Tadpole creek this season. The work is progressing rapidly under the Superintendency of William Van Vactor, and thus far has not cost over \$4 a rod.

MINING ITEMS.—Correspondence from Dutch Flat: The Pacific claims, after a run of 528 hours cleaned up \$5,852 81. The Enterprise after a run of 576 hours cleaned up \$3,156 43. The Atlantic after a run of 652 hours made a partial clean-up of \$3,493 81. This claim is now washing. The rich ticket. The Central after a run of 408 hours made a partial clean-up of \$3,213 54; washed from its poorest streak of gravel. It is now washing apparently very rich gravel from the eastern rim. The Gold Run claims, at Gold Run, after washing 720 hours took out \$7,709 05. This

claim is now laid over for the season, because of the large deposit of tailings in Canyon Creek. The Summit, after a run of 600 hours, took out \$5,617 56, but only netted \$2,393 92. The Cedar Creek Company's main ditches are all running a full head of water; their reservoirs are all full and have not yet been tapped. It will have a full supply of water till the 1st of July or later. Its receipts for water for the month of April amounted to \$8,925 81; the entire net proceeds for the month amounted to about \$15,000.

SAN DIEGO COUNTY.

GOLDEN CHARTER.—San Diego Union, May 22: Mr. E. B. Gifford came in from Julian City yesterday. We learn from him that this Co. have finished sinking the shaft to supply air to this Co. Singularly enough they have struck a richer streak of ore in their air shaft than in the main shaft. The vein cut by the new shaft discloses what may be called "specimen" rock. It is literally studded with gold.

STONEWALL.—San Diego Union, May 29: This mine is going on vigorously as ever. Captain Frary is moving around the mine. The ore looks like being taken out, and the mill runs night and day. Night shifts are now being worked in the mine. The ledge is now from 8 to 12 ft. in width, and works beautifully; not a pound of powder is now needed in getting out the rock.

OWENS.—This Co., at Julian City, have now reached a depth of nearly 300 ft. They are at present getting out ore from the 2nd level. The Owens mine and mine are running night and day.

HELVETIA.—This mine is also being worked day and night. They are getting out a good deal of first-rate ore, which is being crushed at the Deerees & Moore mill.

TOM SCOTT.—They have a shaft down 80 ft., where the ledge is from 8 to 10 inches in width, and widening as they go down.

THE BEARY RELIER.—This Co. are doing wonderfully well with their little overshot water-wheel, two-stamp mill. Their tunnel strikes the ledge where it is from 6 to 8 ft. in width, and they are taking out plenty of ore and doing well.

SIERRA COUNTY.

THE BUTTER.—Downville Messenger, May 31: We visited the Butte mines a few days since, and found everything running smoothly, every man in his place, and the whole vast institution working like a clock, for regularity. The amount of work which has been done here since the new company took the mine, in putting up new buildings, putting in new machinery, and fixing up in the first class manner, is simply enormous. They now have 3 fine mills pounding on the ore, of which is the root of all evil. The Superintendent informed us that there were 200 men working in or about the mine.

We also visited the Independence, Mr. Davis, Superintendent. They have about as much work ahead as they will be able to manage this year, building boarding-houses, a new mill, and so on. **MINERS WANTED.**—A large number of gravel miners can find employment at the North America claims at Hepsidam. They are now forced to work a large force of Chinamen, but would be glad to dispense with them if they could procure white men. The claim is paying well as usual.

CO. OF ALLEGHANY.—Mining interests are almost at a stand-still. The Masonic has discharged a number of men, but running the tunnel. Twenty-one is crushing rock to test its value. On the North Fork they have struck gravel of a very favorable character, and they expect to strike gold any day. The South Fork is fully organized, and has a bid made for running tunnel. The lead mine continues as rich as ever. Some hands have been hired for the purpose of washing dirt and the dump is not large enough to hold a large pile of dirt. Much ground is taken up, and operations will probably be commenced in full.

SONOMA COUNTY.

YELLOW JACKET.—Napa Register, May 31: On Saturday last, we visited the lower level of this mine, in company with ladies and gentlemen, this somewhat of a party in Knight's Valley, Sonoma county, on the western side of Mt. St. Helena, and about seven miles in a direct line from Calistoga.

The existence of a cinabar lode in the neighborhood was known some 7 years ago to Mr. P. H. Newbitt, of Los Angeles, who kept his discovery a secret in hopes of acquiring a title to the lode. For some time he has been working the lode, and has informed Mr. Stuart (who owns the land) of the fact, and proposed to show him where the lead was in consideration of an interest in the mine. The proposition was accepted, and about 5 weeks ago the exact location of the mineral was ascertained, and active preparations at once commenced.

TUOLUMNE COUNTY.

GRIZZLY.—Tuolumne Independent, May 24: Crushing commenced at the Grizzly, on the 19th inst. The vein is 9 ft. wide, showing fine gold very well. This mine is on the great mother lode of the Cherokee section of the country, which can be traced for many miles. Hopes are entertained that it has not outlived its usefulness; and that, as in former times, with good management, it will be ranked among the big things of the country. Their old hooks show that their first clean up, in four of the days, was \$3,455; and from February 20th, '68, to September 3d, 1872, \$22,326.50 in cash dividends.

EXCELSIOR.—Sonoma Democrat, May 24: In this mine a body of rich pay quartz has been struck and is now being taken out.

H. Brandt & Co's Gravel Claim. near Hall & Hale's Saw Mill, prospects well, but water to work it cannot be had before the first rains.

D. F. Baxter's Gravel Claim adjoining the Lamphier Quartz claim, Confidence District, is paying well, with excellent prospects ahead.

SONOMA COUNTY.—Napa Democrat, May 31: The Yuma vein, at Pacific Flat, 2 1/2 miles from Calistoga, and formerly called the Nau Mine, has recently been sold to an English Company for \$18,000.

RIOR.—Nick Baull has found another "pocket" in his claim, at the foot of Bald Mountain, near the Brown mine. He took out, in 2 days, 25 ounces, and more in sight.

SHAWWAT.—A contract was made with the Sonora Foundry Co., this week, to furnish machinery for a 10 stamp mill for this mine immediately.

GOLDEN GATE.—We have seen several pieces of rock taken out of this mine this week that prospects well. As the vein is developed, it is represented as increasing in richness, promising to become a very valuable mine.

Nevada.

MONITOR CO.—Reese River Renelle, May 24: Quite an excitement is going on about the big strike in the lower workings of this mine. For some time past, the work about the lower tunnel has been pushed with all possible dispatch. A cross cut has been run back in the hill over 300 ft., with butting prospect, and the discovery is important, from the fact that it pitches northward as it rises, and is going up through unexplored ground, consequently, the chances are that it may reach near the surface, 340 ft. upwards. This same chimney, on the 400-ft. level, is already 10 ft. thick, and it is really one of the finest breasts of ore we have seen for a long time.

The ore bodies on this level already measure from north to south 350 ft., and the pay strata are larger on the lower side of the level than in the steps above.

BELMONT.—This Co. are pushing things along quite lively. Some 20 tons of ore are being reduced daily at the Monitor-Belmont Mill, and if the mill was double its present capacity it would have more than it could do with the large amount of ore now being extracted from the Belmont mines.

EL DORADO NORTH.—This Co. have commenced again in their vertical shaft. They have let a contract for drifting to the vein.

HUMBOLDT COUNTY.

BOLIVIA DISTRICT.—Silver State, May 31: H. C. Merritt, of Austin, who, with Thomas Wren and Josiah McKenney, of the same place, is interested in copper mines in Bolivia, arrived in town from that district last Saturday. He says all the mines in the district on which work is carried on are looking well and producing rich ore. The Amelia ledge, which the above named persons are developing, is looking splendidly. A tunnel has been run on the ledge 120 ft., and the vein is from 1 ft. to 7 ft. wide. A large lot of first-class ore, which it is estimated will yield from 35 to 75 per cent. copper, has been selected from that portion of the ledge extracted in running the tunnel. Kellogg & Co. are engaged in grading a road over the mountain, but owing to the rocky and precipitous nature of the ground over which the road has been surveyed, it will take two or three months to complete it.

CENTRAL DISTRICT.—Mullen & Co.'s roasting furnace now in course of erection, will be completed in a month. Ham Sherer and R. V. Craig are extracting ore from the Teasmer, and having it reduced at the Humboldt Reduction Works. The business is profitable, and it is said to pay remarkably well. The Marietta Co. is proving to be a valuable mine. The Marietta Co. is working steadily on the mine, which is considered one of the best in the district; ore from the lowest level assays well, and the ledge is much larger and better defined than it is nearer the surface.

WASHOE.

BALTIMORE CONSOLIDATED.—Golde Hill News, May 31: Very little has been done in the south drift in the ore deposit at the 225-ft. level. The drift merely cut into the edge of the deposit, and a heavy flow of water being met with, further work has been discontinued till the water drains out somewhat. The north drift is now in about 25 ft., following the east side of the ore. The drift west at the lower or 450-ft. level is being driven ahead as fast as the nature of the ground will permit. It is already in over 60 ft., with the face in tough porphyry.

CROWN POINT.—Daily yield 500 tons. The 1,300 ft. level is yielding the best. The crosscut east from the third floor above this level passed through nine ft. of good ore, but is now in porphyry. The ore breaks nowhere show signs of falling. At the 1,400-ft. level a crosscut east is being made from the main south drift, which is now in about 15 ft. A drill is kept driven ahead in advance of the drift as a precautionary measure against a heavy flow of water being encountered.

WOODVILLE.—This mine shows continued improvement, and the amount of ore in sight justifies the employment of another mill. A fine body of ore is opened out in the lower level, north of the shaft, being evidently a portion of the ore body found in the level above. The north part of the mine is the best, and improves as further developed. About \$1,000 a day in bullion is being shipped from the mine and this good yield is steadily increasing.

SILVER HILL.—Daily yield about 50 tons, keeping the Bacon mill steadily running. The ore sections are generally looking well and the ore extracted gives an average assay of over \$50 to the ton. The north drift at the second level progresses finely, with good ore still in the face.

FRANKLIN.—Considerable difficulty is met with in clearing out the old tunnel, owing to its caving badly in places, but the work is making fair progress nevertheless.

DETROIT.—The south part of the mine, in the Waller's Defeat ground, still looks well, and yields about 20 tons of good milling ore daily. The 300-ft. level from the incline is opened and being driven ahead in good ore.

CALDONIA.—Main drift, second level, now in 73 ft. The rock continues very hard, which, together with the increasing quantity of water, allows of but slow progress.

GRIMM.—The main shaft, from the 1,454-ft. level, is making good progress in sinking, and some good streaks of quartz, giving low assays, are occasionally met with. At the 700 and 1,300-ft. levels, crosscuts are being made in favorable indications.

IMPERIAL.—Water interferes somewhat in sinking the main incline, therefore progress is very slow. The ore assays at the 1,700-ft. level averages about \$30 to the ton.

JULIA.—Sinking the main drift. This drift is in 12 ft., showing ore all the way, the widest portion being 5 ft.

YELLOW JACKET.—Drifting east at the 1,600-ft., and north and south at the 1,000-ft. level progresses as usual.

GOLLAH-PORE.—Daily yield 160 tons. Average assay \$4. The old ore sections are looking well, as usual, but no new developments as yet.

GOULD & CURRY.—A heavy body of low grade quartz is found at the southern portion of the 2d level, and a better quantity is anticipated. The drift south, at the 1,600-foot level will soon connect with the Savage drift, when a much needed air circulation will be secured. A shaft is being driven below the 2d level, therefore work is difficult and slow.

BUCKEYE.—The mine is looking well and giving forth its usual yield of about 20 tons per day. Owing to repairs to the mill last week, the bullion yield was somewhat retarded, but this week the mill is running again all right. The drift east from the first level is now in about 30 ft.

SIXEY.—The indications for ore at the bottom of the shaft were so favorable that it was thought best to stop sinking and put the shaft in thorough condition throughout. This is now being done, sinking is resumed, and a station for a drift is being also put in.

GREEN MINE.—Work going ahead cleaning out and reopening the old shaft preparatory to the practical working and development of the mine. The main tunnel is already cleared out, repaired and a new track laid in it.

BECKER.—Daily yield 570 tons, from the four ore producing levels, the lowest or 1,300-ft. level has been showing great improvement at the south end of the ore slopes during the past week, and day before yesterday the main drift south of the shaft was driven to the Crown Point, unexpectedly cut into ore at the east side, and to-day the whole face is in good ore. This is evidently a continuation of the main ore body at that level, and no new discovery. The ore breaks everywhere look finely, and the yield for the present month will foot up to over 17,000 tons. During the week ending yesterday, 4,081 tons were extracted. The bullion yield will somewhat overrun that of last month. The main incline is 144 ft. below the 1,200-ft. level.

SAVAGE.—Strong hints and current rumors of rich ore developments at the 1600 and 1700-ft. levels of this mine give it a wonderful degree of interest at this time. The drift north to connect with the 1600-ft. level of the Gould mine has been nearly completed, and the connection will be made very shortly, when the requisite ventilation will be secured, much to the advantage of both mines.

HALE AND NONCHON.—Daily yield 70 tons. The three cross-cuts at the lowest or 1700-ft. level are driving east but have not yet reached the east ore vein. A winze being sunk 75 ft. north of the incline is now down 22 ft. below this level and in good ore all the way, worth nearly or quite \$50 per ton. A good body of ore is reported to be at the 1600 ft. level, near the Savage line.

MINY.—The west wall of the ledge was cut through on Tuesday last, in the upper level, and quartz assaying as high as \$180 to the ton, met with. The drift is

[Continued on Page 384.]

The Lovegrove. (*Nemophila insignis*.)

BY RALPH RAMBLER.

We present our readers, with an engraving of one of the earliest of our floral visitors—the familiar Lovegrove.

What daisies, violets, crocuses, anemones, and liverworts are to other countries, the Lovegroves are to the inland valleys of California. They are the first wild flowers on our plains to unfold their beauties to the sun, as the harbingers of smiling Spring. The buttercup alone (*ranunculus*) in our river bottoms precedes them by a few days.

How children love them, and welcome their first appearance! Not many days ago, the writer was driving through our valley, when he overtook a party of five little boys and girls, tripping along the roadside, their faces beaming with health and happiness. "Good morning," children, said we, "which way are you traveling?" "We are looking for flowers," promptly answered one of the smallest of the boys, his bright face the very picture of childish gratification. And so they were. Their dimpled hands were grasping dense bunches of blue flowers, as though they were so many new-found treasures. These treasures were only Lovegroves. No other flowers were blooming, though they were beginning to be abundant. The re-appearance of their bright blue blossoms had filled these innocent hearts with perfect joy. Surely we older ones should admire all such beautiful wild flowers—should, at least, give them a passing thought, if for no other reason than the happiness they bring our children, and the gentleness they naturally instill into their hearts.

The Lovegrove is peculiar to North America. Two species only are found in the Eastern and Southern States. They have small white or blue flowers. All the most beautiful species are natives of California, where we have four kinds, their flowers varying from a half inch to more than an inch in diameter. All have their corollas or flowers divided into five lobes, which are so deeply cleft in some species as to have the appearance of separate petals. These plants vary in height from a few inches to a foot and more. They continue blooming through spring and the early part of summer. Sometimes they open by the middle of January, sometimes in February, and occasionally, in late springs, like the present, not until the 1st of March. Botanists have named the largest species *Nemophila insignis*, or Showy Lovegrove. Its flowers are a deep sky-blue on the outer edge, the center white and delicately pencilled with purple dots. Another is *N. Atomaria*, or Speckled Lovegrove. Its flowers are small, of a bluish white, dotted with chocolate-colored spots. *N. aurita*, or Ear-leaved Lovegrove, has small, purple, bell-shaped flowers. The flowers of *N. Maculata*, or Spotted Lovegrove, are white, with a large violet spot on the outer edge of each of their five lobes. These were first introduced into England as ornamental plants some forty years ago.

The two first mentioned are our common varieties. The first, which is the one figured by our artist, has the largest flowers and a very agreeable odor. It is much the most abundant, and is the most general favorite. Its flowers frequently expand more than an inch, and when fully expanded are quite flat and wheel-shaped, but when partly open they resemble a bell, and hence a name very common for it among California children is Blue-Bells. Lovegrove is only a literal translation of its systematic name, which is from two Greek words meaning to love a grove, and refers to the habit of the plant in the States East of the Rocky mountains, where it is most thrifty in the shade. On our plains, it entirely loses this peculiarity, as it finds no trees to shelter it. So its botanical name is here no longer appropriate. This shows how even plants, like men, can adapt themselves to circumstances. Here they flourish in the greatest profusion on the bare plains.

In speaking of the Lovegrove as one of our first spring flowers, we said it is to the inland valleys of California what violets are to other countries. We might also have said, what one species of violet is to a part of California. For one of the earliest flowers with any pretensions to beauty in the low foothills of the Sierras, along the Merced and the Chowchilla rivers, for instance, is a very handsome yellow violet, with finely divided leaves. In size and shape it is almost a *fac simile* of the common Heart's-ease. Indeed, its general appearance is so much like the latter, which is a native violet of Great Britain, that we may with propriety call our early spring violet the California heart's-ease. But the inner surface of the five petals is a bright yellow, with a purple spot at the base, while the outer surface of its two upper petals is of a royal purple.

San Joaquin Valley, March, 1873.
—Illustrated Press.

COAL NEAR SEATTLE.—E. M. Smithers has been for some time prospecting coal croppings on his farm on the banks of Black River, about ten miles southeast of this city. We are informed that his explorations have resulted in a discovery which far exceeds his most sanguine expectations. He has opened upon a large and well defined ledge of coal of excellent quality, which, from present indications, promises an inexhaustible supply; more accessible than any mine now opened in the Territory. It is directly upon the river bank, where the coal can be loaded upon barges and towed to this city by river steamers which now ply upon the river.—*Puget Sound Dispatch*.

Concentrating Ores.

In a recent issue, we gave an article from the *Reese River Reville*, in which the utility of Krom's Concentrator is so highly spoken of that that journal thinks the whole question of working low grade ores turns on the cost of mining. It appears from the statement of a Mr. Curtiss that the cost of mining there, in consequence of the smallness of the veins, is about \$45 per ton, a cost that at once precludes all chance of profit in the treatment of low grades ores, no matter how economical that treatment may be. This, however, is fortunately not the case with any of the low grade ores of Utah, which usually occurs in such immense deposits that the cost of mining is but a fraction of the amount named by Mr. Curtiss.

The great complaint seems to be everywhere made that the cost of treatment and the loss in treatment so runs away with the profits that nothing but high grade ores prove remunerative, and, as a necessary sequence, but very few mines pay to work. This is probably one of the main reasons why so many persons are desirous of selling mines instead of working them. Independent of the consideration of the subject of cheapening the cost of milling or smelting and increasing the percentage of the yield over the present average by improved methods of treatment, which all will agree is highly necessary and important, it seems to us that concentration is almost as desirable for high grade

The Railway Postal Service.

The importance and value to the public of the railway postal service has not until quite recently been generally understood. A merchant in New York receives his letters from Chicago, mailed in that city only thirty hours before they are put into his hands, quite as a matter of course, without bothering his head about thinking how this is accomplished. But for the railway postal service, it would be an utter impossibility; and the same letter, which now requires thirty hours only, would take perhaps forty hours in transmission. Every year, almost every month, adds to the number of lines upon which railway postal service is placed, and the corps of clerks employed in this most important branch of the postal service of the country is rapidly augmenting.

In his last official report, dated November 15, 1872, the Postmaster-General says regarding the railway postoffice service:

"Railway postoffices continue to receive the special attention of the Department, and the improvement effected during the past year has been most gratifying. Since the 30th of June, 1871, this branch of the service has been largely extended. Eight new lines have been established, with an aggregate length of 2,909

THE LOVEGROVE. (*Nemophila insignis*.)

ores as for low ones, for if the actual value of ten tons of \$200 or \$300 ore can be represented in one or two tons of concentrated material, then the cost of smelting or milling is reduced by the number of tons of tailings thrown out by the operation, and a much better result attained—even though the tailings contain a small percentage of the value of the ore—in consequence of the refractory material, which really causes the loss in milling or smelting being thrown out.

Concentration seems to strike at the root of the whole difficulty with either high or low grade ore, for it at once does away with many of the metallurgical difficulties in treatment, by separating the refractory foreign material from the metalliferous and easily treated portions.

Utah is about entering on a new era, that of working mines in contradistinction to the past practices of "placing" them in foreign markets. Working mines legitimately will benefit and build up the Territory, while merely speculating with them reacts to our injury. This the past has abundantly proved.

A PERSEVERING MINER.—A man, unaided and alone, has been constantly employed for the last three years and over, driving a tunnel into a hill near Swansea, about two miles and a half from Hamilton, White Pine, and has completed over 400 feet into the solid rock.

MUON building is being done on the Divide, and soon the small space left between Virginia City and Gold Hill will be closed up with dwelling, shops, lodging houses and saloons.

miles. The daily service has been increased 6,094 miles, and the annual service 2,224,310 miles, making necessary the appointment of 136 additional postal clerks of various grades."

From an interesting table appended to the report above quoted, it appears that the amount of railroad mail service, in successive years, from the commencement of each service (the railway mail service, be it remembered, not the postoffice service) in 1836, to June 30, 1872, has increased at an average rate of 1,626 3/4 miles per annum. The report for the first year, 1836, shows the annual transportation on railroad and steamboat routes combined. The length of railroad routes was first reported to be 974 miles at the close of the year ending June 30, 1837. The length in 1872, as has been already stated, was 57,911 miles—an increase of 56,937 miles in thirty-five years. The largest increase in length for any one year was for 1872, being 8,077 miles. The first report of the annual cost of railroad routes, uncombined with steamboat routes, was \$531,752, on the 4th of November, 1845. The cost in 1872 was \$6,502,771; showing an increase of \$5,971,019 in twenty-seven years, and an average increase of over \$221,148 per annum. The largest increase in cost for any one year was for 1872, being \$777,792.—*Scrivener's for June*.

A SHALE DEPOSIT has been found in Dry Valley, near Pioche, of such a character and so situated as to lead some to think a good quality of stone coal might be found in the vicinity.

Alameda County Coal.

The Alameda County *Gazette* says: It is an old and trite saying that "distance lends enchantment to the view." This is exemplified in mining excitements. The farther off the field of discovery, the greater the excitement and rush. This holds good in all minerals, coals not excepted. It is evident that the time is not far distant when California will be obliged to depend exclusively upon coal for fuel. The State is sparsely timbered, at best, and the little timber with which nature has favored us is being recklessly destroyed, and no tree-planting done to replace those destroyed. In view of these facts our coal mines are destined to become very valuable, for the dense population with which the future will people this State, and the thousands of steamers which will plow the Pacific waters, as well as the manufacturing establishments which are now and will be built up. In this connection we have a word to say in reference to the coal mines that lie at our very door. Contra Costa county is rich in coal veins, the croppings of which are far superior to those of any mines we have seen on this Coast. Within a few miles of Oakland lie buried in the bowels of the earth greater wealth than even the rich gold fields of the Sierra Nevada range produces. These coalfields can be made a source of wealth to this city, and for this reason, as much as any other, we have urged forward the narrow-gauge railroad enterprise. A railroad will serve to develop these coal fields, and the products thereof can be laid down in Oakland at a nominal cost. Cheap coal will build up manufacturing establishments on this side of the Bay. Parties who gain control of the coal mines of Contra Costa county, lying on the line of the proposed railroad will procure a fortune of far greater value than the Comstock mines. These coalfields cover a large territory, and if they are as extensive as present indications warrant, Contra Costa county can supply the State with fuel for an indefinite period of years. It is an opening for capitalists unsurpassed by any venture offered on this Coast.

How an Indian Catches a Skunk.

Skunks have their uses (when dead and "tried out") both in medicine and arts, and somebody must catch them, bad as they are to get at. On this subject a Yosemite traveller makes the following contribution to natural history, which may do for theory if not practice.

On my way up there, the other day, I saw two Indians up in a ravine slowly and stealthily approaching each other, with their eyes riveted on an object which proved to be a full-grown skunk. The one who was behind held out his hand, and kept moving it round in a circle, the animal watching him all the while. It prepared to make him a target several times, but the Indian's revolving hand seemed to distract its attention, and it did not execute the threat.

All at once the Indian dashed upon it, twitched it up by the end of its tail, and held it high up and cracked its neck with a stroke of his hand.

The whole operation was performed without the effusion of any stench whatever, which appears to be the main point in killing, and the captors bore it away in triumph. The animal seemed to feel itself so ignominiously discomfited and disgraced in being hoisted by the end of the tail, that it abandoned its usual means of defence.

We don't advise boys to attempt playing Indian in just that way. The experiments might cost too much before they learned how.

A STEAM CENTRE.—The large amount of work done on the Pacific Mail Company's dock has made it necessary to devise some means of extending the steam power facilities, and workmen have commenced building a "steam centre." The steam engines are intended to be ninety horse-power, and will supply all the steam necessary for the wharves, elevators, warehouses and steamers, lying at the wharves. Steam will be up all the time, day and night. There will be two boilers, one to relieve the other. Near at hand will also be one of the largest steam pumps, arranged so as to take suction from the bay, and to connect with the Spring Valley water pipes, which run the entire length of the wharves. In case the water should be turned off from any cause, and a fire break out, the steam pumps can be set to work immediately, and draw from the bay all the water that may be required. The improvement, will greatly facilitate the work on the wharf and help to save considerable property in case of fire.

SECRET CANON.—A gentleman from Secret Cañon informs the *Eureka Sentinel* that the mining prospects of that section never looked half so well as now. The Geddes & Bertrand has commenced shipping ore to the Lemon mill. Three large ore-teams arrived yesterday all loaded to the guards. The ore it is thought will work high up into the hundreds. An important strike is also announced in the Hodgdon mine. This was not unexpected as there was every indication of an immense deposit being fully developed at any time. The ore in the Hodgdon is believed to be equally as valuable as that in the celebrated Geddes & Bertrand, the two parties being only a short distance apart, and without doubt on the same mineral belt. Better times may be looked for in that portion of the district than have been experienced there since the first discoveries were made.

USEFUL INFORMATION.

How to Clean Feathers.

Feathers may be cleaned of their animal oil as follows: Take for every gallon of clean water one pound of quicklime; mix them well together, and when the undissolved lime is precipitated in fine powder, pour off the clear lime-water for use. Put the feathers to be cleaned into another tub, and add to them a portion of the clear lime-water, sufficient to cover them about three inches when well immersed and stirred about therein. The feathers, when thoroughly moistened, will sink down, and should remain in the lime-water three or four days, after which the foul liquor should be separated from them by laying them in a sieve. The feathers should afterward be well washed in clean water and dried upon fine nets. The feathers must be from time to time shaken in the nets; and as they become dry, they will fall through the meshes and may be collected for use. The admission of air will be serviceable in drying. The process will be completed in three weeks; and after being thus prepared, the feathers will only require to be beaten to rid them of the dust.

To Clean Banned Feathers.

To clean white, brown or fawn-colored feathers, dissolve some fine white soap in boiling soft water, and add a small piece of pearl ash. When the water is just cool enough for the hand to hear it, pass the feathers several times through it, squeeze them gently with the hand. Repeat the same process with a weaker solution of soap, and then rinse the feathers in cold water, heating them across the hand, to expel the water. When they are nearly dry, draw each fibre over the edge of a small blunt knife, turning it around in the direction you wish the curl to take. Then, if the feather is to be flat, place it between the leaves of a book to press it.

Black feathers may be cleaned with water and some gall, proceeding as above.

Why do we Oil our Whetstones.

Great men sometimes give utterance to arrant nonsense. Professor Tyndall, in his work, "Heat Considered as a Mode of Motion," asks the same question that we have placed as a caption to this note, and replies, in general terms that it is to prevent friction. We have seen it stated somewhere that a little carbolic acid dissolved in the water which is used to moisten a whetstone, will greatly increase the amount of friction, and thus promote the action of the stone on the steel instrument. If this be true, and there be no nonferrous drawback, carbolic acid will prove invaluable to all who have to sharpen tools or grind metallic surfaces.

We oil our hoes for several reasons. The first is, that almost all stones, unless oiled, become glazed or burnished on the surface, so that they no longer abrade the metal. The second is, that most stones, after being oiled, give a finer edge than they do in a dry or merely wet state. The pores of the stone become in a measure filled up, and while the action is rendered continuous, its character is altered. A dry stone is very apt to give a wire-edge to a tool, and although this sometimes happens when oil is used, yet it does not occur nearly so often. Some stones work better with water than with oil.

HAMMERING IRON TO MAKE IT RED-HOT.—In his lecture on "Heat," delivered recently at the London Institution, Mr. G. F. Rodwell alluded to a singular case of motion transformed into heat, namely, the rendering of iron red-hot by repeated strokes of the hammer. If Mr. Rodwell, who is so well versed in the history of science, will turn once more to the works of Robert Boyle, he will see that this "father of chemistry" had notions of transformation of mechanical movement into heat very nearly akin to it, if not quite identical with, those professed at the present day. Robert Boyle alludes to the rapid development of heat in an iron nail by repeated blows of the hammer after it had ceased to travel into the wood. It has been asked whether iron could be hammered cold until it became red-hot. Mr. Rodwell informs us that it can. Having requested a blacksmith to try the experiment, a piece of very tough iron was hammered with a moderately heavy hammer; it became hot, but would not scorch a piece of paper. It was then hammered by two men, one of whom used a sledge hammer, but with no better result. Presently a man, who was working in the shop, said he had often lit his forge fire by this means, before matches were plentiful. He took a nail such as is used for horse-shoes, and, after hammering for less than two minutes with a light hammer, part of the nail was brought to a light red heat. The blows were light but frequent, and the nail was partly turned at each blow.

WHITENING SMOKED WALLS.—A method of cleaning and whitening smoked walls consists, in the first place, of rubbing off all the black, loose dirt upon them, by means of a broom, and then washing them down with a strong soda lye, which is to be afterward removed by means of water to which a little hydrochloric acid has been added. When the walls are dry a thin coating of lime, with the addition of a solution of alum, is to be applied. After this has become perfectly dry the walls are to be calcimined, or coated with a solution of glue and chalk.

HOW TO COOL WATER.—As the warm season of the year approaches a cool draught of water becomes a luxury which we may enjoy with a little care. By the following method, simple and inexpensive, water may be kept almost as cold as ice. Let a jar, pitcher or vessel need for water, be surrounded with one or more folds of coarse cotton, to be constantly wet; the evaporation of the water will carry off the heat from the inside, and reduce it to a low temperature. In India and other tropical countries, where ice cannot be procured, this expedient is common. Let every mechanic and laborer have at the place of his work, two pitchers thus provided, and with lids or covers, one to fresh water for the evaporation, and he can always have a supply of cool water in warm weather. Any person may test this by dipping a finger in water and holding it in the air on a warm day; after doing this two or three times he will find his finger uncomfortably cool. This plan will save the bill for ice, besides being more healthful. The free use of ice water often produces derangement of the internal organs; which, we conceive, is due to the property of the water independent of its coldness.

NATURAL SUCTION PUMP.—Livingstone, the African traveler, describes an ingenious method by which the Africans obtain water in the desert: "The women tie a bunch of grass to one end of a reed about two feet long, and insert it in a hole dug as deep as the arm will reach then ram down the wet sand firmly around it. Applying the mouth to the free end of the reed, they form a vacuum in the grass beneath, in which the water collects, and in a short time rises to the mouth. It will be seen that this simple but truly philosophical and effectual method might have been applied in many cases in different countries where water was greatly needed to the saving of life. It seems wonderful that it should have been now first known in the world, and that it should have been habitually practiced in Africa, probably for centuries. It seems worthy of being particularly noticed, that it may be highly important to travelers in our deserts and prairies, on some parts of which water is known to exist below the surface.

GOOD HEALTH.

Orange Peel Poisonous.

The *Pacific Medical and Surgical Journal* says: Now that oranges are in every child's mouth, it is well for parents to know that fatal consequences may follow the swallowing of the rind. Many years ago we had in charge two little girls, sisters, four and six years of age, who were seized with violent inflammation of the bowels from this cause. One of them died in convulsions, and the other had a narrow escape. Since that time quite a number of instances, similar in character have come under our observation.

Quite recently we saw a child something over a year old, that was attacked with violent dysenteric symptoms, for which no cause could be assigned. The attack came on during the passage of the steamer from San Diego. The symptoms were so identical with those which we had previously noticed to arise from poisoning by orange peel, that we were induced to inquire particularly if the child had had an opportunity of getting this substance in its mouth. We were informed that it had been playing with an orange and nibbling at it just before the attack of the disease. The discharges from the bowels were frequent, and consisted of blood and mucus. After a week of severe enteric inflammation, the child died. We have no doubt that the disease was brought on by the rind of the orange. Though but a small quantity must have been swallowed, yet a very small quantity of such an indigestible and irritating substance will often produce most serious consequences.

EFFECT OF DIET.—The *Pall Mall Gazette* says Monsieur Cabasson has presented to the French Academy, a curious essay on the effect of diet on the moral and intellectual faculties of man. Its influence is, in his opinion, very great. In a passage of the "Misérables" Victor Hugo likens French vivacity to the light French wines, and English ponderosity "portarbeer;" and many Frenchmen are convinced that the distinguishing traits of the two nations may in a great measure be ascribed to the use of these beverages. But M. Cabasson has dived more deeply into the subject, and experimentalized on his own person with various articles of food. Coffee taken on an empty stomach, seems to have produced most startling effects. He informs us that immediately after imbibing it, his ideas acquired unusual profundity, his style in writing was cold but correct, while, on the other hand, his temper underwent a pernicious change; he became morose, egotistical and generally disagreeable. A moderate breakfast restored him to his normal state, and the disappearance of intellectual profundity was compensated for by an influx of genial and generous ideas.

The theory is as yet too undeveloped to admit of the prescription of a particular diet for every vice; but, as a general rule, M. Cabasson assures us that a diet of milk and vegetables is conducive to moral and intellectual superiority, and quotes Lamartine, who, in one of his prefaces, states, with that complacency with which only a Frenchman can talk of himself, that he attributes to diet, "the purity of feel-

ing, the felicity of expression, and the exquisite serenity" which always characterized him. All Lamartine's friends know that he retained this serenity of disposition till his death; if he really owed it to a vegetable diet, it is a pity that the potato does not seem to have the same desirable effect on the agricultural classes in Ireland.

WALKING.—Walking briskly with an exciting object of pleasant interest ahead, is the most healthful of all forms of exercise except that of encouraging remunerative, steady labor in the open air; and yet multitudes in the city, whose health urgently requires exercise, seldom walk when they can ride if the distance is a mile or more. It is worse in the country, especially with the well-to-do; a horse or carriage must be brought to the door even if less distances have to be passed. Under the conditions first named, walking is a bliss; it gives animation to the mind, it vivifies the circulation, it paints the cheek and sparkles the eye, and wakes up the whole being, physical, mental and moral.

There is no unmedicinal remedy known to men of more value in the prevention of constipation than a few miles' joyous walking; let one follow it up for a week—a walk of two or three miles in the forenoon, and as much in the afternoon—and, except in rare cases, when a longer continuance may be made, the result will be triumphant; and yet nine persons out of ten would rather give a dollar a bottle for some nansensous drops or poisonous pills than take the trouble to put in practice the natural remedy of walking. Nor is there an anodyne among all the drugs in the world which is the hundredth part so efficacious, in securing healthful, delicious, glorious sleep, as a judicious walk.—*Hall's Journal of Health.*

PROLONGING LIFE.—An eminent French chemist, Mr. Robing, in a memoir recently presented to the French Academy, announces his belief that the period of human existence may be greatly prolonged, and enters into an argument to show that his belief is based upon sound reasoning. His argument is, that the mineral matter which constitutes an ingredient in most of our food, after the combustion, is in our system to incur and stiffen the different parts of the body, tend to render imperfect many of the vital processes. He compares human beings to furnaces which are always kindled, and says:

"Life exists only in combustion, but the combustion which occurs in our bodies, like that which takes place in our chimneys, leaves a detritus which is fatal to life. To remove this, he would administer lactic acid with ordinary food. This acid is known to possess the power of removing or destroying the incrustations which form on the arteries, cartilages and valves of the heart. As buttermilk abounds in this acid, and is moreover, an agreeable kind of food, its habitual use, it is urged, will free the system from these causes, which inevitably cause death between the seventy-fifth and the hundredth year."

HIGH-HEELED BOOTS FOR LADIES.—A London surgeon, Mr. P. Hewlett, reports several cases of serious fissures of limbs indirectly caused by high heels, which had tripped up their wearers; and he refers also to the distortion and injury to the foot that they often induce. He says: "Last year I was sent for to see a young lady in one of our London hotels. She wished to consult me about her foot. On seeing it I thought its state depended upon her boots, and I asked to see them. The boots were brought in by the lady's maid, but the only thing I could observe about them was the immense high heels. I said: 'It is the high heels of your boots that cause the mischief, and unless you diminish them I can do nothing for you.' She became quite angry, and said she could not alter them. 'I can not do it and will not,' Suddenly she again calmed down, and said: 'Pray, sir, what would people say if they saw me walking about the park without high heels?' I said: 'It is simply heels versus brains. If you have brains, you will cut off the heels; if you have no brains, you will continue to wear them.' She fortunately had brains, cut off the heels, and her foot got quite well."

TAKING MEDICINE.—Napoleon, who was a man of grand intuitions, once said to the Italian Physician, Antonomarchi: "Believe me, we had better leave off all these remedies. Life is a fortress which neither you nor I know anything about. Why throw obstacles in the way of its defence? Its own means are superior to all the apparatus of your laboratories. Monsieur Covisart candidly agreed with me that all your filthy mixtures are good for nothing. Medicine is a collection of uncertain prescriptions, the results of which, taken collectively, are more fatal than useful to mankind. Water, air, and cleanliness are the chief articles in my pharmacopoeia.

MEDICINAL USE OF NETTLES.—Dr. Nicholl says that the greatest preventive of yellow fever in Bermuda, is dried nettle, powdered and used as a condiment in all cooking. The Doctor resides on the Isle of Jersey, and he uses it successfully among his patients. He preserves it like herb teas, and keeps it in a dry place. Dr. Thornton uses it as a styptic. He dips lint into nettle juice, and inserts it into a bleeding nose, with quick effect. He also prescribes it for gonorrhea, for which it is a specific remedy. In this case he grinds fifteen of the seeds, and administers once a day. The juice of the nettle has a singular effect on steel, which becomes flexible by immersion in it.

DOMESTIC ECONOMY.

Different Ways of Making Tea.

The Chinaman puts his tea in a cnp, pours hot water upon it, and drinks the infusion off the leaves; he never dreams of spoiling its flavor with sugar or cream. The Japanese triturates the leaves before putting them into the pot. In Morocco they put green tea, a little tansy and a great deal of sugar in a teapot, and fill it up with boiling water. In Bokhara every man carries a small bag of tea about him, a certain quantity of which he hands over to the hoth-keeper he patronizes, who concocts the beverage for him. The Bokhariot finds it as difficult to pass a tea-booth as our own dram-drinker does to go by a gin-palace. His breakfast beverage is Schitcha, that is, tea flavored with milk, cream, or mutton-fat in which bread is soaked. During the daytime, angrless green tea is drank with the accompaniment of cakes of flour and mutton-suet. It is considered an inexcusable breach of manners to cool the hot cup of tea with the breath; but the difficulty is overcome by supporting the right elbow in the left hand and giving a circular movement to the cup. How long each kind of tea takes to draw is calculated to the second; and when the can is emptied, it is passed round among the company, for each tea-drinker to take up as many leaves as can be held between the thumb and finger—the leaves being esteemed an especial dainty.

When Mr. Bell was traveling in Asiatic Russia, he had to claim the hospitality of the Buratsky Arabs. The mistress of the tent, placing a large kettle on the fire, wiped it carefully with a horse's tail, filled it with water, and threw in some coarse tea and a little salt. When this was near a boiling point, she tossed the tea about with a brass ladle until the liquor became very brown, and then it was poured off into another vessel. Cleansing the kettle as before, the woman set it again on the fire, in order to fry a paste of meal and fresh butter. Upon this the tea and some thick cream were then poured, the lid put into requisition, and, after a time, the whole was taken off the fire and set aside to cool. Half-pint wooden mugs were handed round, and the tea laded into them, a tea forming meat and drink, and satisfying both hunger and thirst. However made, tea is a blessed invention for the weary traveler.—*Chamber's Journal.*

FAMILY SECRETS IN COOKERY.—Disches used to be family possessions handed down by tradition; a mystery hung about them; the imagination was called in to assist. A respectful awe tempered while it enhanced the amount of fruition. The *Rambler*, we think it is, tells of an old lady who kept the secret of an old orange pudding till scarce failing breath enough was left to reveal it to her favorite daughter; and our own childhood can recall disches with something transcendental about them. Nothing that we ever taste nowadays approaches that exquisite evanescent twang, half taste, half odor, which recorded its existence on memory. But we cannot enter further into this, the pathetic phase of our subject, except just to point out how much real pathos may and often does lie round the memory of some dish supreme to childish tastes, served under the direction of now silent lips, and by hands whose cunning remains to our fancy transmitted.—*London Saturday Review.*

RAISIN, CONNECTICUT DOUGHNUTS.—Heat a pint of milk just lukewarm, and stir into it a small cup of melted lard and sifted flour, till it is a thick batter, add a small cup of domestic yeast, and keep it warm till the batter is light, then work into it four beaten eggs, two cups of sugar rolled, free from lumps, a teaspoonful of salt, and two of cinnamon. When the whole is well mixed, knead in wheat flour until about as stiff as biscuit dough. Set it where it will keep warm, till of spongy lightness, then roll this dough out half an inch thick, and cut into cakes. Let them remain till light, then fry them in hot lard.

SOUPS.—All soups are better to be made with fresh uncooked meat, as that which has been cooked once has lost much of its flavor and nearly all its juices. It is therefore better economy to hash or slice your cold meat, and buy fresh for soup. Soup should not boil very hard, as that has a tendency to toughen the meat. Fat meat is not so proper nor healthy for soup as the leaner parts of the finest meat. The fat does not impart much flavor, and is not palatable. Soup may be kept till the next day; before it is heated over again skim off the cake of fat which congeals on the top.

BE CHEERFUL AT THE TABLE.—A correspondent of the *Pacific Coast Journal* writes that paper: "Your advice to be cheerful at meal times, is thrown away as far as we are concerned; we are not only cheerful but jolly. The dinner hour is one of hilarity. Why should I not be happy; I have the best husband in the world, a duck of a hat, a quarter section of land, a log cabin with all the modern improvements. My principal trouble is a disagreement with the hens as to the way they should make themselves useful; they insisting on setting, while I much prefer they should continue to lay."

Table of Contents.

GENERAL EDITORIALS.—Public Breathing Places; Borax, 853. A Mining Camp Without Capital; Academy of Sciences, 360. Compound Engines—Machinery in New York, 361.

ILLUSTRATIONS.—Yosemite Valley, Cal.; The Lyngrove; Patent Slog Spout; Fishes' Teyre Tester, 361.

CORRESPONDENCE.—Notes of Travel in Stanislaus, Mariposa, and Tuolumne Counties; The Vienna Exposition; A Card, 354. The Comstock Mines, 361.

MECHANICAL PROGRESS.—Grinding Edge Tools; Iron for Specific Purposes; Strength of Materials; Compounding Common Steam Engines; Analogies of Art and Nature; Church Spire, 355.

SCIENTIFIC PROGRESS.—Scientific Revelations—What is Iron; The Sun; The Milky Way; Cheap Furnace for Chemical Experiments; Wonders of the Spectroscope; Air; Central Heat; A New Reagent; Artificial and Sun Light, 355.

USEFUL INFORMATION.—How to Clean Feathers; Why do we Oil our Whetstones; Hammering Iron to Make it Red-Hot; Whitening Smoked Walls; How to Cool Water; Natural Suction Pump, 359.

GOOD HEALTH.—Orange Peel Poisonous; Effect of Diet; Walking; Prolonging Life; High-Heeled Boots for Ladies; Taking Medicine; Medicinal Use of Nettles, 359.

DOMESTIC ECONOMY.—Different Ways of Making Tea; Family Secrets in Cookery; Raised, Connecticut Doughnuts; Soups; Be Cheerful at the Table, 359.

MISCELLANEOUS.—Coal Near Seattle; Concentrating Ores; The Railway Postal Service; Alameda County Coal; How an Indian Catches a Skunk; A Steam Centre; Secret Canon, 353. The Cedarberg; Silver in the Old Dominion; Another Prospecting Party; The Land Mill; The Old Gould & Curry Mill; Will Mining Pay in Utah; A Fine Tailings Mill; Quarrying; An Immense Engine; New Metal Band, 362.

THE UNITED ROYAL SMELTING WORKS of the Kingdoms of Prussia and Saxony have announced through their agent, Mr. Robertson, that until further notice, the works, being overstocked, cannot receive any further consignments. There is a two column editorial in this little item, for, when large works of this kind at such a distance become overstocked, it is about time that works of a similar character and scale should be erected on this coast. It speaks well for the mining interests in one way however, for the ore production must be increasing wonderfully. When will some of our rich men, who have made their money out of mining property, invest a sum sufficient to inaugurate works that will accommodate the vast and increasing amounts of our base metal mines?

THE COINAGE of the San Francisco Mint during the month of May amounted to \$2,760,000 in double eagles, and \$12,000 in half dollars. The mint is to be closed this week for the annual clean-up, which will require three or four weeks. During this period no crude bullion will be received, but fine bars will be taken and coin paid for them the same as usual.

RAILROAD SALE.—The Bingham Narrow Gauge Railroad, Utah, has been sold to parties from Pittsburgh, New York and Salt Lake. One of the heaviest stockholders has started for New York to purchase iron and rolling stock.

GOLD PLACERS.—The Kalama Beacon announces the discovery of good placer diggings at the head of Tontle river.

THE KOSSENTH mine near Silver City, Nevada, is to have a new shaft and workmen have commenced the erection of new hoisting works.

PROSPECTORS from Grant District have brought into Pioche rich looking specimens of free milling ore.

A SMELTING FURNACE is being erected in Spruce District, 85 miles from Pioche.

A Mining Camp Without Capital.—The San Diego Mines.

We have the somewhat unusual instance to record where a quartz camp has, without a single cent of capital, been developed by the energy and perseverance of a few determined men until it has come to be recognized as one of the prosperous ones of California. We allude to the mines of San Diego County, in Julian and Banner Districts, about 60 miles from the city of San Diego. They were first discovered in February, 1870; and although there was an "excitement" in the first instance, it rapidly subsided on account of the prejudice existing among most Californians against the "lower country," and particularly the county in which these mines are situated. Even now, very little seems to be known concerning them outside of the county, and people generally have thought that the accounts in the local papers were exaggerated. We will endeavor to show by a few all-potent, and at the same time reliable, figures, that there is more in these mines than is generally supposed: There are

Two Districts

In which the principal mines are located, Julian and Banner. The formation is slate, sparsely interspersed with granite, and the veins run north-east and south-west. The veins are unusually numerous, though as a general thing small. The auriferous belt is about four miles wide and ten long. The first ledge struck was the Washington, February 22, 1870. It was rich in gold at the surface, but is not now being worked. A number of other mines were discovered and a small Wilson steam stamp custom mill was put up. The camp, however, languished until two very green miners (as usual) who knew nothing about the business, struck a ledge in San Felipe Cañon, while hunting for wild grapes. When this became known the cañon was thoroughly prospected and a number of rich claims located. The majority of them were exceedingly rich in gold, and none were worked but such as showed free gold. A new mining district was formed and called

Banner District.

The cañon in which they are situated is called San Felipe, and the creek of the same name is over 1400 feet lower than Julian city, though only two miles distant. The cañon runs into the great Colorado Desert in ten or twelve miles from the mines.

The principal mines are the Golden Chariot, Madden, Antelope, Kentuck, Ready Relief, Pacific, Aguadiente, Mogul, Montezuma, Chaparral, Ophir, Hidden Treasure, Romeo, Atlantic Cable, Redman, Hubbard, Poor Man, City of Richmond, Last Chance, Buena Vista, Blue Lead, Trail, and a number of extensions of the Golden Chariot.

Several of These Mines

Paid well on the surface, but did not on sinking. Others are now being worked and are paying well. The Redman, the first one discovered in the cañon, is a very large vein, and at one time was thought to be the "king ledge" of the camp. Inexperience in mining operations and financial difficulty has caused it to be temporarily idle. The Ready Relief, next adjoining the Redman on the South, and owned by the Bailey brothers, is in a peculiarly favorable situation for working. They have four good levels running into the side of the mountain, from all of which good ore is being taken. A fine stream of water has been utilized to run a 3-stamp mill, by an over-shot wheel. Ten tons of ore from this ledge some time since yielded \$980. A friend of ours, from there since the writer's visit, states that the mine is now turning out beautifully. The vein is 5 feet wide, and the ore averages \$90 per ton. A shaft is now being sunk on the mine. It is owned by five men. A mill in the cañon some time since took 100 tons of ore from this mine, and after crushing 20 tons, discovered that it would not pay for crushing; whereupon the owners, thinking differently, crushed the rest in an arastra and got out \$60 per ton.

The extension of this mine is owned by Mr. Hubbard. He has a 5-stamp mill, run by water-power, and is making money. The ore from the Kentuck, in this cañon, paid about \$40 per ton. From the Antelope, now idle, selected rock has paid \$4 per pound. Some idea of its richness may be formed from the fact that the owners pounded out enough gold with a mortar and spring-pole to build an arastra, and with both mortar and arastra, got enough to build a 5-stamp mill, engine and all complete, in a few months.

The Golden Chariot Mine

Is the banner mine of Banner District. It was found by G. V. King, in February, 1871, and has proven itself to be the most productive mine in the "lower country." The main ledge was 2 feet wide at a depth of 50 feet. The shaft is now down probably 175 feet. A crushing of the rock some time since yielded

\$23,000, or \$230 per ton. The ore from the upper levels pays about \$190, and from the lower levels about \$200 per ton. In one drift they had 14 feet of pay ore. One run of 50 tons crushed last October, yielded \$8,100 at the mill, or \$160 per ton; 52 tons crushed in August paid \$13,621, or \$257 per ton. The ledge is now quite wide, and is paying at mill \$100 per ton. When first opened the rock was packed to mill on mules; and since they have erected their own mill—a 5-stamp one—the waste rock sorted at that time, is now milling \$100 per ton. They have some 500 tons of this rock on their dump, and are getting out more. The wagon road built to their mill lately, cost them \$1,800. This mine is one of great promise, and bids fair to rival many in older and more prominent mining districts. It has paid all its expenses from the period of its discovery, and a very handsome profit besides. One of the owners—the discoverer—sold out his interest to his partners, last January, for \$25,000.

There are four quartz mills in this district: One Wilson steam stamp battery, belonging to Mr. Whitney, of this city, now in charge of Mr. Begon; the Golden Chariot 5-stamp mill, run by steam; and two water-power mills, one with three and the other with five stamps. They are all wet crushers, and with one exception have copper plates and no pans, settlers, concentrators or arastras. Charges for milling are from \$7 to \$8 per ton.

Julian District.

The prominent mines in Julian District are the Owens, Helvetia, Good Hope, Van Wert, Hayden, Big Blue, Great Eastern, etc. The representative mine of the district is the Owens, which has been incorporated, but is owned by a few parties. It has been more systematically worked than any of the other mines, and has paid large dividends for the past ten months. The shaft when last we heard from it was down 275 feet, and levels have been run at 100 feet from the surface, in ore that paid \$20 per ton at mill. Several levels at a depth of 200 feet were in ore in both sides which milled \$35 per ton. The third level, at a depth of 275 feet, goes east 260 feet and west 200 feet in ore that milled from \$50 to \$60 per ton. Thirty-two and a half tons worked some time since, paid \$40, and ore in considerable quantity has been milled yielding \$75 per ton. During a period of eight months in succession the sum of \$42,319.50 was taken from 920 tons of ore, with 12 men at work. The rock averaged right through \$26.55 per ton at mill. One run of 109 tons turned out \$8,878.28, and 48 tons worked paid \$3,987.40. The ledge is about 3 feet wide. It is owned by six men, and some idea of the value of the lode may be had from the following summary of operations for the last eight months:

920 tons of ore yielded.....	\$42,319 50
Expenses of Extracting milling, etc.....	24,210 25

Net Proceeds for 6 owners in 8 months... \$18,109 40
This paid each owner \$3,036. A fine set of hoisting works is now on the mine, the first shipped to that part of the county except a small set on the Stonewall Jackson mine at the Cuyamaca Mountain. The ledge has been 5 ft. wide, but at present writing is two feet wide at bottom of shaft.

The Helvetia mine has also paid its expenses from the start and has developed itself. The shaft is down upwards of 225 feet, the ledge averaging about 2½ feet; the rock averages about \$30 per ton. The vein is now full three feet wide. A crushing from this mine is made nearly every month and \$30 realized at the mill. A few weeks since a new vein was found at the bottom of the shaft in a place where they never had found ore before.

The Van Wert mine, owned by De Frees, Moore and Taylor has a tunnel now in 200 feet. The ore averages \$50 per ton at mill. This mine was once abandoned after a long tunnel had been run, but these parties extended the tunnel some 20 feet and struck a rich deposit of ore.

The Washington, once the "boss mine," and the first discovered in San Diego county, is being worked on a small scale only; a crushing recently turned out \$40 per ton.

In the Hayden mine, they are down 250 feet; quite a large pile of good rock on the dump. They are taking out a good quality of ore.

The Excelsior belonging to Count Dwarkowsky and Harver, has a vein 2 feet wide at a depth of 40 feet. The result of a recent crushing was \$33 per ton.

The Great Eastern a segregation of the Excelsior is being worked, and pays \$20 per ton at mill.

The San Diego mine cleaned up from a recent crushing \$31 per ton. The Blue Lead, near the Helvetia, is turning out well.

The Stonewall Jackson mine, belonging to Frary and Farley, is about eight miles southeast of Julian City, in an isolated position in the Cuyamaca mountains. A fine ten-stamp mill and hoisting works are in operation at the mine. The mine is being worked systematically and has been well developed. The ledge matter runs from 12 to 16 feet in width. The mill is run by a 40 horse power engine. The lead has been in some instances 20 feet wide and yields from \$12 to \$20 per ton, all through.

Quartz Mills.

The mill of the Stonewall Jackson numbers 10 stamps; that of De Frees & Co., at Julian, 10 stamps; Reynolds & Co.'s mill at Julian, 5 stamps; Whitney's patent steam stamp mill in the cañon has 2 stamps; that of the Golden Chariot in the cañon has 5 stamps; the Ready

Relief mill, 3 stamps; Hubbard's mill, 5 stamps; and Wilson's steam stamp mill near Julian has two stamps. Mr. Wilson has rigged his mill so as to saw wood when out of rock. Fire wood sells in the district at \$5 per cord. Lumber costs 16 cents per foot.

We have given this somewhat extended notice of these mines to show that where

Industry and Perseverance

Are exerted, miners can get along without "waiting for capital." This capital, or want of capital, is the bugbear of all mining camps. These men waited as usual, at first, but capital did not come very fast and they concluded to pitch in and not wait. The result was, they made money. Many mines in the camps which paid well on top "pinched" and were abandoned. Others kept on hopefully, and in whatever mine depth has been attained, good ore has been found without exception. The place had to work out its own salvation. There was no money in San Diego, and San Francisco people were investing elsewhere or dealing in stocks. The mills were all paid for by gold taken from the rocks by the owners.

One mill was brought down by a San Francisco man, who, ignorant of mining made a failure of it. Another was built and through financial difficulties was never started up except for a short and inglorious run, when the sheriff took possession. All those now in camp were put up by mine owners. The people who first came there were all poor, but many of them have made a "home stake" in the country. The mines are situated in the most lovely and best timbered portion of the county; grass is abundant, there is plenty of rain and some snow, and the climate is delightful. The bullion production of these mines was in 1871, \$160,919. In 1872 it amounted to \$488,670; and this year it will be probably doubled. Who says that is not a good showing for a small camp with no capital but pluck and muscle?

Academy of Sciences.

At the last semi-monthly meeting of the California Academy of Sciences, held on Monday evening, Messrs. W. W. Mortague and A. W. Chase were elected members. The contributions to the cabinet included a fine collection of skins of California birds, numbering about twenty specimens, procured in Alameda county which were presented by M. Lorguin. Collections of flowers and grasses from Salt Lake region, also, petrifications from Penitentiary Creek, presented by Mr. Turrill. Specimens of borate of lime, a very beautiful formation of a light-yellow color; received for the Academy by General Hewston, from the Lone Ranch Borate Mining Company. Collections of shells; corals, star fish and other marine specimens procured near Auchem Bay, by A. W. Chase, of the United States Coast Survey. The principal part of the evening was occupied in the reading by Mrs. Carr, of some Mrs., of John Muir, describing the great Tuolumne Cañon. Mr. Muir was the first one to enter this wonderful gorge at its head, and he gives a very graphic description of the beauties of its scenery. A large proportion of the paper was devoted to the subject of the glaciers of the vicinity, and the rivers of California flowing from the Sierra Nevada. The paper will shortly be published in the *Overland Monthly*, and will be an interesting one to lovers of mountain adventure, and fine scenery.

Telegraphic List of U. S. Patents Issued to Pacific Coast Inventors.

FROM OFFICIAL REPORTS FOR THE MINING AND SCIENTIFIC PRESS, DEWEY & CO., PUBLISHERS AND U. S. AND FOREIGN PATENT AGENTS

By Special Dispatch, Dated Washington, D. C., June 3d, 1873.*

FOR WEEK ENDING MAY 20th, 1873.

RAILROAD TIES.—William H. Sterling, S. F., Cal.

SACKING ATTACHMENT FOR THRESHING MACHINES.—Walter Masterton, Stockton, Cal.

STRAW FEEDING ATTACHMENT FOR FURNACES.—David Morey, Watsonville, Cal.

MANUFACTURE OF STUOB.—A. F. W. Partz, Oakland, Cal.

LAMP HEATER.—William Friel, S. F., Cal.

PIPE TONOS.—Frank H. Merrill, S. F., Cal.

ORE FEEDER FOR GRINDING AND CRUSHING MILLS.—Chas. P. Stanford, S. F., Cal.

FASTENING POCKET OPENINGS.—Jacob W. Davis, of Reno, Nev., assignor to Levi Strauss & Co., S. F., Cal.

*The patents are not ready for delivery by the Patent Office until some 14 days after the date of issue.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with greater security and in much less time than by any other agency.

BROKE THROUGH.—We see by the *Enreka Sentinel* that the workmen in the Danderberg mine, broke through a few days since into the Jinksville chamber, and both parties thereupon suspended operations by mutual consent, a very sensible conclusion to come to. The ore deposit is one of the largest and finest on Prospect Mountain. The affair will probably be amicably settled.

THE NORTH STAR Consolidated mine, in Star District, Utah, has been sold to parties from Canada.

Compound Engines.—Machinery in New York.

A friend of ours in New York sends us some interesting items in relation to the machinery now being built in New York for the steamship *Tennessee*, and as the engines in question are the largest of the kind ever built in this country, our foundrymen and those interested in such subjects, will be pleased in reading the description. Our friend says that probably the busiest shop in New York at present is that of John Roach & Son. The new engines for the United States steamship *Tennessee*, are rapidly approaching completion, while a fine iron vessel for the Pacific Mail Company's line of steamers is receiving her engines, imported from England by the company. Shortly after the arrival of the *Tennessee* from St. Domingo with the United States Commissioners on board, it was determined, in view of her poor steaming qualities, to replace the machinery therein, designed by Captain Ericsson, with a pair of Compound Engines.

Mr. Roach secured the contract, and at once went at the task of constructing the enormous engines. There is nothing about them of startling novelty, but as the largest pair of compound marine engines ever built in this country, they deserve some special mention. Compound, four cylinders, back acting—this, perhaps, sums up the design in technical language, but a more detailed description will be read with pleasure by our mechanics.

The high pressure cylinders are 40 inches in diameter, and the low pressure ones are 78 "inches" the stroke being 40 inches. These cylinders are placed horizontally on one side of the shaft, the pairs being about 5 or 6 feet apart in the clear. Of course the smaller cylinders are each placed concentrically behind the large low pressure ones. One piston rod connects the piston in each pair of cylinders, and from each large piston, two rods project, one over and the other under, the propeller shaft, where on each side of the condenser the cross heads slide in massive guides. Opposite the cylinders the condensers, a square box filled with tubes, stands, and under each set of guides there is an air pump, the circulating being accomplished with two large Blake pumps.

There are two slide valves on each high pressure cylinder, one for the steam, and the other for the exhaust. The low pressure cylinders each have a patent form of frictionless slide valve, of English invention, which it is hoped will make a great saving in power. The link motions are operated by a pair of inclined cylinders set beside one of the cylinders of the main engine. The surface condenser has about 8,000 tubes, $\frac{1}{2}$ of an inch in diameter, and about 7 feet 9 inches long, placed horizontally in four undivided sections.

The Propeller

Is of composition, weighing between 10 and 11 tons, its diameter is 19 feet and its pitch 33 feet, made on the Hirsch patent. Its blades are broad at the hub, and narrow down gradually towards the circumference. It certainly is a massive casting, and one does not wonder that such engines are required. It is expected that 60 revolutions of this screw will propel the ship at a rate of 14 knots per hour, the speed guaranteed by Mr. Roach.

The Boilers.

Are ten in number, cylindrical, with flat ends, 11 feet 6 inches diameter by 10 feet 6 inches long, with two furnaces in each boiler, and 164 tubes, 7 feet 9 inches long, and $\frac{3}{4}$ inches external diameter; the shell of the boilers being made of iron $\frac{3}{4}$ of an inch in thickness. The total grate surface in all the boilers is 478 square feet, and the heating surface is about 13,000 square feet. It is expected that these boilers will carry 65 pounds, at the usual working pressure, and with a consumption of 80 tons of coal per 24 hours, drive the ship at the speed mentioned. To attain this will be very satisfactory, as the *Tennessee* is no pleasure yacht, being 375 feet long with 45 feet beam. Mr. Henry Lerratt, the Superintendent of the works, has so far produced a fine piece of work, for we understand he is the designer, and it is to be hoped that the expectations of all parties will be fulfilled.

The New Boat

Of the Pacific Mail Line, the "Colon," was built in Chester, and is the largest iron steamer, except for the navy, ever built on this side of the Atlantic. Her engine was constructed by John Elder & Co., of Glasgow, Scotland, and is of the compound type, vertical with the high pressure cylinder of 51 inches diameter on the top of the low pressure cylinder of 88 inches diameter. The stroke is 36 inches. There are four boilers with 12 furnaces each the same in design as those for the "Tennessee," except that the steam on the way to the cylinder passes through a superheater surrounding the stack, which is placed centrally in relation to the boilers. She is a fine ship, but an American engine would have driven her as fast with as little coal as the English machinery. We have not had much large marine works in our shops lately, and it is gratifying to see the activity and energy with which, when obtained, it is performed.

Tuyere Tester for Blast Furnaces.

The water tuyeres employed in blast furnaces are often imperfectly made, and commence to leak water into the furnace soon after they are put into use; but even if perfectly made, they eventually burn out and allow a greater or less amount of water to run into the furnace. The result is the cooling of the furnace, to some extent, thereby diminishing its smelting capacity during the time a leaky tuyere remains in the furnace. Hitherto the only certain means to determine whether or not a tuyere is leaking water, has been to withdraw the tuyere from the furnace and examine it. This separation causes the furnace to be temporarily put out of blast, and necessarily causing great loss of time and consequent loss of profit.

A recent invention, patented through the agency connected with this office by R. A. Fisher, of Eureka, Nevada, is designed to do away with these objections by providing a device by which the soundness of the tuyere can be detected almost immediately without removing it from the furnace.

Figure 1 of the cuts herewith shown, represents a longitudinal section of a common water tuyere in which A A shows the wrought-iron pipe through which the air that passes into the furnace by means of the galvanized iron "wind-pipe," B, C represents the supply-pipe through which the cold water passes into the tuyere. D shows the discharge-pipe through which the water, warmed by passing through the tuyere, is carried off. E is a globe-valve or

Fig. II.

FISHER'S TUYERE TESTER.

cock, by which to regulate or cut off the supply of water that passes into the tuyere. To determine whether or not a tuyere is leaky, it is only necessary to completely arrest the flow of water through the discharge pipe D and by a suitable contrivance, to determine whether water still flows through the tuyere. This object may be effected by making a section of the supply-tube of glass, and introducing into the glass tube a spiral or other contrivance that will denote a movement of the water; but Mr. Fisher prefers attaching a glass tube to the end of a branch or supplementary discharge-pipe, more particularly described below.

Figure 2, shows the invention which consists, first, in branching out the discharge pipe, D, by the pipe, F, bent at an angle and carried to a greater or less distance above the level of the tuyere and terminating the said branch pipe by a glass tube, G; second, in placing a cock, H, (in Fig. 2) at the end of, or in connection with the discharge pipe, whereby the flow of water through the discharge pipe can be entirely arrested. To determine whether or not a tuyere is leaking water, it is only necessary to close the cock, H, when the water will rise through the branch, F, and begin to overflow through the glass tube, G; then close the inlet cock, E, and if the tuyere does not leak, the water, as it becomes heated, expands and there is a gradual leak, the water falls in the glass tube, G, more or less rapidly, according to the size of the hole in the leaky tuyere.

Mr. Fisher is the inventor of a number of improvements in connection with furnaces, one of which is given in another column of this issue, and another of which—Sectional Slag Pot—was illustrated in the Press of April 26th, 1873. In addition to these he has invented an arrangement for preventing the incrustation of tuyeres, which has been in use for some time at a furnace in Nevada, and after several months use, the tuyeres were found to be as free from incrustation as when first put in. The method employed is a very simple and inexpensive one, and is quite successful. All of these inventions are now in practical use.

THE CABLE gold mine, near Helena, Montana, is expected to be sold, as \$100,000 has been offered for it.

Wood sells at Pioche for \$7 per cord.

Slag Spout for Smelting Furnaces.

The accompanying cut represents R. A. Fisher's slag spout for smelting furnaces, a patent for which was recently obtained through the Scientific Press Patent Agency. The invention consists in the use of a metal lining for slag spouts which are attached to smelting furnaces. Heretofore the slag running from smelting furnaces has passed directly over the surface of a spout which is attached to the breast plate (front) of the furnace. After a time this spout, becomes so much corroded or eaten away by the molten slag as to become useless, and requires to be replaced by a new one. This replacing of the spout necessitates the stoppage of the flow of slag until the new spout is ready, causing an accumulation of slag in the furnace.

By placing a lining, b, of metal or other suitable material within, and resting upon the bottom of the spout, A, before commencing to

PATENT SLAG SPOUT.

run off slag, the spout is protected from the corroding action of the slag and when the lining requires renewal, it can easily be replaced by a new one at much less cost of time and material than is required to renew the slag spout itself. These slag spouts are now in use at Eureka, Nevada, where Mr. Fisher resides.

Comstock Mines.

Latest Home Views by our Virginia Correspondent.

NUMBER V.

The northern end of the Comstock has been somewhat exercised of late on account of the audacity of two

Land Grabbers

Who run a tailings mill at the foot of Six-Mile Cañon.

Having been successful in their line of business for several years past, and knowing its value as proved by the result of working immense bodies of tailings, collected and purchased from various mills in this locality, a praiseworthy ambition has led them to believe that under the law conveying to the C. P. R. R. Co. grants of alternate sections (odd numbers) of agricultural land lying within twenty miles on each side of their road, all tailings, deposits and water rights lying in said sections, on ground heretofore located and worked as mineral lands in this vicinity, can be condemned for agricultural purposes and as such purchased from the C. P. R. R. Co.

An agreement to this end has been entered into by these parties with the C. P. R. R. Co., money deposited, and a bond for a deed given, to be delivered when the title shall be received from Government for this agricultural (?) land. They have also applied for grants of certain portions of even sections Nos. 20 and 28, Township No. 17, Range 21, east M. D. Meridian—if agricultural—belonging to the State of Nevada for the same purpose.

No scientific or practical miner will dispute the fact, that all lands lying within five miles of the reputed boundaries of the Comstock lode, its extensions, branches and spurs, and the various reputed ledges lying to the east and west of this vast deposit, are, and should be indisputably pronounced, mineral lands, and only a brain craved with success, or an imbecile, would support the claim now in question.

The parties above referred to have made several extensive and important locations, covering valuable mineral lands, on and over the Comstock lode, including the Monte Christo Mining Claim, the ground owned by, and the tailings deposits of, the Winfield, Bassett, and Land Mills—an old tunnel of Ophir S. M. Co., a portion of the ground claimed and owned by, and crossed by the croppings of, the Sierra Nevada Mining Co., and on which lies an extensive deposit of tailings from their mill, now and for years past in uninterrupted operation,—then by (for themselves) a skillful coup d'état, skipping the ground of the Utah Mining Co.,—crossing westward they ask for the ground on which the Cedar Hill Tunnel is started, on Section 20, running westerly 3,800 ft., on to Section 19, the N. E. quarter of which they claim. This Tunnel is now owned by the Virginia and Gold Hill Water Company, having been acquired by purchase from Float Rock Mining Company No. 2, by whom the ground was located in 1859, and worked for mining purposes—the

tunnel in its progress showing streaks of quartz and ledge matter, and now furnishing about twenty inches of water—this being the principal source of supply for Virginia and Gold Hill.

All the above leads were pronounced by the first Surveyor General of the State, to be mineral lands, and acting on this assurance of government and State protection, they have been developed and improved at a cost of over half a million dollars.

The Audacity of the Scheme

Is unparalleled, as, if successful, it amounts to nothing less than highway robbery; and the idea of its accomplishment is ridiculous, as the parties in question have not only the Va. and Gold Hill Water Company, and the Sierra Nevada and Monte Christo Mining Companies to contend with, but all the mining companies on the Comstock, for the success of this enterprise would endanger the property of our mines, and of all mills producing tailings to be condemned for agricultural purposes. The parties of the first part, however, show their weakness by relinquishing a portion of their claims in the face of power. Superintendent Requa, of the Chollar Company, having induced them to waive their claim to the Winfield mill, and Major Edington, Superintendent of Union Mill Company, having quietly accomplished the release of their claim to the grounds owned by Nevada Mill.

The case, styled C. P. R. R. Co., and others, to have certain lands declared non mineral, is now on trial before Register Waitz, of the Land Office in Carson, by whom all testimony will be taken, and with his opinion submitted to the Commissioner of the General Land Office, in Washington, for final decision.

The plaintiffs have summoned a surveyor, Mr. Hocholzer, a householder, a Justice of the Peace, a saddler,—all of whom live in Carson, fifteen miles from the Comstock, on agricultural land,—and one practical miner, Mr. James Rule, of Virginia City, as experts, to prove that the grounds claimed are purely agricultural,—the latter gentleman, however, in his examination, last Friday, testifying that he had superintended a mine and milled ore from the same, located on one of the sections in question. The case will probably occupy the next two weeks in taking testimony, when the summary will be forwarded to Washington for final action.

The Decision

Will be awaited with interest, although with little doubt as to the result, as the parties proposing to prostitute the mineral resources of Washoe, and, at one fell swoop, to convert the immense and valuable property of several of our largest incorporations to private use, without paying a dollar's consideration, can only call down upon themselves the contempt and execration of all fair-minded men.

The Past Week

Has shown no special change in the upper end of the Comstock. Work in the Virginia mines is going on nicely, without interruption.

Chollar is doing nothing as yet, on the body of ore lately discovered on their 800 feet level, which they seem to be holding back for some mysterious purpose.

The body of ore, recently discovered on 1,600, foot level in Hale & Norcross, is improving as far as explored.

Sevsge, have not commenced crosscutting on their body of ore as yet.

Reports give Gould & Curry credit for a good body of ore on their lower level, south, which improves rapidly as they drift on it.

In the Consolidated Virginia, the ore body improves as they drift north towards their shaft.

Ophir is running some crosscuts on their 700, 1,100 and 1,300-ft levels, which are rapidly approaching the ledge, and from which much is expected.

On the lower end of the lead, the Crown Point and Belcher are looking exceedingly well, especially the Belcher on their 1,300 south.

No change is noticeable on the S. W. branch, which includes the American Flat Mines.

On the S. E. Branch,

Silver Hill, is constantly improving in the north, and also in the south chimneys. Winze from 1st to 2d levels is down 45 feet in elegant ore, assays of yesterday ranging from \$200 to \$3,800. The future of this mine looks flattering, as it promises to become one of our leading ore producing mines.

The Dayton expects to cut the ledge on their 224-ft. level within thirty days, the drift went being to-day, in 50 feet.

The Kossuth Co. have, during the past week, appointed Mr. James Rule, Superintendent. Their new shaft has been located, and active operations commenced.

For the last few days there has been a better feeling on the street than previously noticed, and the firm confidence in a prospective general development along the line, together with the knowledge that this can be accomplished, imports a healthy aspect to the market generally.

Virginia, June 3d, 1873.

THE GREAT TUNNEL at Blackhawk, Colorado, of which we spoke last week, has actually been commenced. It will be 20 feet wide by 12 feet high, and will drain a large extent of country. It will take 5 years to complete it, and will cost \$5,000,000. The tunnel will run by mainly by English capitalists, and will extend from Blackhawk on the east side to the rim of the Middle Park on the west side of the Suway range.

The Cederberg.

Last Sunday we visited the celebrated Cederberg claim, which is unique, unlike anything ever before discovered, a marvel and a mystery to the most experienced miners. In common with a majority of Californians, we, when we saw the first of the extraordinary specimens from the Cederberg, at once concluded that the discovery was a mere pocket, that it would "peter out," and that there could not possibly be any permanence or reliability about such a mine. But month has followed month, year has succeeded year, a ten stamp mill and good steam hoisting works have been erected and paid for out of the proceeds of the mine, dividends to the amount of forty-eight thousand dollars have been disbursed to the stockholders in the new company, to say nothing of the amount taken out by the original discoverers, and still there seems to be no diminution in quantity or change in quality of the sheets and plates and tangled masses of wire—all bright, shining gold—in the Cederberg.

On the occasion of our late visit, accompanied by the original discoverer of the mine, we were hospitably received and entertained by Superintendent Hulbard, who afforded us every facility for a thorough examination of the mine, mill and works. The mill and hoisting works have been erected with due regard to economy and with cautious reference to the peculiar character of the mine and with apparent deference to the idea that it might not prove permanently rich. But the mill engine is sufficiently powerful to run double the number of stamps now operated, the hoisting engine will take the shaft down three hundred feet, at which time, if the past and present prospects are verified, there will be ample justification for erecting more permanent and expensive works. The mine is in every respect peculiar and wonderful. It is divided into three distinct parts and has three distinct shades of character, if we may be permitted to use this expression in the connection. Adopting the phraseology of the Superintendent, there is the "bull ledge," "the platform ledge," and "the Cederberg seams." The latter are a succession of quartz seams, from two to eight inches in thickness and constituted the original discovery by Cederberg and Hansen. These seams occur in the rocky face of the bluff hillside, from which there appears to have been a slide, and Mr. Cederberg expresses the opinion that this slide occurred before Adam made his appearance on earth. Cederberg, when he first commenced prospecting for this quartz, had become satisfied that it must be right there and wonderfully rich, and after two long and weary years spent in fruitless labor, sinking shafts, running drifts, and after he had run out of money and out of credit, these marvelous seams were brought to light by sluicing off the superincumbent mass of what he styles "pre-Adamic" stone and rubbish. All the world, including Queen Victoria, of England, and the Emperor Alexander, of Russia, have seen more or less of the beautiful and rich specimens from the Cederberg seams, and the end of them is not yet.

Just below and to the westward of the seams is "the platform ledge," so-called because it was sunk upon from the platform of the former seam workings. This platform ledge has walls varying from one foot to ten feet apart. This fissure is filled, not with a regular ledge but with a conglomerated mass of broken quartz, talc, trap, slate and an indescribable mixture of similar substances. As above remarked, this fissure is in places ten feet wide. It has been followed to a depth of eighty feet, everything that comes out of it has been passed through the mill, because of the impossibility of separating the pay rock from the refuse, and the result throughout a period of over a year and a half, has been an average of fully eighteen dollars per ton. A short distance to the southward and westward from this another shaft has been sunk, which is down more than a hundred feet, and which it is proposed, as a certain operation, to sink to a depth of at least three hundred feet. At the hundred foot level a drift has been run, partly for the purpose of rising to the platform ledge shaft to obtain a circulation of pure air, and partly for prospecting purposes. The old shaft has been tapped, there is a fine circulation of air and on the strength of certain indications and prospects a branch drift has been run to the northwestward, following, so far, for a distance of thirty or forty feet, a series of seams that are literally loaded with plates and veins of gold and bunches of precious metal which resemble tangled masses of fine spun wire. With pick and penknife, during our brief visit last Sunday, we exposed gold enough to have paid for at least a week's hard labor. To the westward of the platform ledge, still farther down the hill, but only separated by a wall a few feet in thickness is "the bull ledge," solid white quartz, several feet in average thickness, which so far as prospected has yielded only a limited amount of very fine gold, fine as snuff, not rich enough to pay for extraction and milling. This ledge pitches to the eastward at an angle of nearly forty-five degrees. At and near the surface the seams and platform ledge pitched in the same direction at an angle of fifteen degrees or more, but now they are descending almost vertically, and there is every indication that the whole will converge and unite before the new shaft shall have reached a depth of three hundred feet.

And what then? Will the whole then be characterized by the comparative barrenness of the bull ledge, or will it show the effects of the fruitifying influences which have made the seams and the platform ledge so marvellously rich? We consider the chances in this case about even, but if at any workable depth, a main ledge is found at all approximating the richness of the seams, the Cederberg will be the richest mine ever discovered. So mote it be!

Of the Sliger, which is unmistakably a true fissure, and whose future seems hardly at all problematical, we shall have something to say hereafter.—*Mountain Democrat.*

Silver in the Old Dominion.

The Gallipolis (Va.) Bulletin has the following article: More than a year ago, Henry Pike, of New York city, took several specimens of ore from the land he now owns in Putnam county, West Virginia, to New York, and left them lying in his office. The samples were quarried by Mr. Pike, and taken by him as specimens of "black band" iron ore, and considered rich. After being in his office for some time, Mr. Pike's brother, the late S. N. Pike, happened to come in and seeing the ore lying on the floor, examined it. He at once said, "This is silver ore, and closely resembles specimens of ore from silver mines in Utah in which I am interested." He advised that the ore be subjected to assay, that the truth of his assertion might be tested.

Henry Pike thereupon placed one of the samples in the hands of Messrs. Sderick, Sears & Co., 18 Maiden Lane, New York city, assayers and refiners (one of the largest and most responsible firms in the country devoted to this business), and on the 23d of April, 1872, they made the following report, which we copied from the original:

"Received from Henry Pike one sample ore, which, upon test, yields to the ton of 2,000 pounds 48.8 ounces of silver. Value per ton in gold coin, \$56.61."

For the purpose of more thoroughly testing the matter, Mr. Pike took another sample to the same parties, and on the 25th of April, 1872, received a report, stating that the sample "upon test, yields to the ton of 2,000 pounds 94.90 ounces silver. Value per ton in gold coin, \$123.42."

Another (and inferior) sample was taken to George W. Platt, refiner and assayer, No. 4 Liberty street, New York, and on the 26th of July, 1872, he reported to Mr. Pike, that upon test it yielded to the ton, in gold, \$35.64.

The samples assayed were from the outcropping of the vein. The vein is from six to eight feet in thickness, and inexhaustible in quantity, underlying a vast extent of country.

The important discovery which we here chronicle was made by digging for coal, after going in from eighty to ninety feet, and, as stated before, when found was supposed to be "black band" iron ore. We have examined the original reports of the assayers, and give the result.

The lands of Mr. Pike are within twenty miles of Gallipolis, by river.

ANOTHER PROSPECTING PARTY.—Last Monday a party of men left this city for the purpose of prospecting in the mountains west of Washos Valley, near what is known as the "Big Slide." Near this place there is supposed to be something very rich in the shape of gold or silver. The Indians say the slide was caused by a heavy earthquake which occurred some years before the first white men made their appearance in the country, which is likely enough. The slide has denuded nearly all of one side of a large and high mountain, and the spot, white and bare, is visible to the distances of many miles. Ever since the settlement of the country by the whites, the notion has existed that somewhere about this slide there must be rich mines of gold or silver, and since 1860 there has been done a good deal of prospecting in that neighborhood. Sometimes this prospecting has been done with a view to the striking of gold in the gravel, and again in the expectation of finding a rich vein of silver in the rock of which the mountain is composed. There have always been stories afloat of good prospects in both metals having been found, but we have observed that none of those who have worked there have ever remained there long, nor have we ever seen either silver or gold brought from that region.—*Enterprise.*

THE LAND MILL.—The Land Mill, in Seven-mile Cañon, is now running on ore from the Chollar mine. They now have stacked up at their mill about 1,500 tons of ore, and more is still being hauled. The roof of the mill, about half of which, with the ventilator or cupola, was burned by a fire which occurred there two or three weeks ago, has been repaired, a new cupola built and all is again as good as new. The fire had such a start that it seems almost a miracle that the mill was not destroyed. On the side of the mountain, north of the mill is a large water tank, from which a string of hose extends to the mill, and but for the good service done by this within, while men were fighting the fire on the outside with buckets, the building must have been destroyed. They now have two strings of hose, can throw two streams of water above the smokestacks of the works and feel quite safe in case the mill should again take fire, as they have a stream for both the interior and exterior.—*National Enterprise.*

The Old Gould & Curry Mill.

While taking a stroll yesterday afternoon along Six and Seven-miles Cañons, we passed the site of this once famous mill, the most costly ever erected in this State, taking into consideration the various works connected therewith. The old mill building is now gone, and even the cut stone foundations on which it once stood have been torn down and removed. The old ore house has also disappeared, and but a heap of rubbish marks the spot where it once stood. The large machine shop, where at one time was manufactured everything from a horseshoe to a steam engine, still stands, but seems now to be used as a barn or cow-house. The large stone building formerly used as a store-house, has been metamorphosed into a splendid dwelling, and, we believe, is now occupied by Mrs. Bowie, of the firm of Park & Bowie, whose fine large tailings mill is situated a short distance further down the cañon. The old boarding-house, on the north side of the cañon, where the hundreds of employes of the once rich and flourishing Gould & Curry Co. were wont to get their daily grub, has been torn down and removed. The heavy walls of cut stone, which in former times supported the fancy terraces at the west end of the mill, have been torn down and the stone hauled away and put to some more profitable use than that of holding up banks of rocks and clay. Even the "duck pond," as was called the large and handsome oval fountain, constructed in the palmy days of the company, by Charles Strong, has not escaped the despoiler. The stone-work round about it has been torn down and removed, and the walls of the basin have been dug up and hauled away. The basin is now dry, and perched aloft on the pipe, through which was once furnished a stream of sparkling water, now stands the iron image of a swan, with head turned appealingly to heaven. The tongue of the bird—in times past sacrilegiously called a "goose"—through which used to spurt a stream of water, is dry enough now, and the paint is gone from its head and hack—worn away probably by the curses of stockholders. The "goose" still hangs high, but he looks exceedingly shabby and dispirited. The hen-house, a large and complicated arrangement, where hens used every morning to lay eggs by steam for the breakfast of the superintendent and other officers, still stands. The old stone spring house is also still standing, but a stovepipe which projects through its octagonal roof shows that it now does duty as the habitation of some honest miner. This is about all that is now to be seen on the spot where but a dozen years since was expended over \$1,000,000.—*Territorial Enterprise.*

Will Mining Pay in Utah?

This is a question now so frequently asked by capitalists and those desirous of investing in mines, that it is worth serious attention. That such an inquiry should be made at all is more or less damaging to our future prospects, and is rather a severe commentary on the past mining history of our Territory, which we must admit has not proved of a satisfactory character to the bona fide investor—the purchaser of stock. On the contrary, the facts of the past have proved most conclusively that, to the bulk of English stockholders in Utah mines, the results are such as to move their disgust, and force them to say most emphatically that mining in Utah does not pay, while the individuals who have placed the mines on the market and have "feathered their nests" in the transaction, are undoubtedly of the opposite opinion.

There can be no doubt that a large proportion of our mining transactions have resulted in injuring the Territory to an alarming degree, in fact to such an extent is this the case, that millions of capital at one time eager for investment here have been diverted into other channels. Take, for instance, the present condition of the Emma stock in London, the mine that gave Utah its reputation and created a world-wide interest in our mineral resources. On Saturday last shares, which had probably cost many a shop-keeper or hard-working mechanic \$20 each, were reported selling at £3, while out of some seven Utah mines in the London market only two, we believe, are above par! It is, therefore, not strange to learn that our prospects for selling mines there are completely ruined for the present.

Who have been mainly benefited by these transactions? Certainly not the Territory for the bulk of the money which has been realized has gone to enrich the speculators and manipulators of the properties, while we are left with such an impaired credit that we are told it is now useless to attempt to sell any more property in London! and all because mines have been stocked for many times their real value, of which the Emma is a notable instance.

Let us look at the other side of the picture. We have a Territory unsurpassed in the world for the extent and richness of its mines, enough to build up a great and powerful State, the proper disposition and utilization of which would open new branches of industry, and fill the Territory with a thrifty and prosperous population. To accomplish this desideratum let capital be invited by placing mines abroad for reasonable sums, instead of inflated and fictitious values, and let more attention be given at home to the economic working of the low-grade ores, of which there are such vast quantities;

and when our mining transactions are reduced from a speculative character to strictly legitimate business, then can the question at the head of this article be answered in the affirmative without fear of contradiction.—*Salt Lake Tribune.*

A Fine Tailings Mill.

The Territorial Enterprise contains the following description of Parke & Bowie's mill: The large tailings mill of Park & Bowie, on Six-mile Cañon, below the old Gould & Curry Mill, is the finest mill for the working of tailings that is to be seen in the State. The person desiring to learn the science of cheaply and rapidly extracting from tailings the precious metals they contain need go no farther for the latest and best information, machinery and processes than this mill. The mill is so built in the cañon that teams laden with tailings may be driven in at one end and out at the other, passing through on the third floor and dumping their loads down to the floor on which stand the amalgamating pans. There are four large pans of one muller each, one pan containing two mullers and one of six. The united capacity of these pans is 150 tons for 24 hours. The pans containing the six mullers is smaller than those containing but one. It is in the shape of a long narrow trough and was constructed for the purpose of experimenting. The small mullers it contains run much more rapidly than do the single mullers in the large round pans. This six-muller pan does excellent work and is considered a great improvement on the old style. The pan with two mullers is also a very fine one and it is a question if it is not equally as good as that containing the six mullers, as after passing the number of two the same principles is only repeated as each new set of two is added; it produces no new action of currents formed in the contents of the pan. Contrary to what would be generally supposed at the first glance, the best effect is produced and the contents of the pan are most thoroughly agitated when the mullers run in the same direction. When the two-muller pan was first started, the mullers were run in opposite directions, and it did but very little better work than the pans of a single muller. It was then changed and both were run in the same direction, when a vast improvement in the rapidity and thoroughness of working was at once observed in the pan. A mechanic who was working at the mill about the time the two-muller pan was built, left and went to San José, California. Being in the "cow counties," where there is more use for churns than amalgamating pans, he set to work and made a churn after the plan of the amalgamating pan he had seen in this State, running his buttermilk mullers in contrary directions. He made several trials of his new churn and was laughed at. It took forty minutes to bring butter with his amalgamating machine. In a fit of desperation he altered his churn so that his mullers ran in the same direction, and lo! it brought butter in five minutes. To explain why this is so would take too long in type. Let any one draw two circles near together, then surround them with arrows, showing the direction in which the wheels are moving, and by observing where the two circles of arrows impinge he will see why it is that the mullers should move in the same direction. All the pans in the mill are the invention of Ira S. Parke, one of the proprietors, and he is not yet done experimenting. There are in the many reservoirs in the cañon tailings sufficient to run both the Railroad and the Express mill for years.

QUARRYING.—A company is busily engaged, says the White Pine News, of the 20th, opening one of the finest sandstone quarries in the State on the Pancoke range of mountains. The stone is of the finest texture, and totally devoid of the presence of lime or iron. Having been successfully tried in various instances, it has proved itself the only trustworthy article in the line of fire-rock. The quarry is situated on the old Sbermantown road, about six miles easterly from the Maryland Wells Station, and is accessible to teams at all seasons. A great demand will be made for this rock in the future, as experience has proved it indispensable to smelting furnaces.

AN IMMENSE ENGINE.—This morning the Virginia Consolidated Mining Company received for their works, from the Virginia and Truckee Railroad, the head piece for an engine weighing 26,700 pounds. There is energy and enterprise in the Virginia Consolidated, and it is to be hoped this big machine, when completed, will aid the company in producing results as big in proportion. *Virginia Chronicle.*

NEW METAL BAND.—For use in collieries, suspension bridges, and for other purposes instead of wire rope, Messrs. Scott, of England, have recently patented a band composed of two or more layers of flat steel, charcoal iron, or other metal, of a suitable thickness and breadth. The layers are each made in one piece and are joined together by brazing, welding, or riveting.

A vein of which is supposed to be oldsidian, has been struck in the west drift of the Reed shaft on the Colorado Central lode. It is from four to eight inches wide, and is quite a mineralogical curiosity.

SMELTING FURNACES are being erected at Tucson. The Patagonian mine is turning out crude bullion to an enormous extent.

KNOWLES' PATENT STEAM PUMP.

It has no Cranks or Fly-Wheel, and has no dead points where it will stop, consequently it is always ready to
start without using a starting-bar, and does not require hand-work to get it past the center. Will always start
when the steam cylinder is filled with cold water of condensation.

CENTRAL PACIFIC R. R. OFFICE OF THE GEN'L MASTER MECHANIC,
SACRAMENTO, CAL., January 14, 1873.
A. L. FISH, Esq., Agent of the Knowles Steam Pump, San Francisco—Dear Sir: In reply to your inquiry as to the
merits of the Knowles Steam Pump, in use upon this road, I will say that it gives me great pleasure to report that they
have performed their work well whenever called upon. In no instance have they failed. We have now over 50 of them
in use on this road as fire engines, and pumping water for shop and station use. I consider the Knowles Steam Pump the
best in use, and prefer it to any other. Yours truly, A. J. STEVENS, General Master Mechanic.

Messrs. KNOWLES & SIBLEY, 92 and 94 Liberty street, New York—Gentlemen: In reply to your note of 21st, re-
questing my opinion of your Steam Pump, etc., as suggested from my experience with them in actual service, I have to
state that I have used your pumps, and entertain the most favorable opinion of their great merit and usefulness, and for
every purpose believe them to be superior to any others, and have so recommended and adopted them. They have
given complete satisfaction in all cases that have come under my observation. WM. W. W. WOOD.

A. L. FISH, Agent Knowles' Steam Pump—Dear Sir: In answer to your inquiries, we state that the highest award
for Steam Pumps at the Eighth or last Mechanics' Fair in San Francisco, was a First Premium and Diploma, awarded to
the Knowles Patent Steam Pump, as published in the Official List September 23d, 1871.

W. H. WILLIAMS, Sec'y Board of Managers Eighth Industrial Exhibition, N. Y.

WE BUILD AND HAVE CONSTANTLY ON HAND
The Largest Stock of Pumps in the World,
And for Every Conceivable Purpose.

THE CELEBRATED BOOMER PRESS,
For Wine, Cider, Lard, Paper, Wool, Hops, Hides, Tobacco, Rags, etc.—the Most Powerful
in Use.

A. L. FISH, Agent,

Nos. 9 and 11 First Street, San Francisco, Cal.

P. S. All kinds of new and second-hand Machines on hand. 10726-lambp

BURLEIGH ROCK DRILLS

—AND—
Air Compressors.

The Burleigh Rock Drills, which have stood the test
of five years' constant use at the Hoosac Tunnel, and
which are now in use in nearly every State in the Union,
as well as in Europe and South America, are unequalled
in efficiency and economy by any other Drilling Ma-
chine. They are of various sizes, and equally well
adapted to Tunneling, Shafting, Open Cut or Quarry-
ing, and will drill six to ten inches per minute in gran-
ite. They are driven by steam above ground. The Bur-
leigh Air Compressor is the best engine yet devised for
furnishing the "air motor" for the many purposes to
which it is now being used.

They are to be used on the St. Gothard Tunnel, Swit-
zerland, Tunnel 13 miles long. We refer to the follow-
ing gentlemen and works:

Gen. Newton, U. S. A.....Holl Gate Tunnel, L. I.
Messrs. Shanley.....Hoosac Tunnel, Mass.
J. Dutton Steele.....Nesquehoning Tunnel, Pa.
Sidney Dillon.....Fourth Avenue Work, N. Y.
Col. Roebeling.....East River Bridge Company, N. Y.

VIRGINIA CITY, NEVADA.

AGENT FOR THE PACIFIC COAST. 115

LEA & PERRINS'

CELEBRATED

Worcestershire Sauce.

Declared by Connois-
seurs to be the only good
SAUCE.

Caution Against Fraud.

The success of this most
delicious and unrivaled
Condiment having caused certain dealers to
apply the name of "Worcestershire Sauce" to
their own inferior compounds, the public is
humbly informed that the only way to
secure the genuine is to ask for LEA &
PERRINS' SAUCE, and see that their names
are upon the wrapper, labels, stopper and
bottle.

Some of the foreign markets having been
supplied with spurious Worcestershire
sauce, upon the wrapper and labels of which the names
of Lea and Perrins have been forged, L. and P. give
notice that they have furnished their correspondents
with power of attorney to take instant proceedings
against manufacturers and vendors of such, or any
other imitations by which their right may be infringed.
Ask for LEA & PERRINS' Sauce, and see name on
wrapper, label, bottle and stopper.

Wholesale and for export by the Proprietors, Worces-
tershire, Grose & Blackwell, London, & Co., & Co., and by
Grocers and Oilmen universally. 15244-7

2125-3m **E. G. DENNISTON, Proprietor.**

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.
For rapidly pulverizing and amalgamating ores, they
have no equal. No effort has been, or will be spared
to have them constructed in the most perfect manner
and of the great number now in operation, not one has
ever required repairs. The constant and increasing de-
mand for them is sufficient evidence of their merit.
They are constructed so as to apply steam directly
into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows.
The pan being filled, the motion of the miller forces
the pulp to the center, where it is drawn down through
the aperture and between the grinding surfaces.—
Thence it is thrown to the periphery into the quicksilver.
The curved plates again draw it to the center, where it
passes down, and to the circumference as before. Thus
it is constantly passing a regular flow between the grind-
ing surfaces and into the quicksilver, until the ore is
reduced to an impalpable powder, and the metal amal-
gamated.

Sellers made on the same principle excel all others.
They bring the pulp so constantly and perfectly in con-
tact with quicksilver, that the particles are rapidly and
completely absorbed.
Mill-men are invited to examine these pans and settlers
for themselves, at the office, 229 Fremont Street,
San Francisco.

now being continued along the wall of ledge, stripping it for a distance of 20 ft.

WHITE PINE

CHERRY CREEK DISTRICT.—White Pine News, May 31: Cherry Creek is situated on the east-side of the Egan range, about 5 miles north from Egan Canon, which latter place lays nearly north-east from Hamilton, distant about 60 miles. It consists of a series of high ridges, divided by ravines running east into Steptoe Valley, with continuous croppings of quartz cropping northward and southerly, a distance of six or seven miles, from Cherry Creek to Silver Canon. The vein is situated on the Cherry Creek time to be pitching west into the mountains; but, it is held by old miners, that when depth is attained the direction will change to the east, for the reason demonstrated in the Tea-cup ledge, a shaft on which has been sunk a distance of over 90 feet, and found to be gradually turning from its original inclination toward the east. Another evidence of this fact is, that immediately facing the mineral-bearing ledge spoken of, is a formation of quartzite indicating the easterly dip; the west wall being porphyry. The character of the ore, some of which we have seen, is pure, unadulterated quartz, similar in every particular to that of the Comstock.

MOBILE.—This mine, for work has progressed to such an extent as to entitle the claim to that appellation, is situated on Babylon Hill, near Swansea, and has some 800 or 1,000 tons of fine smelting ore on the dump. Some specimens we have seen show evidence of exceeding richness, and contain sufficient quantities of lead to guarantee easy reduction. Situated one-half mile from the mine described is the Great Valley mine, from which 600 or 800 tons of ore has been extracted, much of which was melted at the furnaces erected by Government or Mattison some time ago.

Arizona.

Arizona Miner May 17. Messrs. Pointer, Johnson and Mollen, from Lynx Creek, were in town during the week, all bringing some dust. There is sufficient water for roasting in the creek, and about a dozen men are at work, averaging about \$3.00 per day each.

Messrs. Collier, Hatz and other owners in Goodwin mine are getting out ore which they propose to send to San Francisco.

Several new quartz lodes have been recently discovered between town and Bradshaw, but, as they are no richer than hundreds of others located years ago, the only point gained is that the finder will know where the veins are when the country "comes out," if they live so long.

The ore on the Tiger dump is slowly de-sulphurizing, or de-oxidizing; or decaying somehow, in the sun, and showing under this process more and more silver every day; and water is still running out of the original 110-ft. shaft on the Tiger.

YAVAPAI COUNTY.

Arizona Miner, May 24: Jackson & Co. are still milling and arastrating War Eagle ore, at their place, some 30 miles south from Prescott. The rock is paying.

A new arastra is running on War Eagle ore. It is the property of Messrs. McKinnon and Goodwin.

In Walnut Grove district Messrs. Henry & White are opening the Rainbow lode, with the view of working the ore in an arastra.

In Weaver district, the Marquis and other companies are working ore very successfully. Placer mines are also doing well.

Wickenburg district. Mr. P. W. Smith is running his mill. The mill is conveniently situated on the Hassayampa, about 9 miles below Wickenburg and an equal number of miles from the mine—Vulture—with which it is connected by a good road.

Colorado.

HOMESTEAK MINE, LAKE CO.—Colorado Sentinel, May 22: This celebrated lode was discovered in the summer of 1871. Samples of ore were taken, camp broke, and at right angles to the course of the vein and on a line with a discovery shaft, a cross cut of 35 ft. in length has been driven, striking the lode about 20 ft. from the surface. West from the point of intersection a drift has been run on the vein 70 ft., gaining in depth about 3 1/2 ft. In 12. Eastward from the "cross cut" an "open cut," 10 ft. in depth and 135 in length, has been made. That shows a continuous, heavy body of mineral; from the discovery to the point where the east drift commences this has been driven but 12 ft. on the vein, and no perceptible change has taken place in the ore vein or general appearance of the mine. The ore has paid all the expenses of mining and shipment to Denver and quite a handsome profit besides.

Colorado Miner, May 22: Harry Campbell is taking out 100 ounces ore from the Scotia in good paying quantities. The veins in that locality (Sherman Mountain) are thick and close together that it would be surprising if something good did not come out of them.

The mines in Brown Gulch are turning out some fine ore just now and prospecting in a very encouraging manner. We bear favorable news from the Terrible, Brown, Hercules, Coin, Seven-Thirty, Black and Goss lodes.

Some splendid specimens of brittle silver were struck a few days ago in the very deepest workings of the Pelican, along with a rich body of the ordinary ore that that lode turns out. The Pelican is second to no vein of silver that has yet been found in Colorado.

COLORADO CENTRAL LODES.—The lessees in the Weaver shaft are putting in studs in the east drift. There is a large body of rich ore in sight, varying from 4 inches to 2 ft. in width. From the same shaft an air shaft is being sunk to tap the west level.

Idaho.

LOCAL MINING RECORD.—Owyhee Avalanche, May 31: Work is now going on here in the following incorporated mines: Mohogany, South Chariot, Minnesota, Golden Chariot, Ida Elmore, Red Jacket and War Eagle. Several unincorporated mines are also being worked, among which may be mentioned the Idlewild, Illinois Central and Morning Star.

The Mahogany is looking better than ever, and has about 400 tons of splendid ore ready for milling. It is reported that a rich and extensive body of ore has been recently struck in the Golden Chariot. They are busily engaged in putting the new steam pump into the Ida Elmore.

J. A. Wilson has taken a contract to sink the Rising Star shaft, in Flint District.

The Owyhee mill is running on Minnesota ore. In the creek and gulches placer mining is going on in every direction, although the late cold weather has considerably retarded operations.

ASSAYERS' MATERIALS.—It is with pleasure we call attention to the advertisement of the long established and well known firm of John Taylor & Co., importers of assayers' materials, etc., which will be found in another column. The firm have supplied the trade for a number of years, and knowing the wants fully of the mining companies and assayers on this coast, and importing direct from the manufacturers in Europe and elsewhere, they are able to supply materials in their line at the lowest possible rates.

New Incorporations.

The following companies have filed certificates of incorporation in the County Clerk's Office, S. F.: Cincinnati G. M. Co., May 31: Location, Kelsey Mining District, El Dorado County. Trustees—George A. Gates, Donald Bruce, E. S. Ganz, George B. Hudson and William Small. Capital stock, \$300,000, in shares of \$20 each. The entire capital stock is subscribed.

Utah-Eclipsa M. Co., May 31: Location, Utah Territory. Trustees—W. T. Robinson, Chas. R. Peters, S. W. Lee, James L. King and W. H. Spencer. Capital stock, \$3,000,000, in 30,000 shares of \$100 each, of which \$500,000 has been subscribed.

GOLD MOUNTAIN M. Co., June 3d. Object: to mine for Gold and Silver, and other precious metals, near the town of Lower Ranchina, in Alameda County. Trustees: Wm. Norris, Maurice Dore, S. B. Boswell, Charles H. Dewey, and E. W. Leonard. Capital stock, \$2,400,000, in shares of \$100 each.

THE DEVILS ELBOW FLUME M. Co., has filed its certificate in the office of the Secretary of State, at Sacramento.

THE SAN PABLO R. R. Co., and the Semi-Tropical Water Co., of Los Angeles County, have also filed certificates in Sacramento the latter with a capital of \$30,000. GEORGE LUTHER M. Co.—At a meeting of this company held in Virginia City last week the following officers were elected: Trustees, F. R. Lewis, (President), J. P. Smith, (Vice-Presidents), Martin White and N. K. Lamson. Secretary, L. B. Hastings.

Meetings and Elections.

MAMMOTH S. M. Co., June 3d. Trustees: Robert Sherwood (President), F. G. Berry, S. Linkton, F. A. J. Dine, J. H. Crocker, R. R. Givens and C. A. Kennedy; J. L. King, Secretary.

MINNEAPOLIS M. Co., June 3d. Trustees: William Norris (President), E. Hull, E. B. Pond, J. F. Boyd and O. H. Russell; Wm. Willis, Secretary; F. F. Coffin, Superintendent.

MECHANICA INSTITUTE, June 2d. Trustees: J. C. Patrick, Richard Savage, Charles Elliot, J. H. McDonald, J. P. Curtis, H. W. Jones and P. B. Cornwall.

THE CROWN POINT MINING COMPANY have elected the following Trustees: J. D. Fry, B. Pearl, Robert Sherwood, William Kohl and J. A. Ditcher; C. E. Elliot, Secretary; Samuel L. Jones, Superintendent. The total receipts for the year amounted to \$7,105,699. Dividends amounting to \$2,180,000 were paid, leaving a cash balance on hand, May 1st, of \$1,873,891.

PACIFIC MINERAL LAND OFFICE.—Messrs. Hoyt, Sears and McKee, at rooms 62-4 Merchants' Exchange, make the business of obtaining U. S. patents for mining claims a specialty; and are prepared to give immediate attention to mining cases in California, Nevada, Utah or elsewhere, in the mineral region, and at Washington, D. C., when forwarded for final action.

We understand that these gentlemen are doing an extensive business in their specialty, being well practiced and fully posted in their important work. Also that Mr. McKee, to form his present connection, resigned the position of Chief of the Mining Claims Division, General Land Office, Washington, D. C., which he had occupied for several years.

AN OLD MINE of immense richness is said to have been discovered within two miles of El Paso, Texas, near the line of New Mexico. The vein is said to be about twenty feet wide, and can be traced for miles, sometimes disappearing beneath the surface and again breaking out full and strong. Shafts of over one hundred feet in depth, and other unmistakable evidences of the value of the lode, have been found. Coal, too, has been discovered near the same city, and in inexhaustible quantities. From this it seems that some of the old stories and legends in connection with abandoned mines in New Mexico are a bant to be verified.

WATER POWER IN CHURCH.—The Organist of one of our city churches, has arrived at the conclusion that water power will beat small boy power in pumping the bellows for his organ, and has accordingly discharged the small boy, and employed one of Martin's hydraulic engines to do the work. The engine is arranged to regulate the supply of air, and takes up very little room. It cost \$200, and will entail an expense of \$1 per month. The engine has proven a success, doing its work well.

ASSESSMENT RESCINDED.—The Kentucky Gold and Silver Mining Co. have rescinded the assessment No. 5, of \$4 per share, and on the 2d of June levied a new assessment of \$1.50, delinquent on the 5th of July. Notice is given that any stock upon which the first assessment was paid will be credited with the amount paid upon the last one and the balance refunded.

TEN TONS OF BULLION from the Starr King mine, near Wells Station, C. P. R. R., was received in San Francisco this week. There were 215 bars in the consignment.

MONEY DISTRICT, in Nye county, Nevada, about 100 miles from Pioche, is beginning to look up. A ten-stamp mill is being erected there.

The case of the Eureka Consolidated, vs. the Richmond mine, has been set for another trial, Monday, June 16th.

A GOLD nugget worth \$110, was picked up a few days since at British Creek, Jackson Co., Oregon.

SMOKING TOBACCO.—Miners in all parts of the world smoke more, probably, than the generality of people. When in isolated camps in the winter season they can put up with almost any kind of tobacco; but they are generally pretty good judges of the weed, and want the best when it can be had—a fact that storekeepers in mining camps usually recognize. California tobacco has not, as yet, found much favor among them, as they stick to old and well-known brands for good reasons. Mr. J. D. Hathaway, of 405 Front street, formerly agent on this coast for Gail & Ax, and now agent for the firm of Thomas & Pilkington, of Richmond, Va., recently showed us a number of different brands put up by the latter firm, among which were their celebrated "Fruits and Flowers." One of our editors, who lived in the mines for some time, says that if the storekeepers in the camps had had this brand, they would have sold twice as much tobacco as they did. He has tried numerous brands put up by Thomas & Pilkington, among them "Fruits and Flowers," "Golden Sceptre," "Indispensable," "Planter's Pride," "Bird's Eye," "Commonwealth," "Esmer's Choice," etc., all well known tobaccos, but he prefers the first-mentioned for delicacy of flavor. If people will smoke, they ought to consume nothing but good tobacco, as the injury done is in proportion to the quality: the worse the tobacco the worse the effects. When the brand is well sun-dried, and grown from a fine cultivated weed, as these tobaccos are, deleterious effects are not felt.

THE SAN JUAN COUNTRY.—Many miners are said to be going into the San Juan country, Colorado, notwithstanding the talk of their expulsion from there. A correspondent writing from Del Norte, Colorado, states that every pack animal going in that direction has full loads of prospectors' outfits, with picks, drills, powder, fuse, etc. Some of the prospectors drew twenty days' rations from the military authorities, which does not look like keeping miners out of the country. The men are all in good spirits, and hopeful of a satisfactory solution of the Indian question.

MINING SUTT. E. K. Howes has commenced suit in this city against H. Cox, P. G. Sabatie, E. Worth, A. A. Webber, W. H. Jessup, Andrew Arnold, Stephen Ostrander, O. B. Powers and C. F. Basset, stockholders in the Continental Silver Mining Company, to recover from each his pro rata of his individual liability on a debt of \$1,600, the amount of a promissory note given by the company to the plaintiff.

DIAMOND DISTRICT, in Eastern Nevada, shows encouraging prospects. The Eureka Sentinel says negotiations are being made with parties in this city for the sale of the Champion mine, and a furnace will soon be erected at the mine. Wood and water are plentiful; the district supplies a large proportion of the mining timbers and charcoal used at Eureka.

SOUTHERN UTAH abounds in coal and iron mines which will be developed to some extent this summer, as they are attracting the attention of capitalists.

WORK has been begun on the Clay Street Hill Railroad, and the men have taken up the street between Kearny and Dupont, to lay the wire rope and track.

A DIVIDEND of one per cent. for the month of June will be paid on the 5th inst. by the National Gold Bank and Trust Company, and by the Pioneer Land and Loan Association.

COAL in extensive deposits has been found near Kanarra, Utah, 8 miles from Pioche, and a company will go into the business of converting it into coke for the Pioche market.

THE railroad connecting Coos Bay with Coquille, was commenced on June 1st, and will be completed this summer as far as the Blaine Mountain coal mines.

TRMES are reported to be busy at Belmont, and the mines are looking well.

THE Mint in this city has suspended business until July 1st.

WE WILL CHANGE THE ADDRESS FREE for any subscriber who notifies us in writing of his new address, with the OLD P. O. address to enable us to find his name among thousands of others.

DANIEL WELLINGTON, of Virginia City, Nevada, is requested to communicate immediately with this office.

Try Dr. Evory's Diamond Catarrh Remedy. Only 50 Cents.

Says John to Nance, you look so bright, Your eyes they sparkle, like a star. Oh! yes, says Nance, Dr. Evory's remedy Has cured that horrid, bad catarrh.

OUT OF THE FOG AT LAST.—Dr. Evory has discovered the only SURE cure for Catarrh and Colds. One bottle gives immediate relief, and a few bottles effect a cure. All we ask is a trial. If your druggist don't have it, send to Dr. A. F. Evory & Co., 9 Post street, S. F. It only costs 50 cts. 147-25-2m

THE ONN FELLOWS' BUILDING AT VIRGINIA.—This building noticed at some length by our correspondent "L. P. Mc," in his "Notes of Travel" when in Virginia last, will be completed on the 15th inst. The building is 128 by 45 feet, and four stories high. There is a dancing hall, dressing-room, gallery, kitchen, suites of rooms for offices, library, chess-room, etc. The building will probably cost \$70,000 when completed, and was built by a stock company. It is a very creditable edifice, excelling those usually built in interior towns on this coast. The library is 24x44 feet; there are at present 3,160 books. The Enterprise says that files of the following papers are kept in excellent order in addition to the magazines and books: MINING AND SCIENTIFIC PRESS, San Francisco Bulletin, the Examiner, Sacramento Union, Gold Hill News, Virginia Chronicle and Scientific American and Territorial Enterprise.

THE GRIZZLY.—A dispatch from Salt Lake city says: an injunction has been granted by Judge McKean to the Lavinia mine against the Grizzly Company for sixty days. The Grizzly is considered worth \$300,000. The prospect is bad for the Grizzly.

THE OROVILLE PLACER CLAIMS are said to be turning out well. From five to ten claims chugue hands daily, at prices varying from \$200 to \$2,000. One man in the vicinity sold his vineyard for \$4,500, to be mined.

HOT CREEK DISTRICT, 35 miles from Belmont, and famous in 1867, is now abandoned as a mining camp, the agricultural interests predominating.

Time Tests the Merits of All Things.

1840 For Over 30 Years, 1873

PERRY DAVIS' PAIN-KILLER

Has been tested in every variety of climate, and by almost every nation known to America. It is the constant companion and inestimable friend of the missionary and the traveler, on the sea or land, and no one should travel on our Lakes or Rivers without it.

Since the PAIN-KILLER was first introduced, and met with such extensive sale, many Liniments, Reliefs, Panaceas, and other Remedies have been offered to the public, but not one of them has attained the truly enviable standing of the PAIN-KILLER.

WHY IS THIS SO? It is because DAVIS' PAIN-KILLER is what it claims to be, a Reliever of Pain.

Its Merits are Unsurpassed. If you are suffering from Internal Pain, Twenty to Thirty Drops in a Little Water will almost instantly cure you. There is nothing to equal it for

Colic, Cramps, Spasms, Heart-burn, Diarrhea, Dysentery, Flux, Wind in the Bowels, Sour Stomach, Dyspepsia, Sick Headache, &c., &c.

In sections of the country where Fever and Ague

prevails, there is no remedy held in greater esteem. Persons traveling should keep it by them. A few drops, in water, will prevent sickness or bowel troubles from change of water.

From foreign countries the calls for PAIN-KILLER are great. It is found to

CURE CHOLERA WHEN ALL OTHER REMEDIES FAIL. WHEN USED EXTERNALLY, AS A LINIMENT, nothing gives quicker relief than Burns, Cuts, Bruises, Sprains, Stings from Insects, and Scalds. It removes the fire, and the wound heals like ordinary sores. Those suffering with RHEUMATISM, GOUT, or NEURALGIA, if not a positive cure, they find the Pain-Killer gives them relief when no other remedy will.

It Gives Instant Relief from Aching Teeth.

Every House-keeper should keep it at hand, and apply it on the first attack of any Pain. It will give satisfactory relief, and save hours of suffering.

Do not trifle with yourselves by testing untried remedies. Be sure you call for and get the genuine PAIN-KILLER, as many worthless nostrums are attempted to be sold on the great reputation of this valuable medicine. Directions accompany each bottle.

PRICE—25 cts., 50 cts., and \$1 per bottle.

Mining and Other Companies.

Owing to the time necessary to mail the present large edition of the M. & S. Press, we are obliged to go to press on Thursday evening—which is the very latest hour we can receive advertisements.

Angels Quartz Mining Company—Principal place of business, 408 California street, San Francisco. Location of works: Angels Mining District, Calaveras County, California.

N. Seibert's Eureka Lubricators.

THE HIGHEST PREMIUM

Awarded by the Mechanics' Institute Fair, San Francisco, and State Fair, Sacramento, 1871.

These Lubricators are acknowledged by all engineers to be superior to any they have ever used; feed constantly by pressure of condensed water, supplied by pipe A, regulated under the oil by valve J, and forced out through check valve and pipe B into the steam pipe C; it then becomes greasy steam, passes to all the valves and cylinder at every stroke of the engine; the time I indicates amount used per hour. Packing on rods and stems lasts longer, and the rings on the piston will not corrode. One pint of oil will last from three to six days, according to speed and size of engine; I, sliding gauge; K, valve to shut off when engine stops; H, F, valves to shut off in case of frost; steam does not enter the cup; it is always cool; warranted to give satisfaction. Patented February 14, 1871. Manufactured by California Brass Works, 125 First street, S. F. 24v23tf

CROCKER'S PATENT TRIP HAMMER QUARTZ BATTERY.

The inventor having perfected and tested the durability and capacity of these batteries to his entire satisfaction, is now ready to manufacture and guarantee them. Parties in want of a Battery cannot find their equal in regard to PRICE, WEIGHT, CAPACITY, POWER TO RUN THEM. State and County Rights for Sale by

G. D. CROCKER,
17v26-tf 315 California street, San Francisco.

BROWN'S PATENT LAMP.

One of these Lamps, when placed at a distance of 200 feet from the bank, will light up a bank surface 250 feet in length and 150 feet high, and to a much better advantage than any other light heretofore tried, and at an expense not to exceed five cents per hour. Lamps furnished at short notice.

Letter of Recommendation.

Mrs. C. B. Brown—Sir: Your Patent Lamp for lighting hydraulic mines, which you sold to me in December last, has given entire satisfaction, and far exceeds my expectations, and I think it the best and cheapest light ever used to light mining claims by night, and am satisfied that I have saved three hundred dollars by the use of it in the last mining season over pitch or any other light of the same brilliancy; and I will also say that if I could not get another lamp, five hundred dollars would not buy it. Yours,

W. D. APLIN.

Little York, Nov. 5, 1872.

For further particulars, address,

C. B. BROWN, Placerville, Cal.

P. J. PHILLIPS & CO., No. 608 Clay street, near Montgomery, San Francisco, are agents for Brown's Lamp, where it may be seen.

The California Powder Works

NO. 314 CALIFORNIA STREET,
SAN FRANCISCO.

Manufacturers and have constantly on hand

SPORTING,**MINING, AND BLASTING POWDER,**

OF SUPERIOR QUALITY, FRESH FROM THE MILLS. It being constantly received and transported into the interior, is delivered to the consumer within a few days of the time of its manufacture, and is in every way superior to any other Powder in Market. We have been awarded successively

Three Gold Medals

By the MECHANICS' INSTITUTE and the STATE AGRICULTURAL SOCIETY for the superiority of our products over all others.

We also call attention to our

HERCULES POWDER.

Which combines all the force of other strong explosive now in use, and the lifting force of the best blasting powder, thus making it vastly superior to any other compound now in use.

A circular containing a full description of this Powder can be obtained on application to our Office.

THE PRALL CONDENSING STEAM PUMP.

The Cheapest, Most Reliable, Most Durable and Most Economical Pump in Use.

This remarkable Pump, though having been used extensively in the Western States for the past year, is now for the first time offered to the trade of the Pacific Coast.

It is adapted to the raising of water or other liquids, under all possible conditions where steam can be obtained, operating absolutely without machinery with more economy and less liability to derangement than any Pump in use. As a MINING PUMP its advantages are most obvious.

The steam is condensed instead of being exhausted into the shaft or tunnel. It is not affected by mud, sand or grit, having no working parts to wear or cut out.

It is economical of steam, because all friction is avoided, and the steam is made to do double duty, that of direct pressure and then by condensation, utilizing the atmospheric pressure to lift the water to the Pump.

It requires no lubrication nor any attention whatever.

For IRRIGATION and raising water for stock purposes, the Prall Pump is vastly superior to anything ever before invented.

It requires less steam to elevate water from 20 to 30 feet than would be necessary to move any other style of Pump doing no work.

It is so simple that any one of ordinary intelligence, however unaccustomed to machinery, can operate it.

They are constructed of seven different sizes, with capacities ranging from two to fifty thousand gallons per hour.

Boilers furnished with the Pumps when desired.

BUY BARBER'S BIT BRACE.

The Mining & Scientific Press,

Started in 1860, is one of the oldest weekly journals now published in San Francisco. It has been conducted by its present proprietors for 12 years, during which period it has been repeatedly enlarged and constantly improved. The active and steadfast efforts of its publishers have gained for its conduct an amount of practical experience greater than any other publishers have accumulated on this coast, of a weekly journal.

The sum paid by us for the best editorial talent obtainable for our special class journal; for engravings, for interesting news and correspondence, and for printing a large-sized, handsome sheet, is unequalled by that of any other American weekly west of the Mississippi. As a PRACTICAL MINING JOURNAL it has no rival on this Continent.

It is the only MECHANICAL, and the only SCIENTIFIC journal of the Pacific States.

Every Miner, Assayer, Millman, and Metallurgist in the United States should take it.

Every Pacific Coast Mechanic, Engineer, Inventor, Manufacturer, Professional Man, and Progressive and Industrial Student should patronize its columns of fresh and valuable information.

Every Mining Engineer, Superintendent, Metallurgist, Mine Owner and Mine Worker in the world should profit by its illustrations and descriptions of New Machinery, Processes, Discoveries and Record of Mining Events.

Every intelligent thinker in the land, in high or humble situation, who would avoid literary trash for genuine information, should SUBSCRIBE AT ONCE.

DEWEY & CO.,

Publishers, Patent Agents and Engravers.
338 Montgomery street, S. F.

DEWEY & CO.,

American & Foreign Patent Agents,

OFFICE, 338 MONTGOMERY STREET, S. F.

The best, speediest, and surest method for you to obtain patents, file caveats, or transact any other important business with the Patent Office at Washington, or with foreign countries, is through the agency of DEWEY & CO., PUBLISHERS OF THE MINING AND SCIENTIFIC PRESS, SAN FRANCISCO, an able, responsible, and long-established firm, and the principal agents on this side of the continent. They refer to the thousands of inventors who have patronized them, and to all prominent business men of the Pacific Coast, who are more or less familiar with their reputation as straightforward journalists and patent solicitors and counsellors. We not only more readily apprehend the points and secure much more fully and quickly the patents for our home inventors, but with the influence of our carefully read and extensively circulated journals, we are enabled to illustrate the intrinsic merits of their patents, and secure a due reward to the inventor, besides serving the public who are more ready to give a fair trial, and adopt a good thing, upon the recommendation of honest and intelligent publishers.

To Obtain a Patent,

A well-constructed model is generally first needed, if the invention can well be thus illustrated. It must not exceed 12 inches in length or height. When practicable, a smaller model is even more desirable. Paint or engrave the name of the article, and the name of the inventor, and his address upon it.

Send the model (by express or other reliable conveyance), plainly addressed, to "DEWEY & CO., MINING AND SCIENTIFIC PRESS OFFICE, SAN FRANCISCO." At the same time, send a full description, embodying all the ideas and claims of the inventor respecting the improvement describing the various parts and their operations.

Also send \$15 currency, amount of first fee of the Government. The case will be placed on our regular file, the drawing executed, and the documents made up, and soon sent to the inventor for signing.

As soon as signed and returned to us with the fees then due us, it will be sent straightway to the Patent Office at Washington.

When the invention consists of a new article of manufacture, a medicine, or a new composition, sample of the separated ingredients, sufficient to make the experiment (unless they are of a common and well-known character), and also of the manufactured article itself, must be furnished, with full description of the entire preparation.

For Processes, frequently no model or drawings are necessary. In such case, the applicant has only to send us an exact description, and what is desirable to claim.

For designs no models are necessary. Duplicate drawings are required, and the specifications and other papers should be made up with care and accuracy. In some instances for design patents two photographs, with the negative, answer well instead of drawings.

For further information, send a stamp for our illustrated circular, containing a digest of PATENT LAWS, 112 illustrated mechanical movements, and HINTS AND INSTRUCTIONS regarding the RIGHTS AND PRIVILEGES of inventors and patentees, which will be furnished post paid. Also a copy of NEW PATENT LAW of 1870.

Portable & Stationary Saw Mills.

MILLS FURNISHED AT SHORT NOTICE

At the lowest Market Prices.

HALLIDIE'S

Patent Endless Wire Ropeway.

Covered by Numerous U. S. Patents.

IMPORTANT TO

Mining Companies, Civil Engineers, Contractors, Etc.

The system of transporting material, such as Ore, from the mine to the mill, Earthe for embankments, Rock from quarries, etc., by means of steel wire rope, has been well tested and found more economical, advantageous and reliable than any other method of transportation; and to the annexed certificates in connection therewith I beg to call the attention of those interested.

EUREKA, Nevada, July 10, 1872.
T. M. MARTIN My dear sir: On your leaving for San Francisco, it gives me great pleasure to hand you my written acceptance of the HALLIDIE TRAMWAY put up by you upon our mine in Frohberg.

It is a perfect success, discharging ten tons of ore per hour with two men's labor. It is perfectly simple in construction, and, as far as I can judge, there is nothing about it to ever get out of order—nothing to wear out. While ours requires but about two thousand five hundred feet of wire rope, I can see no reason why the line could not be extended almost indefinitely with equally happy results. Again, the carrying capacity might be doubled or quadrupled if desired. After several weeks trial upon our mine, the unanimous verdict of all who have seen it is a complete, unquestioned success. If this can be of any service to you, use it in any way you think proper. Very respectfully, O. O. GOODWIN.

EMMA HILL CONSOLIDATED MINING CO.,

Little Cottonwood, Utah.

Superintendent's Office, Sept. 28, 1872.
T. M. MARTIN, Esq.—The Ropeway constructed by you (HALLIDIE'S PATENT) for the Emma Hill Consolidated Mining Company, has been built in a most substantial and workmanlike manner, and is at this time in splendid working condition. I most cheerfully accept the work for the Company, and recommend it to others wishing a sure and speedy transit for ores over places impracticable for wagon roads, etc. Respectfully,

J. W. COLBATH, Superintendent.

"The Vallejo works smoothly with the elevated wire tramway, which carries its load of ore as quietly and easily as if there was no winter or snow in the world."

Whatever the objections to wire tramways may be on account of their cost, I have seen nothing yet that even approaches them in the facilities they afford for moving ore at all seasons of the year. —Correspondent Utah Mining Journal, Alta, Jan. 8, 1873.

The Vallejo Ropeway.

The Vallejo Tunnel Company's Tramway in Little Cottonwood, built on the HALLIDIE PATENTED PLAN, is a complete success. It is between 2,300 and 2,400 feet in length, and is supported by thirteen stations. The fall in this distance is about 600 feet, and the wire rope, which is three-fourths of an inch in diameter, will safely and easily deliver one hundred tons in six hours. The machinery is automatic, loading and unloading the sacks or buckets. About one ton and a half can be sent down at one time. The stations are about two hundred feet apart, and the entire apparatus is strong and safe. As the wire rope is elevated about forty feet above the surface of the hill, the Tramway can be worked all winter long, without the slightest trouble. —Utah Mining Journal, Salt Lake, Sept. 23, 1872.

Mining Companies and others desiring to negotiate for the erection of this system of Ropeway, can communicate with me personally, or through Postoffice Box 904.

A. S. HALLIDIE, Patentee,

112 and 114 California Street, San Francisco.

WIRE ROPE

For hoisting from mines, transmitting power, ship rigging etc., of all kinds and sizes, on hand and made to order.

Wire of all kinds and descriptions, furnished at lowest rates. A. S. HALLIDIE, 112 and 114 California St.

Send this paper to your friends abroad.

VOLUME XXVI.
Number 24.

The Electro-Galvanic Quicksilver-Saving Apparatus.

Quicksilver-saving appliances in mining operations seem to be one of the necessities of the age. In the early history of mining on this Coast, little care was taken to prevent waste of quicksilver, or even the precious metals; but now-a-days, when economy is necessary, and the immense waste without careful manipulation is known, numerous appliances having this object in view are in use. Among the latest improvements is one recently patented through the agency connected with this office, which is the invention of Joseph Potts, of Treasure Hill, White Pine, Nevada. The apparatus is made especially to save the quicksilver and amalgam which usually escapes down the sluices on account of its fineness or subdivision. The method of accomplishing this, as will be seen, is by passing the tailings, or pulp through a sluice-box or section of a sluice, which is provided, with peculiarly-arranged riffles, the pulp being first distributed upon the floor of the sluice by means of a revolving hopper, of novel construction. Figure 1, of the accompanying engravings, represent a perspective view of the machine, and Figure 2 is an end view.

A represents a copper box, one end of which is open. Secured to the other end of this box is a short section, B, of a sluice, which descends at an angle from the sluice, as shown. This section is riveted to the box, A, so that one side will be one inch, and the other side one inch and a-half lower than the bottom of the box. The opposite end of the box is properly enpointed, in order to level its bottom; or, if desired, a very slight inclination toward the open end can be given to it. Inside of the box, A, near its closed end, is mounted a conical hopper, C, by means of a vertical shaft, the lower end of which steps in the center of an arched copper plate, D, the ends of which are secured to the bottom of the box. The upper end of this shaft is supported in a transverse copper beam, E, which passes above the box, and which may be a simple frame, the ends turned down and fastened as shown. A set screw, F, serves as a bearing for the upper end of the shaft. The hopper itself is made of copper, and is provided with radial copper flanges, G, G, which are widest at the upper end, and gradually taper to the lower opening of the hopper. Along the bottom of the box, A, are placed ten rows of copper riffles, I, I, I. Each riffle is riveted to the bottom of the box at an angle of about 30° from the horizontal plane, and extends lengthwise to the box, as shown. A space of about one inch is left between the riffles in each row. The riffles in each alternate row are riveted between the spaces of the upper row, so that there are five rows containing five of the riffles, and five rows containing four.

Upon the bottom of the section, B, are riveted a series of riffles, K, K, which are also made of copper plate. These, however, run across the width of the box, and are set at the same inclination as the box itself, so that they, too, are one and a-half inches in height at one side and one inch at the other. At the higher side these riffles are perforated at N, N, so as to allow the quicksilver and soft amalgam (which by gravitation would naturally fall to this side), to pass through and finally run into the vessel for receiving it. The lowest of these riffles is not perforated, and the main quantity of water and sand is allowed to pass over it into the sluice below. The interior of these

copper boxes, as well as the riffles and the revolving hopper, are all well coated with amalgam and quicksilver. These copper boxes are enclosed in another of zinc plate T; thus in the admission of any tailings or water, however slightly acidulated, a galvanic action is set up. For better protection of these covers the whole may be inclosed in a stout wooden box and kept under lock and key.

This apparatus is so placed as to receive the tailings at the upper end in the revolving hopper, C. The tailings are thus distributed along the course of the riffles and finally discharged from the sluice. In passing through these boxes and over the riffles, the tailings are subjected to galvanic action, which favors the amalgamation of the particles.

ASTRONOMICAL.—Jupiter still remains, as it has been for several months, quite a conspicuous object in the evening sky. It may be seen among the stars of Leo, and sets about mid-

POTTS' QUICKSILVER-SAVING APPARATUS.

night. There will be nineteen eclipses of the satellites of this planet during the month of June—a less number, however, than usually occurs within the space of a month.

Mars is also quite conspicuous. It may now be seen at the meridian about 10 P. M.

Venus, which ceased last month to be the evening star, is now at its period of greatest brilliancy, and is as conspicuous as the morning star. It may be seen by the naked eye about 9 in the morning at an altitude of about 60 degrees.

Saturn rises about 10 P. M., and sets about 5 A. M., and consequently it is now above the horizon only about seven hours.

AN UNLUCKY ACCIDENT.—The aquarum car, with its load of live fish and fish-eggs, to be deposited in the waters of California rivers, did not succeed in getting through safely. The locomotive and this one car were precipitated from a trestle work at the Elkhorn River bridge, about twenty-five miles from Omaha, and the whole consignment of fish were lost in the river. There were about 30,000 live fish, including several thousand Eastern trout; the rest being bass, perch, cat-fish, eels, shad, lobsters, etc. Another attempt will be made to bring a consignment of fish to this coast, which it is hoped will be successful.

HEAVY BULLION SHIPMENTS.—Wells, Fargo & Co. shipped from Virginia City, Nev., during the month of May, in silver bars, the sum of \$2,987,856.72, within about \$12,000 of \$3,000,000. This is the largest amount of bullion ever shipped from that office during the same period. The *Enterprise* says it tells its own story of the present condition of the mines.

Patera's Quicksilver Furnace.

Mr. Kustel writes us from Vienna that Mr. V. Patera has made an experiment with his patent quicksilver furnace, on the plan of a muffle furnace. The quicksilver ore must be pulverized for this process, but Patera thinks that the cost of crushing is insignificant compared with the value of the higher percentage of quicksilver obtained by his process. The officers at Idria admit a loss of 37 per cent. as compared with their usual assay, but the usual assay by retorting compared with the analysis shows a heavy loss besides. The analysis of a series of samples compared with the retort assay gave in average the following results:

Idria assays, 3.94 per cent. Analysis of the same, 5.00 per cent.

This shows 12 per cent. loss by the assay, and with the above loss of 37 per cent. it would amount to 49 per cent. real loss. Mr. Patera claims to work the ore up to 84 per cent. of the

Pacific Coast Marine Work.

The steamer "Oliver Walcott," the first Revenue Cutter built on the Pacific Coast, has just made her official trial trip of 24 hours at sea. The dimensions of this vessel are: length over all, 137 feet; breadth of beam, 22 feet; depth of hold, 10 feet 4 inches. The contractors with the Government for the steamer are the Risdon Iron and Locomotive Works, the hull being built for them by Dickie Brothers.

The machinery consists of one surface-condensing inverted directing engine, with a diameter of cylinder of 34 inches, and 34 inches length of stroke. The condenser has a covering surface of 820 square feet. The boiler is of the ordinary flue, and return tubular type provided with a steam chimney, and with semi-circular legs to fire-box. There are two furnaces with 52 square feet of grate surface, the total heating or fire surface being 1,568 square feet. The whole machinery is strong, durable and well finished, and really a credit to the Works. It operates smoothly and presents a neat appearance. Before proceeding on the trial trip proper a few hours were spent on the bay in smooth water for the benefit of the friends of the contractors, who had conscientious scruples about going "outside." The builders provided an excellent lunch for their guests, and the whole trip was an enjoyable one to all present. The landsmen were put ashore at 12 o'clock, and at half-past one the "Oliver Walcott" proceeded to sea, clearing the heads at ten minutes past two.

Courses were laid off on the charts in about 30 mile stretches in order to test the vessel in every relative position to the sea and wind, of which there was quite enough to make the test of some value. Any one who has been over the bar and out towards the Farallone Islands on one of our breezy, summer afternoons (and this is a particular breezy month) will recognize the fact that a pretty severe test can be given to a small vessel. During the whole 24 hours the vessel and engine behaved splendidly. The average revolutions for the time was 63, and the whole distance run was 238 knots. A test of speed was made while running up the bay in smooth water by Walker's Patent Log, which was found to correspond with the distance run during the trial outside. This gave a speed of 11½ knots, while speed at sea was nearly 10 knots. The trial was in every way satisfactory both to the contractors and the representatives of the Government. Captain White and Mr. Wason represented the Revenue Department and Mr. Dickie the builders.

A difficulty attendant upon the building of this, the first vessel for the Government, lay in the fact that specifications were made in the east, and comprehended the use of eastern woods, to a large extent. Peculiarities of the fitting of windows, doors, etc., not necessary in our climate, were specified, and several attendant details which necessitated the importation of special articles from the east. This will probably be avoided in other cases, as the engineers on this coast will suggest a change in items of minor importance. The builders have, however, turned out a very neat, substantial, and tasty job. The joiner work is well done, and the finish, though not elaborate, is handsome and attractive. Patent steering gear is employed, and a windlass and capstan combined is on board. There are two cabins, with the usual staterooms, pantry, etc. The only houses on deck are the pilot-house, chart room, and cover for the machinery. The vessel has a particularly beautiful and graceful sheer, which any nautical man would notice.

She is rigged to carry two stay-sails, spanker, jib and square-sail. The builders, who recently built the "Eastport," another small steamer, have made such an excellent job of this one that it is to be hoped that this impetus to ship-building on the Pacific will not stop here, but they will in future have their hands full. The speed attained by this little propeller in a seaway is a sufficient guarantee of the skill exercised in modeling her, and of the smoothness and strength of her machinery. In a vessel as small as she is, it is quite remarkable, taking into consideration the fact, that the machinery was new and the water pretty rough.

QUICKSILVER has been found by the locator of the Pope Valley mine, on the O'Farrell Ranch, Bodega, Sonoma county.

CORRESPONDENCE.

A Rambler's Notes in Sierra County.

Forest City was years ago a flourishing town, from the time of the discovery of the famous "blue gravel" lead. It was struck by miners in working up the bed of the creek. The city ranked well up amongst the best mining camps in the county. As the "blue gravel" was being slowly worked out, and no new developments made, the miners left, until the place two years ago, voted only 60 odd, instead of 700 as formerly. When the "Bald Mountain Co." was organized, and went to work with a will, it soon struck as good, if not better, pay than was first found; as an evidence of the success of the company, their expenses up to the present time, in tunnels, timbers, right of way, and over 1 mile of flumes, has been \$100,000, all of which has been paid off, and \$44,000 divided amongst the stockholders. The main tunnel is in 2,500 ft., breasting out 250 to 300 ft. wide, the present faces showing equally as good, if not better gravel, than any taken out. The work under Superintendent Wallace, is being done in a substantial manner, the owners as well may wear smiling faces and talk of hundreds of thousands for the claim. This ground is extensive.

The North Fork Co., are pushing ahead their tunnel now in 2,200 ft., and expect soon to be taking out good pay grit. They join the Bald Mountain on the north and have acres of ground.

The South Fork Company adjoining the Bald Mountain Co., on the south, have organized and let a contract for a tunnel, and will push the work to completion. They expect to strike the ground deposit inside of 2,000 feet. And have a large claim.

Again to the East of the Bald Mountain Co., on the Rock Creek Side, another Co. are preparing to open up their ground by shafting. Upon the whole the present prospects of Forest City looks to surpassing her former greatness. Her business men with an eye to an increased demand are in full supply of goods.

Mr. Ellery of the City Hotel, having moved back the old building, is now erecting a large two-story front. This is a necessity from the increasing demand for hotel accommodations.

Crossing the Ridge to the South, two miles brings you to old Alleghany, quietly resting upon her former laurels. Mr. Briggs, Superintendent of the Highland & Masonic Co. owned by Manson & Co., informs you that they are at present opening the ground by tunneling, formerly worked through a shaft. Too much water forced an abandonment and when the ground was drained, good pay gravel was left, which he expects to strike soon, when you may hear of good dividends from the old Highland & Masonic. One-half mile below town, at Smith's Flat, one Co. is operating in a small way, with favorable prospects. In full view, but across the Creek, (Kanaka) is Chipp's Flat, where very little is doing. Two miles further South is Minnesota, at present, quiet.

RAMBLER.

Borax.

History of its Discovery—Experiments—Mode of Occurrence—Extraction—Assay, Etc.

[Written for the Press by HENRY G. HANES.]

The early history of borax is vague and uncertain. Some writers assert that it was known to the ancients, a statement flatly denied by others. One author quotes from the writing of Suetonius, who lived in the first century, "That the circus in his time was covered with borax and vermillion."

Several writers maintain that the "Chrysocola" (literally gold glue) of the ancients was borax. Chaptal, without giving his authority, says that Chrysocola was an artificial solder, of which oxide of copper was the base. A substance is described by Pliny, under the name of "melites lapis," which is supposed by the translator to have been borax.

The name "Borax" appears in the works of Geber, an Arabian alchemist, who lived in the ninth century. According to Webster, the word is of Arabic origin, and is derived from *buraka* "to shine."

Very Little was Known

Of the properties of borax until the year 1702, when Homberg, a Dutch chemist, discovered boracic acid, which he produced by subliming a mixture of sulphate of iron and borax; the sublimate so obtained was called "Homberg's Sedative Salt" and "Narcotic Salt," which was used as a remedy for fevers. In the old chemical books the term "Sedative Salt" and "Acid of Borax" are of frequent occurrence.

In 1729 Lemery produced boracic acid in the manner still common among chemists, by decomposing borax with a stronger acid.

Geoffroy, in the year 1731, observed that boracic acid imparted a green flame to burning alcohol. This characteristic reaction is still in use, and enables modern chemists to distinguish boracic acid from all others.

In 1752, Baron announced that borax was a

compound of sedative salt and soda. Shortly after this discovery, sedative salt being found to possess acid properties, was for the first time called "Boracic Acid."

The Thibet localities of borax were discovered in 1772, or at least samples of native borax were sent to Sweden by Mr. Grill Abrahamson in that year, which is probably the first authentic discovery of natural borax on record. Shortly afterward, Hoefsr found

Boracic Acid

In lakes of hot mineral waters in Tuscany.

For fifty years after Baron's discovery, the element which is the base of boracic acid remained unknown; Crell nearly discovered it in 1800, when he published a statement that boracic acid was the oxide of a substance resembling carbon.

Davy repeated Crell's experiments, but without obtaining the same results. In 1807, he submitted boracic acid to the action of a powerful galvanic battery, and obtained a black substance at the negative pole.

To Guy Lussac and Thenard belong the honor of first isolating the element

Boron.

Which is now known to be the base of boracic acid. The decomposition was made by fusing potassium with boracic acid in a copper tube.

Modern chemists have added much to our knowledge of boron and its compounds. Until the invention of the oxyhydrogen blowpipe, many substances were assumed to be infusible which now yield to its powerful action.

In 1837 Gardin fused salina into crystals resembling rubies and other precious stones, of which alumina is the base. In 1847 Ebelmen, the manager of a Sevres porcelain factory noticed that boracic acid sometimes volatilized in his furnaces. He commenced experimenting with boracic acid and alumina which resulted in his obtaining shining crystals of extreme hardness which he supposed to be oxide of alumina, but which were probably boron.

It is well known that carbon assumes three forms or conditions which are "graphite," "charcoal" and the "diamond," or, as it would be expressed scientifically, *Graphitoid, Amorphous and Adamantine*. Wohler and Deville have made elaborate experiments on boron, and have found that it likewise exists in three forms like carbon, to which it exactly corresponds. Graphitoid boron is obtained by subjecting a mixture of fluoroborate of potassium with alumina to a high temperature. The amorphous form is prepared by strongly heating boracic acid with a small quantity of alumina, and boiling the residue in hydrochloric acid. It is a dull olive green powder.

Adamantine boron is produced by submitting boracic acid and alumina, in a charcoal-lined crucible, to a temperature at which nickel melts. Crystals of boron result, which are found imbedded in metallic aluminum. Some of the crystals are red; others are yellowish. They are all extremely hard—almost as much so as the diamond itself. Corundum yields to the superior hardness of these crystals. If this substance could be produced cheaply, it might be substituted for the diamond for mechanical purposes.

Properties of Borax.

Borax is a well-known salt, which is composed of boracic acid, soda and water. In the language of chemists, it is a hydrated biphosphate of soda. It is a white salt, found in commerce, generally crystallized in hexahedral prisms, containing ten equivalents of water. It can be crystallized in octahedrons at the option of the chemist, in which case it takes up but five equivalents of water. It has a sweetish taste and an alkaline reaction. It dissolves in twelve parts of cold water and in two parts of boiling water. At a low heat it melts in its water of crystallization; if the heat be continued, it swells and becomes a white porous mass. At a red heat, it fuses into a transparent fluid, which becomes, when cold, a transparent solid resembling glass. Sulphuric acid, added to a solution of borax, unites with the soda, setting the boracic acid free, which, being but slightly soluble in water, falls as a precipitate, and may be separated from the sulphate of soda by washing.

Commercial borax often contains impurity, either accidental or as an adulteration. The following

Simple Tests

Will serve to detect the usual foreign substances contained in borax: When pure it should dissolve in twenty parts of cold water to a clear solution without color or residue. A sample heated to fusion should leave a residue weighing fifty-two per cent. If adulterated with nitrate of potash it will deliquesce when thrown on burning coals. If alum is present as an impurity its solution will react acid on litmus paper. Borax is often degraded by admixture of phosphate of soda, sometimes to the extent of twenty per cent., in which case its solution will give a yellow precipitate upon addition of molybdate of ammonia mixed with excess of nitric acid.

The natural impurities are the alkaline earths and the sulphate and chloride of sodium. Alkaline earths give a precipitate with carbonate of soda. Sulphate of soda gives a white precipitate with chlorides of barium, insoluble in acids. Chloride of sodium gives a similar precipitate with nitrate of silver.

Borax is Used in the Arts

As a flux for soldering metals and in melting them; largely as a glaze for pottery. It has a limited use in the laundry to give softness to the water and a peculiar whiteness to laces and fine clothing; as a wash for the hair and

in several arts and manufactures. A solution of borate of ammonia renders light cotton goods non-inflammable. Borate of manganese is a powerful dryer for paints and oils. Borax has only a limited use in medicine. Borax

In a Crude State

Came formerly to Europe from Indis, Thibet and Persis, under the name of "tincal." According to Prof. Royle, the name "tincal" is derived from *tincana*, the Sanscrit for borax. The Dutch for a long time retained to themselves the secret art of refining tincal or crude borax. When first practiced in France, so great was the prejudice in favor of the Dutch article that they were compelled to ship it first to Amsterdam to be returned to France as "Dutch Borax."

Tincal is shipped in large quantities from Calcutta to Europe. It is quite impure and is covered with a greasy substance which must be removed before the crystals can be dissolved. This oily coating is said to be the result of immersion in asses' milk to prevent efflorescence of the tincal during shipment.

An analysis by Klaproth showed its composition to be soda, 14.5; boracic acid, 37; water, 47.

Sources of Borax.

Borax Lake, in Thibet, from which large quantities are produced, is fifteen days journey from Teshoo Lombo. Being at a high altitude its waters are frozen over during the greater part of the year. The borax is dug from the margin of the lake. The crystals removed are found to be replaced by others after the lapse of a certain time. Another source of borax is the Tuscan Lagoons in Italy. This remarkable region in which they are situated is six miles from the Mediterranean and thirty-six miles north of Leghorn. Boiling springs are common and in places jets of steam issue from the ground, fumes of sulphuric and sulphuretted hydrogen are so dense that animals are often found suffocated in the ravines and depressions of the earth. The waters are highly charged with mineral matter and gases. The discovery of

Boracic Acid in these Boiling Springs,

In the year 1777, by Haefr, Chemist to the Grand Duke, has already been mentioned. In 1818 the first attempt was made to collect the acid, but failed on account of the cost of fuel used to concentrate the waters. In 1827, M. Lardarel, a Frenchman, suggested the ingenious idea of using the natural heat for that purpose. Success followed, which has continued ever since.

It was found that the boracic acid did not come to the surface, but probably crystallized in the fissures below. When water was let in from above, it was forced back by the issuing steam, charged with the acid. Large artificial lagoons of masonry are built over the fissures, which are supplied with fresh water from neighboring streams. The contour of the country being favorable, a succession of these are formed, one below the other. From the upper basin the water is allowed to flow through the others, at each slip becoming more heavily charged, until having passed through eight of them it is found to have a specific gravity of 1.007, and to contain 0.5 per cent. of boracic acid. It is then allowed to flow into shallow vats of large surface capacity, where it is evaporated to dryness by the aid of natural steam conveyed through coils of iron pipe.

The acid so obtained is far from pure. Chemical analysis shows it to contain 76 per cent. of boracic acid, the impurity consisting of the sulphates of eight bases silica, water, free sulphuric acid, and chloride of ammonium. The crude acid is sent to England and France, where it is treated in the large way with carbonate of soda, and the crude borax so formed purified by re-crystallization.

Boracic acid is also

Found in Nature,

Combined in several minerals of a rare occurrence. The following is a list of them as far as known:

Bechillite,	Larderellite,
Boracite,	Rhodizite,
Cryptomorphite,	Sassolite,
Hydroboracite,	Szabibelyte,
Howlite,	Ulexite,
Lesgonite,	Warwickite.

Ulexite furnishes large quantities of borax to commerce. This curious mineral was first found in the nitre beds of Peru in small concretions, showing, when broken, interlaced silky crystals. It sometimes shows, when broken, enclosed crystals of gypsum and salt. It was first examined by Ulex, who showed that it contained boracic acid, some soda and water. It was afterward analyzed by A. A. Hayes, who proposed the formula $(\text{CaO}, 2 \text{BO}_3 + 6 \text{HO})$. He supposed the soda found by Ulex to result from mechanically mixed glauberite. For some time this mineral was called "Hayesene;" but Dana, in the last edition of his work on mineralogy, gives it the name of Ulexite, in justice to the first observer. It is very variable in its composition. Several samples from Iquique gave many results when analyzed. It is, however, a valuable source of borax, being manufactured extensively in England, where it is decomposed by boiling with a solution of carbonate of soda. To extract boracic acid from it in the laboratory, it may be treated with dilute boiling hydrochloric acid. The crystallized boracic acid is thrown down on cooling. Ulexite may be artificially formed by precipitating a solution of borax with nitrate of calcium.

Cryptomorphite is a soft white substance resembling chalk. Its composition is nearly the

same as that of Ulexite. It is a rare mineral. A specimen the size of a bean has been considered a valuable addition to the cabinet of the most celebrated mineralogists. It gives the reactions of lime and boric acid, and under the microscope with a high-power, rhombic crystals are seen, from which peculiarity it takes its name.

The detection of boracic acid qualitatively is simple and certain, whilst the determination of the quantity is attended with many difficulties.

The Best Test for Boracic Acid,

In minerals and compounds containing it, is to place the substance to be tested, in powder into a small evaporating dish; sulphuric acid is added to make a pasty mass after which absolute alcohol is poured in and a spirit lamp placed under the dish. When heated nearly to boiling the lamp is removed and the alcohol ignited; if left to burn quietly the yellow sodium flame masks to a great extent the green color imparted to the flame by the boric acid, but if a current of air is blown across the dish, not strong enough to endanger the extinction of the flame, but sufficiently to agitate it violently, the reaction becomes very distinct and well defined.

Any substance containing free boracic acid will give this reaction without previous addition of sulphuric acid. To test free boric acid with the blowpipe, reduce the substance to a powder, add a drop or two of water, mix with three times its volume of a flux composed of four and a half parts of bisulphate of potash and one of powdered fluorspar and expose a portion of the mixture in a loop of platinum wire to the inner flame of the blowpipe. A green flame indicates boracic acid. A similar flux, called Turner's flux, is two parts of fluorspar and one part of bi-sulphate of potash and is used in the same manner. These tests should be made in a dark place. Solutions to be tested should first be evaporated to dryness, and the test applied to the residue.

The Assay of Borax

Is made in several different ways. A very correct method is to dissolve a weighed quantity in water, to add hydrochloric acid in excess, to evaporate to dryness in a water bath, to add a few more drops of the acid and continue the evaporation until no more fumes of hydrochloric acid escapes. From the chloride of sodium so obtained precipitate the chlorine with nitrate of silver. Knowing the amount of chlorine it is a simple operation to calculate the soda, and from the soda the quantity of boracic acid which was combined with it. If the original sample contained any chlorine, the amount must be determined in a fresh portion, and deducted from the assay.

Borax may also be

Determined Volumetrically.

For this assay a solution of sulphuric acid must be prepared, in which an exact chemical equivalent of the acid shall be contained in each litre. This acid solution, called "normal sulphuric acid," must be carefully preserved in a well-stoppered bottle, as on its purity and uniform strength depends the accuracy of the results. An equivalent of the borax to be assayed (or rather what would be an equivalent if it was pure) must then be dissolved in a litre of distilled water, in the manner and with the precautions to be described. Now if both solutions contain exact equivalents, they would neutralize each other if poured together. In a like manner if a tenth of each solution was mixed, they would neutralize each other. The tenth of a litre is a convenient measure for the assay, because it contains 100 cubic centimetres. If 100 CC of the acid solution neutralized 100 CC of the borax solution, it would be an evidence that the sample was pure. If 80 CC only was required, the sample contains 80 per cent. of borax. In other words, each CC of the acid solution represents one per cent. of crystallized borax in the sample.

When litmus is added to a solution of borax, only a purple-red color is seen while any borax remains undecomposed; but at the instant that the last atom of soda is changed to sulphate, a light red color appears.

One equivalent of crystallized borax $(\text{NaO}, 2 \text{BO}_3 + 10 \text{HO})$ is 190.8. The assay is made by dissolving—with heat—190.8 grammes of the air dried sample in less than a litre of distilled water, and filtering the solution into a litre flask. The filter must be washed with distilled water until the flask is full to the mark, when the whole is shaken together to well mix it. The experiment is made on one-tenth of the solution, which is 100 CC. This quantity is placed in a clean beaker, solution of litmus added until a deep color is imparted to the fluid. Normal sulphuric acid is then dropped in from a burette, graduated to 100 CC and tenths, until the color suddenly changes to a bright red. The first test may be made somewhat carelessly, as it will only be an approximation. The beaker is then washed out and the operation repeated on 100 CC more of the solution, this time with greater care. The result will be nearly correct. A third experiment will serve to verify the result.

Only borax can be estimated by this method. The determination of boracic acid in minerals and other substances is extremely difficult and can hardly be explained without an elaborate description. In the volumetric method described above, it is customary to deduct 0.5 CC to correct for the excess of sulphuric acid required to develop the red color in the assay.

SCIENTIFIC PROGRESS.

The Air We Breathe.

Much attention is now being paid to the characteristics of the atmosphere in various localities, and under diverse circumstances. Analyses show that air in open and exposed localities varies in the amount of oxygen, which it contains from 20.4 to 21.0 per cent. The most favorable localities, as on the heaths of Scotland, show the latter; while it is necessary to go underground into a mine to find the latter. Well ventilated mines show about 20.4; while our ill ventilated mines, where it is possible to labor, rarely go below 20. These results are derived from thousands of careful analyses. Cavendish made 500 in the course of his enquiries.

The cursory reader may think that the difference between 21, and 20 in the per cent. of oxygen in the atmosphere can have but little importance, and is hardly worth enquiring. It is true that the deficiency named is small when considered in figuring; but when we reflect that while 21 represents the largest amount of oxygen ever found in the best natural atmosphere, a candle goes out at 18.50, and life can barely be sustained for a short time at 17.20, the importance of a small per cent. of difference becomes apparent. Even so small a difference as that between 21, and 20.981 is equal to 190 in a million; and if we place impurity in water at that rate it will amount to 13 grains in a gallon. This amount would be considered enormous, if it consisted of putrifying matter or any organic matter usually found in water.

But we drink but a small quantity of water, and with such a percentage we might be several days in swallowing the whole 13 grains; whereas we take into our lungs from 1500 to 2000 gallons of air each day. Moreover the blood receives such impurities almost entire, very little being filtered out in its passage to the lungs; while the stomach has powers of disinfection and destruction which renders harmless very much of the organic impurities contained in water. But if we take the air found in the pit of a theatre, generally about 20.740 we find the minute analyses becomes a matter of the highest importance.

The senses are bad and inefficient guides to the wholesomeness of air as regards the amount of oxygen and carbonic acid, save when the former is reduced and the latter increased to such an extent that the lungs seem to refuse to expand and the whole vital action is threatened with paralysis. Rooms badly ventilated, which contain less than 20.7 per cent. of oxygen are very unwholesome, and the necessity of taking into consideration the proportion of oxygen and carbonic acid in the sanitary inspection of factories and workshops is abundantly evident from the results obtained by Dr. Smith.

Mr. Clemson, a French chemist, made public, in 1856, a theory with regard to the presence of living organisms in the atmosphere, so minute as to be almost or quite unabsorbable by the best microscope, and which organisms exerted a marked influence on health—in fact were the origin of most diseases to which men are subjected. He also argued that there is phosphoric acid in the air, derived from the successive generations after generations of myriads of these organisms, produced, living and dying in the atmosphere; that such organisms exist and are at work, assimilating from one to the other, preparing food for more perfect organisms, from the microscopic points of life to the most perfect animal existence. He also entertained the idea that the increased fertility of the earth by being broken up and exposed to the atmosphere, was due to the presence of such animalcules.

Nerve Power and its Correlations.

One of the most remarkable phenomena presented by contemporary science, is the tendency to unity of all sciences. An additional instance of this tendency has been given in a memoir by Mons. Matteucci on that power, which gives action to the nervous system. A great many physiologists have insisted upon the identity of electricity and this power; it is not, however, accepted for absolutely true, although it is admitted there is a great analogy between them. Mons. Matteucci agrees there are serious objections to this theory, and he holds them to be different agents, but he shows there is a similar analogy between them to that which exists between light, heat, and electricity. He instances tourmaline, which develops electricity when heated, and he shows there is a like relation between electricity and the nervous power.

Reminding the reader that the essential characteristics of imponderable bodies, such as the immense rapidity of their motions, the ease with which they escape observation, and the transformation of each into the other belong to this nervous power as well as to electricity, light, and heat; he goes on to represent this nervous power by ether. "This nervous power," he says, "consists in a particular motion of ether. Ether diffused throughout the nervous system as it is diffused throughout the

universe, assumes the characteristics of nervous power by the modifications which are introduced into the relative disposition of its atoms by the organization of the nervous substance." Whoso the ether is directed from the extremities towards the brain it produces sensation. When it is directed from the brain to the extremities it produces contraction. Thus this hypothesis of ether which has long been admitted in Astronomy, natural philosophy and chemistry, is invading physiology; and electricity, heat, light, and nervous power obey the same laws, and are produced and may be transformed each by the other.

Curious Facts in Astronomical Calculations.

Few persons are aware of the nicety required in astronomical observations. The rod used in measuring a base line is commonly somewhere about ten feet long; and the astronomer may be said to apply the very rod to mete the distance of the stars. An error in placing a fine dot which fixes the length of the rod, amounting to one-five-thousandth of an inch—the thickness of a single silken fibre—will amount to an error of seventy feet in the earth's diameter, of three hundred and sixteen miles in the sun's distance, and to more than sixty-five millions of miles on that of the nearest fixed star. As the astronomer in his observatory has nothing farther to do with ascertaining lengths or distances, except by calculation, his whole skill and artifice are consequently exhausted in the measurement of angles, it being by these alone that spaces inaccessible can be compared. Happily a ray of light is straight; were it not so, in celestial spaces at least, there was an end of astronomy. Now, an angle of a second—3,600 to a degree—is a subtle thing. It has an apparent breadth utterly invisible to the unaided eye, unless accompanied with so intense a splendor, as in the case of a fixed star, as actually to raise by its effect on the nerve of sight, a spurious image having a sensible breadth. A silkworm's fibre, such as has been mentioned above, subtends an angle of a second at three and a-half feet distance; a cricket ball, two and a-half inches diameter, must be removed, in order to subtend a second, about eight miles, where it would be utterly invisible to the sharpest sight, aided even by a telescope of some power. Yet it is on the measure of one single second that the ascertainment of a sensible parallax in any fixed star depends; and an error of one-thousandth of that amount—a quantity still unmeasurable by the most perfect of instruments—would place the star too far or too near by 200,000,000 miles, a space which light requires one hundred and eighteen days to travel.

Carbonic Acid in the Air.

Sir Walter Trevelyan, in a communication recently addressed to the *Gardeners' Chronicle*, starts a curious and ingenious theory on the advantage of a small percentage of carbonic acid in the air. The sedative nature of this gas is well known, and with most animals in a state of nature, sleep comes on at the time when plants commence to develop carbonic acid, that is, at sunset—and it relaxes its hold about sunrise, when plants begin to exhale oxygen. Further, when men and animals compose themselves to sleep, they not only do so in the position which gives the greatest relaxation to the muscles, but "they place the head so as to favor the accumulation of that gas about it, and consequently its inhalation. The head of a man, when at rest, generally lies low, on a soft and depressed pillow, those of most quadrupeds conched between their paws, and those of birds nestled among the feathers of their backs or wings," so that in all these cases, owing to the low and confined position of the mouth and nostrils, much of the air must be inhaled again and again, and become gradually mixed with a larger proportion of carbonic acid. He also adduces the fact that the carnivora, who are nocturnal in their habits, retire during the day to deep and narrow caverns, in which the air becoming vitiated by their respiration, tends to promote sleep. The obvious objection to this theory is, that the carbonic acid becomes rapidly diffused, so that the air in every part of the room would probably be found to be sensibly of the same composition.

SPECTRA OF GASES UNDER PRESSURE.—When the spark from an inductorium is made to pass through a tube containing a gas at the ordinary pressure, the light is feeble, and presents in the spectroscopic very indistinct bands; but if the pressure be slowly increased, the bands become brighter and larger, in the end producing a continuous spectrum. On still further increasing the pressure to about 200 atmospheres, the electric current ceases to pass, and no spectrum is formed.

A NEW QUALITY IN MORPHINE.—A German chemist has discovered that if morphine, which is sometimes used effectually to slay vomiting, be heated with hydrochloric acid, it will become the most powerful emetic known. The effect is produced by introducing a small quantity under the skin and sometimes by spilling it on the skin, but the vomiting soon subsides and leaves no nausea. The discoverer calls the new agent ememorphia.

WONDERS OF THE DEEP.—Some interesting deep sea explorations were made during the recent passage of the British Exploring Ship, Challenger, from Eaglesad to the West Indies. The sounding line and dredge were kept constantly going. The former showed that a pretty level bottom runs off from the African coast, deepening gradually until the depth of about three and one-half miles is reached, at about one-third the distance from the African coast to the West Indies. Five hundred miles farther west there is a comparatively shallow region, a little less than two miles in depth. The water then deepens again to about three miles, and so continues until the immediate vicinity of the islands is reached.

Small quantities of animal life were brought up all along the route, even from the greatest depths, just sufficient to show that life existed, even under such an immense pressure.

At the deepest spots it required 12 hours to reach bottom and haul up the dredge.

Nearly everything of life that came up from two miles and over in depth was new, and among the most interesting novelties was a new species of lobster, perfectly transparent. Living beings were also found in which the eyes constituted the chief bulk of the animal; on the other hand, one new crustacean was brought to light in which not even a germ of an eye could be found. Nature, however, had supplied that deficiency with a great multitude of long and most delicate claws or feelers.

COMBUSTIBILITY OF LEAD, IRON, ETC.—It is well known that iron, minutely divided, burns as readily as tinder. Indeed, poor irona chemically divided will even take fire by being gently tossed into the air, or dropped from an elevation of a few inches only. It is not, however, so generally known that lead, similarly divided, will burn with as much readiness as iron, and with even a greater brilliancy. Indeed, lead is nearly as inflammable as phosphorus, and the only reason why it does not burn under ordinary circumstances is because the solid product of combustion forms a film that prevents the contact of the oxygen of the atmosphere with the surface of the unburned portions of the metal. Perhaps the most wonderful provisions of nature are those admirable arrangements by which these combustible properties of the metal are not only kept under proper control, but though so inflammable, are nevertheless made to serve as our strongest resistors of combustion.

SPONGE IRON is produced by calcining powdered iron ore with charcoal. Such iron forms a most excellent filter, more powerful, it is said than even animal charcoal. It is said that even sewage water filtered through a layer of this substance is completely purified, and will remain sweet for an almost indefinite time.

MECHANICAL PROGRESS.

Steel vs. Iron.

One great objection to the more general employment of steel for purposes where much strain is to be endured, and where human life is to be risked, is, according to Mr. Robert Mallet, the lack of some reliable and ready means of testing the same. The very quality that chiefly recommends steel is the one most difficult to determine, and the most dangerous if absent. The strength of steel in plated structures as proportioned to iron, is usually rated something like 10 to 6.

One great source of imperfection in steel is the injuries which it is liable to sustain in the process of manufacture; when a bar or plate gets a hammer-blow while hot, or anything like a dent, or sustains any concussion which causes a sudden change of dimension, however minute, such bar or plate, in most cases, is certain to give way at the point of concussion on receiving a strain much less than would break the bar elsewhere. Anything, also in the nature of a superficial injury to a plate, is much more serious in its effects on steel than on iron.

Steel as adapted for rails is said to show greater difference of good and evil than it does under any other conditions for use. A commission of fifteen railway engineers recently reported that the weight of evidence was in favor of employing steel instead of iron for rails in railway use; but especial stress was laid upon the necessity that existed for the exercise of the most extreme care in the manufacture of the rails—especially in handling them while hot. Experience had shown that steel rails almost always break at the point where some injury had been received while the rail was hot. In most cases such rails break in a few weeks; while perfectly sound rails work without any perceptible wear or injury, for 12 or 15 years.

Steel is prone to be very much superior to iron when used for gearing; but it is proved that gearing mounted on timber framing is much more liable to fracture than when properly fitted on an iron frame. Wood, even when well secured, will warp and twist sufficient to disarrange delicate machinery.

Close attention is being paid to the use of steel as far as adopted, with the view of its more general adaptation, according to the greater or less extent of success which may attend its present employment.

Indurating Iron on a Large Scale.

The iron work of the new bridge, lately built at Blackfriars (London), was indurated by a process patented by Messrs. Morswood & Co., and is alike important from the great cost which it incurred, and the testing of a rather abstruse chemical formula for the preservation of iron from oxidation and decay. The process is as follows: The iron was thoroughly cleaned, and heated to the requisite temperature in a furnace planned by the inventors. When this temperature is attained, it is plunged into a bath of prussiate of potash, and chloride of potassium, so that when the iron is withdrawn it may easily part with the surplus of the aforesaid chemicals, which should run off like oil. The iron is then to be dipped into boiling water, containing a certain proportion of cyanide of potassium; from thence it is removed to a bath for a final washing. All the processes are carried on under cover, and before exposure to the atmosphere the iron is coated with an asphaltum paint twice, at given intervals; and again it receives two coats after fixing. Of course, all the necessary planing, drilling, and fitting is done preparatory to the indurating. The time the iron remains in the bath varies from one to five minutes, according to the weight of the metal to be operated upon.

The elaborate character of the process to which the contractor was rigidly bound, will account for the large sum which was expended in carrying out this part of the work: \$20 per ton was allowed the contractor for the indurating and painting. Thus, \$80,000 was spent in this effort to prevent oxidation, no greater proof of which, in its damaging results, can be offered than the case of the cleaning of the oxide (rust) from the Menai Bridge, from which was lately removed above 40 tons of oxide of iron.

ANNEALING.—The change produced by annealing is not well understood. Most of the malleable metals assume two distinct forms: one crystalline, which is the result of slow cooling; and the other fibrous, which is brought about by hammering or rolling. If hammered or rolled beyond a certain point, the metals become so hard that they cannot be bent without breaking. If annealed beyond a certain point, the metals become crystalline. Thus, zinc may be drawn into a very flexible and tenacious wire; but if kept in boiling water too long it resumes its original brittleness, and displays a crystalline appearance when broken. The particles of the metal change their arrangement without altering the external form, and this change may be brought about in various ways; thus, brass wire loses its tensile by exposure to the fumes of an acid, and even by air acting on its surface in a damp atmosphere. Hence it is necessary to preserve wire, such as is used in the manufacture of pins, in a dry air, or under the surface of water.

GERMAN STEEL IN CHINA.—It is a fact worth noting that, during the past two or three years, German steel has been gradually gaining ground in the estimation of the native manufacturers of Shanghai, to the very great detriment of the importations of steel from England. While fully recognizing the superiority of the English article, the natives, with their indifferently art, find the quality of the German product more suitable for their inartistic workmanship than that imported from this country, the high temper of which renders it difficult of manipulation by them. The Germans are importing at a profit of about eight per cent., an article called by the natives "bamboo steel," which is simply an ordinary bar dented at intervals of about two inches, and is therefore easily convertible into appropriate lengths.

HOW FAST CAN A WHEEL BE MADE TO REVOLVE?—There is no limit to the number of revolutions which a wheel may be made to make in a given time. Savart, in his experiments on the theory of sound (acoustics), made wheels to revolve from one thousand to two thousand times per minute; but this has been surpassed by Foucault, who invented an apparatus for measuring the velocity of light, to which a small wheel with a mirror was attached, which might be made to revolve 600, 800, and even 1,000 times per second, or 60,000 times per minute. These are the most rapid revolutions thus far obtained that we are aware of, but there is not the slightest reason why even this should not be surpassed. It is evident that for such great velocities cogwheels are out of the question; only hands or strings can be used.

NOW, AND THEN.—A few years since it was thought to be the perfection of economy to saw sticks of mahogany and rosewood into thin veneerings; to-day the loss incurred by this process is ruinous, because half the timber is lost in saw dust. By using a machine that shaves off the slice, none of the material is wasted, and the saving on a single log of rosewood is said to amount to \$600.

DETERMINING STEEL.—An English engineer says that a good method to determine between steel and iron is to burn filings of the samples in a flame, as steel would scintillate, while iron would be merely laminary.

Table of Fluctuations.

Showing Highest and Lowest "Regular" Sales of Mining Stocks on the Board List of the San Francisco Stock and Exchange Board, during the last Four Weeks, together with Number of Feet, Shares, Last Dividends and Assessments.

THIS TABLE is published regularly in our City Stock Edition of the MINING AND SCIENTIFIC PRESS, and on FRIDAYS in the DAILY MINING PRESS.					1873.

Our Weekly Stock Review.

THURSDAY EVE, June 12, 1873.

There has not been much doing in stock circles this week; business was slack, sales light and prices low. The week has been characterized as an extremely dull one. The only thing of interest is the advent of 5 new dividend-paying companies and the very large ones of some of the old stagers. The dividends are as follows:

Mine.	Per Share.	Amount.
Belcher.....	\$10	\$1,040,000
Crown Point.....	10	1,000,000
Meadow Valley.....	1	60,000
K. K. Consolidated.....	25c	7,500
Eureka, (Grass Valley).....	1	20,000
Black Bear.....	50c	15,000
La Grange Hydraulic.....	25c	7,500
		\$2,132,000

The dividends of the Crown Point and Belcher this year have been as follows:

	Belcher.	Crown Point	Total.
February.....	\$312,000	\$300,000	\$612,000
March.....	416,000	300,000	716,000
April.....	520,000	500,000	1,020,000
May.....	832,000	1,000,000	1,832,000
June.....	1,040,000	1,000,000	2,040,000

Total, five mos. \$3,120,000 \$3,100,000 \$6,220,000

The dividend of the Belcher mine this month is the largest ever paid by a mining company on this Coast or anywhere else, as far as we know. The production of Belcher for the month of May was \$1,500,000. The net profits, \$1,130,000, of which \$1,040,000 was paid as a dividend, and \$96,000 carried over to the surplus fund. There seems to be a sort of friendly emulation between the Crown Point and Belcher, and the latter is \$40,000 ahead, thus far. The Crown Point has paid out in two years the sum of \$5,440,000 as dividends. The disbursement of these immense sums ought to make money a little easier in the city, but it does not seem to have done so as yet.

On Friday prices on the Comstock mines advanced to some extent, Belcher rose \$2; Crown Point, \$3; Chollar, \$4; Con. Virginia, \$8; Caladonia, \$1; Gould & Curry, \$2; Ophir, \$3; Overman, \$3; Savage, \$24. Saturday opened with a pretty strong market and firm prices, but some declines were evident, at close Belcher was \$2.50 lower; Crown Point, \$3, Confidence, \$1; Gould & Curry, \$1; Hale & Norcross, \$3; Overman, \$3; Ophir, \$3; Savage, \$2; Yellow Jacket, \$4.

On Monday the market was dull and weak, and prices were low. Belcher fell \$3 from Saturday's sales; Baltimore, \$1; Caladonia, \$1.50; Con. Virginia, \$2; Crown Point, \$7; Gould & Curry, \$1; Hale & Norcross, \$3; Kentuck, \$1; Ophir, \$3; Overman, \$2; Savage, \$14; Jacket, \$4.

Tuesday, prices were still low and there were few orders to buy, business being very slack in the Board. On Wednesday the business done was small, but prices were a little firmer. Belcher rose \$3; Chollar, Potosi, \$1; Crown Point, \$2; and Hale & Norcross, \$1.

The market to-day did not show much improvement; closing prices may be seen by reference to our stock tables.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned:

California.

ALPINE COUNTY.

THE OUTLOOK.—Alpine Miner, June 7: In the Silver Glance 100-ft level the improvement over former and more superficial explorations is very marked, and must be satisfactory to all concerned. Mr. Hunter's experiment in wet crushing ore taken from the Tarahish settles him that a large percentage of the value can be so saved, and the balance concentrated in the form of sulphurets of rich quality. From the ore worked Mr. H. realized 21½ pounds of bullion, quite rich in gold, and he has his sulphurets still on hand. Mr. Chalmers will start his mill near Silver Mountain in a few days, and will still further test the wet process.

EXCHAMBER.—The mill has been delayed in its starting by the absence for 2 weeks of the machinist, and when we were up there on Monday, instead of finding it running, a large force of workmen were still engaged in finishing up. The business of hauling ore from mine to mill had been entered upon in earnest, and we were informed that the prospect was good for a steady supply.

CALAVERAS COUNTY.

SIMPSON & CO.—Calaveras Chronicle, June 7: Monday last we visited their hydraulic claim, in Tunnel ridge, Stimulated by the gratifying result of a recent healthy clean-up, the Co. are pressing operations with renewed vigor, and an immense quantity of gravel is daily passing through the sluice. The ore is rich, and the easy and rapid working of the mine is the unusually large quantity of rocks which the gravel contains, rendering the employment of quite a force of hands necessary for their removal.

DURVA.—Everything is progressing favorably. Washing continues uninterruptedly, and the powerful hydraulic is playing the deuce with the Stockton ridge—an immense derrick is being erected in the claim for the purpose of removing the masses of cement recently uncovered.

STRAUCK GRAVEL.—We learn that Brackett & Co., who for some months past have been engaged in running a tunnel to strike the channel in Tunnel ridge, opposite the entrance to the Gulch mine, have now completed the tunnel. The gravel has been washed down to the bedrock with results abundantly remunerative to the proprietors for the great expense and labor incurred.

WOLVERINE.—We are yielding intelligence of a flattering future to the Wolverine mine, located near Railroad Flat. The 300-ft. levels, north and south, are being rapidly extended, a chimney of first-grade ore, 60 ft. in length, having already been developed. Stopping is being vigorously prosecuted, twenty-seven hands being employed in and about the mine. The ledge averages 4 ft. in width. The yield of the mine during the past month was \$5,000, the scarcity of water preventing the running of the battery but 16 hours a day. The

yield for the present month will probably fully equal that of last.

EL DORADO COUNTY.

SILVER.—Mountain Democrat, June 7: A short time ago we paid a visit to this mine, which is located a few miles north from Greenwood, a short distance above the Cedarberg, in the rich mining belt stretching from Greenwood to Spanish Dry Diggings and across into Placer county. The ledge is large and well defined, with a foot-wall of trap and a hanging wall of slate, trending uniformly at an angle of about 45 degrees, dipping to the eastward, the course of the ledge being a little east of north and a little west of south. The discovery of the ledge was effected by following rich finds of quartz gold up a small gulch, until the break in the ledge was reached. Here a cut was opened to the southward, the ledge stripped and the overhanging rock washed off for a distance of 100 ft. or more and to a depth of 20 or 30 ft., with highly satisfactory results. Then, to the southward of the point reached in the cut, a shaft was sunk on the ledge to a depth of over 150 ft., yielding splendid pay from the top down, so uniformly rich that we will not tax the credulity of our readers by reporting the exact figures. A goodly portion of the ore from the shaft was selected from the mass and separated into reduced, yielding fabulously, and the remainder, which is not yet all crushed and will probably run the mill until operations are resumed in the shaft, has yielded fully up to the usual average of first-class mines. The mill is, and the new hoisting works when completed will be run by water power, with highly-rigid wheels, with over 200 ft. pressure, from a ditch owned by the owners of the mine.

Cedarberg, who discovered and opened the famous mine which bears his name, has located and commenced sinking a shaft on the first extension to the north of the Siliver, which he considers far more valuable than his old claim.

HUMBOLDT.

ECLIPSE.—Silver State, June 7: Work has been resumed on the Eclipse mine by the owners, Messrs. Fielding, Fellows, Davis and Cavanaugh. Considerable labor has been expended in developing it, and it is prospecting to considerable extent by incline shaft and tunnel. It is considered a good mine, and has produced some excellent results, but, like those of many other claims in the district, have not the means to develop it speedily and thoroughly.

RICH ORE.—It is reported that very rich ore has been struck in the Mammoth, in Star District.

INYO COUNTY.

THE BLOOMER.—Inyo Independent, June 7: Beaudry's furnace turned out 4,530 bars of bullion during the last month, less 3 days, when the furnace was undergoing repairs.

KERN COUNTY.

CLEAN UP.—Havilah Miner, June 7: A clean up last Thursday of 22 tons of surface rock of the Joe Walker mine returned about \$1,000. The mine shows every evidence of resulting in a grand success.

MARIPOSA COUNTY.

MARSH MINE CO.—Mariposa Gazette, June 6: From Mr. H. G. Ooward, Superintendent of the mining operations now going on under the above designation, we learn that the Co. have hoisting works already in operation, and are taking out quartz. A mill of ten stamps is in course of construction, and will be completed within six weeks. The mine is situated on Gentry's Gulch at the point known as "Funk Hollow," and was formerly called the Funk Mine. It was worked successfully by Mr. Ooward from 1860 to 1869, and a large amount of gold taken out. At one time it was considered, and was really, one of the richest mines in that section of country.

MONTEREY COUNTY.

NEW QUOTABLE MINES.—Hollister Advance, June 7: On our late trip to San Benito we came across a settler, named Jose Leguina, not more than 12 months in his section, which is within forty miles of the San Benito Post Office. He had sunk a shaft in a coal mine, and found some excellent quality of coal, of which he had a sample tested. Since that time he has developed a first-class quicksilver mine, and has concluded a sale of his interest in it to a company of Salinas capitalists for \$5,000 dollars.

NEVADA COUNTY.

RICH STRIKE.—Nevada Transcript, June 4: We understand that Pat Mulligan recently struck a rich gravel claim near a quartz claim owned by him, in the vicinity of South Fork, Eureka township, from which he is taking rich pay. The yield is ½ ounce to the hand. **JOHN SCHMIDT'S MINE.**—June 5: This mine is located on Wood's Ravine, a short distance from this city. The mine has been worked for several years at intervals, and has always yielded large returns for the amount of labor expended, considerable rich specimen rock having been taken out. For several months the mine has been idle for want of drainage. Recently, however, a pump has been put up, and the water taken out of the mine. The ledge was found to be 2 ft. thick, rich in specimen rock and it will yield very large returns. Schmidt and his boys work the mine, and they have taken out lots of gold.

A GOOD LEAD.—June 8: We yesterday saw some pretty good looking rock from a ledge that is being prospecting by Mr. Baldwin in company with the Provision Mining Co. The ledge is situated on Hitchcock Ravine, above Gold Flat, is from 2 to 3 ft. thick, and the rock is well filled with rich sulphurets and galena. The owners are down 30 ft. on the ledge, and Mr. Baldwin informs us that it gets richer and thicker the deeper they go down. About 20 tons of rock is now on the dump pile, which was taken out of the shaft.

SANTA BARBARA COUNTY.

PIRU MINES.—Santa Barbara Index, June 5: The ledges now located are in Rockwood Canyon, the waters of which flow into and form the chief tributary of Piru creek. In the neighborhood of the mines there is an abundant supply of white pine timber; higher up the mountains and not quite so accessible is a fine growth of redwood. The water of Rockwood Creek never fails, the source of supply being springs, and in midsummer the stream will measure 38 to 40 inches—sufficient at all seasons to supply a dozen quartz mills and innumerable arrastra. Rock from Brown's claim, precisely similar to specimens shown us, has yielded \$350 to the ton, in gold and silver, in San Francisco.

SIERRA COUNTY.

GOON PROSPECT.—Downville Messenger, June 7: Sam Hartley has just finished crushing 18 tons of ore from his ledge opposite Clement's bridge. It yielded a return of \$10 per ton. This, however, is not a fair sample of what is in the ore as it carries a large body of sulphurets which contain at least calculation ½ of the gold. Being so heavily charged with sulphurets makes the ore difficult to work and here gold is again lost.

TUOLUMNE COUNTY.

MINE DE VERDI.—Tuolumne Independent, June 7: Capt. Green's ledge, above Columbia, is paying rich. Johnson & Boyer have the contract to sink 100 ft. on the ledge, at, within 12 days, the vein 20 ft. from the surface. It is known as the old Brown ledge, in Bald Mountain, above Phoenix Ditch, Brown's Flat.

WILL PROSPECT.—Five tons of rock from the Golden Gate have been taken to Brown's Flat, to be run through Oliver Cowan's arrastra. **MORE OF IT.**—We are informed that the piece of gold found by Mr. Ogden, last week, at Columbia, was worth \$171.75 instead of \$150 as before stated.

THE RISING SUN. owned by Hill, Marshall & Co. have turned out some good rock from their new chute. Out of 15 tons of rock they realized thirty two ounces—over 2 ounces to the ton.

ANOTHER GOOD VEIN has been found by Ferrier & Reed above Columbia. It is said to be very rich. This is the 3d vein they have found in that vicinity—all prospecting splendidly.

Nevada.

ELY DISTRICT.

POTLAND.—Pioche Record, June 7: About 20 ft. above the bottom of the drift, where the ledge will be struck is the end of the winze in which work was suspended a few weeks since on account of foul air. When the connection with the winze is completed the ventilation will probably be sufficient. There are 60 or 80 ft. of ore exposed in the winze, the assays of which have been satisfactory.

AMADOR TUNNEL.—This mine maintains its reputation for richness of ore and regularity of extent. Good ore is being extracted, and full forces are engaged.

MEADOW VALLEY.—This mine, the recent great strikes in which have attracted so much attention, has continued to improve since our last. The ore-breasts have widened, and the ore is becoming richer. Very little low grade ore has been encountered in the 7th and 8th levels. The quality of the ore is greatly improved, and ore is being extracted in vastly increased amounts.

BROOKLYN.—This is one of the most promising of our new mines. It is situated on the east end of Spring Mountain. The ledge was struck in the main shaft at a depth of 70 ft., from which point a winze has been sunk 30 ft. in ore. The vein matter is from 4 to 5 ft. in width, some of which is rich chloride ore.

EUREKA DISTRICT.

AN IMPORTANT STRIKE.—Eureka Sentinel, June 5: Nat. Diamond during his brief administration as foreman of the Ruby Con. Co.'s mines, has been making things tell. He commenced nearly all the works now, and in most instances from the surface. On the El Dorado, in particular, his well-directed efforts have been crowned with success. A new porphyritic shaft, the depth of 115 ft., a few days ago, cut a splendid 3-ft. ledge, well defined and carrying a fine grade of ore. Preparations are being made for the erection of hoisting works on the Dunderberg. The workings of this mine, having attained a depth of something over 100 ft., it becomes necessary to employ machinery for hoisting purposes. There never has been any question about the richness and extent of the Dunderberg, and it is now looking even better than ever before.

WASHOE.

ARIZONA AND UTAH.—Gold Hill News, June 7: The drift east from the shaft has reached the ledge, and some very good ore reported to be found, the extent of which has not yet been ascertained.

BELCHER.—Daily yield 500 tons from the 4 ore-producing levels, that from the lowest or 1,300-ft. level—about 180 tons per day—being taken out through the Yellow Jacket shaft. The ore stops everywhere continue looking and yielding finely. The main drift south of the 1300-ft. level is in 223 ft. from the Crown Point line, with the face still in good ore. The cross-cut east of the shaft floor, 100 ft. south of the Crown Point line is in 102 ft., with spots of good ore showing in the face. The cross-cut east from the 4th floor, 50 ft. from the Crown Point line, is in 71 ft., the face showing no ore. The main incline is down 163 ft. below the 1,300-ft. level, with the bottom still in dry, hard blasting rock. At 171 ft. it will attain the 1,000-ft. level, having 15 ft. yet to go. A shaft will then be opened for a drift north of the level.

BALTIMORE CO.—The drift north at the upper or 225-ft. level was continued until yesterday, when the air being too bad, further working at this level was suspended until an air blast can be put in. This will be attached to the pump rod. The drift west of the lower or 450-ft. level is being driven ahead in good looking vein matter.

BALTIMORE.—The mill is kept steadily running on ore from the mine. The different ore sections are looking well as usual, with no particular change to note.

CROWN POINT.—Daily yield 500 tons. The ore-breasts and stopes of the 1300-ft. level are looking and yielding finely as usual. Some very good ore streaks are met with in the 8th and 9th floors—cross-cut east. At the 1400-ft. level the best cross-cut from the main south drift is thought to be near the ledge, from the indications of water met with.

CHOLLAR-POTOSI.—Daily yield 100 tons from the old ore sections. Average assay \$32. The main drift north at the 4th or 800-ft. level, is in 528 ft., having about 140 ft. to go in order to connect with the Hale & Norcross mine. It is remembered, in good shape and going ahead.

CON. VIRGINIA.—Sinking the shaft progressing favorably; no water encountered; 3 ft. sunk per day. The 116-ft. level drift from the Gould & Curry, which is to intercept this shaft makes a daily progress of 3½ ft. The drift is being run east of the ledge and direct for the shaft in order to secure ventilation, and is confidently expected to make connection with the shaft by the 15th of August.

OLIVER.—This mine which is just south of the Baltimore, was located in May, 1860, and 2 shafts were sunk on the ledge, one 60 and the other 100 ft. deep, both developing good quartz, which assayed from \$6 to \$8 per ton. Owing to the subsequent and long continued depression of the mining interest, the mine was discontinued until recently. Work is now resumed under excellent auspices. Six men are employed running a drift across the ledge at a depth of 300 ft. The croppings show for a distance of 300 ft., and the rock is very similar to that of the Baltimore.

HALE & NORCROSS.—Daily yield about 80 tons. At the 700-ft. level, 200 ft. west of the main shaft, a drift was driven ahead, and also the south drift, which is now close to the southern boundary, also sinking a winze below the 1,700 or lower level, 40 ft. north of main incline. Another winze is down 46 ft. As yet the cross-cuts have not reached the eastern vein.

IMPERIAL.—The drift at the 1,700-ft. level encounters more quartz above the indications for ore. The sinking of the incline progresses favorably, and everything in and about the mine operates well.

JULIA.—The rock encountered in sinking the shaft is very hard, yet good progress is made. Considerable water is found in the south drift, indicating close proximity to the ore body.

JUSTICE.—Daily yield 90 tons from the old south mine. Drifting in the tunnel and south for connection at the 400-ft. level is progressing well and the cross-cut east, 600 ft. south of the Justice shaft to cut the old Cedar chimney is commenced and making good progress. The incline at the south line is in ore which improves as sunk upon.

CROWN POINT RAVINE.—Drift west from shaft in 175 ft. and for the last few days has been blasting rich ore. This morning there was a change which appears to be favorable to the finding of ore.

DANBY.—New shaft sinking at a good rate of progress. The hoisting-works are being removed to it from the old shaft.

FRANKLIN.—Good progress is made in clearing out and repairing the tunnel, and during the week some very good detached masses of ore has been met with. It will take about 2 weeks longer to reach the ledge.

GOULD & CURRY.—The south drift at the 1000-ft. level is being pushed ahead to form an air connection with the Savage. This is expected to be made in 8 days both companies working with the same object. This connection is of vital importance to the ventilation of both mines. On the 450-ft. level the drifts and cross-cuts to the south and west are exposing a large body of ore, just below milling quality, 90 ft. in width. Putting in new pumps throughout the shaft and discarding the old ones.

GLOBE.—The raise from the tunnel is progressing well, considering the great heat, and shows some good ore spots.

JACOB LITTLE.—Some very good rock is found in the lower tunnel to-day, which gives an average assay of gold \$165; silver \$377; or \$482 to the ton.

KNICKERBOCKER.—Main west drift in 554 ft. from the shaft. The water having decreased considerably, the drift is being driven ahead at a lively rate, 3 light hour shifts being employed. It is now running in porphyry upper level just before the strike of good ore at that point.

MINT.—The main drift in the upper working is in 65 ft., the latter half of which distance it follows the wall of the ledge principally. The face of the drift is working into very favorable looking vein matter, with clay seams. Thirty ft. back from the face of the drift a cross-cut is being made which is now in about 7 ft. in solid rock, which assays from \$16 to \$160 to the ton. The position of the ledge being now pretty well ascertained, work in the main drift at the 75 ft. level will be resumed next week.

NEVADA.—Work goes on in the old works as usual—taking out ore. A strong force of men have been employed during the week grading a road for the purpose of hauling rock to the mill. Sinking the new shaft has been somewhat retarded during the week, on account of putting a new frame over the shaft, which will be finished in a day or two, when sinking will be resumed.

NEW YORK CON.—Water still interferes materially with progress in sinking, yet a ft. a day is made nevertheless.

OPHIR.—Some good-looking quartz is met with in the bottom of the shaft, the sinking of which progresses well.

OVERMAN.—Drifting west progresses at a satisfactory rate, with no change to note. Still in granite and porphyry.

OCCIDENTAL.—Have just completed the crosscut on the northern or extreme end of the tunnel, in which a body of low-grade ore 30 ft. in width is encountered. Now running two other crosscuts back from the cut named above, 250 ft. apart. The northern one has struck into the ore vein. The track in the main tunnel is being repaired, preparatory to an energetic development of the mine.

SAVAGE.—The drift north at the 1,600 ft. level will connect with the south drift from the Gould & Curry in about a week, giving greatly-needed air circulation. The reported richness of the lower levels still continues unabated.

SLAYER HILL.—Daily yield, 50 tons. The ore body in the looking drift is looking finely, and the south drift shows a fine vein, 16 ft. wide. The incline also is giving a good showing of pay ore, and in fact all parts of the mine are looking better than ever. The mill is doing excellent work, and the total bullion receipts for May footed up to nearly \$31,000.

WOODVILLE.—The north portion of the mine at both upper and lower levels still shows finely in the way of good ore. A raise for ventilation purposes is being made from the upper level to the old surface tunnel. It is over 50 ft. up, and in good ore all the way. Some very good ore is also found in the old surface mining tunnel. Both mills are kept steadily running.

YELLOW JACKET.—A drift north is now being made from the main east-drift at the 1,500 ft. level, running in very favorable-looking quartz. The winze is being completed to this level through from the 1,300-ft. level, 300 ft. from the north line, and a drift south from the bottom of it is being run to connect with the drift north, above mentioned. Crosscutting is being done at the 1,400-ft. level, but with no ore developments.

Arizona.

YAVAPAI COUNTY.—Arizona Miner: Jackson & Co. have struck water in the well, and expect to be able to run the mill (a 5-stamp one) and arrastra, night and day. They have succeeded in procuring the pack-trail of Mr. Wm. Simmons, which keeps them supplied with quartz from their claim on the War Eagle ledge. Messrs. McKinnon & Goodwin were running nine arrastra, with horse power, upon ore from the War Eagle. The intention is to construct and run two other arrastra.

The ore from the mine is exceedingly rich in free gold, and some people say, silver. Not long since Mr. Wm. Cole picked up a piece of rock as large as a man's head, pulverized and washed it, after which performance he had left a teaspoonful of pure gold. This piece of ore came from the bottom of a 70-ft. shaft.

Mr. Foster, while gazing on the Tiger dump, had no difficulty in picking up pieces of ore which, he says, were literally covered and veined with native silver. Mr. Davis who has seen all the mines in Wallapai district, and much of the ore which has been extracted from them, has declared to us that the refuse ore which makes the Tiger dump, is the richest pile of ore in this or any other district.

Nearer Prescott, in the old Turkey Creek district, Messrs. Caylor, Hatz and other gentlemen are taking out gold and silver ores, for shipment to San Francisco.

Montana.

GOLD RECEITS.—Montanan, May 29: Since our last issue there has been a fair receipt of gold dust and bullion received at Elling's Banking House from the gulch and the several quartz districts.

Edwards, Jones & Co., gulch mining below Nevada, sent up \$1,500 worth on Sunday, from their first clean-up; 30 ounces came in from the Chiusa diggings on Bunker Dan's Bar; 56 ounces were placed in bank by J. J. of Adobe Hop, Lee & Co. (China), deposited 15 ounces from the Junction diggings, and a small lot of Highland was sent in. This Highland gold, considering the price of gold in New York, brought a handsome price—\$22.25 per ounce.

On Saturday Dr. Alexander sent in a handsome 15-ounce gold brick, the result of a short run on Rising Sun ore, Sterling.

Seventy ounces came up from the Bedford ledge, Meyer & Wilson, at Silver Star, the first of the week, with nothing but the silver-bearing rock.

The Clipper came to market as usual, with 70 ounces, and the Co. tell us we shall hear from them every week after the same style.

Messrs. Porter & Ellis brought up on Monday another evidence of the wealth of Nugget Lode (Silver Star district) in the shape of 75 ounces of the handsomest bullion that has yet been taken from the mine, and report the streak looking better than ever.

A report from Lown's Red Bluff bullion, shipped some time ago, gives a coin value of \$15.69 to the ounce.

GOLD CHECK.—Deer Lodge Independent, May 31: Meagher and Roberts, on the lower end of Bratton's Bar, employ 12 men, and the Pioneer Co. on same lot of 35 men, 12 men play hydraulics and cleaned up \$4,000 last week. Pemberton & Kelley are running one pipe, employ 6 men and have as good ground as any on the Bar. Gibbons & Co. have just started 1 pipe; Ashmead & Allen run 2 pipes on Malden's Bar, employ 11 men, have made 3 clean-ups this spring, the highest amounting to \$2,000. On French gulch Bunker & Co. employ seven men on their bed rock flume, which is paying good wages.

Washington Territory.

RICH QUARTZ.—Walla Walla Union, May 31: During the week Mr. J. D. Cook had an exhibition on a small lot of rich silver-bearing quartz, which he has just brought from the Cœur d'Alene Mountains, where he has been prospecting for a few weeks past. He is now making preparations to return and prospect the mine more thoroughly. He thinks he has struck it rich in the mountains.

FOR THE MINES.—During the week some parties have owned the place, for the different mining camps of Eastern Oregon and Northern Idaho.

Song of the Quartz.

Science taught while I have slumbered,
Heedless of the march of Time;
How in Nature's silent chambers,
Active agents wrought sublime.

How that nameless, subtle gases,
Hardening, moving into place;
Slowly changing and maturing,
Would enrich a future race.

Dawns the era—yes 'tis breaking;
Doubts and doubters disappear;
Stalwart forms from slumber waking,
Rise to bless the pioneer.

Rise to search for indications;
Spur and angle trace with care;
Pierce the granite's stern formation;
Lay the surface croppings bare,

Onward rolls the tide of seekers—
Swifter flies the jarring wheels;
Wealth comes heaving to the movement.
All the force that genius wields.

Jetting stream and glowing furnace,
Rob me of my ancient trust;
Whirling pans in rapid motion,
Grind my fairest forms to dust.

Iron jaws and ponderous stampers,
Draws subsistence from my veins;
Spacious vaults—plethoric pockets,
Groan beneath increasing gains.

I am sovereign here no longer;
Guardian care of wealth is past;
Take my treasures—kept or squandered—
I am broken—crushed at last.

GALVANIC ACTION IN THE EARTH.—An eminent London cutler, Mr. Weiss, having observed that steel seemed to be much improved when it had become rusty in the earth, provided that the rust was not factiously produced by the application of acids, made the experiment of burying some razor blades for nearly three years, and the results fully corresponded to his expectation. The blades became coated with rust, which had the appearance of having exuded from within, but were not corroded, and the quality of the steel was decidedly improved. Analogy led to the conclusion that the same might hold good with respect to iron, under similar circumstances. He accordingly purchased fifteen tons of iron with which the piles of London bridge had been shod. Each shoe consisted of a small inverted pyramid, with four straps, rising from the four sides of the base, which embraced and were nailed to the pile, the total length, from the point which entered the ground to the end of the strap, being about sixteen inches, and the weight about eight pounds. The pyramidal extremities of the shoes were found to be not much corroded, nor indeed were the straps; but the latter had become extremely and beautifully sonorous. When manufactured the solid points in question were convertible into very good steel, also the bolts; but the straps produced steel of unequal quality.

MINING NEAR MEADOW LAKE.—The owners of the U. S. Grant mine, near Meadow Lake, are making active preparations to work the mine the present season. They have an eight-stamp mill ready for business. The ore from the mine is to be roasted and worked by the chlorine process, and arrangements are being made to erect two roasting furnaces as soon as possible. The machinery for these furnaces is being cast at the foundry at Nevada City. There are seven men at work at the mine at present, and the owners have sent below for additional men, and also for teams for hauling supplies, ore, wood, etc. Parties in Truckee who own ledges near the U. S. Grant are also preparing to develop the same, and test the ores at the smelting works in this place. If any cheap process can be found that will successfully extract the gold from the base metal in the ores around Meadow Lake, that once famous mining region will prove to be valuable in reality as it formerly was in imagination. —*Truckee Republican.*

MEXICAN MINES.—In a letter to the *Bulletin*, a correspondent writes from Acapulco as follows concerning the mining interests: The news from the mines of Tascos are very favorable; also those of Sihnatanejo are worked to advantage, and the new gold diggings are yielding handsome returns. General Alvarez has sent a messenger to London for the purpose of forming a large company to work the mines of Guerrero. In the neighboring State of Oajaca the Indians have been troublesome again, and the garrison of Tehuantepec had to be increased to keep them down.

TO REMOVE STAINS BY MACANESSE.—An exchange says:—Put an ounce of manganese into a stone jar, and pour on it some sulphuric acid; expose the stain to the vapor which arises, for a few minutes, and then rinse the article in cold water. Ink, fruit, or other stains, not from grease, are readily removed in this manner; but if care is not used, both the cloth and health will be seriously impaired. Of course only white cloth can be treated, as printed and dyed colors will be removed as well as stains.

NEW PROPELLER.—Reid Brothers, of this city, are about to build a steamer at Port Madison, Puget Sound. She will be 170 feet long, 32 feet beam, and have two decks. She will be a propeller, and will be ready to run by October next.

VENEZUELA.—The mines of Caracolas still continue productive. In the month of March they produced 56,000 marcos of silver, resulting from 28,000 quintals of ore.

Corn and its Varieties.

Among the indigenous grains of the American Continent, Corn—*Zea mays*—stands pre-eminently high, as regards its value to the human family as an article of food. We have many varieties of wild rice, wild oats, wild rye and other native cereals that would go far to sustain life, but none of them can take rank with corn or maize in its now almost numberless varieties. It is this great variety that has caused a doubt with some as to their having originated from anything like a single species.

Doubtless, the mere difference of latitude or length of the growing season, or mode of culture, or quality of soil, have an influence in modifying a single species and be productive of variations from the original type. Be this as it may, we now have varieties that, seem adapted to any phase of climate from the torrid through the entire of the temperate zones of the earth, in any land and country, though unknown to the rest of the world until the discovery of the American Continent by Europeans.

If any proof was wanting that the ancient

spirits hover about them, and therefore will not enter them.

Corn may be said to be the most universal article of food cultivated by the Indians of New Mexico, Arizona, California, Nevada and Utah, while the tribes of the Indian Territory consider this grain their staff of life. The cultivation of corn has not been acquired by them from others. It is a matter of historical record that, when living in the Southern States, long before the white man set foot in the country, it was cultivated, and by nearly all the Indians of the present United States to a greater or less extent.

The Indians who grow it in the primitive manner, and have the original corn of America, are the Pueblos of New Mexico and Arizona. The grains vary in color through shades of pink, blue and white, and the ears are generally rather small and slender. The blue variety, Fig. 2, is preferred for bread, and is sorted from the rest with much care, and stored by itself. The ear has fourteen rows of grains, which are full and plump, and is six and three-quarters long, and four and three-quarters inches around. The corn, after being reduced to meal in a stone mortar, has a peculiar bluish-white appearance.

From these original growths have come the wonderfully varied and interesting varieties

INDIAN CORN. (*Zea mays*)

inhabitants of this continent were the growers of corn, we have the evidence both from North and South America. The Smithsonian Institution has an ear of corn, Fig. 3, of our illustration found deposited in an earthen vessel eleven feet under ground, in a grave with a mummy, near Arignipe, in Peru. The grains are rather sharp-pointed, small, and slightly indented at the apex, lapping one over the other, in thirteen rows. A small portion of this specimen is broken off, hence it is but four and a half inches long. When stationed at Camp Lincoln, Arizona, as post surgeon, the writer explored some ancient rock caves near by, which were plastered in the interior, and obtained several corn-cobs, two of which were preserved, and are now in the museum of the Smithsonian Institution.

One is slender and narrow, Fig. 1, being five and one-quarter inches long; the other is thicker, but its length is only four and one-half inches. The former had ten and the latter eight rows of grains, with no more difference discernable than exists among the corn raised by all the Pueblo Indians of to-day, and which certainly is the kind grown by them at the Spanish conquest of Mexico. The ruins in which the cobs were found have not been inhabited by the present Indians of the country, who are Apaches, as they believe that evil

that now furnish so many of mankind as well as countless lower animals, with a most important and coveted article of food.

MAMMOTH FERRY BOAT.—The Central Pacific Railroad Company will within two months commence the building of a mammoth ferry-boat at Oakland. She is to be about 400 feet in length over all, and is intended to have a double track on which to carry trains across the bay from the Oakland side. The boilers, two in number, have already arrived, and the machinery is being built East. As soon as the lumber arrives from Puget Sound, the building of the boat will be commenced under the superintendence of Captain Foster. Some idea may be formed of her immense size by giving that of some of our large river boats. The "Capital" is 293 feet over all, the "Chrysopolis" about 280 feet, and the new ferry-boat will be nearly the combined length of the "Capital" and the "Corra." The new boat will accommodate about twenty cars—ten on each side. This is double the capacity of the "Thoroughfare," the boat now running.

Four hundred and forty-three tons of quartz were crushed at the North Star mine last month, yielding \$16,000 in gold.

The Germania Works.

The Germania Separating works are situated about seven miles south of Salt Lake City, on the line of the Utah Southern Railroad. The business of this company is to buy base bullion, separate the gold and silver, and make a pure quality of lead; this they are doing successfully. These works are very extensive, substantially built, and in every respect very well arranged. Their present working is a little over forty tons of base bullion per day.

When this company first proposed to establish this business here, it was thought to be a very wild speculation, but so satisfactory have been the results, that it is contemplated in connection with their present business—the manufacturing of white lead—to increase their separating facilities to eighty tons per day. This, we should judge, will demand a further expenditure of about two-thirds the present cost of their works, which cannot be very far from one hundred thousand dollars. We attribute this success, in the main, to the gentlemanly managers, Messrs. Seryar & Billings, and their business capacity, and to Mr. Seryar's thorough understanding of the refining business. Everything, to the observer, seems to be under a rigid discipline. All the different stages of separation impress us as being finished and complete, and every part from the least to the greatest, most carefully attended. We cannot say what the amount of a year's business may be, but it must be very large. At the time of our visit they were melting bullion assaying four hundred and sixty ounces of silver to the ton. We judge, however, the average to be about one hundred and fifty ounces.

It must be gratifying to every man who is at all interested in Utah, to know that every branch of business connected with the mines is being successfully prosecuted, and we take a pleasure in recording a success so complete and promising as that of the Germania. —*Salt Lake Journal.*

PETROLEUM IN CALIFORNIA.—The Los Angeles *Star* suggests the establishment of a petroleum refinery in that town, and makes the following estimate of the expense and profit of producing kerosene from the crude oil, of which considerable supplies are now obtained near San Fernando:

Cost at the deposits for oil, 5 cents per gallon for crude, three of which will make one gallon of refined oil.....	15 cts
Haulage.....	2 1/2
Expenses of refining.....	2 1/2
Containers, tins.....	3
Miscellaneous.....	1

Total expenses per gallon..... 23 cts

Market value..... 40

Net profit..... 17 cts

But the profits of a refinery would not stop here, for there would still be left the unrefined oil, which contains from 16.6 to 31.7 per cent. of lubricating oil, used in machinery, and after this there is a solid residuum.

COAL IN PERU.—A very valuable deposit of coal, pronounced by one of the Government Engineers to be among the best and richest mines on the Pacific Coast, has recently been discovered near Pisco, Peru, and the locomotives on the Ica and Pisco railway are already using the article with great success. The engineer, in his report, states that the coal is finer in quality than any found in Chile, and that the extent of the deposit is very great. Situated close to the sea, near to a perfectly safe harbor, the mine must prove to be very valuable and useful.

THE HOOSAO TUNNEL.—The Massachusetts House of Representatives has appropriated \$200,000 toward the completion of the Hoosao Tunnel, and requested the Governor and Council to report to the next Legislature on the best uses to which it can be applied. The question of State ownership of railroads in Massachusetts is still agitated, but no general policy is agreed upon. The proposition before the Legislature contemplated the State owning one of three competing lines of railroad, all of which were to have the use of the tunnel.

TO CLEAN STEEL PENS.—When a pen has been used until it appears to be spoiled, place it over a flame—a gaslight for instance—for, say, a quarter of a minute, then dip it into water, and it will be again fit for use. A new pen, which is found too hard to write with, will become softer by being thus heated.

SPIEGELISEN is the kind of pig iron used to make Bessemer steel. It is made from magnetic ore, containing 13 per cent. of manganese, with English coke. Spiegelisen is found chiefly in the county of Siegen, Prussia, where fine steel ores are found with a large proportion of manganese. The ores are calcined.

BULLION FROM THE MANHATTAN MILL.—The Manhattan Company shipped during the month of May 103 bars of bullion weighing 10,515 pounds, and valued at \$149,229.25. It was all the product of the mines of this district and was worked at the Manhattan mill. —*Reveille.*

USEFUL INFORMATION.

WONDERS OF NATURE.—It is a wonderful thing to look abroad over the face of nature, and see how every mineral, vegetable and animal production is constituted, so as to minister in some way to the wants of man—to see the vegetable world silently engaged in extracting mineral matters from the soil, and storing them up for the use of man, and man impelled by instinct, selecting these as his own proper food—to behold not only his food and drink flowing constantly to him through the ever revolving cycle of three kingdoms, but even his most valuable ornaments presented through the same natural channel! It is more than wonderful, it is sublime, to view atom from atom of the whole creation unceasingly changed place, that man, the lord of creation, may be abundantly supplied with all his comforts and luxuries; to see the lilies of the field, and the insects of the earth and air, living and dying for man, yielding up their lives for man's sustenance and adornment. True, "the lilies of the field wake no thought for the morrow," but the unseen finger that opens their petals to the day points them out as the appropriate food to some of the animals whose life or death ministers to man! The blooming cactus not only charms the eye of man, and makes the arid desert blossom as the rose, but it furnishes food to an insect that feeds upon it, and grows and dies to clothe man with the same resplendent dye.

ORGANIZED PRODUCTS.—An organized product can appear only from forces of nature which are the movements of the Divine will. A man can arrange, manufacture, weave, forge, adjust, refine; but he cannot organize a nautilus. He can make machines through which the forces of nature play for cunning ends; but he cannot conjure the principles of life into any mould of his own making. He can start shuttles that will weave a carpet for the reception room of a palace in one loom; but he can build no mill, he cannot start no laboratory where the warp and woof of a banana leaf can be plaited. He can tell how the sugar is secreted in the veins of the clover blossom, but he cannot make the clover seed; and we might as well ask the wisest scientific man to fashion a world as to create one of the green needles which a pine tree produces by the million, or one blade of grass. Every organization is of God. The atoms of matter are constantly passing from one organization to another. The great periods of the history of the globe are marked by the appearance of higher organizations, in which material elements and forces are confederated into a nobler unity and broader beneficence. Man is the highest of these organizations, and we exist to be bound together in moral affections, and religious harmonies and unities. In the moral world, as well as in the physical one, organizations are the creations of the Divine Spirit.—*Rev. T. S. King.*

A CEMENT TO STOP FLAWS OR CRACKS IN WOOD OF ANY COLOR.—Put any quantity of fine sawdust of the same wood your work is made with into an earthen-pan, and pour boiling water on it, stir it well, and let it remain for a week or ten days, occasionally stirring it; then boil it for some time, and it will be of the consistence of pulp or paste; put it into a coarse cloth, and squeeze all the moisture from it. Keep for use, and, when wanted, mix a sufficient quantity of thin glue to make it into a paste; rub it well into the cracks, or fill up the holes in your work with it. When quite hard and dry, clean your work off, and, if carefully done, you will scarcely discern the imperfection.

HOW TO REDUCE GAS BILLS.—First—In lighting your gas, turn the gas on the meter about one-half, then light the gas, and regulate the lights by the stop-cock that lets the gas into the meter. This prevents the pressure of gas from making the index move so fast. The greater the pressure of gas on the meter the faster it moves, and the larger the gas bill. Second—From the time the gas is usually lighted until 8½ or 9 o'clock, the pressure is the same. After the stores and shops are closed, the pressure is then greater on the meters in use, and the stop-cock should be turned at the meter so as to regulate the pressure.

TRANSPORTATION OF PETROLEUM MADE SAFE.—It is proposed by Mr. Jordery to render the transportation of petroleum less dangerous by adding an aqueous extract of soap-wart powder, in the proportion of thirty volumes of oil to one volume of soap-wart. The product is consistent and stable. To restore the oil to its original limpidity a few drops of carbolic acid are allowed to drop on the surface, or a large amount of crystallizable acetic acid, when a complete separation follows, the oil floating on the top. The cost would be about \$3 per hundred barrels of petroleum.

ASHBERIUM, a substitute for Britannia metal, invented by Ashberry, of Manchester, consists of eighty parts of tin, fourteen of antimony, two of copper, two of nickel, one of aluminum, and one of zinc. For common articles lead is to be added.

WHITEWASH THAT WILL NOT RUB OFF.—Mix up half a pailful of lime and water; take half a pint of flour and make a starch of it, and pour it into the whitewash while hot. Stir it well, and make it ready for use.

BUILDING BRICK WALLS.—In olden times hard burnt bricks only were used in building houses. The bricks were first saturated with water before being laid in the wall, and when such walls were torn down, the bricks and mortar had to be separated with a sledge or crowbar. But brick walls built in these days, are chiefly made, not of hard bricks, but of what are called stretchers and salmon, or imperfectly burnt bricks, and most commonly brought dry and warm from the kiln, and laid in the wall in that state, with mortar made adhesive by the admixture of loam. When the bricks are laid in the mortar, as quick as a flash they will absorb the mortar and prevent cohesion, inasmuch that the bricks can be separated from the mortar as clean as if they had not been laid in it. Bricks of inferior quality will make a tolerable good wall if dampened and laid in good sharp sand mortar, and whoever wishes to put up a good substantial building, should be careful not to let worm and dusty bricks be heaped in the walls, unless first damped with water.

ECONOMY IN ILLUMINATION.—It is a singular fact in connection with a gas flame, that the power of the light is the same whether the flame is tested edgewise or flatwise. The conclusion arrived at is, that the use of cylindrical glass chimneys with round jets (Argand) is on the whole the most economical.

Mr. Offert states that in bats-wing burners, though the size of the flame diminishes with the amount of gas consumed, it is not in equal ratio. The light of a large flame, for example, may be equivalent to fifteen candles, while that of two small ones together will be only seven or eight candles, though they burn the same amount of gas as the large flame. This is caused by the complete combustion of the gas in the blue zone of the flame, which gives little or no light in either case, and has more favorable circumstances for its occurrence relatively to the size of the flame in the small than in the large flame.

A BULLFROG BAROMETER.—A hotel on the Boston road to Melrose, keeps an ordinary bullfrog in a glass jar, half filled with water. Inside the jar is a diminutive ladder, from the bottom of the vessel to the top. Just above the water line is a perch, on which his frogship in dry weather is to be seen sitting perfectly motionless as long as the dry season lasts. On the slightest indication of a change in the atmosphere, the frog quits his perch and takes to the water, returning to the landing only at long intervals to feed upon the flies that are thrown into the jar. This animated weather-gauge never takes any nourishment except in rainy weather.

GOOD HEALTH.

The Ear and its Treatment.

Let me describe what is probably the most frequent way in which the ear is impaired; that is, by the attempt to clean it. It ought to be understood that the passage of the ear does not require cleaning by us. Nature undertakes the task, and in the healthy state fulfills it perfectly. Her means for cleaning the ear is the wax. Perhaps the reader has never wondered what becomes of the ear-wax. I will tell him. It dries up into thin, fine scales and these peel off, one by one, from the surface of the passage, and fall out imperceptibly, leaving behind them a perfectly clean, smooth surface. In health the passage of the ear is never dirty; but, if we attempt to clean it, we infallibly make it so. Here—by a strange lack of justice, as it would seem, which however, has no doubt a deep justice at the bottom—the best people, those who love cleanliness, suffer most and good and careful nurses do a mischief negligent ones avoid. Washing the ear out with soap and water is bad; it keeps the wax moist when it ought to become dry and scaly, increases its quantity unduly, and makes it absorb the dust with which the air always abounds. But the most hurtful thing is introducing the corner of the towel, screwed up, and twisting it round. This does more harm to the ears than all the other mistakes together. It drives down the wax upon the membrane, much more than it gets it out. Let any one who doubts this make a tube like the passage, especially with the curves which it possesses; let him put a thin membrane at one end, smear the surface with a substance like the ear wax, and then try to get it out by a towel. But this plan does much more mischief than merely pressing down the wax. It irritates the passages, and makes it cast off small flakes of skin, which dry up and become extremely hard, and these are also pressed down upon the membrane. Often it is not only deafness which ensues, but pain and inflammation, and then matter is formed which the hard mass prevents from escaping, and the membrane becomes diseased and worse may follow.

Washing should extend only to the outer surface, as far as the finger can reach. It is a bad practice, also, to put cotton wool soaked in laudanum or chloroform into the ear for the relief of toothache. When a child's ear becomes painful, as it often does, everything should be done to soothe it, and all strong, irritating applications should be avoided. Pieces of hot fig or onion should not be put in, but warm flannels should be applied, with

poppy fomentation, if the pain does not soon subside.

It should be remembered that constantly covering the ear is adapted to injure it. On the whole, men, in whom the ear is habitually exposed, suffer, if anything, less from ear-disease than women, in whom it is so often covered.—*Popular Science Monthly.*

Useful Effects of Light.

Sir James Wylie, late physician to the Emperor of Russia, attentively studied the effects of light as a curative agent in the hospital of St. Petersburg, and he discovered that the number of patients that were cured in rooms properly lighted, was four times those confined in dark rooms. This led to a complete reform in lighting the hospitals of Russia, and with the most beneficial results. In all the cities visited by the cholera, it was universally found that the greatest number of deaths took place in narrow streets, and on the sides of those having a northern exposure, where the salutary beams of the sun were excluded. The inhabitants of the southern slopes of mountains are better developed and more healthy than those who live on the northern sides, while those who dwell in secluded valleys are generally subject to peculiar diseases and deformities of person. These different results are due to the agencies of light, without a full supply of which plants and animals maintain but a sickly and feeble existence. Eminent physicians have observed that partially deformed children have been restored by exposure to the sun and open air. As scrofula is most prevalent among the children of the poor, this is attributed by many persons to their living in dark and confined houses, such diseases being most common among those residing in underground tenements.—*Scientific Artisan.*

MUSCLE AND BRAIN.—Nature is a strict accountant; and if you demand of her in one direction more than she is prepared to lay out, she balances the account by making the deduction elsewhere. If you insist on premature or undue growth of any one part, she will with more or less protest concede the point; but, that she may do your extra work, she must leave none of her more important work undone. In primitive times, when aggression and defense were the leading social activities, bodily vigor, with its accompanying courage, were the great desiderata, and then education was almost wholly physical; mental education was little cared for, and indeed was often treated with contempt. But now that muscular power is of use for little less than manual labor, while social success of nearly every kind depends very much more on mental power, our education has become almost exclusively mental. Instead of respecting the body and ignoring the mind, we now respect the mind and ignore the body. Both these attitudes are wrong. We do not sufficiently realize the truth that, as, in this life of ours, the physical underlies the mental, the mental must not be developed at the expense of the physical. The ancient and modern conception must be combined.

A BATH in hot sand is the latest discovery offered by a therapist of London, as an "infallible cure" for rheumatism. He claims that the advantage of this mode of treatment consists, especially, in the fact that it does not suppress perspiration like the hot water bath, but rather increases it; and another advantage it possesses, is that it does not interfere with the respiration of the patient, as do the steam bath or Turkish bath. It is asserted that the body can endure the influence of such a bath for a much longer time, and a much higher temperature can also be applied. It can be used for infants, and permits of easy application to a part or to the whole body. If this remedy shall prove efficacious for so serious an ailment, it will indeed be a boon to a large class of sufferers.

DIFFERENCE IN MEN.—Two men while walking get well soaked by the rain. One man shakes off the water pretty much as a dog or a duck might do and rather enjoys his shower-bath than not. Another man is taken ill of inflammation of the lungs, and probably dies. The doctors cannot explain the different issues, and they would also be very much puzzled to give a satisfactory account of the pneumonia itself. They will, indeed, generally explain diseases by theories more or less plausible, and practice has been built upon theory, and theory has, no doubt, sacrificed a number of human lives. Yet medicine must have its dogmatic system, and without it medicine becomes little better than empiricism.

M. AERLIN, of Stockholm, places children afflicted with capillary bronchitis or croup in small rooms where there are vessels in which water is kept continually boiling. This treatment, it is stated, if prolonged for days or even weeks, eventually produces a cure. The mortality from the disease in Paris, *Les Mondes* says, has been thus reduced from 48 to 18 per cent.

FRECKLES AND PIMPLES.—A writer in *Rural New Yorker* says, the best way to remove or prevent freckles and pimples is to keep clean; bathe the whole body once a day at least. Eat wholesome food, as little fat pork and greasy food as possible, plenty of fruit, and do not abuse your person.

MISCELLANEOUS.

About Kitchen Work.

The kitchen, in every well-modeled house, should be a large, pleasant, commodious room, for there the good wife is confined from early morn till noon, and generally part of the afternoon. There she works and toils and tires; no one but herself knowing how much she does. The daily round of breakfast, dinner, supper, setting tables, clearing them away, washing dishes, sweeping, etc., etc., is a dull, monotonous life, that she sometimes tires of. But for her there is no reprieve, no putting off or putting by. Every day it must be done. To know how to do her kitchen work thoroughly, easily and well, should be the care of every wife.

The first thing every morning should be the taking care of the milk, if cows are kept, and I take it for granted that nearly all our readers keep one or more cows. If the setting and skimming of the milk can be done before breakfast, much is gained. Everything appertaining to the dairy should be kept with scrupulous neatness. Allow no spilt milk to remain upon the shelves to sour and mold. Wash your pans, pails, strainers, skimmers, ladles and clappers always in warm water, with soap; never use hot water for the first washing.

Keep a nice white cloth to wash the dairy utensils with, not using it to wash other dishes. After washing well in soap and warm water, scald once or twice, and turn them round to dry, or put them in a clean place in the sun, where the sand and dust from the street cannot blow upon them. If you use a wire strainer for milk, it will sometimes get filled up, notwithstanding the utmost care is used. When such is the case, take a tooth brush, which you must keep in a convenient place, and where it will never be used for any other purpose, rub some soap upon it, and clear your strainer by brushing it thoroughly, using warm water. Wash the brush well and dry it before putting it away, that it may keep sweet. This is a much easier way than by scouring with sand, as some do.

The dairy cellar should be small, airy and very clean. The floor should be brick or stone, and nothing should be kept in the cellar but milk and butter. A cellar where pork, fish, vegetables, etc., are kept, is no place for milk. It will not keep sweet; and if the milk is not sweet, the cream certainly cannot be, and therefore the butter is spoiled.

In washing all kinds of dishes, hot water should never be used first. Take warm water, wash your dishes, whether milk or table dishes, all over, then rinse in hot water, wiping dry. A dish cloth should always be made, as much as a dress. Take two pieces of cotton cloth, sew them together on all sides, and you have my idea of a dish cloth, which must be kept nice and sweet and white, never using it for anything but to wash table dishes, scalding it often, and laying out on the grass when convenient. What is more disgusting than to see a woman washing nice white dishes with a little mess of water and a nasty old rag all strung out? I have seen such rags, that I longed to pitch into the stove or pig pen. Have also a nice dish cloth made and put away, to wash your glass and China ware; for the common dish cloth, if ever so good, is not quite good enough for that purpose.

A word about preparing the dishes for washing. Place the large plates at the bottom, the smaller next, and so on. Never put them helter skelter in the sink, and wash them just as they happen to turn up. Let order characterize every step. Mothers, teach your little daughters how to pick up the dishes in order for washing, and they will never forget the lesson.

Never throw the knives, forks, silver spoons, etc., into the bottom of the sink, or in the pan of dish water to soak, till the handles all come off and they are gone. Lay them on a shelf or put them upon a plate, and when washed wet the handles as little as possible, as it spoils them. Always scour your knives once a day at least, and then at noon. By dipping the blade into hot suds before rubbing, they will polish much easier.

Use a wooden tub, in size according to the family, to wash the dishes in, washing it inside and out, and draining at every using.—*Ohio Farmer.*

FISH AS DIET.—Dr. Merryweather says: "A fish diet is a great humanizer of the temper of mankind. Its consumption tends wonderfully to render them more kindly to one another, and consequently tames the passionate disposition to crime. As carnivorous animals are always the most fierce and violent, so become human beings who have carnivorous stomachs. Could such stomachs have an occasional respite by the consumption of fish, the world would be all the better for it. I speak as a medical man, and firmly assert that many maladies would be mitigated, and perhaps annihilated by such a process."

PAPER FOR WARMTH.—A thin shawl may be made warm by folding a newspaper inside of it. The paper is impervious to the wind and cold air from outside, and prevents the rapid escape of the warm air beneath it. If you suffer from cold feet on a journey, fold a piece of newspaper over your stockings; this is better than rubbers. If you are cold in bed, newspapers spread under the upper cover, will serve as an additional blanket.

Table of Contents.

GENERAL EDITORIALS.—The Electro-Galvanic Quicksilver Saving Apparatus; Patents of Quicksilver Furnace; Pacific Coast Marine Works, 369. Is Mining Profitable to Poor Men, 376. Parvian's Steam Plow; Vienna Exposition, 377. A New Enterprise, 380.

ILLUSTRATIONS.—Potts' Quicksilver Saving Apparatus, 369. Indian Corn, 374. Parvian's Steam Plow, 377.

CORRESPONDENCE.—A Rambler's Notes in Sierra County, 370. The Comstock Mines, 376. Paul's Opinion of Utah, 377.

SCIENTIFIC PROGRESS.—The Air We Breathe; Nerve Power and its Correlations; Curious Facts in Astronomical Calculations; Carbonic Acid in the Air; Spectra of Gases Under Pressure; A New Quality in Morphine; Wonders of the Deep; Combustibility of Lead, Iron, Etc., 371.

MECHANICAL PROGRESS.—Steel vs. Iron; Indurating Iron on a Large Scale; Annealing; German Steel in China; How Fast can a Wheel be Made to Revolve; Now, and Then; Determining Steel, 371.

MINING STOCK MARKET.—Table of Daily Sales and Prices and Comparative Prices for the Week; Notices of Assessments; Meetings and Dividends; Review of Stock Market for the Week, 372. **MINING SUMMARY** from various counties in California, Nevada, Montana, Arizona and Washington, 372-3.

USEFUL INFORMATION.—Wonders of Nature; Organized Products; A Cement to Stop Flaws or Cracks in Wood of any Color; How to Reduce Gas Bills; Transportation of Petroleum Made Safe; White-wash that Will Not Rub Off; Building Brick Walls; Economy in Illumination; A Bullfrog Barometer, 375.

GOOD HEALTH.—The Ear and its Treatment; Lethal Effects of Light; Muscles and Brain; Difference in Men; Freckles and Pimples, 375.

MISCELLANEOUS.—Borax, 370. Song of the Quartz (Poetry); Galvanic Action in the Earth; Mining Near Meadow Lake; Mexican Mines; To Remove Stains by Magnesia; Mammoth Ferry Boat; The Germania Works; Petroleum in California; Coal in Peru; The Hoopoe Tunnel, 374. Manufactures of California; Working Mines vs. Selling Mines; Mining Prospects in New Mexico; Capital for Development Needed in Utah; San Francisco District; Red Jacket Mining Company's Report, 378.

WATER is beginning to get scarce in several places in the placer mining districts, and some of the camps between the Yuba and Deer Creek have already been compelled to shut down. On the ridge beyond the Yuba there is still plenty of water. Big Moore's Flat will probably experience a scarcity by the middle of August.

SUBSCRIBERS, LOOK TO IT!—Every subscriber is requested to see if he is properly credited to the date paid for on the printed label attached to his paper—after paying or renewing his subscriptions. Report at once, if not credited, after paying at the office or to an agent.

DISASTROUS FIRE.—A fire in the freight depot of the Indianapolis and Marietta Railroad at Cincinnati, on the 8th occasioned a loss of \$250,000. About 3,400 barrels of oil, 3,000 feet of walnut lumber, some freight cars and 30 horses were burned.

THE MOOSE MINE, Park county, Colorado, produced about \$330,000 worth of ore in 1872. The Fairplay Sentinel says the mine has a continuous vein of solid mineral 200 feet in length and from two to seven feet wide and is valued at \$2,000,000.

CINNABAR.—A dispatch from Salt Lake states that some of the Indians, of the Colorado Valley, near the Rio Virgin River, are in possession of large amounts of cinnabar. Valuable mines are supposed to be in that vicinity.

PLACER diggings have been discovered in the Cascade range east of Oakland, Oregon. The mines are located on Steamboat and Blue Creeks, tributaries of the North Umpqua.

THE NORTH STAR Consolidated mine, in Star District, Utah, has been sold to parties from Canada.

Is Mining Profitable to Poor Men?

It is very often stated that mining operations are profitable to no one but heavy speculators, and that the small fry have no chance. This may be true of stock speculations, which many people think is all mining amounts to, but is not the case with legitimate mining operations. Of course, a rich man has a better chance to make money than a poor man in any sort of business—what would be the use of being rich if it were otherwise?—but we contend that there is more chance for man without means to make money in this pursuit than in any other. Large fortunes are the exception, all over the world, and the proportion of men who have to work, in one way or another, is immense. This is, of course, necessary and right. When we speak of mining being profitable we do not mean the chances of realizing immense sums of money, but in gaining a competence or a comfortable living as in other classes of business. It is a well known fact that when three or four intelligent men get hold of a good claim, and work it themselves economically and practically, they will make money where a corporation would run heavily in debt. The corporation has too much management—ormismmanagement—and superintendents working other people's property are not so apt to be economical as when a proportion of the expenses come from their own pockets. This fact holds good in other pursuits as well as in mining. We know of many hardworking men now at work in the gravel mines of California or the quartz mines in this and other Pacific States or territories who have claims which yield them a very comfortable living and money to spare for a rainy day. The only trouble is, that the average miner has very crude ideas of economy and thrift, and don't think of the umbrella until it rains.

But how about the people in this city, on salaries, who hear of the rich strikes of men in mining operations and who invest and lose oftener than they make? The answer to that question is, that they didn't invest in mining operations at all; they invested in stocks which they knew nothing about and whose value depended entirely on the manipulations of a few men who, like everybody else, are on the lookout for "number one." This system, generally spoken of as connected with mining alone, pervades everything and everywhere. The few make money; the many lose. The "middle men," bringing the buyer to the seller and knowing something of both sides of the case, are apt to take advantage of that knowledge to their own profit. In the case of mining property the owners generally know more of it than the buyers, who, when they find themselves "bitten," get even by performing the same operation on some other unlucky individual. The large "operators," as they are called, know a good thing as well as anybody, and will not sell a mine for less than it is worth, by any means. The poor fellows who invest their savings in the manner spoken of have our profound sympathy, but they must recollect it is oftener the man they deal with who causes their losses than the mine.

The common miner, he who delves and digs in the bowels of the earth, far from the light of day, tearing the precious metals from their hiding places, with force of muscle and force of powder—are these operations profitable to him? Most assuredly they are. These men must have employment, to support themselves and the families dependent upon them. True, they might find other tasks upon which to expend their energy, but these men gain better wages, generally speaking, than in other pursuits they would be likely to engage in. With the superintendents and foremen to give directions, little intelligence is necessary, and common, unsuited men can do their work as well as those with superior advantages. Skilled labor, as we term it, in a foundry or machine shop, is a necessity; it takes intelligence and experience to carry out these orders; but in a mine, with a pick, gad and drill, a few weeks' work will teach a man to use them well enough to get average wages. With the foremen, etc., it is of course different; they require extensive intelligences and good judgment to do their work properly.

To these common miners, then, mining operations are profitable. By them they make a living and a pretty good one too as the world goes for what we call the "lower classes." The more mines there are the more money there is; the larger the operations the larger the disbursements. In looking over the report of any of our mining companies, it will be seen that the largest outlays are for "labor." Those common miners then get the largest proportion of what is expended. True it comes back again indirectly through the storekeepers and others, into mercantile channels, but the miners had the use of it for their own benefit. Here we have an example. Last week, according to the Green Hill News the miners employed by the Crown Point mine were paid off, and their wages amounted to \$60,000; the Yellow Jacket then received \$13,000 and the Belcher miners got \$70,000. This is an aggregate of \$143,000 distributed by three mines among the laboring men within two days. It ought to make money plenty in that locality.

It must be remembered, however, that there are some 40 other mines on the same lode proper, and hundreds of others in the immediate vicinity; all at work and being developed more or less extensively. Two of these mines, the Crown Point and Belcher, can afford to pay out money for labor for they disburse as divi-

dends this month between them the sum of \$2,040,000; but none of the others are on a dividend paying basis, and the proceeds of the ore in many cases all goes to pay the hands. During the year 1871, the Belcher did not pay any dividends, but paid out \$137,103 for labor alone, while it levied assessments to the amount of \$51,000 and turned out \$1,199,135 in bullion all of which was eaten up as expenses. The Chollar Potosi during the fiscal year ending July, 1872, paid out \$259,000 as dividends and \$164,793 for labor, while the cost of milling the ore was \$431,793.

While we are about it we might as well give a few figures about some of the mines in the Comstock and see who got the most money out of those mines at that time, the poor or the rich men; that is, stockholders or the miner. We will take these at random from several companies' reports:

The Yellow Jacket mine during the fiscal year ending July 1st, 1872, paid for labor \$265,249 and only paid \$120,000 as dividends; crushing and labor at mills cost \$236,943. This loss for that year was \$10,872.

During the year ending July, 1872, the Savage paid out for reduction \$560,361; labor, \$313,232; balance ore drawn, \$132,708. Same mine during year ending July, 1870, paid out \$231,396 for labor, exclusive of labor at mills, and levied \$280,000 assessments.

The Gould & Curry, in 1869, paid out \$135,732 for labor, and levied assessments amounting to \$72,000; this was exclusive of \$11,946 paid as salary to President, clerks, general employee's salary, etc. The same mine in 1870 paid \$48,000 as a dividend, and the labor account was \$229,398.

The Imperial for fiscal year ending May, 1872, levied assessments amounting to \$141,740, and paid out for labor \$134,161.

The Ovsman in 1870 paid no dividends, and paid for labor \$115,868.

The Chollar-Potosi mine in 1869 paid \$41,545 as dividends, and \$238,663 for labor. This same mine in 1872, paid \$252,000 as dividends, and \$164,793 for labor, and \$431,793 for working ore.

The Belcher, during 1871, paid out \$137,103 for labor paid no dividends and levied \$51,925 in assessments. This mine from January 1865 to January 1872, paid \$421,200 as dividends, and it took \$535,600 in assessments besides the production of the mine to do it. That was \$405 per foot of dividends and \$515 per foot of assessments.

The Crown Point mine in 1869 paid out for labor, \$176,726, and levied \$90,000 in assessments. Last year this mining expenses and mining improvements cost, 1,200,906, and the dividends were \$2,180,000, the only case where the stockholders got the best of it.

One California mine quoted as a dividend paying one, the Enreka, paid during the fiscal year ending September 1872, a dividend of \$20,000, and for supplies and labor \$148,433. From October 1865, to October 1872, it paid dividends amounting to \$1,714,000, and expended for labor \$1,381,614.

The figures in all the examples quoted are exclusive of other expenses, many of which employ numbers or men. They do not include timber, lumber, machinery and foundry work, iron, hardware, charcoal, wood, candles, feed hauling, powder, fuse, assays, printing, building materials, all of which items require labor.

Last any body glance over the business and see who has had the best of it and where most of this money circulated. The "poor men" got it and stock sharps paid for a good deal of it. A majority of the mines on the Comstock are now only prospecting so to speak, and do not expect any dividends for some time to come, nevertheless they must have men, and the men must be paid; many of these prospecting mines are pursuing extensive operations, and the money to do it comes out of the pockets of the stockholders, the majority of whom are residents of this city. It may be a pleasant reflection to some of those who revile against San Francisco as playing a "hogging" game, that these little expenses must be paid by them.

If the class of people who invest in such securities were absent, where would the money come from to pursue these operations. They would not be pursued at all or to a limited extent, and many men would be out of employment. It seems to be a chronic complaint among many residents of the interior to run down the "city" as, "gobbling up" all the good things, and monopolizing everything. They seem to forget that San Francisco has had to pay dear for her whistle, and that she has to monopolize all the bad things too. If any money is wanted to develop mining property they come to the city for it, but when the pay dirt comes along, they pitch into the city people for walking off with the profits. This is human nature perhaps, but if isn't justice exactly. If we stand the expenses we ought to reap the profits.

In the case of the Crown Point and Belcher mines they are paying their own expenses and most magnificent dividends also. But just look at the number of other mines, some with excellent prospects, no doubt; but all partially developed and expensive to run, which are now in operation. The rich men—by whom we mean those able to invest—have got to pay these expenses, and the poor men we mean the miners—get the coin. We have spoken of this subject at some length, but we want people to understand that our mining interests are most important to the country, and that the common classes of people with us, are benefitted by the operations carried on, whether profitable to stockholders or not,

The Comstock Mines.—No. VI.

Latest Home Views by our Virginia Correspondent.

A Lookout from a Disinterested Standpoint on the Comstock, between Mines of Merit and what are Termed Wildcats.

In the San Francisco Stock Board the first three calls on this list usually give the cue for each day's operations. For example, as a comparison: Should Ophir discover a body of ore which enhances its value, in the eyes of stock operators, 50 to 100 per cent. in one Board, Gould & Curry and Savage following in the wake, would carry the entire list of leading Comstock miness and wildcats in almost the same proportion. Should the first few stocks called show a weakness, for no reason whatever, when the state of the respective mines is taken into consideration, a universal feeling of distrust, and an uncontrollable depression is manifested, even dividend-paying mines being equally affected, and also mines away down on this list, which, since last Board may have improved 50 per cent. in actual value.

As a body, the Virginia operators being at home, and almost to a man, replete with extensive and valuable information on all mines of interest, buy and sell on the actual merit of their investment.

In San Francisco, the greater number of operators, being a vacillating and excitable class, buy and sell promiscuously. Regarding more the popular feeling in this state of the market than the actual merit of the mines they deal in, they take the first few calls in the Board for the basis of their day's operation, irrespective of what may have been developed in some one of the miness on the latter part of the list.

This may be regarded a prominent reason why so

Many Sudden Collapses

Are almost daily occurring among the more adventurous operators in San Francisco, for it is seldom that a failure occurs in Virginia, except through the recklessness of connections in the Bay City, their business being purely a gambling proposition, in which large operators are constantly subject to annihilation, consequent upon the sudden success or failure of any mine.

To obviate this disporable state of affairs, to insure the actual value of all stocks to be represented in figures on the Stock Board, to concentrate the speculative capital of the country mainly in enterprises of known merit and value, and eventually rule worthless stocks—the miness which they represent being controlled by reckless speculators, whose money alone insures them a place among men, and who, in their insane desire for sudden increase of wealth, have not the patience or enterprise to develop and show to the world the riches which they claim their mines contain, thereby benefitting the whole country as well as themselves; or, in the event of their knowledge and experience, they know them to contain nothing, take advantage of the excitement occasioned by a development in a mine,—which from a combination of snags, capital and perseverance, has given to its managers the reward they merit—to foist their worthless stock on the market, thus victimizing the innocent and confiding who invest their little all in stocks that are cheap, simply because they are cheap, and who, when the excitement subsides awake, to the reality that their hard earnings have gone for valueless paper, the mine which it represents being simply a location, with a ten foot hole on it to preserve its individuality, from the market. Would it not produce a beneficial result to change the present stereotyped form of

Calling Before the Board

Of brokers, and on the principle by which jurors are drawn, place in a box the names of all mines to be called, and, without partiality, and with equal justice to all, commence the list with whichever name is first drawn from the box? In this manner, which changes the programme daily, frivolous speculators would have nothing from which to take their cue.

Wildcat stocks, if valueless, would sell for their actual worth—merely nothing, and eventually sink into obscurity; while old miness of known value, or actively prospecting claims, making developments, would in their turn advance and recede on call according to their merits.

A change of this kind would give justice to all. Crown Point and Belcher, now paying 10 per cent. a month on the market value of their stock, would advance to a price commensurate with their known value and prospect for a continuance of dividends, and other miness such as Sierra Nevada, Silver Hill and Boneye, being in paying condition and out of the reach of assessments, rapidly accumulating funds and with brilliant prospects, would take their representative place among our valuable miness, while enterprising miness such as Ophir, Consolidated Virginia, Gould & Curry, Savage, Hale & Norcross and Chollar, and old Gold Hill miness generally, of established record and of prospective merit would also assume their representative stations, with a certainty of advancement should their developments warrant it.

The miness here, although ateadily pushing ahead in their usual energetic way, seem to come to a standstill as far as items of interest are concerned, nothing new, of especial importance being noticeable in any of them.

CANA,

Virginia, June 10th, 1873.

Parvin's Steam Plow.

We seize with interest upon anything that seems to promise success in this line of steam plowing in which the power is locomotive or self-moving; because it seems to us to be a great necessity upon our wide plains or prairie lands. We must have, if possible, a steam motor, that will start off for a mile or five miles if necessary, with its gang of six or eight plows, and return, doing its work well. Parvin's invention or combination of locomotive and railroad track seems to give promise of being one of the foremost motors for the coming steam plow.

In the last Agricultural Report there is a description, among some eleven other new patents in this line, of Parvin's steam plow. The machine carries and lays its own track in the manner of some road-engines, causing a rotary motion in a horizontal shaft located at or near the hind part of the bed. This shaft is connected by suitable gearing to a driving-wheel suspended beneath the bed of the engine. The driving-wheel, it is understood, does not touch the ground, but is provided with an endless chain, the alternate links of which are made with ridges that mesh into suitable recesses on the periphery of the wheel.

At some distance in front of this driving-wheel is located another wheel of like dimensions and construction, hung in a similar manner. The endless chain referred to also engages with this wheel, so that when steam is applied, the wheels are revolved and the chains travel over them. At regular distances along this chain is placed a series of metal plates, constituting the feet of the machine, and shod with wooden shoes about two inches thick. At each end of this feet is placed a roller of some ten inches diameter, and upon these rollers rest the tracks or ways attached to the under side of the bed of the engine.

Thus it will be seen that the body of the engine rests and moves upon a series of rollers attached to feet, which are automatically raised from the ground, carried forward and deposited again in front, to be passed over regularly. In other words, the machine carries and lays its own track. Its operation is precisely as if a series of rollers were attached to ties laid in a straight line across the field and the engine dragged over them. The only difference is that in this case the ties are chained together and are picked up, carried along and are used continually. The construction will easily be understood by reference to the well-known endless-chain horse-power.

The means used in this case under consideration to propel the carriage consist of just such an endless carrier, arranged to come in contact with the ground—two feet being always on the ground and three off. It ought to be remarked that this principle of propulsion of steam-plows is not for the first time applied. In this case the real novelty, aside from detail, consists in combining the traveling feet with suitable guiding mechanism. This engine is guided by means of two forward wheels mounted on pivoted axles, and so arranged as to be turned right or left at will. The plows, which are of ordinary construction, are connected to the rear part of the machine, and are arranged for the necessary vertical adjustment.

It is said that on the trial in a field near Philadelphia the machine worked well and the experiment was a success. It went a quarter of a mile and back, across a field, with the plows almost up to the beam, at a rate that required rapid walking to keep up with it. The plows are made by the Northwestern Parvin Steam Motor Manufacturing Company, the head office of which is in Chicago and the manufacturing establishment in Farmington.

VERY IMPORTANT IMPROVEMENTS.—The Central Pacific Railroad is now using the Westinghouse Patent Air Brakes, by which an engineer stops a train more gently than can be done by the old system, or brings it to a sudden halt at will. Also, Miller's Patent Platform and Coupling Device, by which the cars are made self-uniting, and are detached by use of a lever, without any danger to the railroad attached. In case of accident they are also self-uncoupling. The Miller Platform is raised to a level with the floor of the car, and being in a straight line with the solid bottom frame of the car prevents the great danger of telescoping—so often happening with cars having the platform a step lower than the car-floor. The adoption of these improvements—which, owing to their great value, are costly patents—is a very great consideration in favor of the traveling public.

Paul's Opinion of Utah.

Our friend, Mr. Paul, having recently made a visit to Utah, called on me the other day and we asked him his opinion of Utah. Here is what he says:

You ask what I think of Utah. I would like to write it up in full, but have not time to do so.

In a geological sense it is a marvel. In a mineralogical one, a wonder. In a political sense, an enigma. In a religious one, a study.

Its products are minerals, fruits, grain, wool and babies.

Within its population are men of the highest and lowest in human intellect. There are physiognomies that would puzzle a Lavater—contour of brains that would form a new field for a Spurzheim. Among the Mormons all is for the Lord and "Bro. Brigham;" among the Gentiles all is for themselves.

As for polygamy, it is the exception. I

who builds up towns, manufactures, telegraphs and railroads almost at a word. In the eyes of the Mormon Church he is next to the Lord. Thousands he has lifted up from abject poverty to comfort, and is it any wonder he is held in reverential awe. The religious love of the true Mormon amounts to an infatuation—a superstition; but many are beginning to look around and think, with a desire for more individual wealth and less religion.

To throw the mind back thirty years, view in retrospect, the barren, inhospitable wilds, and survey this then desert now "blossoming as the rose," with the many, many towns, made self-sustaining and attractive by spacious gardens ornamented with fruit trees of all varieties—a work worthy of imitation by older communities—now happy homes of many a once poor down-trodden European soul.

With all the wrongs and iniquities perpetrated by religious fanaticism, superstitious, and his power, who in America has done so much good for so many. "Let justice be done, etc."

To return to her metals, I will say they are strewn broadcast—of every kind—for

The Vienna Exposition.

[FROM OUR SPECIAL CORRESPONDENT—GUIDO KUSTEL.]

Still raining. Since the last of April up to this day it has been cold, rainy and disagreeable. All the parks and gardens are robbed in luxurious green of the spring, but there is seldom half a day without rain. This unfavorable weather prevents outsiders from coming to Vienna, and the Vienna people from visiting the exposition; nevertheless, the Emperor, Crown Princess, and the other high guests, are almost every day in the industrial palace. Goods are still coming. The work of "fixing up" is progressing in every direction. The agricultural departments, the western half of which is occupied by England, the other half by France, Portugal, Spain, Holland, Italy, Denmark, etc.; and the eastern, belonging to Germany, Austria, Hungary and Russia, are nearly finished. There are a few other private buildings for agriculture and forestry, of great interest, which will be ready in a short time.

Going Through the Main Gallery

Of the industrial palace, one can easily see the practical sense of the English exhibitors, who advertise their goods in the most advantageous way. Most of their articles are advertised in English, French, and German, explaining where necessary, showing the prices not only in pounds and shillings, but often in francs and florins. All other nations use only their own language, generally. Thousands of people are reading the labels of articles every day, without being able to understand them. The practical result of the English mode is quite perceptible—they seem to sell more than the "monolabelers."

One complete exhibit, at least, in the Austrian department, is the

Glassware.

A whole side gallery, and a considerable part of the main gallery, is taken up by Vienna and Bohemian Glass. If one wants to get a true idea of a crystal palace, he must visit the glass exhibition. Hundreds of the most brilliant, large lustres, are hanging over the heads of the people, who admire the splendid play of rainbow colors produced by the large and small cut light-crystals, with which lustres of four to six feet diameter are ornamented in profusion. If lighted by the sunbeams, the colored rays fall on the glassware exhibited on the tables, and one is surprised to see glasses, bottles, etc., in beautiful rainbow colors. There are tables covered with glass for table use, of the very finest crystal glass, cut and engraved in the most delicate and tasteful manner; candelabras, vases, dessert and tea services, bottles for perfumery, pitchers, etc. Some tables show only white glass, with the finest engraving; others red and yellow, blue and green. Of the last color are those of emerald green, very beautiful. The glass gilding is brought to a very high state of perfection, and carried out on white and colored glass in the finest designs, delicate and very tasteful. This Austrian glass industry will probably keep the first rank in the field. There is no French glass exhibited as yet, and only two in the English department. The English glass shows brilliancy and taste, and very fine engraving. There is only one, but a magnificent lustre exhibited. Till now no colored or gilded glass is displayed. The Russian exhibition in this line has nothing remarkable.

The rain stopped this morning; in a few hours the streets were dry, and the exhibition palace was crowded. The art hall was opened to-day by the Emperor, but it is not known as yet when the machinery hall will be declared open, although visitors have had free access from the beginning. The opening will therefore only be formal, while the art hall has been closed only to-day. The Turkish side gallery is now fixed up and open. The Chinese department is barricaded yet, as is that of Morocco, Brazil, and the United States. o. k.

Vienna, May 16, 1873.
[Some other correspondence of Mr. Kustel's, in relation to mining matters, will be found in another column. Eds.]

RAILROAD TRAFFIC.—The Lake Shore and Michigan Southern Railroad Company is said to have given orders for 3,000 additional freight cars, and the New York Central 1,500 cars. The leading railroads are experiencing a car famine, as the car factories are so over-crowded it is impossible to get orders filled. Is not this an indication of prosperity?

GOLD PLACERS.—The Kalama Beacon announces the discovery of gold placer diggings at the head of Toutle river.

most beautiful inland cities of America.

The press, both Mormon and Gentile, is intellectual, vigorous and enterprising, and will compare with any East, West, North or South.

The Mormons as a whole are industrious, moral, temperate people, and apparently contented with their lot.

I heard President Young, Apostles Taylor, Jos. F. Smith and J. Young, Jr., speak; heard nothing objectionable to God or man, mainly good advice in morals and temperance. Separate co-operation is being pushed for all kinds of business; it is the grand idea of Brigham Young, and is only equalled by the conception, permanency and expansiveness of the Great Temple itself.

This co-operative programme is far reaching, further than many appose. It is a spreading network, whereby the finer and coarser, older and younger elements of Mormon society, are blended into one common interest—one idea, one will. Among his people Brigham Young is the great I am, and his far-seeing brain, broad, spreading conceptions, grasping disposition, and great executive ability entitles him to it. One cannot but admire the awe-inspiring powers of the man who stands as President and Director of 100,000 worshippers in Utah alone: The man

history can repeat itself. The Tabernacle may have the Golden Calf of Aaron; the modern Solomon of many wives can lavishly decorate with gold and silver his Great Temple, and Salt Lake City abound in silver ornaments, as stones in Jerusalem. This is no ideal matter—time will develop it into a fact.

ALMARIN B. PAUL.

GEOLOGICAL EXPLORATIONS.—The Yale College party, with Professor Marsh has started on their western tour, to continue the geological explorations of last year. The party will spend the summer in the Rocky Mountains, the autumn, probably, on the Pacific Coast, and will return to the East in December.

THE GIANT POWDER IMPROVEMENT.—In cheapening the process of mining, we have had no improvement in the last decade greater than that of Giant Powder in places where it has been introduced. At first, slow of introduction, we believe it is now gaining favor rapidly in new places, and holding fast to its old patrons.

RAILROAD SALE.—The Bingham Narrow Gauge Railroad, Utah, has been sold to parties from Pittsburgh, New York and Salt Lake. One of the heaviest stockholders has started for New York to purchase iron and rolling stock.

Manufactures of California.

A correspondent of the *Bulletin* has been reading up the ninth census and extracting from a mass of figures those connected with the manufacturing interests of this State. He says the census of 1870 gives us a clear and pretty reliable basis upon which to ascertain the status of California as a manufacturing State, a claim to which she is eminently entitled. The great manufacturing States, in conspicuous order, are New York, Pennsylvania, Massachusetts, Ohio, Missouri, Illinois, New Jersey and Connecticut. Michigan, Rhode Island and Indiana weigh with great pressure in the grand scales, and Rhode Island, though showing less in figures for the State, and if size were taken into account and her figures correspondingly increased, would be comparatively many times greater than any other State as a seat of manufactures. But California stands, in this line, at the head of a very long list of States. Here is her position by the census of 1870:

State.	Product.	State.	Product.
Maine.....	\$79,491,521	Dist. Columbia	9,292,473
Wisconsin.....	77,214,326	Florida.....	4,685,403
Maryland.....	76,594,613	Kansas.....	11,765,833
N. Hampshire.....	71,035,249	Louisiana.....	24,161,905
California.....	68,584,556	Minnesota.....	23,110,700
Delaware.....	64,625,809	Mississippi.....	8,154,768
Iowa.....	45,534,322	Nebraska.....	5,738,812
Virginia.....	38,364,342	Nevada.....	16,870,539
Tennessee.....	34,362,636	North Carolina.....	19,021,327
Vermont.....	32,184,606	Oregon.....	6,877,337
Georgia.....	31,196,116	South Carolina.....	9,858,981
Arkansas.....	4,629,234	Texas.....	11,617,392
Delaware.....	16,791,382	West Virginia.....	24,102,201

The Lesson.

The lesson from this table is of important bearing. The great ironeries and sawed and log lumber regions, and cotton mills of Maine; the immense sawed lumber, meat-packing and flour interests of Wisconsin; the sugar refineries, clothing-houses, cotton mills, oyster packing, etc., of Maryland, and the pride of the east, those large cotton, woolen and worsted mills, boots and shoes and Yankee notions of New Hampshire do not swell their States' aggregates as much as California. Kentucky, Iowa, Virginia, Tennessee, Vermont, Georgia, Delaware and West Virginia are looked upon as manufacturing States, but Kentucky, with its Louisville, and the great Bourbon whiskey interests of the interior of the State, and the two Virginias together, with their Wheeling and Richmond, are far behind California, while Delaware's great shipbuilding interest is not one-third as important as California's machine and hicksmat shops.

California Industries.

The following tables show in detail and by counties the industries of California as reported by the Commissioners of the Census for 1870:

MECHANICAL AND MANUFACTURING INDUSTRIES.	Establishments.	Hands.	Products.
Agricultural implements.....	10	68	\$118,540
Artificial flowers.....	2	4	5,500
Bags, other than paper.....	1	30	64,200
Baking-powders.....	1	5	64,200
Bellows.....	1	14	64,000
Belt and hose (leather).....	6	44	91,654
Billiard and bagatelle tables and materials.....	453	812	1,161,790
Blacksmithing.....	1	114	1,000
Blackening and dyeing.....	1	114	171,942
Bookbinding.....	1	4	8,560
Boat and shoe findings.....	4.0	1,526	2,214,807
Boots and shoes.....	1	68	70,000
Boxes, cigar.....	4	16	18,000
paper.....	8	195	368,778
wooden.....	1	3	13,500
Brass and copper tubing.....	6	97	114,006
foundry and finishing.....	74	320	1,185,820
Bread, cracker and other bakery products.....	34	610	407,800
Brick.....	13	73	164,885
Brooms and whisk-brushes.....	1	3	6,500
Brushes.....	8	21	207,368
Butchering.....	266	663	1,391,163
Carpentering and building.....	1	4	5,100
Carpets, rag.....	8	640	1,309,443
Carriages and wagons.....	3	80	329,500
Cars, freight and passenger.....	1	8	30,000
Cement.....	2	12	18,239
Charcoal.....	1	4	8,500
Chronos and lithographs.....	108	528	1,090,270
Clothing, men's.....	69	229	738,339
women's.....	13	92	417,716
Coffee and spice, roasted and ground.....	11	34	104,332
Coffins.....	1	12	22,350
Collars and cuffs, paper.....	18	55	269,612
Confectionary.....	61	259	474,444
Cooperage.....	2	7	10,200
Copper, milled and smelted.....	4	16	51,360
Coppersmithing.....	1	162	850,000
Cordage and twine.....	1	2	2,500
Cordials and syrups.....	3	52	63,000
Curled hair.....	4	16	33,775
Cutlery.....	3	6	3,492
and edge tools, (not specified).....	20	24	60,250
Dentistry, mechanical.....	1	4	26,338
Drain-pipe.....	21	190	617,870
Drugs and chemicals.....	10	31	67,000
Engraving.....	3	4	5,000
and metal cutting.....	2	14	37,000
Explosives and fireworks.....	1	1	2,500
Feathers, cleaned, dressed and dyed.....	2	13	20,180
Files.....	2	5	6,900
Fish, cured and packed.....	116	690	9,036,386
Flouring and grist-mill products.....	20	200	200,000
Fruits, canned and preserved.....	48	236	629,762
Furniture (not specified).....	10	240	1,356,753
Gas.....	2	6	13,000
Glass, cut.....	6	90	62,045
Gloves and mittens.....	2	21	78,300
Gins.....	2	35	375,000
Gold and silver, reduced and refined.....	2	12	2,900
Grease and tallow.....	3	7	526,487
Gumamuthing.....	14	24	28,490
Hair-work.....	4	9	11,780
Hand-stamps.....	1	2	3,000
Hardware.....	1	2	1,180
saddlery.....	4	7	12,400
Hats and caps.....	16	62	120,140
Hoop-skirts and corsets.....	3	16	20,277
Instruments, professional and scientific.....	3	6	22,500
Iron, forged and rolled.....	2	129	370,000
bolts, nuts, washers and rivets.....	1	7	15,180
castings, (not specified).....	27	647	1,159,841
stoves, heaters, and belloware.....	4	80	190,120
Ivory work.....	2	3	4,100
Jewelry (not specified).....	29	173	498,780
Lead, pig.....	1	15	200,000
shot.....	1	12	277,000
Leather, tanned.....	43	207	151,045
curried.....	27	65	428,878
Lime.....	1	130	170,050
Liquors, distilled.....	16	75	1,692,207
malt.....	96	389	1,641,174
vinous.....	139	762	602,553
Locksmithing and bellhanging.....	7	18	24,295

(a) Sutter county is returned as having no manufactures.

Taking the State through we find that San Francisco county is by far the largest producer, Sacramento next, and Santa Clara next. The greatest industry outside of mining, agriculture and railroads in the State is the production of flour, grist, etc., from mills, while sawing lumber, refining sugar, milling quartz and making boots and shoes, are also reported as industries of considerable importance. It must be distinctly understood, in respect to the census, that it was taken for the year commencing June 1, 1869, and ending May 31, 1870.

Largest Manufactured Product.

There have been some disputes as to the importance of various manufactures in the United States. David A. Wells, in his report of 1869, contended that leather and its manufactures was the largest. The census report shows that he was mistaken; according to it the relative rank is as follows:

Whole manufactured product of U. S. \$4,232,345,442

Iron and its manufactures..... 628,303,885

Cotton, Woolen and Worsted Goods..... 611,495,177

Flouring and Grist Mills..... 444,385,143

Leather and Boots and Shoes..... 340,831,727

Lumber..... 252,333,039

Sugar and Molasses..... 119,789,097

Liquors, malt, distilled and vinous..... 94,123,014

Tobacco, Cigars and Snuff..... 71,622,044

As between the products of wool, cotton and leather, the order of precedence is leather products, wool and products, cotton and products, but the exact figures cannot, in the nature of the wool and cotton statistics, be furnished separately for those two items in all their manipulations.

Working Mines vs. Selling Mines.

Like all other mining Territories, we have had an era of selling mines, which, from a Territorial point of view, has not resulted in those benefits to the country which rightfully belong and should accrue to it if the Territorial welfare had been made a matter for consideration.

Although it is reasonable to suppose the past will be repeated at every favorable opportunity, yet it is nevertheless our conviction that the practice of selling mines abroad instead of working them at home and reaping the benefits, is the most prejudicial one to home interests, that is, when conducted in the manner sales have been in the past.

As an illustration of this, we point to almost any of the mines placed on the London market for extravagant sums, and ask to what extent has the business of the country been enhanced beyond the sums received by our own residents, and which have been freely spent in improvements at home, and the amount disbursed by these foreign companies for the extraction of the ores? The bulk of the amounts represented in the sales have certainly gone to those who have no interest in our Territory beyond speculating in our resource, while the actual products of our mines are benefitting not our own residents, but those of some other country. Surely this is not the kind of political economy to make us rich?

If we turn to Nevada, Colorado or other mining Territories, we find that with all their mineral riches their material growth has not been commensurate with their exportations of the precious metals. The reason is obvious, they are owned and speculated upon by those not interested in the country itself, except, to the extent of making money out of it. This being the case it is not a matter for surprise that Nevada with her \$25,000,000 yield of last year, can only show a tithe of that amount in actual home progress and prosperity.

We do not expect that this state of affairs can be entirely obviated in Utah, but we do firmly believe that much better results would follow the inauguration of a system of owning and working mines at home instead of hoarding, selling and disposing of them abroad. That we need capital for development and for the more extensive working of our mines is most apparent, and that it should be invited by every legitimate means is also true, but we think the object should be to invite that class of capital which can see chance enough in Utah to become permanent and resident here. We are hopeful enough to believe that our Territory is now beginning to assume that importance abroad which will influence men of means to unite their destinies with that of Utah.

We have predicted that our mining future will differ in all essential features from that of any of our neighbors, and we have the prediction on the belief that we are entering on an era of mine working by such improved processes as are developed by the experience of our neighbors. We have the wealth here to build up one of the most remarkable States in the Union, the consummation of which will depend greatly on the wisdom used in appropriating it. Working mines with home capital instead of selling them will be found to be a sound doctrine.—S. L. Tribune.

MINING PROSPECTS IN NEW MEXICO.—A gentleman of this city has just received a letter from Socorro, New Mexico, extracts from which we have been permitted to make. They will doubtless interest our readers. The writer says the mines in the vicinity of Silver City have rich ores on the surface but are not of a lasting character; there are or will be more mills than can be supplied with ore. Everybody is in debt to the merchants and there is no money in circulation. A large furnace is to be erected this season by a Chicago company, which may do well for a time. There are large bodies of silver and copper ores from 60 to 100 miles from Silver City, but they cannot be made available until the completion of the Southern Pacific Railroad, which may be five or six years hence. The inhabitants are mostly old Mexicans, and have not yet woken up to realize the future destiny which awaits their country. The advent of railroad communication, together with the infusion of a different element from the influx of the Anglo-Saxon race, will bring about important changes and make the country a profitable field for enterprise.—S. L. Tribune.

BORAX AND ASAPALITUM.—The Commissioner of the General Land Office has decided that asphaltum and borax lands can be taken up for patenting, under the Mineral Land Law of May 10, 1882.

Capital for Development Needed in Utah.

In the present condition of our mining affairs in Utah, says the Salt Lake Tribune, there is no want more keenly felt in some of our districts, and particularly that of Star, in the south, than capital to aid in developing the many mines already opened up, the owners being too depleted in purse to prosecute work to the extent necessary in the development of their property. From all quarters letters come to us in which the writers complain of the lack of capital, and solicit our influence to induce men of means to assist in the great work of opening up mines.

Knowing that, under the present aspect of the various mining markets, it is next to impossible to "place a mine," confidence having already been too much abused, the next best thing to do, and indeed about the only likely thing to accomplish, is to endeavor to secure capital sufficient to aid in opening up mines already discovered throughout the country.

With this object in view, we ask those having money, and who are desirous of investing

The Mining and Scientific Press Marching Onward!

Our careful system of compiling, judiciously condensing, and conveniently arranging into regular departments, has been heartily endorsed. It renders the paper worth more to readers, who can find handily the which interests them most.

The weekly issues of the Press will contain reliable

Information for Practical Miners,

Treating on the Opening of Mines; Mining of Ores; Milling of Ores; Smelting of Ores; Separation and Roasting of Ores; Amalgamation; Saving of Gold and all precious Metals; New Processes of Metallurgy; New Discoveries of Mines; Mining Engineering and Hydraulics.

For Inventors, Mechanics and Manufacturers.

All new and important developments in Scientific and Mechanical Progress; Patents and Inventions of the Pacific States; Progress of Home Industries; Hints for Local Manufacturers; Illustrations of New Machinery; Reports of Popular Scientific and Industrial Lectures.

Our Mining Summary

Gives the progress of mining work from week to week in the various counties and districts throughout the principal mining regions of the United States, arranged in alphabetical order. It is the most extensive record of mining operations published in the world. It affords the intelligent miner a rare opportunity to know and profit by the work and experience of his neighbors. Miners have few sources of practical information in their calling, and should embrace every reliable means for improvement. Mining Operators and Shareholders, at home and abroad, weekly examine our Summary with increased interest and profit.

Our "Domestic Economy"

Enriches every cabin and household. Short and interesting—the articles under this heading are freely read and practiced with profit and improvement to the readers.

The Press is not strictly a "paper for professional, scientific men," but rather a

Liberal and Popular Scientific Journal,

Well calculated to make practically scientific men from our intelligent masses. This is our stronghold for accomplishing good. Plain, correct and pleasing language, easily comprehended by all, confined mostly to short articles, is our endeavor.

For Self-Improvement,

Every issue of the Press abounds with articles of an elevating character, to stimulate the higher virtues and nature and progressive intellects of both men and women.

Hundreds of Dollars

Are oftentimes saved to the readers of this paper by a single hint or article of information in its columns. Such instances have been repeatedly reported to the editors and proprietors during their long connection with the Press. Our paper presents

The New and Novel Developments

In the progress of this comparatively new section of the Union (but recently settled and now rapidly increasing with a population of the most intelligent and venturesome people, attracted from nearly every quarter and clime on the globe), enable us, with due enterprise, to display vigor and freshness in our columns not met with in similar journals elsewhere. The same circumstances also render such a paper more especially valuable to its readers in a new, and to a certain measure, untried field, where the best methods and processes of industry are not so well established or traditionally known as in older communities. Published experiences often save costly experiments and disastrous results.

A Great Variety of Industrial Information, In brief and fresh form, suited to the wants and tastes of the readers of this coast, which is not obtainable otherwise so timely, or in so cheap and convenient form. As an industrial publication, meeting the wants of so many kindred industries, this journal stands pre-eminent and without a precedent.

Subscriptions payable in advance—\$4 per annum. Single copies, post paid, 10 cents. Address—

DEWEY & CO.,

MINING AND SCIENTIFIC PRESS AND PACIFIC RURAL PRESS Office, 338 Montgomery St., S. F.

TO BUILDERS AND ARCHITECTS.

Brooklyn Freestone Quarries,

Three miles from the Brooklyn R. R. Depot and Landing, and 4 1/2 miles from Oakland City Hall.

Having just completed a good road to these quarries, we are prepared to furnish large or small orders for either dimension stone, or rubble stone, in San Francisco, Oakland, or Brooklyn, at such prices as cannot be competed with, for equal quality of stone; for base and elevation walls, for public and private buildings, monuments, fence walls, coping, window caps and sills, doorway trimmings and steps, stepping stones, curbing for streets and sidewalks, pavements or streets and street-crossings, bases for grave-stones and plain and ornamental work for cemeteries, etc.

We can furnish cellar and basement walls of rubble stone of superior quality in San Francisco at about the cost of brick work for the same.

The gray freestone from these quarries is considered far superior to that of any other within practical distance of San Francisco. It is readily worked and imperishable.

For samples we refer to the first story of the City Hall, Oakland, erected four years since, and the window caps and sills, and other finished work in the Deaf and Dumb Asylum, Oakland; in the Oakland Cemetery around the lot of J. S. Emory. Also small specimens in the offices of Augustus Laver, Architect of the S. F. City Hall; Kearney St.; David Farquharson, Architect, Cor. Kearney and California St., S. F.

Orders may be left with George W. Thompson, on the premises, or A. T. Dewey, Scientific Press, No. 338 Montgomery St. S. F., where samples of the stone may be seen.

THOMPSON & DEWEY.

The Most Complete Invention for Opening Cans ever Invented.

No family that uses canned Foods, Vegetables, Sardines or Oysters, should be without one of these convenient household tools. No Restaurant, Hotel or Oyster Saloon can afford to do without one. It will cut any shaped food, from a triangle to a perfect circle. One sample sent postage free for 75 cents.

WIESTER & CO.,

17 New Montgomery St. (under Grand Hotel), S. F.

PURCHASERS please see advertised in Scientific Press.

Valuable Premiums & Subscriptions.

A Sewing Machine

of Real Value (Beckwith's) given for \$40 worth of Subscriptions.

The AMERICAN AGRICULTURIST, in speaking of this Machine, says:

We are prepared to endorse the Book with Sewing Machine as one worthy of being at once acquired by all who cannot purchase the expensive machine.

1st. It is well and strongly made.

2d. It is easily attached to any table or stand having a leaf or edge projecting an inch or so, and can thus be used in any part of the house, near a window, etc.

3d. It makes the stitch as deep as the same as the Willcox & Gibbs and some other good machines, which with a little care in making the closing stitch is abundantly strong for wear, and is less liable to break in washing and wearing, owing to its elasticity.

WE WILL GIVE

For \$12, a Machine and the Illustrated Press, 1 year.

For \$12, a Machine and the Mining & Scientific Press, 6 mos.

For \$12, a Machine and the Pacific Rural Press, 6 mos.

For \$13.50, a Machine and the Mining & Scientific Press, 1 yr.

For \$13.50, a Machine and the Pacific Rural Press, 1 year.

For \$40, we will give a Machine and \$40 worth of subscriptions to either paper or all jointly. Send for Circular.

Express charges must be paid by the purchaser. Address, for further particulars, the PUBLISHERS OF THIS JOURNAL.

Useful Inventions

—FOR THE—

House, Field and Farm.

A safe and perfect FIRE KINDLER.

A HORSE RAKE that has no equal.

Parrell's Lubricators for Locomotives and Stationary Engines.

Shears for cutting grapes and flowers.

A NEW ROLLER SKATE that is superior to all others.

Self-Regulating DRINKING FOUNTAIN for fowls.

A superior ROAD SCRAPER.

The cheapest and best FARM FENCE ever built.

A POST DRIVER that every farmer should have.

A SASH TIGHTENER that keeps out all dust, takes the place of weights, and keeps the windows from rattling.

A BED SPRING that never gets out of order.

A POTATO DIGGER that will dig a row as fast as a man can walk.

A HOUSEHOLD TOOL needed in every family.

A GAS LAMP that costs only half a cent per hour to burn.

The best SELF-OPENING GATE ever invented.

A Blow on a new principle—it works to perfection in action.

An improved PLOW CLEVER.

A TOY ENGINE that every boy should have for instruction.

A NEW GLASS CUTTER that heats a diamond.

A CAN OPENER that cuts any size or shaped hole.

The best WASH BOILER ever invented.

An Egg BEATER that beats eggs in one minute.

A WALL PROTECTOR for placing behind wash stands.

THE LITTLE GIANT CORN SHELLER.

A KNIFE SHARPENER that should be in every kitchen.

A CORN HUSKER that husks 40 bushels per day.

The best machines to CLEAN GRAIN in the world.

A superior PAPER FILE HOLDER.

Address: WIESTER & CO., Patent Brokers, 17 New Montgomery street, San Francisco.

Something New for the Kitchen.

THE

Aerating Egg Beater.

Various devices have been presented to the public for beating eggs, but nothing, we think, equal to the one herein shown. This, in fact, is the only aerating device ever made, and is very properly called the "Aerating Egg Beater."

This Beater, as will be seen by reference to the engraving, is simply a tin can with a cone bottom and a cone dasher, the lower portion of the dasher being perforated with very small holes, as shown. Under this arrangement the upper portion, when forced down, fills with air, which is forced through the egg, thereby finely dividing and thoroughly aerating the mass. It beats one egg as well as half a dozen. For further particulars address

WIESTER & CO.,

17 New Montgomery St. (Grand Hotel Building), S. F.

Mine for Sale at Michigan Bar.

A one-half interest (1,800 feet) in the mine is offered for the sinking of 60 additional feet—the present depth of shaft being 50 feet, well timbered throughout. Parties will have to furnish everything connected with working the mine. Assay value at depth of 48 feet, from State Assay Office, \$10 in gold; silver, \$3 per ton making \$15 per ton.

27-26-3m E. G. DENNISTON, Proprietor.

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared to have them constructed in the most perfect manner and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits. They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Settlers made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill-men are invited to examine these pans and settlers for themselves, at the office, 229 Fremont Street, San Francisco.

PATENTS & INVENTIONS.

Telegraphic List of U. S. Patents Issued to Pacific Coast Inventors.

FROM OFFICIAL REPORTS FOR THE MINING AND SCIENTIFIC PRESS, DEWEY & CO., PUBLISHERS AND U. S. AND FOREIGN PATENT AGENTS.

By Special Dispatch, Dated Washington, D. C. June 10th, 1873.

FOR WEEK ENDING MAY 27th, 1873.

PAPER CLIP.—M. A. Wheeler, S. F., Cal.

MEDICAL COMPOUND OR OINTMENT.—John G. Hucks, S. F., Cal.

SAW SHARPENING AND SETTING MACHINE.—Edward Duffy, Oakland, Cal.

HARROW.—James F. Gazley, Canyonville, Oregon.

APPARATUS FOR SEPARATING QUICKSILVER FROM AMALGAM.—Marcus B. Howard, Ellsworth, Nevada.

GRAIN RAKE AND LOADER.—George S. Dudley, Dixon, Cal.

MUSICAL INSTRUMENT.—Cameron Maresna, Salt Lake City, Utah.

FEDDER FOR QUARTZ MILLS.—Thomas A. Cochran, Jamestown, Cal.

The patents are not ready for delivery by the Patent Office until some 14 days after the date of issue.

NOTE.—Copies of U. S. and Foreign Patents furnished by Dewey & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with greater security and in much less time than by any other agency.

A New Enterprise.

A few weeks ago, while passing up Market street, in this city, our attention was attracted by a crowd of persons in front of 727, next door to Bancroft's building, and upon investigating the cause of the gathering, we found that the Keeler, Hine & Thomas Company, of New York, had opened a store of their beautiful wares in the building, and that this crowd was merely a congregation of eight-seers. We entered the store, and found a large collection of statuary, fountains, vases, aquariums, and a number of other styles and kinds of ornamental goods, which our Coast is greatly in need of. All of these articles are made of metal, and beautifully finished, so as to look either like marble-work or real life, as occasion requires. While examining these articles we could not help picturing to ourself our future palatial residence, which we expect to build, when the PRESS shall have made us wealthy. These two large and beautiful mastiff dogs we will place on either side of the gateway, think we, and this fountain, with the little boy holding the nozzle, will be just this thing to place in the center of the yard. Yes, and how nice it would be to have "Captain Jack and his dog" and place them just in front of the house. The ferocious appearance and threatening position of the noble savage would be a splendid protection from burglars at night and beggars by day. Yes, thought we, we must have "Captain Jack and his dog." Thus we went on theorizing and building air-castles, and furnishing our front yard and spacious grounds, when we were accosted by Capt. J. M. Keeler, the affable gentleman in charge of the store, in whom we recognized an old-time friend. After showing us all of the different styles of ornamental goods, he led, or rather directed, us to a box-shaped arrangement with a long handle sticking out of it. This, said the Captain, is the celebrated Sluthour Pump, formerly known as the Eureka Pump. This latter name attracted our attention, as we had heard of the wonders performed by the Eureka Pump. Upon inquiry, we found the reason why the name was changed was that the world is full of "Eurskes," but was very deficient of "Sluthours." Besides, Mr. Sluthour was the inventor, and the pump is known by that name in the Eastern States. This pump is really a little wonder. It throws more water with less exertion than any other pump we have ever seen. Last fall, when the foundation of the Niantic Hotel, on the corner of Clay and Sansome streets, was being laid, a small pump of this pattern was used to remove and keep out water from the excavation, and during the entire period that it was in use it was surrounded by a large crowd of observers, all of whom expressed their surprise at the remarkable capacity of the pump and the very small amount of power required to operate it. As a farm pump, mining pump, and, in fact, for all uses that a pump can be put to, we consider it a success. The valves are large enough to allow stones, gravel, and any ordinary body that would clog the usual styles of pumps to pass. For this reason it is especially suited as a mining pump. Any person of ordinary mechanical skill can repair it, should it get out of order. From the pump we passed to the Continental Windmill—a new thing in windmills. Besides being quite effective as a windmill, it has the extra attraction of being a model of neatness.

"A thing of beauty is a joy forever," The Continental Windmill, therefore, would be a joy forever. Capt. Keeler is ready to fill all orders for the above goods, and we expect that many of our wealthy citizens will take advantage of the opportunity and relieve the monotony of their lawns by an occasional piece of statuary.

Leather Market Report.

[Reported for the PRESS by Dolliver & Bro.]

SAN FRANCISCO, Wednesday, June 11, 1873.

The demand for Domestic Skins and Sole Leather continues light and old prices. The same may be said in reference to French Skins, except that they have an upward tendency.

Ida and Rhoda Lewis Consolidated Mining Company--ANNUAL MEETING.
The annual meeting of stockholders of the Ida and Rhoda Lewis Consolidated Mining Company, for the election of Directors and transaction of such business as may be presented, will be held on Tuesday, June 17th, at 1 o'clock p. m., at the office of the Company, No. 10 Webb street, San Francisco, California.
J. DE STA MARINA, President.
A. O. MORSE, Secretary.
San Francisco, May 19, 1873. m19-td

Mazepa Silver Mining Company--Location of works, Ely Mining District, Lincoln County, State of Nevada. Principal place of business, San Francisco, Cal.
Notice is hereby given, that at a meeting of the Directors, held on the 20th day of May, 1873, an assessment (No. 1) of Fifty Cents per share was levied upon the capital stock of the Corporation, payable immediately, in United States gold coin, to the Secretary, at the office of the Company, No. 22 Sansome street, San Francisco, California. Any stock upon which this assessment shall remain unpaid on the 24th day of June, 1873, will be delinquent and advertised for sale at public auction, and unless payment is made before, will be sold on Tuesday, the 15th day of July, 1873, to pay the delinquent assessment, together with costs of advertising and expenses of sale.
M. F. GAMIE, Secretary.
Office, No. 22 Sansome street, San Francisco, Cal. m26

Newton Booth Consolidated Mining Company--Location of principal place of business, San Francisco, California. Location of works, Ely Mining District, Lincoln County, Nevada.
Notice--There are delinquent upon the following described stock, on account of assessment levied on the seventh day of May, 1873, the several amounts set opposite the names of the respective shareholders, as follows:

And in accordance with law, and an order of the Board of Directors, made on the 7th day of May, 1873, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the office of the Company, No. 314 California street, San Francisco, California, on the 12th day of July, 1873, at the hour of 1 o'clock, p. m., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.
LOUIS FRANKLIN, Secretary.
Office, No. 314 California street, San Francisco, California. j14

Omega Table Mountain Mining Company.
Location of works, Tuolumne County, California.
Notice is hereby given, that at a meeting of the Board of Directors, held on the 4th day of June, 1873, an assessment (No. 2) of Five Cents per share was levied upon the capital stock of the Corporation, payable immediately, in United States gold and silver coin, to the Secretary, at No. 28 Merchants' Exchange, San Francisco, California. Any stock upon which this assessment shall remain unpaid on the 15th day of July, 1873, will be delinquent and advertised for sale at public auction, and unless payment is made before, will be sold on the 23rd day of July, 1873, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Directors.
DAVID WILDER, Secretary.
Office, No. 28 Merchants' Exchange, California street, San Francisco, California. j5-4w

BROWN'S PATENT LAMP.

One of these Lamps, when placed at a distance of 200 feet from the bank, will light up a bank surface 250 feet in length and 150 feet high, and to a much better advantage than any other light heretofore tried, and at an expense not to exceed five cents per hour. Lamps furnished at short notice.

Letter of Recommendation.
Mr. C. B. Brown—Sir: Your Patent Lamp for lighting hydraulic mines, which you sold to me in December last, has given entire satisfaction, and far exceeds my expectations, and I think it the best and cheapest light ever used to light mining claims by night, and am satisfied that I have saved three hundred dollars by the use of it in the last mining season over pitch or any other light of the same brilliancy; and I will also say that if I could not get another lamp, five hundred dollars would not buy it. Yours,
W. D. APLIN.

Little York, Nov. 5, 1872.
For further particulars, address,
P. 22-11 C. B. BROWN, Placerville, Cal.

SAN FRANCISCO.

Manufacturers and have constantly on hand
SPORTING,
MINING,
And BLASTING
POWDER,

OF SUPERIOR QUALITY, FRESH FROM THE MILLS. It being constantly received and transported into the interior, is delivered to the consumer within a few days of the time of its manufacture, and is in every way superior to any other Powder in Market.
We have been awarded successively

Three Gold Medals
By the MECHANICS' INSTITUTE and the STATE AGRICULTURAL SOCIETY for the superiority of our products over all others.
We also call attention to our

HERCULES POWDER.
Which combines all the force of other strong explosive now in use, and the lifting force of the BEST BLASTING POWDER, thus making it vastly superior to any other compound now in use.
A circular containing a full description of this Powder can be obtained on application to our Office.

NEW ENTERPRISE.
KEELER, HINE & THOMAS COMPANY,
New York and San Francisco.—Manufacturers of
The Celebrated Sluithour Pump.

We offer this wonderful Pump on this coast, confident that it surpasses any other in use when the amount of water discharged, the power required and the cost are compared; also the simplicity and durability of its working parts add to its great merit, it rarely getting out of order, and when it does, requiring no skill to repair it. It has no equal as a Windmill Pump.

Farmers, stock raisers, miners, ship owners, captains of vessels, dry-dock owners, irrigating companies, railroad men, or any one interested in Pumps, come and see its wonderful operations. This Pump has been approved (as a Fire and Bilge Pump) and adopted by the Superintending Board of Inspectors of Steam Vessels, and by the Secretary of the Treasury, as appears by Circular No. 4, issued from the Treasury Department February 21, 1872. This Pump can be seen on practical exhibition and for sale at our warehouses, No. 727 Market street, San Francisco. This Pump was exhibited and tested, with wonderful results, at the last State Fair in Sacramento.

HENDY'S
IMPROVED STEAM ENGINE REGULATOR.
OVER 400 HAVE BEEN PUT IN USE.

RECOMMENDATION.
St. Patrick Mill, Placer Co.,
Feb. 10, 1873.
JOSHUA HENDY, ESQ., SAN FRANCISCO:

Dear Sir: We, the undersigned, take pleasure in giving you the following testimonial as to the merits of the Hendy Governor, which we ordered from you about four months ago. Though more than pleased with its workings at first, we deferred writing until we had tested it thoroughly.

Our engine is 12x36 (carrying 70 lbs. of steam), driving 16 stamps, 725 lbs. each; 1 Wheeler Fan, 1 Knox Fan, 6 Hendy Concentrators. The discarded Governor was the common "Arm and Ball Governor;" it giving but poor satisfaction, we decided to try the "HENDY," and are pleased to report in its favor for the following reasons:

1st. It SAVES US FUEL. Previous to attaching your Governor we were burning 34 cords of wood per 24 hours. We now consume but 2 1/2 cords doing the same work.

2d. For SAFETY. The "trip" saved us from an expensive smash up but a few days ago, during the temporary absence of our engineer. The Governor kept the Flywheel from striking the Governor, and the result, no damage. Had we been using any other Governor, the probability is that we would not have had a whole cam in the mill.

3d. It is a PERFECT GOVERNOR. We can turn off the Wheeler Fan and hang up one-third of our stamp, without any perceptible change in speed.

4th. THE ADJUSTMENT for regulating the speed without increasing or reducing the size of our Governor pulley, is admirable, and as easily managed as setting a clock.

5th. It is SIMPLE and not liable to get out of order, or requiring more than ordinary care.

Yours respectfully,
JAS. H. CROSSMAN, Supt.
GEO. H. BARNEY, Chief Eng'r.

BURLEIGH
ROCK DRILLS

—AND—
Air Compressors.

The Burleigh Rock Drills, which have stood the test of five years' constant use at the Hoosac Tunnel, and which are now in use in nearly every State in the Union, as well as in Europe and South America, are unequalled in efficiency and economy by any other Drilling Machine. They are of various sizes, and equally well adapted to Tunneling, Shifting, Open Cut or Quarrying, and will drill six to ten inches per minute in granite. They are driven by steam above ground. The Burleigh Air Compressor is the best engine yet devised for furnishing the "air motor" for the many purposes to which it is now being used.

They are to be used on the St. Gothard Tunnel, Switzerland; Tunnel 13 miles long. We refer to the following gentlemen and works:

Gen. Newton, U. S. A.....Hell Gate Tunnel, L. I.
Messrs. Shanley.....Hoosac Tunnel, Mass.

Second-Hand Engines and Boilers

For Sale by McAfee, Spiers & Co., Boiler Makers, etc., 309 to 315 Howard St.

10-Horse Power PORTABLE THRESHING ENGINE—Cylinder 7 inches diameter, 12-inch stroke. Boiler well proportioned, has all the mountings, is mounted on wheels, in first-rate condition, and will be sold cheap. This is the very thing for opening a new or working a small mine. Price, \$700.

30-Horse Power LOCOMOTIVE OR FIRE BOX BOILER—made of the best c. h. No. 1 American iron, 516 inch thick. Furnace 4 feet long, shell 42 inches diameter, contains 45 tubes 3x17 inches, with grate bars, breeching and smoke stack, all in good condition. Price, \$750.

THREE 35-Horse Power BOILERS, each 50 inches diameter, 16 feet long, containing 42 tubes 3x inches diameter. These boilers have been entirely rebuilt, and are in thoroughly good condition. Will be sold together, or separately, at a low price.

15-Horse Power BOILER—32 inches diameter, 12 feet long, containing 32 tubes 2x inches diameter, with steam drum, furnace front, grates and all fittings. Price, \$300.

30-Horse Power BOILER—48 inches diameter, 16 feet long, containing 34 tubes 4 inches diameter, with furnace front, grate bars, breeching, stack and all mountings complete, and in good condition. Will be sold very cheap.

25-Horse Power HORIZONTAL STEAM ENGINE—Cylinder 10 inches diameter, 20-inch stroke, with heater, pump, governor, etc., complete. Will be sold very low. Build all kinds of Boilers, Water Pipe, Pump Column, Buckets, Tanks, etc. j14-1m

Paul Process

Having fully tested the practicability and efficiency of the Paul Process and Machinery, we consider it due to Mr. Paul, and of interest to the Miners of Utah, to express our complete satisfaction of the same, pronouncing, as we do, a thorough success, and have no hesitation in recommending it for such silver areas as Mr. Paul considers it adapted for. So well satisfied are we of its practicability, that we have given an order for another mill, which in a practical sense amounts to more than our most enthusiastic praise.

HALLIDIE'S
Patent Endless Wire Ropeway.

Covered by Numerous U. S. Patents.

IMPORTANT TO

Mining Companies, Civil Engineers, Contractors, Etc.

The system of transporting material, such as Ores, from the mine to the mill, Earths for embankments, Rock from quarries, etc., by means of steel wire rope, has been well tested and found more economical, advantageous and reliable than any other method of transportation; and to the annexed certificate in connection therewith I beg to call the attention of those interested:

T. M. MARTIN My dear Sir: On your leaving for San Francisco, it gives me great pleasure to hand you my written acceptance of the HALLIDIE TRAMWAY put up by you upon our mine in Freiberg.

It is a perfect success, discharging ten tons of ore per hour with two men's labor. It is perfectly simple in construction, and, as far as I can judge, there is nothing about it to ever get out of order—nothing to wear out. While our regular haul, about two thousand five hundred feet of wire rope, I can see no reason why the line could not be extended almost indefinitely with equally happy results. Again, the carrying capacity might be doubled or quadrupled if desired. After several weeks trial upon our mine, the unanimous verdict of all who have seen it is a complete, unquestioned success. If this can be of any service to you, use it in any way you think proper. Very respectfully, O. O. GOODWIN.

EMMA HILL CONSOLIDATED MINING CO.,
Little Cottonwood, Utah.
Superintendent's Office, Sept. 28, 1872.
T. M. MARTIN, Esq.—Sir: The Ropeway constructed by you (HALLIDIE'S PATENT) for the Emma Hill Consolidated Mining Company, has been built in most substantial and workmanlike manner, and is at this time in splendid working condition. I most cheerfully accept the work for the Company, and for no facilities they have wished a quick and speedy transit for ore over places impracticable for wagon roads, etc. Respectfully,
L. W. COLBATH, Superintendent.

"The Vallejo works smoothly with the elevated wire tramway, which carries its load of ore as quickly and easily as if there was no winter or snow in the world."
"Whatever the objections to wire tramways may be on account of their cost, I have seen nothing yet that even approaches them in the facilities they offer for the moving ore at all seasons of the year."—Correspondent Utah Mining Journal, Alta, Jan. 8, 1873.

The Vallejo Ropeway.

The Vallejo Tunnel Company's Tramway in Little Cottonwood, built on the HALLIDIE PATENTED PLAN, is a complete success. It is between 2,300 and 2,400 feet in length, and is supported by thirteen stations. The fall in this distance is about six feet, and the wire rope, which is three-fourths of an inch in diameter, will safely and easily deliver one hundred tons in six hours. The machinery is automatic, loading and unloading the sacks or binnets. About one ton and a half can be moved in the shortest time. The stations are about two hundred feet apart, and the entire apparatus is strong and safe. As the wire rope is elevated about forty feet above the surface of the hill, the tramway can be worked all winter long, without the slightest trouble.—Utah Mining Journal, Salt Lake, Sept. 28, 1872.
Mining Companies and others desiring to negotiate for the erection of this system of Ropeway, can communicate with me personally, or through Postoffice Box 964.

A. S. HALLIDIE, Patentee,

112 and 114 California Street, SAN FRANCISCO.

WIRE ROPE

Metallic Tile Roofing.

The question of fire-proof roofs is an important one, as is that of water-proof roofs. When the two improvements are combined, as they seldom are, we need go no farther. Now comes a roof which not only fulfils these requirements, but adds the feature of ornamentation, without detriment to the necessary utility. It is styled the Pappelendam Metallic Tile Roofing, after the inventor, who claims that in it, the objections to other methods are removed. Metal roofs are without doubt the best in use. Generally large plates or sheets are used, but the material being one of the best conductors of heat, they are liable to crack from expansion or contraction caused by heat or cold. Small ribbed plates of galvanized iron meet with less objection, but the necessity of overlapping one-half to prevent the rain from being driven underneath, renders this style of roof too heavy and expensive for general use.

The illustration accompanying this description shows the Pappelendam tile and its application. Figure 1 is a section of a building covered with roof tiles; Fig. 2 is a view representing a number of the tiles as arranged upon a roof; Fig. 3 is a detail sectional side view of the same; Fig. 4 is one of the roof tiles; and Fig. 5 is a wall tile; the white part of it is covered by the one above it and requires no description. On the lower edges can be pressed an ornament to cover a few nails or screws. The principle of the improvement consists in forming a covered channel between the ridges and the tiles to exclude the water. The tiles are made of galvanized iron and other suitable material and may be struck out of sheet metal, or cast as desired. The tiles may be made square or diamond-shaped and are placed diagonally upon the roof or wall, as shown in Fig. 2.

Upon the two upper edges of the tiles are formed two upwardly projecting ridges, about three-eighths of an inch in height, the ridges running along the edges of the tiles and the second ridge being parallel with and at a little distance from the outer ridge so as to form a channel between them, as shown in the drawing. This channel will conduct any water that may pass over the lower rib, downward, and deliver it up in the upper surface of the next tile below. Upon the under side of the lower edges is formed a single downwardly projecting ridge. The side angles of the tile are cut off as shown in Figs. 4 and 5. The tiles are arranged upon the roof or wall, as shown in Fig. 2; the downwardly projecting ridge of each upper tile being placed below, and embracing the upward projecting ridges of the adjacent edges of two tiles.

By this construction the inventor claims it will be impossible for water or wind to beat in and pass above the three ridges. Upon the body of the tiles, may be struck up, or otherwise formed, an ornament. It strengthens the tiles and prevents them from being rolled up by the wind, and, at the same time, adds greatly to the beauty of the roof or wall. The roof made in this manner is quite light, yet so firmly attached that it cannot blow off, as the ordinary tin roofs are apt to do. The tiles are joined so as to give the roof sufficient elasticity to guard against the effect of sudden charges of temperature. The roof is water tight, durable, and not liable to need repairs. The wall tiles shown in Fig. 5 can be easily attached to any kind of a house. They may be ornamented in any desired way, so that fashionable people can have their monogram all over the

house if they want it, and business men the insignia of their trade.

The great importance of the subject of roofing is fully realized by property owners everywhere. The safety and preservation of property depends in so great a degree upon the character of the roofing of buildings that there has been a general demand for some material that will afford greater protection than is obtained by any roofing heretofore in use. That made of shingles is liable to be ignited by sparks or cinders; slate is fit only for steep roofs, such as churches and steeples, and is moreover easily broken. Paper roofs are said to require too much attention to keep in repair. Houses with metal roofs and sides stand much less chance of fire than those without. Patrick Gibbons, of 513 California street, in this city, or 398 Tenth street, Oakland, is pro-

Scientific and Mechanical Progress.

New and gigantic inventions mark almost every passing year, and new powers of nature are constantly being evoked, which give birth to new and lucrative possessions in the domains of Art and Science. Man seems to have only to propose, and somebody or something comes along by which he is enabled to carry out his purpose.

Dr. Lardner thought, in 1827, he had fully proved that the then mooted project of transporting passengers by railroad, at a high rate of speed was utterly impracticable; but two years afterward Stephenson's locomotive completely demolished Lardner's logic. A famous engineer was once asked to give an opinion about the feasibility of an aqueduct planned by Brindley, a mechanic somewhat in advance of

could a mountain of ore on the earth, tells us that we are as yet only on the confines of discovery. Hundreds of new subjects are still open to the research of the chemist, the philosopher and the inventor, and many rich and important secrets are in store as rewards for original investigation into the arcana of physical science.

Verily it seemeth that the time has come when "knowledge runneth to and fro." So quickened and so successful is the human intellect, that the application of a principle in one direction only paves the way for its higher application in some other department of research or art.

Palmacea—Palms.

The number of known species of palms are over a thousand. The most remarkable are the Betelnut palm (*areca catechu*), the fruit of which, divided into quarters, rolled in the pepper leaf, and sprinkled with lime, is in general used as a masticatory amongst the natives of the East Indies, much the same as tobacco is employed by us. This mixture gives a red tinge to the saliva, and seems to have some narcotic power. The Sago palm (*Saguerus Rumphii*) grows in the south of China, Japan, and all over the East Indies. The pith of this palm, from which the sago is obtained, is a chief means of nourishment for millions in warm climates, and is exported largely from Singapore, where it is manufactured. In our California climate it is both nutritive and easy of digestion. It is much used for puddings, and constitutes an excellent article of diet for invalids. The Oil palm (*Elais Guineensis*) is a native of the western coast of Africa. The oil is obtained from the fruit, which is about the size of an olive, and of a yellow color. The Cocoa-nut palm (*Cocos nucifera*), which grows by the sea-side in most tropical countries, is especially abundant throughout the South Sea Islands. It forms a fine shade. It makes a good thatch, and excellent baskets. The young leaflets make fans and bonnets; also clothing, goblets, likewise fire kindling, fish lines, and cords, a balsam for wounds from the juice of the nut, and oil for embalmment of the dead. Posts can be made from the trunk, and charcoal to cook with; paddles for canoes, and oars and spears for battle. Lastly, we direct attention to the Donm palm of Upper Egypt (*Hyphene Thebaica*). The fruit of this is much larger than the Date palm (*Phoenix dactylofera*), and is equally nutritious. The rind of the fruit is brown and mealy, and has both the taste and color of gingerbread; hence one of its common names is the gingerbread tree. The spongy, internal portion of the fruit of this palm forms an important article of food, and when this pulp is mixed with an infusion of dates, it constitutes a cooling drink, much prescribed by the Arabs in febrile affections as cooling and demulcent.

THE BULLIONVILLE RAILROAD.—We see by the Pioche Record, that the Nevada Central Narrow-gauge Railroad, between Pioche and Bullionville, has been completed. The new locomotive weighs 36,000 pounds. Another locomotive is in the shops. The completion of this railroad marks an important epoch in the progress of Southern Nevada. The facilities for getting Ely District ores to the mill are greatly increased.

WORK on the tunnel near Martinez, which is being cut through for the road to be constructed from Bantas to Oakland, is being pushed with energy. Two shifts of men are engaged in the work.

IMPROVED ROOFING.

prietor of this patent for the Pacific States and Territories, and those desiring further information on the subject can address him at either place.

PAUL'S PROCESS IN UTAH.—Our Utah exchanges are filled with encomiums on Mr. Paul's "Electro Magnetic Dry Amalgamating Process," which has lately been introduced in that Territory. Mr. Paul has put up a 5-ton mill on the Enterprise mine, at Springfield, Utah, and the proprietors are so well satisfied with its work that they have ordered another of the same capacity. They publish a card testifying to the practicability and efficiency of the process. Mr. Paul has the interests of the mining community at heart, and has labored assiduously to introduce his process on the coast, and is now meeting with a reward. There are now five of these mills in operation, one of which is in Australia. The bullion turned out of the new mill was assayed by Messrs. Selby & Gunter, of Salt Lake City, and shows a fineness of 995, which speaks well for the process. It is pure and clean, and looks quite different from the generality of silver bullion.

COMPROMISED.—The controversy between the Eureka Consolidated Company and the Richmond Mining Company has been amicably settled, the latter company paying a round sum for the title of the Eureka Company to the Lookout ground, which was the matter in dispute between them. It is also said that the Eureka Consolidated mine will shortly resume monthly dividends.

his day. After looking at the place the engineer quietly remarked that he had often heard of castles in the air, but he had never before seen the spot selected for the site of one; yet the aqueduct was built.

It is a little over fifty years since the idea of propelling vessels by steam was pronounced the height of folly. Forty years ago the idea of issuing ten or fifteen thousand copies of a daily paper would be forever an impossibility, for lack of a machine on which to print so large an edition with sufficient celerity; now an edition of 200,000 is no impossibility.

Who could have imagined, fifty years ago, that the sun would ever be employed to print the crimson face, or the moon to take its own portrait? Who, at that time, could have thought that the fierce lightning could ever be so tamed and harnessed to convey the thunder of Senates to their constituents thousands of miles away, as fast as the hurrying words of eloquence fell from their individual lips? Yet all these things and vastly more have been realized during the lives of the present generation, and greater than these are still in store; for let no one imagine that the field of invention and research is any less restricted than it was fifty years ago. The study of the properties of light which, almost within the last decade, has led to the construction of an instrument by which we can analyze the sun or star more readily than we

CORRESPONDENCE.

Little York, Nevada County.

[Written for the Press.]

The Mining Outlook — Short-Water Season.

EDITORS PRESS:—The condition and outlook of the mining interest in this part of the State is not very different from what it was when your traveling correspondent visited and gave such a full and excellent description of it some fourteen months ago. The only drawback to a fairly-successful season in hydraulic mining, the principal branch carried on here, is the threatened short supply of water, which has already ceased to run in some of the smaller ditches, and even begun to fall off in those heading in the higher Sierra; the prospect being that the season will be at least four weeks shorter than usual, owing to the early disappearance of the snow on the mountains.

Mines and Mining in Little York Township.

If we include the adjacent camps of Dutch Flat and Gold Run, there is as much hydraulic mining done, perhaps, in this as any other township in the State; the material operated upon being, at the same time, of a superior quality and the natural facilities for prosecuting the business unusually good. But the ground as yet opened and operated here is not a tithe of what might be profitably worked, could capital be had for fitting up claims and water be procured for washing the gravel. But here is the trouble—the quantity of water is comparatively limited, with no chance for largely increasing the supply. Capital could, no doubt, be had, and of gravel there is no stint, but, about all the water available for mining purposes has already been utilized, the only chance left to much increase the quantity lying in the construction of additional reservoirs, for which there remain still a few unappropriated sites in the mountains. The present summer, however, will see these about all taken up, at least so far as there are any left unclaimed in this section of country.

As regards hydraulic gravel, there is enough along the ridge formed by Bear River, Steep Hollow, Greenhorn and their branches to profitably employ the water flowing through half the ditches in the State. There are here thousands of acres of deep gold-bearing banks, some of them just sufficiently prospected to demonstrate their value, with here and there a small patch washed off or being actively worked, the greater portion remaining wholly untouched. Under these ridges run in every direction sections of the old buried rivers, carrying in the lowest part of their channels the characteristic blue gravel.

The idea of there being but one dead river creating a single blue lead, is, of course, now exploded; experience having shown that these ancient channels are very numerous in this region of country, and that each one has created its own "blue lead,"—this being the color of the gravel wherever it lay sufficiently low to be protected from the influence of the air and the atmospheric water which, by decomposing the iron pyrites present, have tinged the upper strata gravel with a rusty hue. Doubtless there was one main river that, with many meanderings, flowing generally north and south, passed in this vicinity through Quaker Hill, Red Dog, under Chalk Bluff, having here made a sharp curve to the east, after which, doubling on itself, it swept round to the southwest, and passing You Bet, bore off to the southeast through Little York till it reached Dutch Flat, where, making another deflection to the southwest, it held on in that direction through Gold Run, Low Hill, and Forest Hill to Todd's Valley, where it disappears, having been swept away by the Middle Fork of the American River. This central trunk had many branches, vestiges of which are found coming in on the east at Berrington Hill, Mount Oro, Buckeye Hill, Chalk Bluff, Little York, and under or along all the other ridges between Bear River, Steep Hollow, Greenhorn and their tributaries, enriching the diggings at Elmore, Liberty, Lowell, and Remington Hills, and also at Stranahan's, the Cascades, Red Diamond, and many other old camps along these several divides.

A District Set Back from Want of Water.

In passing up these ridges and the cañons separating them, one sees many points where mining was formerly carried on, sometimes by drifting and again by ground-sluicing, or the hydraulic process; some of the latter fitted up extensively and at considerable cost. But there is very little work going on here now, the ditch companies having shut off the water and practically forced the miners out of the country. Everywhere the cabins and hamlets are deserted and in ruins. The branch ditches, which the miners had built at their own expense to bring the water from the main, are half and half filled up, the flumes and sluices decayed, and the iron pipes covered with rust; and this, not because the mines were at fault, but simply because water could not be had to work them. Wherever opened, the gravel here has been found to pay remarkably well, showing that these side channels are equally as good as any other portion of the old river system. On Berrington Hill, lying between the main forks of Deer Creek, and on Mt. Oro, the next ridge south, there is now scarcely a cabin occupied or a miner to be seen, although

there are here more than twenty hydraulic claims; some of them partially, and others thoroughly opened, nearly half of them having been well fitted up and run as long as water could be had, with capital results. On the other divides, between the branches of Greenhorn and Steep Hollow, nearly a like condition of things exists; and yet a thousand men might find profitable employment here, if they had the means to open up these grounds and the water to work them.

A Prospect of Relief.

At the present time a company, made up in part of miners living here and owning many claims on these ridges, and in part of business men, residents of San Francisco, are engaged consolidating these claims with others, and adding much valuable property thereto; it being their intention to bring in an adequate supply of water, through ditches now owned by them, or through others which they expect to procure. This association has been organized under the name of the Bear River and Chalk Bluff Fluming, Ditch and Mining Company, it being a part of their plan to construct an immense tunnel under the divide between Bear River and the North Fork of the American, and laying down flumes in the former, run off the vast accumulation of tailings that have lodged in that stream and its tributaries, and, passing them through this tunnel discharge them into the deep cañon of the North Fork. This company own here several thousand acres of mining land, every part of it permeated by one of the largest of our pliocene rivers and feeders, the whole overlaid by beds of gravel from one to three hundred feet in depth. Their main canal will reach over 150 miles, exclusive of branches, while the extent of their tailing claims are estimated to cover at least 20 miles, and to be 100 feet wide and 50 feet deep. The Company, through its agents, has been very active here for the past two months, making surveys, locating tunnel rights, and otherwise perfecting their preliminary labors, all of which are about being brought to a close. They are said to be financially strong, and have certainly shown no lack of energy or judgment in getting together a magnificent property, and placing the whole scheme on what seems a sound and practical basis. This is by far the most important mining enterprise ever set on foot in California, whether reference be had to the magnitude of the property so skillfully aggregated, the outlay of labor and money involved, or

The Benefits Likely to Result from Its Early and Successful Prosecution.

For many years past the gulches and streams in this neighborhood have been rapidly filling up with tailings, these having so accumulated at some points as to prevent further hydraulic working, and should this cause of obstruction be suffered to continue much longer, work on many other valuable claims will have to be suspended. All attempts at working the great body of these tailings further down stream have signally failed, nor can this be accomplished until an outlet is furnished carrying them clear out of Bear River. This the proposed tunnel would do, nor does there seem to be any other feasible plan for effecting that object. As a consequence its construction, already called for, will soon have grown into a necessity, the exigencies of which will increase with every year's delay. This tunnel has long been a dream with the miners here who see in it the means of relieving them from a threatened evil, and a source of enrichment to those who are to participate in the profits likely to arise from its construction.

Truly marvelous are the stories told of the wealth buried under or supposed to be mixed up with these tailings, it being the current opinion among miners that not one-half the gold they originally contained was ever extracted from them. If these notions be well founded, then must they hold in their keeping many millions of dollars, these gulches and streams whence they came having been amongst the most opulent in California. Certain it is they contain gold enough to warrant the outlay contemplated by this Company, who will make themselves to some extent public benefactors, should they carry this great and useful work to an early completion.

The Following Hydraulic Companies

Are now at work in this neighborhood: Jacob & Sargent at Quaker Hill; Rose & Duryea at Buckeye Hill and Chalk Bluff. The Birdseye Co. at You Bet, and the Little York at this place. They run from four to six streams and consume about 2,000 inches of water, each under a pressure ranging from one hundred and fifty to two hundred and fifty ft. each. They usually make two weeks run, clearing up from \$1,200 to \$2,000 to each pipe, with the exception of the Little York Company, who own three ditches having capacity to carry 1,000 inches each; these parties obtain nearly all their water from the South Yuba Company, who own the most extensive system of canals and the best water franchise in the State. Although they sell water at the low price of 12½ cents per inch for 24 hours, their revenues are large and their property very valuable; of the ten or a dozen cement mills operating about here a few years ago not more than two or three are now running; the manner in which the cemented gravel is now broken up with powder and the powerful streams brought to play upon it, aided by the present more efficient system of undercurrents and dumps, enabling the miner to extract the gold from this material pretty effectually without recourse to crushing, which

besides being expensive was a very slow and tedious method for disposing of it.

H. DEGROOT.

Little York, Nevada Co., June 7, 1873.

A California Miner in the East.

[Written for the Press.]

EDITORS PRESS:—Since I bid you adieu, I have wandered through the mining regions of the East, from northern Jersey to northern Georgia, where I find a decided difference in visiting these mines, to those of the West; there is not such suspicion expressed by the officers; and the "No Admittance" which is frequently seen in the West, is rarely met with in the East; everywhere I applied I was politely escorted through the mines, and went whither I pleased. In the neighborhood of Dover, New Jersey, a stranger is surprised at the amount of magnetic iron ore excavated daily, from veins imbedded in gneiss, and extending for many miles in length. The most extensive mine is "Mount Hope," yielding about 10,000 tons monthly, employing nearly 700 men.

The Coal Fields of Pennsylvania

Are so well known that even a hint here is needless. In the southeastern part, Lancaster county, are situated the nickel mines which were wrought for copper prior to the "Revolution," at which time the nickel was cast aside as valueless; now it is the chief ore sought after. I was under the impression that these mines formed well defined veins, but it is otherwise, being very irregularly deposited between two formations, hornblende and slate. These deposits are composed of a superfluity of iron pyrites, (which nickel ore very much resembles) copper, cobalt, etc., with myriads of rounded pebbles, from the smallest size imaginable to large boulders, all of a substance foreign to the surrounding strata. South of these mines in the same locality are the abandoned chromium mines in a similar formation (serpentine) to those deposits so plentiful in the Coast Range mountains. There are but few

Mines in Operation in Maryland,

Except in the western part, wherein is the Cumberland Coal Basin which produces large amounts of bituminous coals. West Virginia is of a similar nature. Old Virginia is awakening slowly from her lethargy.

Eastern Tennessee.

There are many mines in operation, yet on a small scale, except at Ducktown copper mines, which are superficially extensive, its characteristics being very similar to the copper mines of the West which are enveloped in mica, slate, carbonates, black oxides, yellow sulphurets, finally an excess of iron pyrites.

In North Carolina

There are but few mines working, which are coal and mica. All the Southern mine holders are flattering themselves with a hope that capitalists will come from the North and develop their mines—hence their cry, "come and help us." Unfortunately for them the West has the precedence and thither will the capitalists go.

Miners in the East.

I am pleased to relate that capitalists have displayed better judgment in carrying on their mines East than they have generally done, when investing west. Of course there are a few exceptions, but the majority of the superintendents are truly practical miners who commenced life by excavating the secreted treasure of the earth for a livelihood and having worked their way to the summit of their ambition, there is no trembling or rapid pulsation of the nerve when a stranger arrives at their works for fear of being questioned. Notwithstanding they have not been taught at the "school of mines," where theories appertaining thereto, in many instances, are nearly as vague and unsatisfactory as astronomy was in the days of Galileo, but have been taught by experience in the laboratories of Nature—where all who desire to become useful and economical servants for mining proprietors must be trained, notwithstanding other assertions. Neither must it be believed that all men who have labored in mines from their youth up are adequate for the undertaking and carrying out of mines properly; perhaps, not one in fifty or even a hundred are trustworthy.

Mining Management.

Yet rarely those who are intelligent and competent—having passed their whole lives in the one occupation—should be taken in preference to those who have spent their life behind the counter of a dry goods establishment, or four years (equivalent to two years of a miner's observations) at a "school of mines," as we have frequently seen in our wanderings. Suppose an incompetent person were put captain of a ship, and that ship became wrecked through his ignorance, would the material which composed that ship be censured? No; but the captain in charge—but this is not the case in mining—it is the non-productiveness of the vein, etc. (alas! ignorance of its captain in many cases) that produces failure. Sometimes it is asserted that so and so will do very well for to manage mines if he can get a good, intelligent "boss." That is another delusion—ridiculous in the extreme—for of what use is he there, if the boss performs the duty incumbent? He is nothing but a drone on the company or part of it, because he must have influential friends to keep him there, not a good mining reputation. Such men like to make a display of buildings, etc., at surface,

meantime negligent of the development of the mine—or see a company I know who had \$45,000 expended at surface and \$5,000 under ground and then abandoned it for lack of funds—having paid that sum to learn that a miner understood mining better than a salesman from a dry goods establishment. Not only American capitalists act thus ignorantly but English also. I know some of the best direct from England to the West to take charge of mines who, at the same time sorely knew a mine from an extinct volcanic crater. Then, what can be expected of such but failures? Yet they are not censured; but the veins, formations, etc.; in fact, the whole region round about.

There is Another Error

Which many of the greatest experts have made. Is it possible that a stranger can enter a large mine, or even a small one, and report in favor of, or against it, by being ushered through it every part in a few hours? Experience says not. He may be, as a mining engineer remarked to me a few months since, "I have been very lucky; I generally guess right!" This gentleman was brought up at a mining school; so he told me. A gentleman like Prof. Silliman may enter a mine and give his report in "tee, idee, 'ice and 'ers—words foreign to the masses of the people, yet this does not demonstrate the fact that his opinion is preferable to a report of an honest, intelligent miner. Can you tell a dozen of instances in the West where the erratic geologist ever placed a miner to work which proved profitable? I think not; but the miner has first to discover, then the geologist follows and relates how it came there.

T. S.

SILVER AND COPPER SMELTING WORKS AT TUCSON.—The Tucson Citizen of the 27th ultimo contains the following: Furnaces are being erected six miles south of Tucson for the purpose of smelting silver and copper ores. Old smeltworks and smelting works are to be seen at this place that were erected and successfully operated years ago, but the Apaches constantly levied contributions upon the horse and mulee in use, and one by one murdered the employee and owners, until the works were abandoned. We understand that Messrs. Simpson & Meyers have made a contract for smelting some ore from their mine, and are now preparing to haul the ore to the furnace. Smelting will soon commence in Sierra District. Some of the ore from that district recently taken to Mexico and smelted, paid \$1 per pound in silver. Thomas Yerkes, Superintendent of the Patagonia mine, is piling up crude bullion mountain high. Unless some arrangements are soon made to freight it away, he will get so much of it on hand that he will have to wait until the railroad is completed.

BRAZILIAN DIAMOND MINING.—The Anglo-Brazilian Times of April 23d says: The large bands of garimpeiros, who this year equated on the diamond and gold lands leased by various companies and individuals, in the district of Diamantina, Bahia, and were maintaining forcible possession of washings, had been, at last, driven from their usurpations by a body of soldiers sent up for the protection of the lessees. A Rio correspondent of a Buenos Ayres paper, reported this one of many repeated conflicts between the lessees and the gold and diamond squatters as an insurrection of an Indian tribe of 3,000 men! Much enmity exists between the companies and the garimpeiros, the latter objecting to the practical monopoly of the good washings and accusing the authorities of unduly favoring the great miners. Hence the frequent illicit squatting on the leased lands and periodical disturbances, sometimes requiring bodies of troops to effect wholesale evictions from the squattings.

THE SAN FRANCISCO MINT has coined during the fiscal year the sum of \$17,061,500, of which \$94,500 was silver and the remainder gold. In July the sum coined was \$2,245,000; August, \$730,000; September, \$1,264,500; October, \$1,895,000; November, \$1,525,000; December, \$1,436,600; January, 1873, \$900,000; February, \$1,219,400; March, \$1,140,000; April, \$1,282,000; May, \$2,772,000; June, \$652,000. The total coinage for previous year was \$18,745,500, of which \$955,500 was silver and \$17,790,000 was gold. The sum of \$8,700 was turned out in dollar pieces.

UNNECESSARY ASSESSMENTS.—The Pioche Record hears that public meetings of resident stockholders of several mines are suggested to take action against Trustees levying assessments when the corporations they represent have, or ought to have, money in their treasury. The plan is to secure co-operation with foreign stockholders, through correspondence.

THE RAYMOND & ELY mine is said to have about \$800,000 in its treasury, or \$26.33 per share. The Record says the amount due shareholders is increasing at the rate of \$5 per share per month.

A WIRE TRAMWAY, Hallidie's patent, one and a quarter miles in length, has been contracted for and will be put up on the Chicago Silver Mining Company's property in Utah.

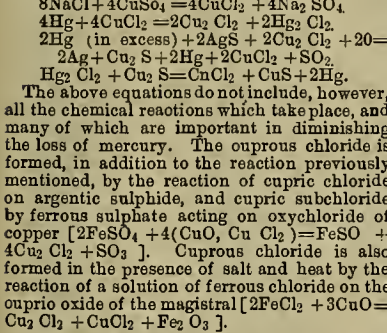

A RICH gravel claim has been struck in the vicinity of South Fork, Enreka Township, Nevada county in this State. The yield is half an ounce a day to the hand.

PROSPECTORS from Grant District have brought into Pioche rich looking specimens of free milling ore.

SCIENTIFIC PROGRESS.

Theory of the American Amalgamation.

This *Berg-und Hüttenmännische Zeitung* publishes a paper devoted to combating the views advanced by De Visl in the same journal for 1870. According to Gruetzner, the magistral is the chief agent in inducing the commencement of the amalgamation, and the mercury is the principal reducing agent. The surface of the silver particles is converted to argentic chlorides by salt, and this former is reduced by mercury, $2AgCl + 2Hg = Hg_2Cl_2 + 2Ag$, and the pure silver beneath the chloride at once amalgamates with the mercury. This mercury promotes the reduction of cupric chloride to cuprous chloride, and is changed, in small quantities, to mercurous chloride, which exerts the same reaction as cuprous chloride on silver and its compounds. It also reduces the cupric oxide, which is constantly striving to form and which is able to convert even silver suboxide, to cuprous oxide, chiefly in the presence of a concentrated sodium chloride solution, and decomposes it, being aided in this by the concentrated lye. The mercury also reduces the argentic sulphide, with formation of sulphuric acid, to metallic silver, which last is absorbed by the mercury as soon as formed, while the sulphuric acid set free decomposes the sodium chlorides, which aids very much the completion of the process. Consequently, the practice of the American amalgamation depends more on an exposure of the surface of the metallic silver (in decomposed ores) and decomposition of the argentic sulphide to metallic silver than on the formation of argentic chloride. This theory is supported by the unusually favorable action produced by the addition of metallic copper, or still better, copper amalgam. The reactions are: $20 + 2Cu_2Cl_2 = 2CuO + 2CuCl_2 + 2Hg + 2CuO$ (striving to form) $= Cu_2O + H_2O$; $Cu_2O + H_2O + 2AgS = Cu_2S + SO_2 + 2Ag + 2Hg$, and the amalgamation takes place thus: $2Hg + 2AgS + 2Cu_2Cl_2 + 20 = Cu_2S + 2Hg + 2Ag + 2CuCl_2 + SO_2$, the last being converted by the air and oxychloride of copper to sulphuric acid. The excess of mercury or of silver amalgam formed in the patio acts—after exciting electrochemical activity, in consequence of friction, of contact, and of the action of the cupric chloride under the influence of some chlorides—in such a manner as to form sub sulphide of copper, sulphuric acid, cupric chloride, and metallic silver thus:—

The Most Dangerous Explosive in the World.

Hydrogen and oxygen can be liquified together by simply burning the hydrogen in the oxygen, or vice versa; the result is of course water. But if we could succeed in liquifying a mixture of the two gases in the proper proportion by mere pressure, or any chemical means, without combustion, we would obtain a most violent explosive, as then all the latent heat of dissociation would be set free at the moment of ignition, and starting from a very concentrated spot, the expansion of the gaseous product would take place with the most enormous rapidity. Similar conditions are met by nearly all explosives in which the active materials are more or less diluted with other ingredients. In gunpowder the carbon and sulphur are in close proximity to an amount of oxygen sufficient for the complete combustion. This oxygen is in the nitre, in which it is kept by the potash and nitrogen, which latter two only dilute the force of the compound, but are necessary to keep the oxygen in the solid state. It is the same with gun-cotton, in which the carbon and hydrogen are the combustibles, while nitric acid is combined with them in sufficient amount to furnish all the oxygen needed for their combustion. Nitroglycerine belongs to the same category, while the compounds made from it, as dynamite, giant's powder, etc., are merely diluted nitroglycerine, in which the force is diminished to some extent by foreign ingredients, in order to obtain other advantages desired in some circumstances. But there are other supporters of combustion than oxygen; such are the so-called halogens: chlorine, bromine, iodine, the affinity of which to hydrogen is very great. In supporting the combustion of this element they develop a great heat, and form respectively hydro-

chloric, hydrobromic, and hydroiodic acids. This mixture of chlorine and hydrogen gas explodes much easier than that of oxygen and hydrogen. Mere exposure to the solar rays is sufficient to ignite it; and it is this mixture, when liquified to an oily consistency, which is the most dangerous explosive in the world. It cannot, however, be produced by direct compression, but by chemical agency; and here again the nitrogen is used, as in the former explosives, to hold the two elements close together, without that they have given of their latent heat of dissociation by combustion.—*Manufacturer and Builder.*

Creation.

The scientific theory that creation and annihilation are impossible, and that the laws of nature are immutable, is not in accordance with exact science, and is, therefore, an error; for every change is only annihilation of the old and creation of the new; and every progressive step, whether universal or local, is the repeal of an old law, and the enactment of a new and better one. What we are cognizant of as the physical universe is not matter itself, but the force which actuates it, and variety of quality in matter, is only variety of molecular motions. Therefore, as changes of color occur by refraction; of taste, by chemical action, and sound, by length of rhythms, so all creations of which we are truly conscious, are but modes of motion, undergoing constant annihilation and re-creation.

Nothing, then, in the physical universe is immutable but elementary motion and matter, being wholly imperceptible to mental sense, is rather an immutable principle in nature than a creation; for how can we conceive of a thing of which we cannot be cognizant. And the only immutable principle in natural law is, that motion inevitably takes the direction of least resistance.

All physical things then, of which we are conscious, being modes of motion, creation consists in forming such channels of least resistance as produce those modes of motion which effect consciousness as physical qualities. This being the only definition of creation, which harmonizes with exact science, is the datum from which true ideas of the creator may be formed.

Science has taught us that the potency of wisdom is superior to physical power, and is competent to resist and change the directions of physical motions; it, therefore, logically follows that Supreme Wisdom is the creator of those intelligent modes of motion which constitute the concrete universe of animate and inanimate matter, the scrutiny of which is scientific research, and the knowledge gained thereby is exact science.—*Am. Artisan.*

THE MANAGEMENT OF AQUARIA.—The walls of aquaria, exposed to light, become covered with a growth of cryptogamous vegetation. M. Charbonnier has observed that sometimes two or three days are sufficient for the full growth of this green moss, while at other times it hardly appeared in eight or ten days. He has noticed that every month, at the time of full moon, the vegetation has its maximum of intensity, and it is almost nil at new moon. At full moon a daily cleaning is needed; whereas, this period over, cleaning twice a week will be sufficient. M. Charbonnier has also made observations on the germs of microscopic ferns in water coming to his reservoirs from the Ourcq, in Paris. This water passes a considerable distance in the open air.

Now, the quantity of these germs is found to be very variable, and it is greatest at the time of the full moon. The explanation he suggests for such a curious phenomenon is as follows: Vegetable germs lying at the bottom of a stream are raised in sunlight by the gas bubbles, they then give off in respiration, and which continue some time attached to them. When night comes on the bubbles disappear, and the plants sink again; but if there is strong moonlight the production of gas continues, and they are kept floating; hence the superabundance met with at full moon.

IGNITION BY SUPERHEATED STEAM.—In view of the interest lately manifested with regard to ignition by superheated steam, a correspondent of the *Scientific American*, from Frankfort, Ky., sends that journal the following singular fact which recently occurred under his own experience. He says:—"I had prepared some gun cotton, and after washing it a little from the acids, I laid it on the T joint of a steam pipe to dry, 80 yards distant from the boilers; the pipe runs 40 yards of the distance under ground. In about three minutes, there was a flash like lightning; the cotton I laid on the T joint had exploded by spontaneous combustion."

I have often seen cotton yarns and raw cotton, that have been dyed with sulpho-nitrates and nitro-muriates, ignite in a few hours, being in contact with superheated steam pipes. May not wood, under certain circumstances, absorb inflammable gases, and thus be rendered more liable to spontaneous combustion?"

SAVING THE CAFFEINE IN ROASTING COFFEE.—It is proposed to save the caffeine, the most of which is now wasted in the process of roasting coffee, by attaching a condenser to the roaster. A pound of coffee will yield an average of about 75 grains of caffeine. As the annual consumption in this country amounts to some 25,000 tons; if this saving could be effected on all the coffee roasted, it would amount to about 375 tons annually of this most valuable part of the berry.

MECHANICAL PROGRESS.

Sulphur and Phosphorus in Iron.

The worst comparative feature of American pig iron is the sulphur, which averages 0.207 in the American, against 0.035 in the English Cleveland, or nearly six times as much; while the other general enemy, phosphorus, stands at 0.16 in the American, and 1.27 in the English—I. e., nearly eight times as much in the latter. The relations of these are thus reversed, and this reversal corresponds with that of their detrimental importance in the manufacture of rails, plates, etc., of the past and those of the future. Sulphur is the old enemy of the puddler, and the great enemy of the modern manufacturer of Bessemer work, and of all other steel, is phosphorus. The difference is of considerable practical importance.

Although the best of all pig for Bessemer work is that which contains neither phosphorus nor sulphur, or the smallest possible quantity of each, there are good reasons for believing that where a notable quantity of phosphorus is present, a balancing proportion of sulphur is rather beneficial than injurious. Thus, a pig containing, say, 0.15 per cent. of sulphur and 0.12 of phosphorus, would make better Bessemer rails, tires, etc., than another pig containing 0.12 of phosphorus and no sulphur, other constituents being the same.

This future development of iron manufacture is evidently in the direction of substituting semi-steel—such as is now produced by the Bessemer process—for ordinary puddled iron. The superiority of Bessemer rails and their greater practical economy is fully established. Whenever these are laid down, tires of equal, or greater hardness, become indispensable, thus two of the heaviest elements of railway plant are demanded. As the skill of the Bessemer workers improve, and they go on vanquishing their chief difficulty by securing a more reliable homogeneity and constancy of composition, the applications of Bessemer steel must extend to boiler plates, ship plates, angle and T iron, to engine shafts, to girders, to bridges, and all other structures and elements of structure where strength of material and economy of weight are demanded.

CAST IRON ENAMELING.—A great improvement is effected in pump cylinders of cast iron by the process of enameling, and the following method of treatment has recently been recommended as the most simple and practicable for accomplishing the purpose.

To separate the graphite, they are laid for two or three hours in an acid bath, and then well washed off with water and brushes. A mass consisting of thirty-four parts quartz, fifteen parts borax and two parts carbonate of soda, is then uniformly spread on; the pipes are then heated for ten minutes in a muffle of a semicircular cross section, three feet wide and nine feet long. They are then withdrawn, cooled, and coated uniformly with a glazing composition consisting of thirty-four parts feldspar, nineteen parts quartz, twenty-four parts borax, sixteen parts oxide of tin, four parts fluorspar, nine parts carbonate of soda and three parts nitre. The mass is prepared by melting the materials together in a crucible and then grinding them in a mill, with the addition of water. After the cylinders have been covered with the glazing, they are heated in a muffle to a white heat for twenty minutes, and are then withdrawn and coated with coal tar before they are cold.

REVERSING GEAR.—Considerable inventive genius has been expended of late in devising some method whereby the shocks arising from reversing rolling-mill gear and other heavy machinery where clutches are employed, may be, to a certain extent, obviated. One of the latest and most promising devices proposed was recently made by Mr. Jeremiah Head, and described in a paper read before the Iron and Steel Institute, at London, (Eng.). His plan is to make arms of flat-plate springs, laid up in leaves like those of car-springs, with this exception, that the leaves are straight, instead of bent, as in the ordinary car-spring. It is evident that, on this plan, if the center of the wheel be suddenly checked in its motion, the rim will advance in its revolution to an extent limited by resiliency of the spring arms.

Mr. Head went through elaborate mathematical calculations to show that the strength and resiliency of these spring arms would be ample for the purpose, and he gave diagrams illustrating the details of the construction.

IMPORTANT MINERAL DISCOVERY IN ENGLAND.

Extensive discoveries of Speigle iron ore have recently been made in North Devonshire, Eng., on the line of an important railway. This discovery is especially important when considered in connection with the manufacture of Bessemer steel, as hitherto the chief part of the Speigleisen, for the English furnaces have been derived from Germany, and the increasing demand therefore, and short prospective supply of the ore has increased its value at Rotterdam, from about \$30 to \$75 per ton. Hence, any new deposit of ore suitable for the production of Speigleisen is of the utmost importance to the steel stock. Speigleisen is employed for carbonizing in the Bessemer converter.

GUNS AND GUNPOWDER.—This problem of throwing the largest possible projectile with the greatest possible velocity, must be solved in one of two ways, either to strengthen the gun or so modify the powder that the cannon can stand the discharge with less strain.

The first method has been the one generally adopted, until this utmost practical limit in that direction has been about reached, and engineers are now turning their attention to the second proposition. Mammoth powder was first introduced to reduce the rapidity of combustion and thus briag the pressure to bear on the projectile gradually. Though the mammoth powder reduced the rapidity of the combustion, the greatest pressure still existed when the projectile had moved only a short distance, and necessarily diminished with the diminished surface of the grain as the shot traversed the remainder of the bore; while the desirable object is to increase rather than decrease the rapidity of the combustion from the instant the shot commences to move.

To obtain this desirable result it is now proposed to make the powder in large grains with several preparations, by which a small surface will be presented at first, which will rapidly increase by having their walls burned away.

SCIENCE AT FAULT.—Soon after Mr. Bessemer commenced his experiments, it was found that certain qualities of pig iron were utterly unfit for his process, and in this way scientific enquiries became inevitable in order to discover the cause. The chief source of trouble was traced to the presence of phosphorus, and next followed sulphur. It was then proved that if the former exceeded .06 or .07 per cent., the iron containing it had to be rejected. No sooner was the evil influence of these two substances detected than any number of (so-called) specifics were proposed to eliminate them from the iron, more thoroughly than could be done in the ordinary puddling furnace. But as yet no marked progress has actually been made, and Mr. Bessemer has to confine his process to iron produced from ores which contain no sulphur.

It is hoped, however, that as our knowledge of the chemical relations which exist between iron and other substances advances the great problem of eliminating those enemies to iron above named may be satisfactorily solved, so that all classes of ores of iron may be economized by this truly wonderful process of conversion. Such a result, however, will be accomplished only at the expense of long and patient study and experiment.

AMERICA ACKNOWLEDGES TO BE ENGLAND'S RIVAL.—I. Lowthian Bell, in his address to the members of the English "Iron and Steel Institute," said: "It is not the old world of Europe we have to fear, but the immense and undoubted powers possessed by the western hemisphere. In ores of the finest description, the resources of the United States are unlimited, while in coal our own wealth is, in comparison, but poverty." "In the matter of skill, every one who has had the opportunity of inspecting the American iron works concurs in reporting that their development is quite in keeping with the advantages Nature has conferred upon that highly favored country."

IRON SHIPS WITHOUT SEAMS.—A mechanic in Philadelphia proposes to build steamships of one solid piece of iron or steel, without seam or joint. This he accomplishes by welding the plates and frame, instead of using bolts or rivets. He claims that he has invented machinery by which the thing can be done, at a great saving of cost, of weight and of time, and with a great gain of strength and durability.

COMPRESSING MOLTEN STEEL.—It is found necessary, in order to remove the air cells from molten steel by Whitworth's plan, to subject the fluid metal to a pressure of twenty tons to the square inch. Steel so compressed has been found, without further treatment, to bear fully double the terrible strain of the best iron made after the ordinary manner.

RAPID WORK.—One of the small engines employed to drive the machinery in the American Department at the Vienna Exhibition was lying at the works in pigs only twenty days before the vessel sailed by which it was taken to Europe. The engine has a 12-inch cylinder with 24-inch stroke, and was constructed at the Norwalk Iron Works, New York.

DURABLE CRUCIBLES FOR MELTING STEEL.—Such crucibles are prepared from a mixture of 10 parts ground and washed chamotte, 10 graphite, 15 asbestos, 3 quartz (not too finely powdered) and 22 fireproof clay. The asbestos, as a fibrous body, prevents the falling asunder of the crucible when cracking, and thus any loss can be prevented.

"INDURATED TAR," whatever that may be, it is claimed, does not crack, shrink, nor blister, and on that account it is thought would be well adapted for coating iron vessels. It is now being tested for that purpose in a British Government dockyard.

GLASS-LINED WATER PIPES, already alluded to in these columns, are being generally introduced into the dwellings of New York city. These pipes are, of course, free from the objections peculiar to all-lead pipes.

THE heating of buildings by hot air was practiced in Germany nine centuries ago. It is not, therefore, a modern idea, as is generally supposed.

Our Weekly Stock Review.

THURSDAY EVE, June 19, 1873.

There has not been very much doing in the Stock Market this week. There has been so much decline in business of late that the Board has resumed 11 o'clock as the hour of meeting. Our Comstock letter in another column will give a good idea of the state of things in that locality. The Crown Point and Belcher mines which combined have paid \$2,040,000 in dividends this month are still improving. The usual quantity of ore was not raised from the former last week on account of the breakage of the main spur wheel of the hoisting gear. The pattern in this city was destroyed by fire recently, so it will take nearly two weeks to replace the wheel. The controversy between the Eureka Consolidated and the Richmond Mill & Mining Co. has been compromised by the payment of \$85,000 by the latter Co. for the Lookout Ground. The Eureka Consolidated declares a dividend of \$1, payable on the 24th inst.

As showing the rapid quarterly increase in ore production and value of ore in the two leading Comstock mines the following official returns from the assessment rolls of Storey County is interesting:

1871.	Belcher.	Crown Point.	Pr. ton.	Val.	Val. Tons.	Pr. ton.	Val.
Quarter to	Tons.	Tons.	Tons.	Tons.	Tons.	Tons.	Tons.
March 31....	279	1,034	5,908	\$125,574	\$11 28	53 42	
June 30.....	18,972	719,122	37 81				
September 30	2,680	212,038	17,240	\$26,885	30 56		
December 31	15,790	985,848	17,828	\$59,924	33 65		
1872.							
March 31....	20,998	1,071,350	19,121	\$1,030,149	53 42		
June 30.....	21,932	1,203,037	35,183	\$1,739,746	50 10		
September 30	17,431	1,015,414	33,379	\$1,041,475	32 16		
December 31	23,131	1,504,858	24,079	\$67,478	31 70		
1873.							
March 31....	30,926	2,055,896	43,108	\$2,405,211	57 80		

Two months of the June quarter already show an increase over the production of the total quarter ending March 31st, and the product will probably double the latter.

We have had quite a number of assessments this month, but the dividends far exceed their amount. Three new companies, the Black Bear Quartz, K. K. Consolidated and La Grange, declared their first dividends and the Meadow Valley and Eureka Consolidated have come in the dividend paying list again. These, in addition to the large dividends of the Crown Point and Belcher, foot up a goodly sum. The eight dividends this month are as follows:

NAME.	PER SHARE.	AMOUNT.
Belcher.....	\$10.00	\$1,040,000
Black Bear Quartz.....	50	15,000
Crown Point.....	10.00	1,001,000
Eureka.....	1.00	20,000
Eureka Consolidated.....	1.00	50,000
K. K. Consolidated.....	25	7,500
La Grange.....	25	7,500
Meadow Valley.....	1.00	50,000
		\$2,200,000

The following assessments were delinquent in June:

Name.	Per Share.	Amount.
American Flat.....	50	\$15,000
Alpine.....	\$1.00	12,000
Alps.....	50	15,000
Bowery.....	50	15,000
Golden Charlot.....	2.00	20,000
Hayes.....	25	12,500
Hermes.....	3.00	90,000
Huhn & Hunt.....	1.50	45,000
Insurance.....	25	7,500
Minnesota.....	1.50	30,000
Mint.....	10	3,000
Mazappa.....	50	15,000
Noonday.....	25	5,000
Peavine.....	25	7,500
Pioche-Phoenix.....	1.00	40,000
Pioche West Extension.....	50	15,000
Regent Consolidated.....	10	3,000
Rising Star.....	1.00	10,000
South Charlot.....	50	10,000
Spring Mount.....	50	15,000
Standard.....	2.00	20,000
Utah.....	1.00	20,000

This list foots up the sum of \$430,500, while the dividends are \$2,200,000, leaving a balance of \$1,769,500 in favor of stockholders. The assessments and dividends since January have been as follows:

	—Assessments—		—Dividend—	
	No.	Amount.	No.	Amount.
January.....	24	\$550,950	5	\$573,181
February.....	30	636,000	7	819,000
March.....	36	681,950	5	811,000
April.....	18	338,860	4	1,980,000
May.....	20	616,900	3	1,872,000
June.....	22	450,500	8	2,200,000
Total.....	150	\$3,354,260	33	7,365,181

This leaves a balance of \$4,010,921 in favor of stockholders.

On Friday last the market was rather dull with the exception of Crown Point. At close compared with previous prices, Crown Point was \$3 lower on sales of 245 shares; Savage \$4; Belcher rose \$2; Hale & Norcross \$1.50; Meadow Valley \$1; Yellow Jacket \$1.50; and Ophir \$1.

Saturday showed another weak market except for Crown Point, the low price of which brought in buyers. At the close prices showed a very general decline: Belcher 3; Ophir 3; Hale & Norcross \$4; Kentucky \$1; Ophir \$1; Overman \$2; Savage \$2; Crown Point rose \$1, and after the Board \$104 was bid.

On Monday the market was stronger than on Saturday and Crown Point rose \$10. The break in this stock was explained by the fact that the stock of Mr. Patten, deceased, consisting of 2,700 shares was thrown in the market at a sacrifice. The mine looks better than ever. At close Belcher was \$1 higher than on Saturday; Chollar \$5; Con. Virginia, \$5; Gould & Curry, \$2; Hale & Norcross, \$4; Kentucky, \$5; Overman, \$3; Savage, \$20; Seg. Belcher, \$5; Jacket, \$4.

On Tuesday the market was rather quiet; but prices for most kinds were better. Wednesday showed a weak market and a decline in prices.

To-day the market was weak and prices irregular; a decline is apparent; closing prices may be seen by reference to our stock tables.

The following items of interest from prominent mines are collated from letters or telegrams from superintendents on file at the offices of the respective companies in this city.

Crown Point.

Dispatch of the 18th says the crosscuts from third and still floor 1300-foot level, are both in porphyry. We are running a drill on the 1400-foot level. No change elsewhere.

Chollar-Potosi.

Letter of the 17th says during the 24 hours ending this morning, 152 tons 800 pounds of ore were taken from the mine. Average assay value of the same was \$32.40 per ton. Drift on fourth station has a better appearance in the face, the material is better, progress more rapid. Ore face and ore producing sections have changed more during the past 24 hours. Ore slips for the 15th were 181 tons, 1,650 pounds.

Caledonia.

Letter of the 17th says that since the last report no change has taken place in the ground in the main drift on the second station. The ground in the south drift is hardening considerably. The water is rising a little, and is hot troubling as much. The general work in and about the mine is going on as usual.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned:

ALPINE COUNTY.

TABERNER.—Alpine Miner, June 14: Mint returns from the crude bullion sent down by Mr. Hunter from the recent short run at this mill, shows a much better result than was expected. The value of the bullion was \$392, and on a close calculation of expenses considerably over half a clear profit per yet used in hydraulic mining. Besides this Mr. Hunter has several tons of nice sulphurates saved, and altogether the result is so satisfactory that an increased force is to be put on the mine, and another run of the mill soon made.

STICKLES.—Calaveras Citizen, June 14: Word was received at Angels, from San Francisco, June 4th, to shut down this mine. On the day following, Thursday, a drift was started into the hanging wall, and they had not run more than 2 ft. before they struck the vein. This will be seen that the Company have been working within 2 ft. of the vein for the last two months. They have a vein over 8 feet wide, and are not through it yet. The rock shows free gold.

GAUNDALF.—This claim, situated at Robinson's Ferry, is looking well. The Company have a vein 8 ft. thick, showing free gold. We understand that Dr. Rodgers is there looking at the mine. The Co. intend erecting a mill shortly.

Bio Minx.—Rock in this claim, at Angels, is looking better, but continues hard.

COMET.—Last week the proprietors of this mine crushed 10 tons of rock, taken from their lead, which is situated about 1/4 mile from San Andreas. The rock was not as good as that from the lead, but it was very rich. The result was fully up to their expectations, and we are informed the rock paid \$20 per ton.

PLACER COUNTY.

DEUTER FLAT.—Placer Argus, June 13: The Staples Bros. have recently had manufactured about 3,000 ft. of new pipe, varying in diameter from 11 to 42 inches, for the Sunset claim. They have also one of Hoskin's Little Giants, and are at present working at the unusual and tremendous pressure of 460 ft., which will soon be increased to over 500 ft. This is without doubt the heaviest pressure ever used in hydraulic mining. Some idea may be formed of the tremendous force of the stream when it is known that a strong man cannot strike a crowbar through it. For the information of miners and others interested I would say that the heaviest iron used on the pipe is No. 16; riveted in a single row, rivets 1 inch apart.

Mr. Ludlum, manager for the English company, is engaged in clearing off, preparatory to raising a shaft in the Jehoshaphat claim, next to the Sunset here, also (as in the Sunset) in the prospecting of all parts of the ground about 80 ft. in the shallow part, and very much richer than any that has yet been washed in this claim.

The Miners' Ditch Company, of Old Run, have received their Burleigh drill and the machinery to drive it, and calculate when they get all set up and running to make a short job of their tunnel. When this tunnel shall have been completed and the bottom gravel in the Blue Lead commenced to be worked, then hydraulic mining will have been about commenced in this section. Some idea of the extent of the gravel deposit in this section may be formed when it is known that in the Cedar claim, which is on the lead, gravel of about an average depth of 175 ft. has been washed. Mr. Kipp, the present manager, is sinking a shaft, and is already down 100 ft., and the gravel is soft and prospects finely. Mr. Kipp does not anticipate striking bottom until he has reached a depth of about 230 ft.

SIERRA COUNTY.

FOREST CITY.—Downville Messenger, June 14: Since the success of the Bald Mountain Mining Co., Forest City has taken a new lease of life and prosperity. The Co. have been working from 60 to 80 men up to Saturday last week, when, it becoming evident that they would have hard work to do for the summer, they suspended work for a week to enable them to wash up their dirt, and enlarge their dump. A new reservoir has been put in at a cost of about \$1,200, which the water they now have fills some 7 times in 24 hours, each reservoir full, enabling them to run about 1 1/2 hours. When all their arrangements are completed they will be enabled to keep their water force working all summer.

The South Fork Co. have their new tunnel in about 100 ft., are pushing forward to pay gravel as fast as possible.

The North Fork are also well on their way to their lead. A new company has been formed to sink a shaft near the old Oalloway Ranch, for the purpose of prospecting for the extension of the Bald Mountain lead.

The Alaska Quartz Mine, at Pike City, which paid well as long as the machinery they had would keep the mine clear of water, is likely to be sold to parties able to put in heavier machinery. When this is done, it will be one of the best paying mines in the mountains. With a five-stamp mill, during the short time this work is done, it will do over \$30,000.

REPUBLICAN.—The Twenty-one Quartz Mill, near Alhambra, is running again, on rock taken out some time since, for the purpose of clearing it away to make room for further working. It is supposed the rock will pay.

TUOLUMNE COUNTY.

REPUBLICAN.—Tuolumne Independent, June 14: This mine (adjoining the Orcutt) has just cleaned up 30 tons, supposed to pay \$25 per ton.

SPRING GULCH.—For the month of May at the Spring Gulch mine the wash-up was 170 ounces.

GRIZZLY.—This mill is running Louisiana rock. The mine is being carried by by Maynard & Kimball, of San Francisco.

ORCUTT.—They are running a four-stamp mill, and are getting out rock from their chute that will pay \$200 per ton easy. They are down 60 ft. below water, where they are taking out their rock.

Nevada.

ELY DISTRICT.

SILVER PEAK.—Pioche Record, June 14: The work of grading for the machinery is about completed. There is now on the dump about 50 tons of assorted ore—first class, ready for shipment.

SPRING MOUNT TUNNEL.—Work on ledge No. 3, in this tunnel, is being prosecuted night and day, the shaft having reached the depth of 90 ft. since the resumption of work on the 23d of May last, with greatly improved prospects of soon reaching good ore. The ledge has steadily increased in width for the last 20 ft.

CHIEF EAST EXTENSION.—The main shaft is now 175 ft. below the 90 ft. level. The ledge at this point is 3 feet between the walls—well defined and showing some good ore on the foot-wall.

RAYMOND & ELY.—The hoisting works are in course of rapid completion. The foundation for the engine is the richest piece of workmanship. The engine to be next put up will be 80-horse power, and securely anchored. There is a large amount of ore on the dump.

MEADOW VALLEY.—Running about as usual. Now awaiting the arrival of another engine from San Francisco, which is expected soon. When it is received it will be placed on No. 3. Work will then be carried on on a more extensive scale. Even with one engine the Company sends off about \$5,000 in bullion daily.

ARIZONA.—Drifting steadily for the ledge from 300-ft. level—and taking out ore from the upper works.

BROOKLYN.—The winze from the 80-ft. level is now down 35 ft. The ledge is about 4 ft., with some good

ore through the vein. There is every indication of their near approach to a rich body of ore.

CHIEF OF THE HILL.—On the dump of this mine at the mouth of the tunnel we found about 25 tons of as hard-looking ore as we have ever seen in Ely District. It is of a higher grade than any previously found in this mine.

PIOCHE.—Working the usual number of hands, but taking out ore faster than at any previous time during the past 5 months. The Superintendent shipped yesterday by Wells, Fargo & Co.'s express, thirteen bars of bullion, valued at \$15,033.24. This bullion was about as fine an average lot as has ever been produced by any mine in Ely District. The assayer's certificate showing the most of it to reach over 900 fine. Superintendent Nelson says he will make a smaller shipment at an early day. The new shaft in this mine is progressing rapidly, the ground being of a favorable character. The work is being done by contract, at the rate of \$11 per foot—probably the cheapest piece of the kind ever performed in this district.

BOWEN.—On the strike in this mine holds out well, and bids fair to prove a rich and permanent development. They will commence shipping ore his week.

HAVANA.—Since our last report the mine has been worked energetically, and the ledge is looking as well if not better than at any other time. The incline on the ledge is now down about 190 ft. The ledge is at least 8 ft. between the walls, and the Co. are hoisting some very fine ore.

WASHINGTON AND ORCUTT.—The Co. are hoisting about ten tons of ore daily. Superintendent Tarpey showed us an assay made by Mr. Cahill, which he assured us was a fair sample of the ore now being raised from the mine—considerable care having been exercised in its selection. It was assayed at the rate of \$302.73 to the ton. About 20 tons a day are now being sent to the mill, a portion of which being ore extracted some time ago, from old works, reduces the average a little; but, notwithstanding, the ore is piling at the mill \$150. They are also raising on the ledge; the stopes showing an average of 2 1/2 ft. of ore. A winze has been sunk on the ledge recently, and a drift from the winze, run towards the east, now shows 3 ft. of ore, assaying equal to anything ever found in the mine.

HUMBOLDT.

DON GLEN.—Silver State, June 14: Dick Oranville and Tom Thomas are working on a gold ledge. Last week they saved about 50 pounds of the richest specimens, which they worked in a hand mortar. It yielded a little over 2 pounds of bullion, worth \$400.

A New COPPER DISTRICT.—Antoine Kaufman arrived in town last Tuesday with specimens of copper ore from the Table Mountain Range. Immense masses of copper ore were discovered about 20 miles from Bolivia District, in the same range in which that district is situated, organized a new district, to which they have given the name "I. X. L.," and located several claims.

RELIEF DISTRICT.—The Batavia and Pacific Co.'s mill is running steadily day and night on ore from the Central Pacific mine. The quality of the ore extracted during the past month has not been as good as that worked last winter. Within the last week, however, a decided improvement is apparent. A shaft is being sunk on the ledge, and at the present depth, 225 ft. from the surface, the ledge is 10 ft. wide principally white quartz with occasional spots of rich sulphure ore. The Central Pacific is encased in limestone, and it is well defined. The ore near the surface is rich, some of it working as high as \$1,300 per ton.

GOOSEBERRY.—Steve Torrell and Pete Keenan struck a rich vein of quartz in Relief District, one day last week, to which they have given the above name. The ledge is about 3 ft. wide, and samples of the ore tested by David Van Lennep, assayed \$300 per ton.

GEM.—A body of fine ore was struck in the lower level of this mine in Sierra District a few days ago. The ore is exceedingly rich, and remarkably free from base metals.

HENNING.—Some very rich specimens of black sulphure ore, from this mine, may be seen at David Van Lennep's assay office. This character of ore was struck the present week, and is richer than any heretofore found in this mine.

INSPIR.—Four tons of ore from this mine, and shipped by Harris & Phillips to the Humboldt Reduction Works, last week, yielded \$239 per ton.

BUTTE.—A few days since a horse used at the hoisting works at this mine, while being led by a Chinaman, fell in an incline shaft and broke his neck. For sanitary reasons a committee of the city officers have been concluded to bury the carcass. In digging a hole for that purpose, a rich ledge was discovered.

ARIZONA.—Seven tons of ore from this mine, worked last week by Olintz & Gineacs, at the Humboldt Reduction Works, yielded \$601.61 per ton.

WASHOE.

BELCHER.—Old Hill News, June 14: Daily yield over 600 tons. The main south drift at the 1300-ft. level has its face still in good ore. The cross-cut east show no change from last week, and the main incline is within a few ft. of the 1300-ft. station, with the bottom in hard blasting rock. The south portion of the 1300-ft. level is looking even better than at our last report, showing that the great ore body holds out and extends well to the southward.

JUSTICE.—Daily yield about 20 tons, from the old south mine. The 270-ft. level, at this point, gives a very good showing of ore, and the main incline shows 6 ft. of very good ore. At the 400-ft. level from the old Justice shaft, the main drift is in 600 ft., and the cross-cut east from the old Justice chimney is in 16 ft., the face being close to the vein.

SUBMERGED ROCK ISLAND.—The work of cleaning out the old tunnel is making very good progress, it being now repaired and put in working condition a distance of about 360 ft.

DANBY.—New shaft 112 ft. deep. Not sinking deeper at present. The foundations for the new hoisting works building are laid, and the erection of the frame work commences to-day. The boilers are being set, the engines and other machinery being put in position.

JULIA.—Good progress still made sinking the shaft, notwithstanding the hardness of the rock. The south drift is being pushed ahead and ought soon to cut through into the ore body. The water increases somewhat.

HALE & NORCROSS.—Daily yield 80 tons. The winze below the 1700-ft. level is down 50 ft. and a cross-cut is being made in it to determine the size of the ore body it is in. The ore is of medium quality. The north drift at the 1700-ft. level has reached the southern boundary.

BALTIMORE.—The drift is resumed at the upper or 225-ft. level, drifting both north and south. At the lower, or 445-ft. level, the drift west is being pushed steadily toward the expected ore deposit, making good progress, a id with very encouraging indications.

GOULD & CURRY.—The extensive body of ore mentioned in last report as being developed at the second level is of too low grade for working. Prospecting goes on as usual at the lowest level, and the connection is nearly made with the Savage mine at the south drift at the 1500-ft. level.

ARIZONA & UTAH.—The ore developed in the ledge by the east drift east is considered a very important strike, although not promising largely at present.

CROWN POINT.—Owing to breakage of machinery and arrangements for a distance of about 300 feet, the work making very good progress. A ledge about 160 ft. wide is exposed, composed of good, lively quartz, black dyke, seams of talcose clay, with plenty of sulphurates and occasional spots of ore. Being only about 60 ft. below

the surface, such indications are highly favorable to the finding of an extensive body of good paying ore at a greater depth.

IMPERIAL.—All preparations being at length completed, the extraction of ore from this mine commenced on Wednesday, and it is now coming out at the rate of 30 tons a day from the lower level. It assays well, and will probably pay well under the stamps.

MIST.—The main tunnel of the upper workings is now in 92 ft., still following the ledge. A cross-cut is to be made next week into the ledge, which constantly improves in appearance as farther developed.

JACON LITTLE.—Very good headway is made in the lower level, and the ore is rich. It assays richly, some of it going as high as \$500 to the ton.

SAYATOR.—Drifting south at the lower level, but not cross-cutting east into the reputed rich ore deposits as yet. The connection with the 1600-ft. level for ventilation is nearly completed.

CHOLLAR-POTOSI.—Daily yield 160 tons, from the old ore station. The main drift north at the 800-ft. level is being actively driven ahead, to connect with the Hale & Norcross.

SIERRA NEVADA.—The mine shows considerable improvement especially to the northward, where a very good streak 10 ft. wide is developed. Mill running steadily.

VALLEY.—Total depth of the shaft, 344 ft. The appearances at the bottom indicate that the vein is close at hand, the ground being a mixture of clay and quartz.

CALEDONIA.—Considerable water is encountered in the main drift, second station; no other change to note. Still extracting and shipping ore to mill.

OVERMAN.—The main drift west, and both its right and left branches are going ahead finely in granite, with occasional streaks of quartz.

OPHIR.—Some very good ore streaks of quartz are found at the 1300-ft. level in cross-cutting, which give low assays and promise better.

WOODVILLE.—Both mills kept steadily running on ore from the mine. Everything working well, and plenty of ore in sight.

VALLEY JACKET.—Nothing new to report. Drifting north and south in the vein, at the 1400 and 1500-ft. levels as usual.

SILVER HILL.—Daily yield about 60 tons. The mine continues to look finely in all parts, with nothing new to report.

Idaho.

MAHOGANY.—Owyhee Advertiser, June 14: Preparations are being made to sink a winze for the 8th level, 220 ft. south of the main shaft. A new and exceedingly rich body of ore has recently been struck in the 7th level drift, 264 ft. south of the shaft. The vein is from 2 1/2 to 3 ft. wide, and this week an assay of ore (noted in reference to its special richness), yielded \$406 in gold and \$806 in silver per ton, or a total of \$1172 per ton. There is plenty of the same quality in sight. The ore is a black sulphure, interlined with pure native silver and fine gold in abundance. The stamps of the Ellmore mill commenced running on Mahogany ore last Tuesday, and they had over 500 tons ready for hauling and crushing.

MISSEWA.—The main shaft is down on the 6th level which takes it to a depth of 536 ft. The 6th level is being run both north and south, having cut a very rich 2-ft. vein in the latter direction. A winze from the 5th to the 6th level, 26 ft. north of the shaft, is down all the way on the vein, which is from 3 to 4 ft. thick. The 4th level drift is in 208 ft. south and 370 ft. north, also showing very rich ore, a depth of 3 ft. in width.

GOLDEN CHARLOT.—It now transpires that a rich and extensive body of ore has been developed in the 6th level of this mine, commencing at the winze, 200 ft. south of the main shaft and continuing farther south for a distance of 150 ft. The ledge varies in width from 15 inches to 2 1/2 ft., and shows pure gold and silver in abundance—decidedly richer than that which the mine yielded in the palm days of '83. The ledge is well defined and immensely rich throughout, it being estimated that considerable of the ore will pay from \$500 to \$2,000 per ton. The daily yield is now about 12 tons, which will be largely increased as soon as the level shall be properly opened. The main shaft is down to the 9th level, a depth of 580 ft. A 70-ft. winze from the 5th to the 7th level commenced on the 10th of drift 200 ft. south of the shaft. An 80-ft. winze, 200 ft. south of the shaft has also been completed from the 7th to the 8th level. The 8th-level drift south is now in 210 ft. Both the 7th and 8th levels are yielding good milling ore.

RED JACKET.—The north level is now in 600 ft., being within 250 ft. of the drift shaft where a very rich chute of ore is known to exist. The incline winze is down 90 ft., and the west cross-cut from the lower level is in 90 ft. in

Mine Development.

The general dissatisfaction existing among stockholders in regard to the management of some of our mining corporations has made more popular the plan of developing mines by selling undivided interests to a few responsible men, and then opening and working them at the expense of each in proportion to his interest. This is substituting the simple copartnership for the incorporation plan. Under this method mines that would pay no profit to, and might be a tax upon, several hundred shareholders, owing to the outlay to meet the salaries of a score or more of corporation officers, would speedily bring fortunes to their limited number of owners. It is reasonably believed that there is not a developed mine in Ely district which would not, if owned by a limited number of working partners—by which we mean practical miners, who would develop their property in an economical and miner-like manner—pay handsome profits. But under the incorporation policy, how few are dividend-paying? Not one in twenty brings legitimate profits to its shareholders. How could a mine of ordinary richness, be expected to be profitable, when a score of ornamental appendages are luxuriously supported by its development proceeds? We can name a dozen of mines which would be purchased by capitalists at all their certificates of stock call for, if there were any way by which purchases could be consummated; yet they not only do not, as now managed pay dividends, but have leveled themselves after assement. Attempts to buy the property always fail, as the first movement in that direction throws the stock up above what the proposed purchaser would be willing to pay, and the Trustees usually have "too good a thing on their salaries" to entertain propositions looking to disincorporation. And yet, we are forced to acknowledge that our silver districts would long lie undeveloped were it not for the incorporation system. It requires vast capital to open up and prove by practical results the wealth and argentiferous veins; individuals are seldom found who are willing to take such risks; and we must, of necessity, look to the incorporation system for the first development of newly discovered mines. But this necessity ceases to exist in regard to new mines in old camps. Assay offices, mills, and mining supplies of all kinds, are now here in abundance. The mine-owner has only to bring paying ores to the surface to realize profits from his mine. More custom mills, managed in an honest and economical way, with owners who would be satisfied with fair returns on their investment, is the present great requirement in this mining district. The history of quartz mining in California and along the Comstock exemplifies the correctness of these views. The attention of capitalists is invited to this promising field for the erection of custom mills. Cheap and efficient reduction of ores would bring into availability scores of ledges now lying undeveloped.

HOW TO MEASURE THE INCLINATION OF A SLOPE BY THE EYE.—Powell in his "Colorado expedition" says: And here I made a discovery that has been interesting and useful to me since. On looking at a mountain directly in front, the inclination of the slope to the horizon is greatly exaggerated, and the distance to its summit and its true altitude is correspondingly diminished. To judge of the slope of a mountain side you must see it in profile. Now, in coming down to this point during the afternoon, I had noticed the slope of a particular part of the cliff, and had made an estimate of its altitude. While at supper I had noticed the same cliff from a position facing it, and it seemed vertical, but not half so high. By lying on my side and looking at the same, its true proportions appeared. This seemed a wonder, and I got up to take a view of it standing erect. It was the same cliff as at supper time. Lying down again, it was the cliff as seen in profile in proportion to the advantage of seeing the features of its full face. And musing on this I forgot the morrow and the cañons to come. I had found a way to judge of altitude and slope as I could judge of distance and trend along the horizontal. The reason, too, is simple; a reference to the stereoscope will suggest it at once. Since then I have often laid down on my side to search the cañon far away to its summit.

IMPORTANT TO MINERS.—Mr. A. J. Doolittle, of Liberty Hill, Nevada county, is having built in this city for himself, Wm. Hara and Henry Raymond, a newly invented machine for hydraulic mining. It is of an entirely new pattern, based, Mr. Doolittle says, on scientific principles, and gives a greater area of discharge than is usual. There are no bolts or nipples to interrupt the flow. Mr. Doolittle claims that his machine will accomplish the purpose for which it is made without the loss of power incident to the machine now in use. It will work at a sufficiently low angle to enable miners to wash out the "blue cement" without the necessity of blasting. It will turn 25 degrees below horizontal at short range and give an unbroken effect. We have seen the machine, now nearly completed, but cannot at present enter into details of construction or operation.

Dubois' Mower Attachment.

The accompanying cut represents Dubois' Mower Attachment. This is the device for lodged grain or grass—the one used for standing grain or grass being much smaller. This for lodged grain or grass consists of a small cast iron shoe fitted to the under side of the cutter bar, and in most respects like any other shoe, with the exception that it is just on a level with the top of the cutter bar. This pattern has to be slightly varied to suit the different kind of machine upon which it is placed.

The balance is alike on all machines, and consists of a $\frac{3}{8}$ -inch bar of iron bolted upon the under shoe at the point and also at the end of the cutter bar.

This iron projects forward three feet and a half; then is turned back and rises at an angle of about fifty degrees, and turns toward the body of the machine. A knife is placed upon this point near the ground, and rises with the same angle, and is about two feet long. The bar of iron first mentioned also projects behind the cutter bar two feet or more, curving all the way toward the body of the machine, and then runs directly to the cutter bar, where it is fastened by a bolt. The whole is housed with light galvanized iron.

The effect is this: The knife in front cuts through all obstructions in the line of the shoe, the curved iron in front turns it toward the body of the machine, and the hinder part completes the separation. The wire is attached to the curved iron in front, and attached to a

We are pleased to notice this highly favorable opinion of a practical working test of one of our California inventions. Mr. D.'s patent was obtained through this office, and we hope he will reap a rich reward from his ingenuity and enterprise.

A further trial will soon be made at Fruit Vale, Oakland, under the auspices of the Farmers' Club, timely notice of which will be given through the Press.

MINES IN GUATEMALA.—In a letter to the *Alta* from Guatemala a correspondent has the following item in relation to the mines:—We are told of quicksilver, two days' journey from this place, through a chaparral jungle, where the metal flows, a dripping stream thick as a goose-quill—a mine of argentiferous galena and one of zinc, near Point Isabel, on the Atlantic side. We have not found a reliable guide to the former, and the road to the other is barred at present by the revolutionists.

But it is plainly to be seen that there is a vast and varied wilderness of mineral wealth quite unexplored—gold, silver, zinc, copper and lead—all free to adventurers, and under a Government generous in concessions, and apparently making no invidious distinctions. It appears to us that native labor tends entirely to agriculture, and mining force must come from abroad. No objections will be made to Asiatics, Africans or Indians. White can scarcely be made a standard, where shading off prevails almost to the other extremity.

Land and mineral veins can be had by simple denouncement, which means recorded notice of preemption. This entitles you to an order of survey. When this is returned, a sale is made to the highest bidder—always cheap enough.

COAL.—The *Contra Costa Gazette* says coal mining is very brisk at our Somerville and Nortonville mines, which are being worked

DUBOIS' MOWER ATTACHMENT.

standards on the body of the machine with a spiral spring wire. This is sometimes used and sometimes not, according to the character of the mowing. For standing grain or grass we use the wooden sweep, mounted on standards on the body of the machine, and the smaller device above mentioned.

The effect in standing grain or grass is that the heads of the grain or grass are turned toward the body of the machine before it is cut, and when cut drop nearly straight with the cutter bar, and that part behind the cutter bar moves it away from the standing grain or grass. When the mower has passed the beneath will be found to lie even and straight as if cut with a grain cradle, with the butts all toward the standing grain, and separated from it about one foot. From the many flattering notices that we have seen from the press, as well as from what we have seen, we regard it as a most valuable invention, and will no doubt do away entirely with all those devices heretofore used for the same purpose, and which have proved so entirely inadequate to the purpose for which they were intended.

The California *Agriculturist* for Sept., 1872, says of Dubois' Attachment to Mowers, that we have examined the working of these devices, both in standing and in lodged grain, no other grass being in season to cut on Mr. Dubois' farm at this time. In tall grain the sweep attachment laid the cut grain with the heads away from the standing grain against a strong wind, saving the labor of forking it away. We regard this invention as a very valuable one. It is just the thing desired.

The other device is a knife and mould-board attachment to be used in lodged grain or grass. It worked admirably, separating the swath from the uncut grain as nicely as the best swarther can do in good standing grain or grass. We only wonder somebody had not thought of it before. Both inventions are simple but excellent, and seem to perfectly supply a want long and seriously felt.

with day and night-shifts of hands. The recent purchase of the Eureka and Independent ground at Somerville, by the Pittsburg Company, gives it not only a vastly-increased deposit of coal to work, but warrants outlay for working it to greater advantage than would be possible otherwise, and insures steadiness and permanence of operation at that place. The new shaft of the Black Diamond Company is steadily going down, and has already reached a depth of 350 feet. The new hoisting works, engine, and other adjuncts of the shaft, will be of the most substantial and effective character for the permanent and advantageous working of the mine. With the increase of working force the village of Nortonville, extending down the ravine, has nearly doubled the number of its dwellings within the past year, and every week from two to five or six new ones are put in course of construction.

DISCOVERY OF COPPER IN THE HUMBOLDT RANGE.—The *Unionville Silver State* says: Henry Jenkins and John and Charles Twice have discovered what they have substantial reasons for believing a good copper mine, in Tehama Cañon, Star District. They have located the ledge, which they have named the Independence, under the United States mining law, and are now engaged in prospecting it. At a depth of twelve feet from the surface they have a well defined vein, which carries from two to six inches of high grade copper ore, a few specimens of which, brought to town by Mr. Jenkins, can be seen at the Exchange Hotel. This is the first copper ore ever discovered in the Humboldt Range, and if the vein from which it was taken proves to be a mine of that mineral, its proximity to the railroad will add much to its value. Specimens of the ore assayed 65 per cent. copper, and strange to say, coming as it does from the immediate vicinity of rich silver mines, not a trace of silver. The owners entertain great hopes from the appearance of the vein that it will prove to be a permanent and very valuable copper mine.

Some American Benefactors.

Do not Americans appreciate education? Here is a list of some of their benefactions: \$1,300,000 by Mr. Simmons of Boston, for the industrial education of women; \$1,000,000 by Daniel Drew, to endow a Theological Seminary, to which Abel Menand adds \$100,000 more "for the education of women for the ministry," \$200,000 by Erasmus Corning, for a female College; \$400,000 by Robt. Barne of Indiana, for the education of orphans in that State; \$100,000 by Orange Judd, the agricultural book publisher, for Scientific Department in Wesleyan University; \$60,000 by Cyrus McCormick, the reaper, for Theological Seminary at Chicago; \$100,000 by Daniel Appleton, the book publisher, for chancellorship and library in New York University; \$100,000 by Nathaniel Thayer of Boston, to Harvard University; \$100,000 by Chauncey Rose of Terre Haute, Ind., for Female College; \$100,000 by Henry Sage of Brooklyn, New York, for female college building at Cornell University; \$500,000 by Mr. Shaw of St. Louis, for park and botanic garden; \$200,000 by Mr. Pardee of Pennsylvania, for Scientific Department of Lafayette College, at Easton Penn.; \$75,000 by Horace Sibley of Rochester, New York, for a library building at Rochester University; \$50,000 by the Rev. Jesse T. Peck to the new University at Syracuse, New York, which has been increased by other citizens to a million and a half; \$1,250,000 by Samuel Williston for educational purposes in Easthampton Mass.; \$250,000 by Captain Richardson of San Francisco, Cal., to found the Richardson College in Chicago University; \$50,000 by Edward Tompkins to found a chair of oriental languages in the University of California; \$20,000 by Mr. Raymond of Oakland, to the college at Toledo, Ohio; \$75,000 by Dr. H. H. Toland to endow a Medical Department in the University at California; \$100,000 in property and \$50,000 in cash, by John Anderson, of New York, to found the Penikese School of Natural History.

EXPLORATIONS OF THE ROCKY MOUNTAINS.—Four distinct scientific expeditions are now engaged in the exploration of the territory lying between the northern borders of Wyoming and the Southern line of New Mexico. One of these expeditions is headed by Prof. Hayden and conducts its explorations under the direction of the Interior Department. An expedition, fitted out by the War Department, and detailed to survey and explore those portions of Colorado, Utah, Arizona, and New Mexico, lying along the line of the 100th meridian, is under the charge of Lieut. George M. Wheeler. The engineers of Gen. Ord's staff are engaged in exploring northwestern Wyoming, while those of Gen. Pope's staff are at work surveying that section known as the San Juan country. To this list another scientific party from Yale College, in charge of Prof. Marsh, the eminent Paleontologist, is about to be added, being now on its way to join the Wheeler party, with which it will cooperate. The most important results may be expected from the labors of these expeditions, as the topography, geography, geology, and general resources of the territory to be explored will be carefully examined and noted.

SCHOOL OF NATURAL SCIENCE.—John Anderson, who gave Pembroke Island, his completely furnished residence, and \$50,000 to Professor Agassiz, to found a school of natural science, suggests that, to make the endowment ample and the institution a national one, that State Legislatures contribute \$25,000 each to the fund. If the States cannot constitutionally do this, the friends of the school hope that the wealthy men of the several States will emulate the generosity of Mr. Anderson, and endow the school with sufficient means to make it preëminent among scientific institutions.

MINING SWINDLER.—The *Pioche Record*, of a recent date, speaking of mining swindlers, makes the following sensible remark: "When we give the world to understand that the mining communities themselves view such swindlers as heinous crimes we shall have much less difficulty in inducing the investment of capital in the mountains in honest enterprise."

THE NEW OBSERVATORY to be erected on the west side of the Weber, at Ogden, will require twenty men to take care of it. It will be the headquarters of the Topographical Corps of Utah, Arizona and Idaho.

MINERS are in demand, according to the *Boise City Statesman*, both in the Basin and at Rocky Bar, while those who are handy with the ax can get plenty of wood to cut at \$2 per cord.

MINERS are leaving Pioche for the Cherry Creek mine and to northern Arizona in search of cinnabar, rich deposits of which are said to exist in that region.

SPARTA, a mining camp in Union county, Oregon, was disappointed in its water supply this season, as it went away without doing them much good.

WET MOUNTAIN VALLEY is excited on account of the discovery of what appears to be the richest gold mine in Colorado.

THE HALE & NORRIS mine receipts for May amounted to \$45,581.

USEFUL INFORMATION.

SPECTACLES.—Spectacles are worn by so many people now-a-days, that we are often inclined to wonder how former generations managed to get on without them before they were invented. The old Greeks and Romans do not seem to have known the luxury; but then, perhaps, their eyes were better than those of the present short-sighted race of mortals. One thing, they had not so many newspapers to trouble them as we have.

But spectacles, after all, are not such a recent invention as might, perhaps, be thought. They did not come into use in Europe until about the year 1300, but they are of unfathomable antiquity in China—not indeed, of glass, but of rock crystal. We affect to despise the humble efforts of the untutored Esquimaux, but even they have had a sort of spectacles of their own, long before they ever had an opportunity of seeing any from other lands. They are ignorant of the manufacture of glass, or even of pottery, and they, therefore cannot construct a lens; but they have constructed an instrument of wood and bone—an eye shade—which is not only a protection to the visual organs, but assists the visual power of the eyes. The Esquimaux term it *itlee yaya*—far sight—the very synonym of our word telescope.—*Once a Week.*

THE POWER OF COAL.—The Secretary of the West Yorkshire Association of Miners is rather eloquent on behalf of his clients when he says thus:—"A man who is a good, strong, practical miner in some of our thick seams will, by an extra effort, produce five tons of coal in a day, and what will these five tons do? In the first place they will realize for himself 62 cents per ton for getting them; secondly, they will bring to his master nearly \$12.50 in profits. Then if we take them to the factory door, they will turn the engine, and find one day's employment for over 2,000 factory operatives, whose average wages at 75 cents each, amounting in the aggregate to about \$1,500, will be distributed into every channel of trade, besides realizing to the owners of the factory \$1,000 more in profits. Then probably they may be the means of producing from 6,000 to 7,000 yards of calico or other fabric which may be used to the warmth and comfort of 2,000 people, and this may be done from the work of one miner by one day's hard work." What will he say of such a coal proprietor as Earl Dudley, who gives employment to 8,000 or 10,000 of such valuable miners?

CHARACTERS AS WELL AS FEATURES TRANSMITTED.—In Galton's recent work treating of hereditary influence, he holds that there are certain marked types of character justly associated with marked types of feature and temperament. That the latter are inherited, no one questions, and the same may therefore be inferred of the former. As examples, Galton instances the face of the combatant, which is square, coarse and heavily jawed, differing so strikingly from that of the ascetic, the voluptuary, the dreamer and the charlatan. But still more strongly marked than these are the typical features and characters of different races of men. The Mongolians, Jews, negroes, gypsies and American Indians, severally propagate their kind; and each kind differs in character and intellect as well as in color and shape forming a class of instances worthy of close investigation, in which peculiarities of character are invariably transmitted from the parent to the offspring.

NUTRITIVE VALUE OF BLACK TEA.—Tea is not only to be considered as a stimulant, but also as nourishment. That people who use tea are able to live longer and do more work on an insufficient amount of food, than those who abstain from the beverage, is attributed to its power of preventing the waste of the body, and in the animal economy may be compared to the financial proposition that a "penny saved is twice earned."

From the large amount of nitrogen it contains, it may also be considered, to a certain extent, a direct means of nourishment. A. Vogel has thought it worth his while to determine how much of his nitrogen is employed in the infusion. The tea examined gave 6.6 per cent. ash, and 25.5 of extract, which was found to contain 2.8 per cent. nitrogen, while the partially exhausted leaves contain 3.58 per cent. From this it would seem that, unless we contrive to devote the whole leaf, we lose the largest portion of the nitrogen.

FOAMING IN BOILERS.—The *Scientific American* in reply to the queries of a correspondent, "What causes foaming in an engine boiler? Is it dangerous or apt to cause an explosion of boiler? Does steam ever descend under the water in a boiler and force the water up and then take its place?" answers as follows: "Foaming is caused by the generation of steam more rapidly than it can discharge itself from the mass of water within which it is formed. It may give rise to inconvenience, and even danger, either by carrying water out of the boiler more rapidly than the feed pump can replace it, or by entering the steam cylinder of the engine and creating a liability to accident, when the piston strikes upon it, at the end of its stroke, by breaking crank pin, connecting rod or cylinder head. Steam does not get under the water, but is sometimes so rapidly discharged, at points on the heating surface under water, as to almost or quite displace the water.

A CHEAP AND EXCELLENT FLY-TRAP.—Now that the hot weather approaches, the following method of trapping flies, as practiced and indorsed by a correspondent of an Irish agricultural paper, will be found useful: A common glass cover, or bell-glass, is the instrument to be used; this has to be tightly covered at the bottom with thick white paper. A circular hole, $6\frac{1}{4}$ inches in diameter, is then cut in the center of the paper, and the glass is placed on three bricks over a plate filled with beer, sugar and a little rum, a moderate distance from the infested spot. The effect is magical; in a few hours the glass is crammed with flies, which having tasted the sweet, fly upward to the light. A common sulphur match, made by dipping brown paper into brimstone, will destroy thousands. The constant hum of insect life will attract all to the glass, and the scent of the rum is sure to induce the most fastidious wasp to enter, as no insect can resist its powerful attraction.

VITALITY IN WOOD.—Vitality will sometimes remain in a bit of wood an incredibly long time. Not long ago a Boston lady, having occasion to use a support for an ivy plant which she was raising in a pot, took an old grape-vine cane and thrust it into the earth. Some time afterward, wishing to remove the ivy, she pulled up the old cane and found to her astonishment that it had sent out shoots and was making vigorous efforts to root itself by the side of the ivy. This bit of grapevine had been used for a long time as a cane, and for years which no one in the family could number, had been laying about the house.

RAPIDLY INCREASING CONSUMPTION OF HORSE MEAT IN PARIS.—There are now forty shops or stalls in Paris devoted to the sale of horse meat as an article of food. During 1872, 9,725 horses, 866 asses, and 51 mules were consumed by the inhabitants. *Les Mondes* says that the animals are prepared for the market in the ordinary way, and that the meat sells for about half the price of beef. The horses are inspected at the slaughter house with the greatest care. It may be noted as an interesting fact that hippophagy is decidedly on the increase, as 2,408,076 pounds of equine meat were eaten in 1872 as against 1,113,024 in 1869.

GOOD HEALTH.

Is it Safe to Drink Hard Water.

There is a popular prejudice that hard water is dangerous to the health, and on that account we are constantly warned by physicians to beware of it, but in England one of the leading authorities on this subject, Dr. Letheby, after devoting many years to an investigation into the properties of the water introduced into English cities, and to a study of the sanitary reports on the subject, comes to the conclusion that moderately hard water is safer and more healthier than soft water. Hard water is not only clearer, colder, more free from air, and consequently more agreeable to the eye and to the taste than soft water, but is likely to absorb organic substances, to sustain the life of zymotic organisms, or to exert solvent properties upon salts of iron or upon leaden conducting pipes. The lime salts exert a beneficial influence upon the animal economy, and even protect the system from dangerous outward influences. Dr. Wilson, of Edinburgh, has also collected much valuable material on the subject, and comes to the same conclusions as Dr. Letheby. He takes the ground that the human body requires for its nourishment and support a supply of certain mineral salts, among which carbonate and phosphate of lime play an important part in building up the compactness of the bones and in other functions. We usually obtain phosphate of lime in our animal and vegetable food, but not from the water we drink. Carbonate of lime, however, is not contained in adequate quantity in our solid food, but generally obtains in spring and well water.

It has been incontestably shown that in mountainous districts, where the water is more or less hard, the inhabitants exhibit the best physical development. On the other hand it is believed that in large cities the mortality is inversely as the hardness of water supplied to the inhabitant. A water which contains about six grains of carbonate of lime to the gallon is suitable for use in all household purposes. As a drink and for cooking food, such a water offers the necessary carbonate of lime for the support of life in the simplest, most natural and most digested form, and at the same time more agreeable, fresh and sparkling. It is evident that our preconceived popular notions on the subject of hard water need revising, and that it may be better to use such water than to have recourse to rain or ice water.

CARBOLIC ACID IN SCARLET FEVER.—Rubbing the body with hog's fat has the effect of reducing the temperature of the skin, in scarlet fever. Fr. Betz, of Heilbronn, directs to incorporate one or two grammes of carbolie acid into 100 grammes of lard, and, with this, to rub the whole body, excepting the head, two or three times a day, according to the intensity of the inflammation. It produces a pleasant feeling of coolness, and keeps the skin softer, and, after each application, the temperature of the skin falls somewhat. The carbolie acid has the effect of killing the germs and spores of the disease.

Worms in the Blood.

The use of the microscope has resulted in a great many important discoveries. One of the more recent and startling facts which have been brought to light, has been the result of an investigation by Mr. T. R. Lewis, Assistant Surgeon of the British Army in India, an account of which is given in the *London Lancet*. Mr. Lewis having been assigned to special duty under the Sanitary Commission for the Government of India, in examining the urine and blood of certain patients, discovered the existence therein of living, active worms, hitherto unobserved. These worms are one seventy-fifths of an inch in length, and have a transverse diameter of one three-thousandths of an inch. They are so numerous as to be found in blood drawn from any part of the body, and so persistent that they may exist in the system for months or years, without any marked evil consequences being observed. It is said, however, that they may give rise to serious diseases, and ultimately cause death.

The name *Filaria Sanguinis Hominis* has been given to them. It is described as moving about incessantly, coiling and uncoiling itself, and rushing about among the blood corpuscles, in all directions. These worms appear, through the microscope, like incompletely developed snakes. They continue active from six to thirty hours. From certain characteristics, it appears that they do not exist anywhere but in the blood and urine. Patients in whom these worms have been discovered are also observed to void what is known to physicians as chylous urine.

Dr. Lewis believes that the blood of persons who live in tropical countries is frequently invaded by these microscopic worms, which are not identified with any known species. The chylous condition of the urine is considered to be only one of the symptoms of the presence of the worms, although it is the most characteristic. It is believed that some of the hitherto inexplicable phenomena connected with tropical diseases will, ultimately, be traced to this condition of the blood.

Novel Treatment of Dyspepsia.

A very curious method of treating dyspepsia is announced as a complete success, by Dr. Brown Séquard. The most extraordinary thing is that the cure forbids the use of medicine, and relies not on articles of diet, but on the regulation of time in taking nourishment. Eat any meat and bread; be rather sparing of vegetables; drink wine and water—but you must not take more than two or three mouthfuls at a time. This homeopathic meal is to be repeated every fifteen minutes or so, not exceeding thirty minutes interval between these mouthfuls. Relief is soon felt; and in ten to twenty days' treatment you may begin gradually to increase the mouthfuls and the time spaces till finally you can take your former three meals in peace and digestive felicity. The rationale of this process is not given in the medical record we have seen. But it may be presumed that the disease is referred to the torpid production of gastric juice. A full meal finds no adequate response, and the food weighs heavily on the stomach and passes away to trouble the organism along the whole line of its extension. There is gastric juice for a few mouthfuls, and the patient soon finds the proper measure. Rest and relief from oppression give the stomach a show to recuperate; and Nature having fair play, effects the cure. Accepting this theory, Thackeray's condemnation of lunch and the orthodoxy of two meals a day may be questioned. For gourmands, the axiom may do "that lunch is base ingratitude to your breakfast, and a premeditated insult to your dinner." Stomachs that can digest leather, want no rigid rules. But not only does Dr. Brown Séquard's prescription sanction our usual three meals a day, but it rather prefers the usual fourth meal of England, viz.: supper at nine, and a Punda nightcap to woo repose.

TRANSPLANTING HAIR.—The successful transplanting of skin and flesh to assist the recovery of wounds, has induced some one to experiment on hair, and the result is a process of removing portions of the scalp, with the hair on, from some luxuriant head, and planting on the victim of baldness. A contemporary points out that it may soon become fashionable to wear hair of various hues and shades, thereby producing the most singular and beautiful effects of color; or the hair might be made to appear white, green, blue or red, at the owner's option, and by various ways of disposing it. "Take, in due proportions, hair of all the prismatic tints, rumple it, and immediately you have white hair; comb it in another way, and there is your purple, your ultramarine, your yellow, or any possible hue." If these directions are followed, the recognition of the original color of the head may require the use of the spectroscopic.

A foreign medical journal states that bullock's blood is now in great vogue in Paris as a remedy for anemia and phthisis. Persons of all ranks and ages and of both sexes, may be seen every morning thronging the shambles, to drink the foaming, reeking blood of oxen. Young ladies prefer it to cod liver oil, and swallow it with a gusto. For more fastidious patients an extract is prepared in the shape of pills. Of course many cures are reported.

COFFEE AND QUINIA.—M. Briquet considers the common practice of administering quinia, forming a tasteless and insoluble and almost inert salt—the tannate of quinia, from which the stomach has as much difficulty in extracting quinia as from powdered bark. It is, he thinks, one of the worst preparations of quinia.—*Brit. Med. Jour.*

QUININE is rapidly giving place to *Eucalyptus globulus* in the treatment of malarious fevers in the island of Mauritius. During the hot season these fevers are very prevalent there, and this substance given in the form of an infusion of the leaves, is said to be quite as effective in treating them as quinine, and far less expensive.

DOMESTIC ECONOMY.

How to Cook a Parsnip.

A badly cooked parsnip is neither eatable nor digestible, but cook it properly and it is a delicacy worthy of a place on an epicure's table. I shall show how to make the best of this nourishing root, and hope that many readers who have cared little for parsnips hitherto will, after a fair trial, appreciate them as they deserve. No matter what the size or shape of a parsnip, it is invariably good throughout, and very little, indeed, should be wasted in preparing it for the table. The best are those of medium size and even outline with few brown specks on the bark. They should come into the cook's hands quite clean, and to prepare them thus far it is generally necessary to scrub them with cold water. From the moment they are taken in hand for cooking until they are served on the table there should be no delay of any kind; for the more they lie about after being scraped, and especially if they soak the water, the more they lose flavor and tenderness, for the most precious qualities are soluble, and are soon soaked out, the fibre only being left. Cut out the crown without waste, remove the extreme tail and any small side roots, and then scrape off the bark and carefully cut the brown specks and streaks. It is better to scrape than pare them, for the outside is richly flavored and highly nutritious. It is scarcely possible to cook large parsnips whole, and, of course, there need be no directions given how to cut them. But it is very important to bear in mind that they should always be cooked whole if possible, and when they must be cut, the less cutting the better. The more they are cut, the more surely the goodness "flies away, flies away." Now, we want for the cooking a small quantity of boiling water seasoned slightly with salt, in an iron pot sufficiently large for the parsnips. Throw them in, shut them down, and put the pot on the fire. As soon as it boils draw it to the side, and there let it simmer for full three-quarters of an hour, and then try the parsnips with a fork. If quite tender, pour the water off, and shut them down, and keep them on the hob until they are wanted. They may stand an hour without harm, if close shut down, on a hot plate or hob with steam enough of their own to keep them from burning. If cooked slowly in scarcely water enough to cover them, they will be as soft as butter, and of the most delicious flavor. If cooked in a large quantity of water, and especially if put on in cold or even warm water, they will be comparatively worthless, for the goodness will be soaked out of them, as too often it is soaked out of potatoes and boiled joints of meat.—*Gardener's Magazine.*

Cooking Celery, Carrots and Salsify.

When there is a plentiful supply of celery on hand, it is not only desirable to eat it raw, but also cooked, and there is as much difference between cooked and raw celery, as between cooked and raw tomatoes. In cooking celery, the green stalks can be used as well as those fully blanched, and thus it is an economical process.

Cut the stalks into pieces an inch in length, and stew in a little salted water until quite tender; then turn away all the water, and pour over it a small cup of rich sweet milk; add to it a good big piece of butter, thoroughly rolled in flour, and boil it up for ten minutes.

This makes a very rich, creamy-tasting sauce, and the whole dish is appetizing and agreeable. Carrots cooked and served in this manner are also very much liked in our family; and those who have never tasted them will find the dish a pleasing addition to their table. We are all of us accustomed to their use in soups—but few eat them as a table vegetable.

Salsify or vegetable oyster, if cooked and served in the same manner, is also a delicious relish. It can be grated fine, after boiling, and then seasoned with butter, salt and pepper, and fried like codfish balls.—*Country Gent.*

"EGOS A LA SOLFERINO."—Boil some eggs hard, cut them in two, take out the yolks, and beat these up with a little parsley and salt, and replace into the whites, of which out previously the under part a little, so as to make them stand in the dish, and serve up with a nice sauce round them. Let them be quite hot when served.

Table of Contents.

GENERAL EDITORIALS.—Metallic Tile Roofing; Paul's Process in Utah; Scientific and Mechanical Progress; Palmaces Palms, 385. Potash Salts; Agricultural and Mining Lands; Academy of Sciences, 392. The Comstock Mines, 393. Notices of Recent Patents, 396.

ILLUSTRATIONS.—Improved Roofing, 385. Standish's Ore Feeder, 392. Steven's Balance Slide Valve, 393.

CORRESPONDENCE.—Little York, Nevada County; A California Miner in the East, 386.

SCIENTIFIC PROGRESS.—Theory of the American Amalgamation; The Most Dangerous Explosive in the World; Creation; The Management of Aquaria; Ignition by Superheated Steam; Saving the Caffeine in Roasting Coffee, 387.

MECHANICAL PROGRESS.—Sulphur and Phosphorus in Iron; Cast Iron Enameling; Reversing Gear; Important Mineral Discovery in England; Guns and Gunpowder; Science at Fault; America Acknowledged to be England's Rival; Iron Ships Without Seams; Compressing Molten Steel; Rapid Work, 387.

MINING SUMMARY from various counties in California, Nevada, Montana and Idaho, 388-9.

MINING STOCK MARKET.—Table of Daily Sales and Prices and Comparative Prices for the Week; Notices of Assessments; Meetings and Dividends; Review of Stock Market for the Week, 385.

USEFUL INFORMATION.—Spectacles; The Power of Coal; Characters as well as Features Transmitted; Nutritive Value of Black Tea; Fossiling in Boilers; A Cheap and Excellent Fly-Trap; Vitality in Wood; Rapidly Increasing Consumption of Horse Meat in Paris, 391.

GOOD HEALTH.—Is it Safe to Drink Hard Water; Carbolic Acid in Scarlet Fever; Worms in the Blood; Novel Treatment of Dyspepsia; Transplanting Hair; Coffee and Quinia, 391.

DOMESTIC ECONOMY.—How to Cook a Parrot; Cooking Celery, Carrots and Salsify; Eggs a la Solferino, 391.

MISCELLANEOUS.—Silver and Copper Smelting Works at Tucson; Brazilian Diamond Mining; Unnecessary Assessments, 386. Mine Development; How to Measure the Inclination of a Slope by the Eye; Important to Miners; Mines in Guatemala; Coal; Discovery of Copper in the Humboldt Range; Some American Benefactors; Explorations of the Rocky Mountains; School of Natural Science; Mining Swindle, 380. The Meadow Lake Mines—A Deserter City; Omnibus Law; Temperature on Railroad Expense; Gold in Napa County, 394.

• INTERESTING COLLECTION.—Mr. J. W. Glass, is exhibiting, at 1053 Broadway, Oakland, a large and interesting collection of mineral, botanical and fossiliferous specimens, and Indian relics and curiosities, which he has collected mostly in Arizona and New Mexico and upon the great Colorado desert. There are upwards of 2,000 botanical specimens, many of which are both new and interesting. All are well preserved and mounted. There are also some 8,000 mineral specimens and curiosities. The collection is offered for sale, entire, at a very small sum; with which, when realized, Mr. Glass will again take the field for further explorations. It would form a very fine museum for an academy or scientific association, or for a private gentleman. An opportunity is here presented for some person to immortalize his name, and encourage scientific exploration and investigation by making this collection a present to some public institution. The exhibition is free and well worth a visit.

THE FLAGSTAFF MINE, Little Cottonwood, Utah, is arranging to ship 100 tons of ore per day. The Emma mine is also increasing shipments.

THE Burnt River Ditch in Eastern Oregon, has been leased for a term of three years by R. Pleasanton, of Rock Island, Illinois, for \$280,000.

A BLAST of 368 kegs of powder was exploded in the Blue Point claim, at Sucker Flat on the 17th inst.

MINING at Grand Ronde river, Oregon, is in a very prosperous condition.

Potash Salt.

The mines from which this product is obtained are very valuable, since there is no competition in the market. There are only two of these mines, one of which is in Germany, at Leopoldshall and Stassfurt, and the other in Austria at Kalusz. Mr. Knstel writes us from Vienna, that a very complete exhibition of everything connected with potash and its production, can now be seen at the Vienna Exposition. He says, in referring to the mines mentioned above, that it is the belief that these potash deposits are the result of the evaporation of former remainders of large seas that concentrated in a few favorable localities. The formation of these deposits under such peculiar and lucky circumstances, indicates that little prospect for new discoveries exist in this line, but it is not impossible that such deposits may be found in the United States, in districts where salt-rock is known to exist. Although the potash was known and used in many branches of industry long ago, its large and extensive application in practical life is not older than the discovery of the Stassfurt deposit (twelve or fifteen years ago). Formerly, the potash salt that covered the salt-rock bed was considered a nuisance; it was not utilized; its value not known; and now, not the immense bed of salt-rock, but the above nuisance is considered the wealth of Stassfurt. Eight millions of thalers were offered for that part of the deposit which is in Stassfurt, but the offer was not accepted. The total extraction of the salt in 1872, at Stassfurt and Leopoldshall was eleven millions of hundred weights. This shows what extensive use is made of this article in agriculture and trade. The potash is not free in the salt, but in several combinations. Beautiful specimens are exhibited of "Carnall-

STANDISH'S ORE FEEDER.

ite," consisting of chlorpotassium and chlor-magnesium. Then there are light, yellow specimens of "Carnallite"; it contains sulphate of potash, magnesia and chlor-magnesium. This will probably be the more valuable mineral for its sulphate of potash. Another, but less frequent mineral, is the "Sylvine" of pure chlorpotassium, and the "Boraxite," containing principally borate of magnesia, of which the produced large borax-crystals are also exhibited.

The existence of the potash in the salt-rock deposits of Kalusz was found in the year 1867; first in shape of sylvine, then appeared the carnallite, and lately also the carnallite in small quantities. Contrary to the appearance in Stassfurt, the more valuable mineral predominates in Kalusz. The sylvine is, as before mentioned, composed principally of pure chlorpotassium, which is extracted by simple leaching, and, of course, is obtained free of chlor-magnesium, which is difficult to accomplish at Stassfurt, even after several recrystallizations. In larger proportion than the sylvine, is found at Kalusz the carnallite, producing sulphate of potash and chlor-magnesium besides iron. This mineral, on account of its amount of sulphate of potash, is more valuable than either of sylvine or carnallite. The specimens exhibited (from Kalusz) are massive blocks of several dozen each. The carnallite runs in parallel, yellow-brown stripes. The carnallite is grayish-yellow. The sylvine appears in red and white varieties, mixed up with blue salt-rock.

CITY CREEK CANON.—A dispatch from Utah says: Much interest is felt in the discovery of a rich galena lead, in City Creek Cañon, seven miles from Salt Lake City and 500 feet from the new iron mine location. No mineral discoveries of moment have heretofore been found in these hills which bound the town on the north. This fact causes the unusual feeling that prevails over this location, and prospecting is lively; the proximity to the city is a material point.

Ore Feeder for Shaft Furnaces.

Among the patents connected with the mining industry, recently obtained through the agency connected with this office, is an ore-feeder for shaft furnaces, invented by E. V. Standish, of Belmont, Nev. The invention is an improved device for feeding pulverized ore and salt into upright or stack-furnaces. In this class of furnaces the ore is first finely pulverized and then dropped down through the furnace stack with a certain proportion of salt, so that in its passage through the heat and flames the ore is roasted and chloridized. This process of mixing and feeding the ore and salt into the top of the furnace requires to be accomplished regularly and thoroughly, and this invention is intended for this purpose.

Figure 1 of the accompanying cuts is a side elevation showing a section of one part of the device and figure 2 is a plan view. A represents the top or upper end of a stack-furnace. Upon this stack is constructed a shallow hopper, B, the opening through the bottom of which is almost if not quite as large as the upper end of the stack. The capacity and shape of this hopper can be varied to suit the different furnaces upon which it may be placed. The bottom of the hopper is constructed of a number of square metal bars, c c c, placed parallel with each other, and supported in place by means of journals at both ends which bear on the opposite sides of the bottom of the hopper. These bars may be made in a variety of shapes, but the inventor prefers the square or diamond shape. The bars are placed so that two opposite angles of each bar lie on a

Agricultural and Mining Lands.

A dispatch, dated Washington, June 13, says: Private inquiries having been made of the Attorney-General on the following subject, the question was referred by him to the General Land Office, and Acting Commissioner Curtis to-day makes this statement as a rule of the Department: On lands that have been entered or patented as agricultural lands, upon which valuable mines were known to exist at the date of such entry, parties owning such mines are in no way debarred from acquiring title thereto upon compliance with the laws and instructions regulating the disposal of mineral lands, as, by express provisions of the laws, no title can be acquired to mineral lands under the Acts regulating the disposal of agricultural lands. In all cases where lands have been returned as mineral upon the township plot, or where affidavits are filed with local land officers, alleging that the lands are more valuable for mining than for agricultural purposes, it is the duty of the Register and Recorder to cause a hearing to determine their true character, before allowing their entry under the pre-emption and homestead laws.

Academy of Sciences.

At the last regular semi-monthly meeting of the California Academy of Sciences, held on Monday evening, Messrs. Geo. W. Lewis, Agapius Houcharenko, Cutler McAllister, and John R. Jarboe were elected resident members and Wm. C. Ralston a life member.

The following additions to the cabinets were received: Specimen of gorgonia, obtained at Cerros Island; also skull of species of fish related to the Rays, both presented by Captain J. A. Wilson, of San Pedro; skull of the mountain sheep, *Ovis Montana*, with immense horns, presented by E. Waeserman; two curious specimens of crustacea, from San Francisco Bay, presented by Henry Chapman.

Judge S. C. Hastings read a paper on the cation of frost on vines, which will be communicated to the Wine Growers' Association.

Mr. A. W. Chace read a very interesting paper on Artesian Wells in Los Angeles County, which we will take an early opportunity of publishing with accompanying diagrams.

Copies of the Proceedings of the Academy for 1873 were distributed to the members. It is quite a creditable production for so short a time considering the few contributing members. It contains about 96 pages and completes the proceedings up to May. The pamphlet contains several plates and the subjects treated are all of Pacific Coast interest.

TREATING THE ORES OF MERCURY.—A correspondent calls attention to the letter of Mr. Kustel, in our last issue, on the Patara process for the treatment of the ores of mercury. He thinks Patara is making poor progress in his improvements in that direction, when viewed from a California standpoint. He very properly considers a loss of from 30 to 50 per cent., as set down for the Idria mines, as a most wasteful practice, and notwithstanding the great reduction in such loss effected by Patara—from 30 or 50 per cent. to 16—the average of loss still remains far greater by this improved method than the most wasteful process employed in this State.

The loss at Almaden is not above 5 or 6 per cent.; while the Coalt & Roach, and the Knox & Osborne and other processes claim to work within one per cent. of assay value; and where wood can be obtained at \$5 per cord, at a cost of only \$1.25 per ton for ordinarily selected rock, simply reduced to what may be called a large egg size; the great cost of crushing, stamping and concentrating is saved by the latter process. We have written to our Vienna correspondent for a full description of the Patara process, which will be placed before our readers as soon as received.

A CLEAN-UP (partial) of the Spring Valley Canal and Mining Company at Cherokee Flat, of a ninety-days' run, resulted in \$50,000 being taken up. Their new Canal is nearly finished, but the pipe across Feather river is somewhat delayed. One "chief" and a 5-inch nozzle only was used, nor was all the flume cleaned.

CHERRY CREEK mine, 75 miles from Eureka, which were discovered last September, turn out some very rich gold ore. Capital is wanted to erect reduction works; and no ore has as yet been worked.

IMPORTS of silver ore into Liverpool during May amounted to 1,520 tons and of silver lead ores 380 tons.

ANTIMONY is quoted in Liverpool at £60 to £61 for French Star.

We unintentionally omitted to credit a correspondent of the *Bulletin* for the article on Meadow Lake Mines, on page 394 of this issue.

The Comstock Mines.

Latest Home Views by our Virginia Correspondent.

NUMBER VII.

The results attending the rise and decline in stocks are manifold. Stocks forming the basis of all transactions in this enterprising portion of the world, rule with an unerring hand our individual destinies, controlling professional, mercantile and social affairs to a degree which is surprising when one stops to give the subject a moment's thought. When the

Stock Market is Lively,

Interested holders of idle stocks awake to the supposition that the mines which they represent can be made to assume a value in the eyes of the speculative portion of the community; old titles are looked up, and in the conflict of dispute to decide imaginary lines of long forgotten locations, the professional man is called into service and reaps a rich reward for his study of the mysteries of mining laws and croppings, dips, spurs, angles and variations of real or imaginary mines. Speculators are encouraged and flush, their prospects looking bright and promising, and realizing the success of their anticipations, the man of business feels the change in the increase of his sales. The social circle feels the change, and is happy, resources for amusement are invented, and as long as the delusion lasts everything runs smoothly. The expert can furnish positive information on all the workings of any mine, its prospects, developments and merits.

But When Stocks are Down

The world seems dead, business of all kinds is depressed, amusements die out for want of support, and in regard to the mines, although the leading ones are worked with the same pertinacity and vigor as before, but little attention is paid them, except by the far-seeing, close-monthed insider who knows its prospects and quietly prepares for the consequences, while the trifling adventurer stands powerless, asking anxiously of every passer-by "what is to become of us." For the last week we have experienced a season of depression.

Savage and Chollar.

Savage, making its rich development suddenly and unexpectedly, and the fact becoming surreptitiously known, the stock went up with gigantic strides, leaving the innocent and unsuspecting managers out in the cold, or, not looking for so valuable a change, or being short on it, caused them to prick up their ears and rustle in order to save themselves from total wreck. The strike in Savage, buoyed up by the recent previous showing of Consolidated Virginia, and followed by the strike in the Chollar, carried with a lively splurge the whole line of the Comstock, and awoke to life the somnolent wildcats, relics of last year, which for a short season have gloried in a prominence, for several months past unknown.

These recent developments being of great importance, it now becomes necessary, preparatory to the inauguration of a lively season, in view of the coming elections of Savage and Chollar, and for other reasons, to break these stocks, in order to reacquire their control for future manipulation, be weakening the public confidence temporarily in their value,—an operation hereafter in its conceptions, and to accomplish which, they whole market must suffer.

The mines above referred to, Savage and Chollar having been under the control of the managers of Crown Point and Belcher, now safely corralled for months to come, the stocks of the latter two, have, for the past few days, been hurled at the public at a ruinous sacrifice, and the object is being rapidly achieved.

The stock list is daily contracting, low priced stocks are sinking into obscurity or to a mere nominal figure, while those who are sacrificing stocks of known value, are at the same time quietly absorbing what indications promise to furnish a rich return for their seeming recklessness.

Another reason for this forced and unreasonable decline, between leading forces, in all lines of business, there is always a subject of dispute, or a personal animosity, which will injure itself to get even. The future of the

Hale and Norcross

Is not flattering. They have worked out their body of ore on the south to the Chollar line, and in the north have only a limited body on their 1600-ft. level on the Savage line, which amounts to but little and is doubtless the tail end of the Savage body.

The insiders of Hale & Norcross being aware of this, and knowing that a long season of assessments and hard work must elapse before its station, as a valuable mine, can be resumed, are gradually relinquishing their hold of the stock at as good an advantage as possible, which advantage the management of the Chollar are seemingly determined shall not be enhanced, at present, by what can be shown there. The Chollar have accordingly abandoned their crosscut west to the ledge, and are continuing their main drift north to intersect the opening on the Hale & Norcross south

line for air, and will probably do no more crosscutting until after July elections.

Cons. Virginia

Are running a drift N. E. from their main north drift towards their shaft, with which connection will be made in about two months, when the extensive body of ore which indications favor to exist in this mine will be explored, extracted and milled.

Ophir

Is pursuing the even tenor of its way; their encouraging developments during the past year being of sufficient importance to warrant their belief that they will soon be rewarded for the perseverance and expense which they have thus far incurred. They are sinking a permanent two-compartment shaft from their 1465-foot level, 400-feet east of their main shaft which will strike the west wall at from 400 to 500 feet depth. This shaft having become too deep for speedy sinking by windlass, a hoisting connection, by means of a series of pulleys has been made through the drift and shaft with one of their engines on the surface which works splendidly and will enable sinking to progress at the rate of four feet per day.

In the course of a month, a station will be opened at 1600-ft. from surface and the ledge cross-cut east and west. A good development in their mine, which it is hoped will be made soon, together with the recent developments in Savage and Consolidated Virginia would go far towards establishing the continuity of a series of rich ore-bodies along the entire Comstock ledge at about the level that the Sutro Tunnel will intersect it.

The Sierra Nevada

Some time since encountered a small streak of quartz in prospecting their upper workings, which, on being followed, has widened out to a body of good ore, now six to eight feet across, the extent of which is as yet unknown as it is

STEVEN'S BALANCE SLIDE VALVE.

still increasing in width and promises to be a valuable discovery for this company.

An Old Location,

Called the Sutro, on the north side of Cedar Hill, has lately been re-opened, and work on the same is progressing. As to merit, the result of future working will be reported, should the mine prove of sufficient importance to deserve public attention.

In Gold Hill

There is nothing new of stirring importance in the way of developments, except a steady and marked improvement in Crown Point.

The Imperial Company are hoisting about 1,000 tons of ore, which they have been sowing away in openings on and between the 1,600 and 1,700-ft. levels,—which would seem to indicate a preparation for more vigorous work, and probably to fully develop the body of ore which they are said to have struck in their south mine.

Crown Point—The Aulocral of the World

In Silver mines, improves with astonishing rapidity as prospecting continues. Their strike, two years ago, on the 1,000-ft. level, occurring in what was looked upon as a valueless mine, and about to be abandoned, was accidentally found by a prospecting drift, run at random, solely in the hope that the stock would advance a dollar a share,—old, original shares, then selling at \$3—in order that large holders might dispose of a portion of their stock at an advanced figure before closing their mine for good. This accidental discovery, unparalleled in its results, has grown to be the keystone of the Comstock, reviving the hopes and stimulating the belief that this great lode is inexhaustible.

The discovery was for a long time regarded with uncertainty, and especially by those most interested, but as prospecting advanced and its richness has been exposed, the extent and value of which is now as great a mystery as for the first six months of its development, the mining world stands agape with wonderment, and, speculating on the possibilities, work with redoubled energy, deep and wide in this fathomless vein, in the belief that similar bodies can and do exist.

This body, since its discovery, has been opened up to the 900-foot level, at which point

it seems to commence, and as deeper levels are opened a steady and rapid increase in its extent is shown going north—its limits advancing northerly at the rate of 50 to 60 feet for every 100 feet vertical in depth.

The Crown Point is comparatively a small claim, showing by actual measurement only 540 feet on the ledge; and should their body of ore increase on the north as it promises, a few more levels will show it to extend across the whole claim, and even across the Kentuck into the Yellow Jacket, on which ground it should make its appearance at about 1,900 feet deep. Reports have been current from time to time that the Crown Point ledge was "petering out," but a simple examination of the mine will dispel all such suppositions, for the most cynical cannot but find an increase in extent and value as depth is attained; the deepest point at which a pick can be struck into ore being the richest.

The only level in the mine which has been thoroughly worked is the 1200. On all other levels extensive bodies of ore remain for the future working. After working through their main body on the 1200 ft. level, a drift, 120 ft. north of Belcher line, was run east through a mass of barren quartz and porphyry, 36 ft., when an east body of ore was struck, 6 ft. wide at that point; this body has been sunk on by winze, and on the 5th floor above the 1300, another drift was run 53 ft. east from main body to connect with this winze for air. The east body at this point shows 27 ft. wide; milling \$65 per ton.

From the sill floor of 1300, a drift is run 66 feet through barren matter, cutting in the east 14 feet of rich ore, milling \$200 per ton, and is being continued through another streak of barren quartz toward the east wall, in the belief, according to indications above, that the main east body is not yet reached.

On 1400-foot level a drift is being run south,

on west wall, for Belcher line, which is now in 140 feet, at this point a crosscut east is in 40 feet, intended to top the north end of the ore body, and is being cautiously advanced on account of the body of water which the ledge contains, and which prevents sinking by winze from the 1300.

Crosscuts from this will be run east as progress is made, and as soon as the water is tapped, three winzes will be sunk from 1,300 to connect with this level for air.

On the 1,300 foot level the ledge consists of a pure body of ore, requiring no assorting, and anguring well for richness in deeper workings.

On the 1,200 foot level, the ore body was 60 to 100 feet in width. On the 1,300 foot level the ore body is 90 to 130 wide, and extends northerly 370 feet from Belcher line.

At a depth of 1500 feet, a new station is now being made, above which levels—should their mine increase in length and breadth to the extent that present developments promise—many years must elapse before the mine, as far as opened, can be exhausted. To timber this vast opening, six millions feet of timber is required annually, and in various avocations about the mine, the force employed is between five and six hundred men.

Last night it was excitedly reported that

Ballimore Consolidated

Had made a strike. At 9 o'clock p. m., Sup't Strother proceeded to the mine with a couple of Sharon's experts to prospect the new attraction, and being followed by a mob of curbstone sharps, on foot, the excitement was intense, the result being shown on the board this morning: "Balto. Con. struck another bunch yesterday, in their lower drift, about 120 feet from shaft, similar to their late discovery above, and from which a \$20 assay was had to-day." Only this, and nothing more. CANA.

Virginia, June 17th. 1873.

RICH STRIKE.—The Havana mine, one of the oldest locations in Ely District, has just developed a rich body of ore. The Record says assays go from \$200 to \$600 and the ledge is at least 8 ft. from wall to wall. This mine is on Spring Mountain, about 400 ft. east of the American Flag.

Stevens' Balance Slide Valve.

The accompanying cut represents Stevens' Balance Slide Valve for locomotive, stationary, and marine engines. It has been in use in a number of marine and other engines for nearly seven years. Mr. A. J. Stevens, the inventor, is general master mechanic on the Central Pacific Railroad, and resides at Sacramento. These valves have been in use for some time on the locomotives on that road. The valve is cheap in construction and durable in operation, having never in any instance caused trouble or delay to any engine using it.

By referring to the accompanying cuts, its operation will be seen.

B is the balance yoke fitted around the top of valve, and working stem tight against the inner surface of steam chest cover, and should be fitted so as to move on and off freely. SS are springs fitted into pockets in balance yoke, and resting on the back of the valve, for the purpose of holding the yoke, B, to its seat when steam is shut off. They should be adjusted so as to hold the yoke just up to its seat without causing friction. When the yoke or valve is worn sufficiently to require adjusting, it is only necessary to put shims of proper thickness under the springs, SS. T is a packing ring of type metal, and is cast in place. It is intended to make a steam-tight joint between the valve and yoke, and at the same time to allow the yoke to yield to expansion and contraction. This ring is made thickest at the base, or wedge-shape, so that a tight joint will be had when it is pushed up by the pressure of steam. W is a steam-way through the valve for the purpose of allowing steam to pass freely from end to end of the steam chest. RR are relief valves, and PP are passages to relief valves. These valves are simply pieces of 3/8-inch square iron, and have about 1/8 of an inch lift; the passages are holes 3/16 of an inch in diameter, drilled through the flange of the valve. These valves are intended to relieve the piston from back pressure. V is a vent hole communicating with the exhaust cavity of the valve. A is a 2-inch air valve of the common globe, check pattern. This valve is intended to admit air to the cylinder when the engine is moving and not working steam, and must in all cases be used on locomotives with this valve. A self-lubricator of some good pattern should be used in connection with the valve.

Great care should be observed in fitting up the steam chest to get the upper and lower seats parallel. The cover should have a bearing opposite the outside of the chest bolts, so as to prevent the cover springing up in the center by the strain on the bolts. As this valve is exposed to little or no pressure, it can and should be made quite thin and light in all its parts. A copper gasket is used to make the lower steam chest joint; the top joint is usually ground, but can be made with a copper gasket also. The valve is so constructed that it is exposed to very little pressure, and consequently runs with a small amount of friction.

Some idea of the value of this valve may be had from the following condensed mileage statement of engines running on the Central Pacific Railroad, and using Stevens' slide valves:

No. of Engine.	Kind of Fuel.	Date Balance Slide Valve put in.	Mileage run since put in.	Value of Fuel consumed.	Value of Balance Slide Valve.
3	Coal	August, 1871	78,400	78,400	20,000
15	Coal	August, 1871	47,983	47,983	20,000
23	Coal	March, 1872	31,700	31,700	20,000
39	Coal	October, 1872	14,255	14,255	20,000
66	Coal	February, 1871	67,749	67,749	20,000
94	Coal	February, 1871	63,140	63,140	20,000
11	Coal	December, 1870	58,200	58,200	20,000
75	Coal	August, 1871	52,698	52,698	20,000
89	Coal	March, 1872	26,090	26,090	20,000
137	Coal	October, 1871	36,415	36,415	20,000
122	Coal	April, 1872	29,364	29,364	20,000
123	Coal	April, 1872	26,090	26,090	20,000
146	Coal	February, 1871	39,934	39,934	20,000
150	Coal	March, 1872	18,594	18,594	20,000
153	Coal	September, 1872	15,750	15,750	20,000
155	Coal	December, 1872	12,100	12,100	20,000
156	Coal	July, 1871	67,148	67,148	20,000
162	Coal	March, 1871	72,401	72,401	20,000
172	Coal	May, 1870	51,901	51,901	20,000
173	Coal	November, 1872	11,575	11,575	20,000
176	Coal	March, 1865	81,630	81,630	20,000

From this it will be seen that at the time the statement was made on only engines 15,176 and 94 had had valve seats faced, since running with this slide valve. Some 17 new engines are being fitted with it. Mr. Stevens has numerous testimonials from prominent engineers certifying to the efficiency of the valve. He guarantees it to run 50,000 miles if fitted up according to the foregoing directions. Mr. A. J. Stevens, of Sacramento, will furnish working drawings and all information required by those wishing to make and use this valve.

THE HASKINS' perjury case in relation to changing the records of mining locations has been decided and the charges against Haskins were not proven. The testimony went to show that Haskins was very particular in keeping correct copies of the records, and that he personally had not meddled with them. No evidence was elicited showing who had made the alteration. The case has excited considerable interest.

The Meadow Lake Mines—A Deserted City.

Town and Mining District of Meadow Lake.

Not a locality in California has a more melancholy history than this whence I write. In the adjacent State of Nevada it would be easy to parallel the untoward fortunes of Meadow Lake, and even on this side the mountains one meets with many a mining town as solitary and ruinous as this. But these towns lived their day and accomplished the end for which they were built. Having sprung up for the accommodation of the mines in the neighborhood, they naturally want to decay when the latter become impoverished. Not so here; this place has become a desolation, not because the mines have been exhausted as in California, nor because it was without mineral resources to sustain it, as was the case with many of the ephemeral towns of Nevada. This district abounds with gold-bearing quartz lodes, many of them of large size and undoubted value, none of which have been worked out, or even more than fairly prospected; the trouble having been that the gold the ores are known to contain could not be saved by any process heretofore employed in working them.

Discovery and Locality of the Mines—Character of the Country, Etc.

The mines here were first discovered ten years ago the present summer, though but little noticed until two years latter, when a population of four or five thousand were drawn hither, the most of them coming from Western Nevada and the adjacent mining districts of California. The town was estimated at one time to contain over four thousand inhabitants. It now contains two, between which number and none at all the population has fluctuated for the last five years. Henry Hsrtly, hunter and miner, has been the sole resident of the place for the past two winters. He considers it a hopeful indication that the population should have doubled within the last thirty days, and remarked on my arrival that the sight of three persons on the streets at once imparted to them quite a thronged appearance.

The Meadow Lake District, which derives its name from the artificial lake created here by the South Yuba Canal Company for reservoir purposes, lies on the westerly slope of the Sierra Nevada very near the summit. It has a mean altitude of about 7,000 feet, and is situated twelve miles by the wagon road, in a northerly direction from Cisco, nearest station on the Central Pacific Railroad. The country in the vicinity is rugged and desolate, the mountain peaks and ridges consisting almost wholly of bald and timberless masses of ecinitic granite. On their tops and northerly slopes the snow usually lies till midsummer, feeding numerous streams of pure cold water, that flowing down their sides unite and form the upper tributaries of the South Yuba. A great deal of snow falls here in the winter, the accumulation generally reaching a depth of twenty-five or thirty feet.

Summer Pasturage—Mountain Lakes and Reservoirs.

The valleys and lower mountain slopes of this region are well timbered and afford a great deal of summer pasturage, this being one of the summer resorts of the California stockmen. The overflowing of a large meadow, the site of the present lake, destroyed much good feed, whereat the cattle owners felt much aggrieved. Their stock range here threaten soon to be encroached upon, it being the intention of the Canal Company to convert Fordyce Valley, another of these natural meadows, lying a few miles further south on the main fork of the South Yuba, into a reservoir the present summer. It may seem a pity to destroy in this way the green pasturage so much needed by our stock growers during the dry season, but the gold that the water so stored up will wash out in a single year, amounts to the value of the cattle that might have been fed upon the grass many times over; and should it ever come to pass that this water is no longer required for mining purposes then these dams can be removed and this submerged land be restored in a few years to its original condition.

The damming up of Fordyce Valley will require a structure 2,500 feet long and 60 feet high, whereby an area of 1,500 acres will be covered from 40 to 60 feet deep. The creation of Meadow Lake, on the westerly edge of which the town is situated, necessitated the building of a dam 1,150 feet long and 42 feet high. It overflows 500 acres to a depth of 30 feet, and when full affords enough water to keep the company's several large ditches supplied for two weeks or more. This year they have not been able to fill it more than two-thirds full, abridging their supply accordingly. This reservoir has scarcely half the capacity of that to be built at Fordyce Valley.

Area and Geology of the District—Richness and Obstinacy of the Ores—Mills, Processes, Production, Etc.

The district covers an area of about fifty square miles and is altogether Alpine in its topography and surroundings. To the north and east the main Sierra rises to a height of 10,000 feet, while standing centrally in the district and between the town and the railroad "Old Man" Mountain lifts itself to an equal

height, a precipitous and isolated mass of glistening granite. The prevailing formation is sienite, through which the lodes of auriferous quartz course mostly in a northwesterly and southeasterly direction. They are quite numerous, several hundred having been located in the district; appear to be regular in their structure and are of a fair size, generally ranging from two to eight feet in thickness, a few being much larger. The ore carries an unusually large percentage of sulphurets, the latter composing about one-sixth of its bulk. Both the sulphureted and the free gold, of which the latter there is a good deal in the rock, appear to be combined with some substance that almost totally defeats amalgamation, nor has any other plan yet been tried here whereby the gold could be saved; hence the failure of all mining operations undertaken and the final abandonment of the district. The sulphurets show a value of about \$60 per ton by assay, and ought to pay well could they be effectually and cheaply worked. Of these several methods of chlorination tried here the Plater process came the nearest to achieving success, but even this did not answer the purpose, and the miners becoming discouraged after repeated failures, finally gave up and for the last five or six years scarcely anything has been done or attempted in the district. During the years '65 and '66, the most active period in the history of Meadow Lake, eight quartz mills were erected in the district, carrying an aggregate of 72 stamps, and costing over \$200,000. With the exception of the U. S. Grant, located six miles south of the town, none of them ever accomplished much, the entire production of the mills and chlorination works not exceeding \$100,000. The total expenditure incurred on account of working the mines, building mills, towns, roads, etc., not to include material and work otherwise bestowed, nor the labor of those not employed on wages, is supposed to have reached \$2,000,000. Meadow Lake has therefore been able to return us yet but one dollar for twenty spent in helping to develop its mines.

A Glean of Hope.

Within the past two days Mr. Matman, of Nevada City, has arrived in this district, bringing with him the fixture and material for erecting chlorination works after the style of those successfully operated by him for a number of years near that town. His works, on a moderate scale for the present, will be put up at the U. S. Grant mill, where some 500 tons of sulphurets have been collected. Mr. Matman has experimented on a portion of these, and found no difficulty in saving the gold up to a close percentage, and feels quite confident that he can conquer the obstacle that has so long stood in the way of success here. He will have his works completed in the course of a month or six weeks, and he will be able to make determinate tests very soon thereafter. A good deal of interest attaches to this experiment, since we may consider the case of Meadow Lake almost hopeless if the difficulties here should baffle one who has made the treatment of sulphureted ore a specialty. Though attended with the best results, this undertaking could hardly put much life into Meadow Lake the present season, as the snow falls early here and not much could be done during the winter. But should it turn out happily it would be likely to revive business in the district next year and perhaps insure for it a prosperous future.

A Sad Spectacle—The Vacant City in the Wilderness.

If anything were needed to emphasize one's convictions of the folly of premature action in mining affairs, a visit to this locality ought to have that effect. A more striking example of undue haste and foolish expenditure can hardly be instanced even in California. Quite a large and handsome town, besides two or three small hamlets, seven costly mills and nearly as many chlorination works were rushed up here before ever it was known whether any of them would be needed or not. After such a long abandonment many of these improvements are now in ruins, the snow having crushed in some while the tempests and the fallen timber have demolished others. The spectacle of a town as large as this standing afar in the wilderness, surrounded by gloomy mountains and emptied of its inhabitants is not a pleasant one. Had the place been burnt up with fire or otherwise wholly laid waste, we would contemplate its fate with less of sadness. The sight of so many buildings, some of them large and costly structures, and not a few still remaining partially furnished, but all silent and deserted, fills one with a feeling of awe that an utter ruin would fail to inspire. As we look upon them we feel that there has been here worse wrecks than these before us, wrecks of fortune and of hopes, of brilliant prospects and promising schemes, all frustrated by a single metallurgical difficulty that could neither be foreseen or overcome.

It is easy to see what uses a majority of these buildings were put, the signs denoting the fact, being still upon the most of them. Or, if one is curious, he may enter and inspect the premises, the doors of such, in many cases, stand wide open. In nearly one-half the houses there still remain stoves, tables, bureaus, bedsteads and such other bulky articles of furniture as could not be well removed, and sometimes also more costly and portable wares. One establishment is to be seen tolerably well outfitted with beds, crockery, cooking utensils, and many other things necessary for carrying on a good-sized hotel. Here is a gaily-papered drinking saloon, with its bar and other paraphernalia now covered with dust, and hard by

a restaurant, its tables half set and its ample cooking range still in good condition for service. A capacious oven erected in the rear of a comely edifice attests the fact announced on the sign without that Peter Bauer once conducted a bakery within; and a stranger may know that a son of St. Cripin must have plied his calling opposite the pile of lether chips, if the wooden boot swinging at the door were not conclusive on that point. The hall of the "Board of Brokers" still stands confronting the office of one of the craft, who, through a sign conspicuously displayed, advises the public that he buys and sells Meadow Lake stocks and other first-class securities. And so we might go on and find here the evidences of all those diverse vocations, useful and otherwise, so apt to spring up with mushroom growth in a precocious mining town.

Many of the largest buildings, being those most exposed to destruction from this cause, have been broken down by the snow and now lie splintered and crushed into magnificent piles of oven wood. Several of the quartz mills have shared a like fate, that of the Mohawk Mining Company, standing close on the shore of the lake, having fallen into the water, where in disjointed fragments the super-structure is drifting about leaving the ponderous machinery quite out of doors.

From the foregoing it will be seen that Meadow Lake is an altogether dilapidated town, the history whereof is well represented by its present woe-begone and hapless condition. Let us hope that a better day will soon dawn upon it, re-peopling its deserted tenements at least in part, and that the mines here, the master impediment being removed, will return the capital and labor spent upon them a fair reward. Yet of all this we may not be too sanguine; nor can the resuscitation of the district in any event be other than slow and somewhat delayed. Meantime, it will be well if the mistakes committed here shall serve as a useful warning to others, saving them from the hard fortune that befel the over-confident founders of Meadow Lake.

Omnibus Law.

A Philadelphia court has made a decision that seems to give general satisfaction. It is, that when the seats are full, it is not lawful to charge for admission. The ticket of admission implies that you are to be seated. Though this decision was at the suit of a person for return of his money, because he had to stand in a theater, the just principle of law applies also to omnibuses. In Paris, this law is rigidly enforced. Coaches are allowed 14 passengers inside and 12 on the impensale—that is, seats on top, which are half price.

There should be some regulation here. We suggest larger coaches, or French top-seats at half rates.

Omnibus tickets are paper currency, and probably against the law. It is vexatious to be obliged to buy tickets not interchangeable, and to have to pay rates not represented by any currency, for single fares. What the public wants is a uniform price, say five cents, and no paper currency. This would be justice, and an equal regard for the rights of both parties.

TEMPERATURE ON RAILROAD EXPENSES.—The report of Mr. Robinson, Locomotive Superintendent of the Great Western of Canada, shows very strikingly the effect of severe weather on train expenses. While the time table calls for 12,069 hours of locomotive service on freight trains for January last, the freight locomotives were actually under steam 18,379 hours. This increase of 50 per cent. must have extended, or nearly to the same extent, to fuel consumption, locomotive and train service and to repairs probably in a greater proportion.

MR. T. P. Woon, of Chesterfield, has invented an ingenione and effective self-feeding corking machine. The corks are placed in a large hopper over the machine, where they are kept in a continual state of agitation, and drop down a tube, in which there is an arrangement similar to that in a shot-pouch: This permits only one cork to pass at a time, which is admitted into a cylinder, from which a plunger drives it into the bottle.

THE GLADIATOR TUNNEL, above the Illinois and between the Emma and Flagstaff mines, Utah, is in 490 feet.

THE HOLLY WATER WORKS at Sacramento have been tested and found to work satisfactorily.

RAWLINGS, Wyoming Territory, is excited over the finding of gold in the red hematite iron beds.

CARSON MINT.—W. Hopkins has been appointed Assayer of the Carson Mint, by the President.

MINERS continue to arrive in Trinity from Nevada, Placer and other counties.

MORMON BASIN is another mining camp with favorable prospects for the season.

HOISTING WORKS will soon be put on the Dunderberg mine at Eureka.

THE CARSON MINT last month received as deposits \$1,012,506.

PROCTOR BULLION shipments last week amounted to \$90,000.

Gold in Napa County.

The quicksilver excitement in this vicinity of the past two months has been the agent, through the numerous prospectors, of the discovery and full development of one of the most valuable gold and silver ledges on the Pacific Coast. That gold and silver has existed in the gulches about three miles northwest from this place has been known for the past fifteen years, but not in sufficient quantities to pay, as has been repeatedly tested by the old residents hereabouts. All the auriferous quartz that has heretofore been discovered near here, has been in boulders or what is termed "float rock." About four months ago a perfect quartz lode was discovered on the farm of Josiah Hasbrouck, some six or seven miles west of this place, and in assaying for quicksilver, of which there was strong indications, gold and silver in about equal quantities, were found, in value \$18.80 per ton. The ledge was so clearly defined that it was readily traced in a northeasterly direction to almost the summit of St. Helena mountain, where it crops out boldly some thirty or forty feet high, and the thick covering of moss has deceived all who have seen it, who took it to be sandstone or slate. The entire ledge, which is traceable some six or seven miles, has been taken up, claimed and recorded, and the developments of the past week prove the ledge to be of astounding value. Chips broken from the exposed ledge were assayed by John Hewston, Jr., at the California Refinery, and proved to contain \$70 per ton in gold and silver. Rock from the tunnel of the St. Helena Gold and Silver Mining Company, about three hundred yards off the toll-gate on the Harbin Springs road, was assayed last Saturday and was found to contain \$126 per ton—the proportion of silver increasing as the tunnel progresses, which is now in some twelve feet. The ledge appears to be about six feet wide on top and gradually widening as they go down. Mr. Alex. Badlam, the Superintendent of the mine, brought down yesterday quartz taken from the surface containing free gold, and several beautiful specimens containing pyrites of iron and chlorides of silver and free gold. The rock has the precise appearance of that from the Comstock Ledge, and is pronounced by competent judges to be the only well defined and perfect auriferous quartz ledge on the Coast Range. Over five hundred persons have visited the mine within a week, among whom we noticed Hon. J. P. Jones of Nevada, Milton Lambeth, mining expert, General G. S. Dodge, John Landers, James A. Pritchard, G. F. Kellogg, James McCue, Speaker Blaine, J. A. Mars, and many others who are astonished at the discovery. Work is progressing rapidly and if the development continues as commenced, the future of Calistoga will be in no particular problematical. The original locators of this valuable mine are Richard Swift and John Evans, of this place, and Col. C. S. Bulechely, Alex. Badlam, Jr., and J. L. Sanford, of San Francisco, who may be congratulated upon their good fortune, for, without doubt, the mine could be sold for hundred of thousand now, without another dollar being spent upon it.—*Calistoga Tribune*.

The above item appears in the *Tribune* under the head of "Great Auriferous Discovery—Is it Another Comstock Ledge," etc. Now we are pleased to hear of new mining discoveries wherever they may be, and particularly in California, but would mildly suggest a few items to the *Tribune*. In the first place a period of four months is hardly time to prove whether a "mine" is a "true fissure vein" or not, so the "competent judges" might be mistaken in their statement that this claim is the "only auriferous quartz ledge in the Coast Range." Moreover 500 assays of gold rock will not prove as much concerning the ore as will a run of 25 or 30 tons in the mill. Lots of mines turn out gold ore assaying \$100 per ton that will not pay to work; a fact which hard and stern experience has impressed upon many an incipient investor. "The proportion of the silver increases as the tunnel progresses" is good, considering the same sentence tells us that said tunnel is in only 12 feet. The "increase" must be very sudden in so short a distance. Tracing a ledge by its croppings does not amount to very much, so far as its paying is concerned. We have seen a continuation of croppings several miles in length and only one place on which it would pay at all; moreover after sinking about 50 feet the ledge "pinched" and when it widened again there was not anything in it.

We do not know how far they have got down on this ledge, though we are told that it is "6 feet wide on top and widening as they go down." That is an old phrase, need indiscriminately by many who have no right to do so. The *Tribune* man tells us that the lucky owners can, without doubt, sell the mine for "hundred of thousand" now, without another dollar being spent on it. If they can do so they'll be as smart as Arnold was in selling diamond fields. If the editor of the *Tribune* can find any man in California who will pay a tenth of a hundred thousand for a "mine" with a 12 foot tunnel, in Napa county, with ore that "assays" \$136 per ton, and has never been milled or tested in any other way, he had better come down on California street and go into the business, for he can make more money "getting capital" than in running a country paper. We hope the *Tribune* will keep us posted in "new developments" and tell us when ever a mill is put up.

DEWEY & CO.**American & Foreign Patent Agents,**

OFFICE, 333 MONTGOMERY STREET, S. F.

PATENTS obtained promptly; Caveats filed expeditiously; Patent reissues taken out; Assignments made and recorded in legal form; Copies of Patents and Assignments procured; Examinations of Patents made here and at Washington; Examinations made of Assignments recorded in Washington; Examinations ordered and reported by Telegraph; Rejected cases taken up and Patents obtained; Interferences prosecuted; Opinions rendered regarding the validity of Patents and Assignments; every legitimate branch of Patent Agency Business promptly and thoroughly conducted.

Our intimate knowledge of the various inventions of this coast, and long practice in patent business, enable us to abundantly satisfy our patrons; and our success and business are constantly increasing.

The shrewdest and most experienced Inventors are found among our most steadfast friends and patrons, who fully appreciate our advantages in bringing valuable inventions to the notice of the public through the columns of our widely circulated, first-class journals—thereby facilitating their introduction, sale and popularity.

Foreign Patents.

In addition to American Patents, we secure, with the assistance of co-operative agents, claims in all foreign countries which grant Patents, including Great Britain, France, Belgium, Prussia, Austria, Victoria, Peru, Russia, Spain, British India, Saxony, British Columbia, Canada, Norway, Sweden, Mexico, Victoria, Brazil, Bavaria, Holland, Denmark, Italy, Portugal, Cuba, Roman States, Württemberg, New Zealand, New South Wales, Queensland, Tasmania, Brazil, New Grenada, Chile, Argentine Republic, AND EVERY COUNTRY IN THE WORLD where Patents are obtainable.

No models are required in European countries, but the drawings and specifications should be prepared with thoroughness, by able persons who are familiar with the requirements and changes of foreign patent laws—agents who are reliable and permanently established.

Our schedule prices for obtaining foreign patents, in all cases, will always be as low, and in some instances lower, than those of any other responsible agency.

We can and do get foreign patents for inventors in the Pacific States from two to six months (according to the location of the country) sooner than any other agents.

Home Counsel.

Our long experience in obtaining patents for inventors on this Coast has familiarized us with the character of most of the inventions already patented; hence we are frequently able to save our patrons the cost of a fruitless application by pointing them to the same thing already covered by a patent. We are always free to advise applicants of any knowledge we have of previous applications which will interfere with their obtaining a patent.

We invite the acquaintance of all parties connected with inventions and patent right business, believing that the mutual conference of legitimate business and professional men is mutual gain. Parties in doubt in regard to their rights as assignees of patents, or purchasers of patented articles, can often receive advice of importance to them from a short call at our office.

Remittances of money, made by individual inventors to the Government, sometimes miscarry, and it has repeatedly happened that applicants have not only lost their money, but their inventions also, from this cause and consequent delay. We hold ourselves responsible for all fees entrusted to our agency. The principal portion of the patent business of this coast has been done, and is still being done, through our agency. We are familiar with, and have full records, of all former cases, and can more directly judge of the value and patentability of inventions discovered here than any other agents.

Situated so remote from the seat of government, delays are even more dangerous to the inventor of the Pacific Coast than to applicants in the Eastern States. Valuable patents may be lost by the extra time consumed in transmitting specifications from Eastern agencies back to this coast for the signature of the inventor.

Confidential.

Take great pains to preserve secrecy in all confidential matters, and applicants for patents can rest assured that their communications and business transactions will be held strictly confidential by us. Circulars free.

Engravings.

We have superior artists in our own office, and all facilities for producing fine and satisfactory illustrations of inventions and machinery, for newspaper, book, circular and other printed illustrations, and are always ready to assist patrons in bringing their valuable discoveries into practical and profitable use.

DEWEY & CO.,

United States and Foreign Patent Agents, publishers Mining and Scientific Presses and the Pacific Rural Press, 333 Montgomery St., S. E. corner of California St., San Francisco.

Valuable Premiums for Subscriptions.

A Sewing Machine of Real Value (Beckwith's) given for \$40 worth of Subscriptions.

The AMERICAN AGRICULTURIST, in speaking of this Machine, says: We are prepared to endorse the Beckwith Sewing Machine as one worthy of being at once secured by all who cannot purchase the expensive machines.

1st. It is well and strongly made.
2d. It is easily attached to any table or stand having a leaf or edge projecting an inch or so, and can thus be used in any part of the house, near a window, etc.
3d. It makes the elastic loop stitch (the same as the Willcox & Gibbs and some other good machines), which with a little care in making the closing stitch is abundantly strong for nearly all kinds of sewing, and less liable to break in washing and wearing, owing to its elasticity.

WE WILL GIVE

For \$12, a Machine and the Illustrated Press, 1 year.
For \$12, a Machine and the Mining & Scientific Press, 6 mos.
For 15, a Machine and the Pacific Rural Press, 6 mos.
For \$13.50, a Machine and the Mining & Scientific Press, 1 yr.
For \$13.50, a Machine and the Pacific Rural Press, 1 year.
For \$40, we will give a Machine and \$40 worth of subscriptions to either paper or all jointly at regular rates. Send for Circular.

Express charges must be paid by the purchaser. Address, for further particulars, the PUBLISHERS OF THIS JOURNAL.

HINTS FOR

We will send on receipt of stamp for postage, FREE, our 32-page Circular, containing 112 Illustrated Mechanical Movements; a digest of PATENT LAWS; information how to obtain patents, and about the rights and privileges of inventors and patentees; list of Government fees, practical hints etc., etc. Address DEWEY & CO., Publishers and Patent Agents, San Francisco.

INVENTORS.**Something New for the Kitchen,****THE Aerating Egg Beater.**

Various devices have been presented to the public for heating eggs, but nothing, we think, equal to the one herein shown. This, in fact, is the only aerating device ever made, and is very properly called the "Aerating Egg Beater."

This Beater, as will be seen by reference to the engraving, is simply a tin can with a cone bottom and a cone dasher, the lower portion of the dasher being perforated with very small holes, as shown. Under this arrangement the upper portion, when forced down, fills with air, which is forced through the egg, thereby finely dividing and thoroughly aerating the mass. It heats one egg as well as half a dozen. For further particulars address

WIESTER & CO.,

17 New Montgomery St. (Grand Hotel Building), S. F.

Ranch for Sale near Oakland.

280 Acres, situated about four miles northeast of the City Hall, Oakland, and just above Fruit Vale, in Brooklyn Township. One hundred and more acres have been tilled. The whole is favorably located and well suited for a milkman's dairy. The dwelling house contains eight rooms, hard finished. Barn, 40x100 feet. It is handsomely supplied with sweet spring water, besides being watered by several creeks. There is also a fine sulphur spring, with a large and constant flow of mineral water.

A STONE QUARRY

Of well proved quality will be sold with the balance of the place if desired. It possesses special natural advantages superior to any other tract of land within the same distance from San Francisco and Oakland. The title is perfect, and the place has been in the possession of its present occupant for 12 years. Will be sold at a low price. Part of the purchase money can remain on security. The property should be seen to be appreciated. Apply to A. T. Dewey, 333 Montgomery street, S. F., to Geo. W. Thompson, on the premises, or to P. H. Sumner, Real Estate Agent, 6 Montgomery St., S. F.

The Most Complete Invention for Opening Cans ever Invented.

No family that uses canned Fruits, Vegetables, Sardines or Oysters, should be without one of these convenient household tools. No Restaurant, Hotel or Oyster Saloon can afford to do without one. It will cut any shaped hole, from a triangle to a perfect circle. One sample sent postage free for 75 cents.

WIESTER & CO.,

17 New Montgomery St. (under Grand Hotel), S. F.

Mine for Sale at Michigan Bar.

A one-half interest (1,300 feet) in the mine is offered for the sinking of 40 additional feet—the present depth of shaft being 60 feet, well timbered throughout. Parties will have to furnish everything connected with working the mine. Assay value at depth of 48 feet, from State Assay Office, \$10 in gold; silver, \$3 per ton making \$13 per ton.

For further information apply to ml5 6td-8ts JOHN J. COLLINS, Lodi, Cal.

2v25-3m E. G. DENNISTON, Proprietor.

Varney's Patent Amalgamator.**These Machines Stand Unrivaled.**

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared to have them constructed in the most perfect manner and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Settlers made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill-men are invited to examine these pans and settlers for themselves, at the office, 229 Fremont Street, San Francisco.

PATENTS & INVENTIONS.

Telegraphic List of U. S. Patents Issued to Pacific Coast Inventors.

FROM OFFICIAL REPORTS FOR THE MINING AND SCIENTIFIC PRESS, DEWEY & CO., PUBLISHERS AND U. S. AND FOREIGN PATENT AGENTS

By Special Dispatch, Dated Washington, D. C., June 17th, 1873.

FOR WEEK ENDING JUNE 3d, 1873.

EXPLOSIVE COMPOUND OR GIANT POWDER.—Egbert Judson, assignor to the Giant Powder Co. and Atlantic Powder Co., S. F., Cal.

ORE FEEDER FOR GRINDING AND CRUSHING MILLS.—Charles P. Stanford, S. F., Cal.

RAILROAD SWITCH.—John T. Linthicum, assignor to Ira Gilchrist, Vallejo, Cal.

HYDRAULIC ELEVATOR.—Timothy Stebbins, S. F., Cal.

TELEGRAPH POLES.—Thomas J. McCarver, James Athey and Berryman Jennings, Oregon City, Oregon.

*The patents are not ready for delivery by the Patent Office until some 14 days after the date of issue. NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with greater security and in much less time than by any other agency.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co's Scientific Press American and Foreign Patent Agency, the following are worthy of mention:

IMPROVED REFINER FOR DISTILLING PURPOSES.

The preparation of alcohol, or any fermented spirituous liquor, is divided into three distinct stages or operations—fermentation, distillation and rectification. The latter is found the most difficult and at the same time it is the most essential to a good article. Indeed, so difficult is the process of rectification that many distillers do not perfect their products, but pass them over to the rectifying distiller, whose business it is to remove from them any contaminations which are disagreeable or injurious. Even where the producer conducts his operations to their final result, the rectification process is usually done apart and in a distinct portion of the premises.

The object of the invention, herewith presented, is to place within the reach of the distiller, at a reasonable cost, a simple and effective device by which the process of refining may be more readily performed, and by the distiller himself, and used, if desired, directly in connection with the still.

This device consists mainly in a novel construction of an elongated vessel, having diaphragms placed across it at intervals, which diaphragms are perforated, alternately at top and bottom, for the passage of the vapors. Each compartment thus formed has a pipe leading out of it into a corresponding compartment in another vessel placed below the one first described. The compartments in the second vessel are so arranged that whatever oils, fluids, etc., may be condensed in the several compartments of the vessel above, pass out thence, through the pipe above mentioned, into a corresponding compartment in this lower vessel, and from which they may be drawn off at leisure, or passed automatically again to the still for redistillation, and further elimination of any spirituous liquor which may have been deposited in the first instance with the contaminations.

These vessels and their compartments may be constructed of any number and size, by which means the vapors of the still may be made to pass any distance, with, of course, decreasing temperature under which the various oils and other impurities which pass out of the still, may be condensed as they meet the various temperatures required for such condensation, until nothing but the pure spirituous vapor is left to be deposited in the vessel designed for its reception. The proper temperature is kept up by a water or steam jacket which surrounds the first described vessel.

We have examined samples of spirits which have been refined by this apparatus; the change in the character of the liquors thus produced is really surprising, and such as to commend the device as a most important improvement in the art to which it is applied. We understand that the inventor, Mr. William Neil, of No. 311 Mission street, in this city, has just received a patent for this invention through the MINING AND SCIENTIFIC PRESS Patent Agency, and has also made application for foreign patents for the same.

ACCOUCHMENT COTCH.—E. L. Moore, San Francisco, Cal. Too little attention has heretofore been given to improving the appliances which are requisite for alleviating the suffering of women during the accouchment period. We are too prone to think that nature and the physician will take care of such things without special aid. This patent is for a couch which is provided especially for this purpose, being provided with all of the conveniences and appliances which have been found to be necessary during the confinement. It will undoubtedly prevent much suffering and possibly save many lives.

A NEW POCKET FASTENING.—Mr. J. W. Davis, formerly of Reno, Nevada, but now residing in this city has just received through the SCIENTIFIC PRESS PATENT AGENCY, letters patent for an improvement in fastening the seams of pockets. The improvement consists in the employment of a metal rivet or eyelet for fastening the seams. Simple as this device seems nevertheless it is quite effective, and we do not doubt that his manufacture, of overalls especially, will become quite popular amongst our working men, as the overalls are made and cut in the style of the best custom made pants. Nothing looks more slovenly in a workman than to see his pockets ripped open and hanging down, and no other part of the clothing is so apt to be torn and ripped as the pockets. Besides its slovenly appearance, it is inconvenient and often results in the person losing things from his pockets. Levi Strauss & Co., of this city are sole agents for the new manufacture, and will soon place them in the market in large quantities, so that our miners, farmers and workmen can supply themselves with superior overalls.

ORE FEEDER FOR QUARTZ MILLS.—T. A. Cochran, Jamestown, Cal. This invention relates to an improvement in the ore-feeders which are operated automatically from the tappet by the drop of the stamp, to feed the ore beneath the stamp in quartz mills. The improvement consists in the employment of an endless belt operated by a ratchet and spring-pawl, the pawl being long enough to extend up to, and receive a stroke from the tappet at each descent of the stamp stem. This operation causes the endless belt to travel towards the battery. The ore is placed in a hopper over the belt so that it will fall upon the belt and be delivered into the battery as the belt travels.

Heretofore it was found impracticable to feed wet ore by the self-feeders in use, but by this device wet ore is fed as evenly and regularly as dry ore.

COPPER.—James Lewis and Son's Liverpool Report on ores and metals, dated 31st ult., states that quotations of copper ore on that date in Liverpool were £82 to £85 10s for Chili ore on the spot. Ore and Regulus nominal at from 16s to 17s per unit. The transactions in ore and Regulus have been confined to the Swansea Ticketing sale on the 13th of May which averaged 15s 7½d and 16s 2d for Cape ore, or a fall of about £7 10s per ton of copper. The labor question and the continued high price of coals unsettle everything and makes the smelters very cautious in their operations. Chili exports to let of May amount to 19,327 tons fine against 26,023 tons in same time last year. Stocks of West Coast Produce are estimated at 21,659 tons fine against 20,460 on May 1st.

Time Tests the Merits of all Things.

1840 For Over 30 Years, 1873

PERRY DAVIS' PAIN-KILLER

Has been tested in every variety of climate, and by almost every nation known to Americans. It is the constant companion and inestimable friend of the missionary and the traveler, on the sea or land, and no one should travel on our Lakes or Rivers without it. Since the PAIN-KILLER was first introduced, and met with such extensive sale, many Liniments, Reliefs, Panaceas, and other Remedies have been offered to the public, but not one of them has attained the truly enviable standing of the PAIN-KILLER.

WHY IS THIS SO? It is because DAVIS' PAIN-KILLER is what it claims to be, a Reliever of Pain.

Its Merits are Unsurpassed.

If you are suffering from Internal Pain, Twenty to Thirty Drops in a Little Water will almost instantly cure you. There is nothing to equal it for

Colic, Cramps, Spasms, Heart-burn, Diarrhea, Dysentery, Flux, Wind in the Bowels, Sour Stomach, Dyspepsia, Sick Headache, &c., &c.

In sections of the country where

Fever and Ague

Prevails, there is no remedy held in greater esteem. Persons traveling should keep it by them. A few drops, in water, will prevent sickness or bowel troubles from change of water.

From foreign countries the calls for PAIN-KILLER are great. It is found to

CURE CHOLERA WHEN ALL OTHER REMEDIES FAIL.

WHEN USED EXTERNALLY, AS A LINIMENT, nothing gives quicker ease in Burns, Cuts, Bruises, Sprains, Stings from Insects, and Scalds. It removes the fire, and the wound heals like ordinary sores. Those suffering with RHEUMATISM, GOUT, or NEURALGIA, if not a positive cure, they find the Pain-Killer gives them relief when no other remedy will.

It Gives Instant Relief from Aching Teeth.

Every House-keeper should keep it at hand, and apply it on the first attack of any Pain. It will give satisfactory relief, and save hours of suffering.

Do not trifle with yourselves by testing untried remedies. Be sure you call for and get the genuine PAIN-KILLER, as many worthless nostrums are attempted to be sold on the great reputation of this valuable medicine. Directions accompany each bottle.

PRICE—25 cts., 50 cts., and \$1 per bottle.

WATER SUPPLY.—The report that water for mining purposes is likely to fail soon at Moore's Flat, Nevada county, is incorrect. From Snow Point all along the ridge down to French Corral, the supply will be full until winter.

THE UTAH MINE, Washoe, has been started up again, in charge of Mr. Owen, late foreman of the Kentuck. The shaft, which is nearly full of water, is being pumped out.

SMELTING WORKS.—Chicago intends starting another set of smelting and refining works to cost \$200,000.

Meetings and Elections.

CITY RAILROAD Co.—June 14. Directors: Robert B. Woodward, Allan G. Gladding, M. P. Jones, Jos. H. Moore, J. Hyde, E. Dewitt, R. Kent. ior Shoes and Dies. 20v26-3m

Machinery.

N. Seibert's Eureka Lubricators.

THE HIGHEST PREMIUM

Awarded by the Mechanics' Institute Fair, San Francisco, and State Fair, Sacramento, 1871.

These Lubricators are acknowledged by all engineers to be superior to any they have ever used; feed constantly by pressure of condensed water, supplied by pipe A, regulated under the oil by valve J, and forced out through check valve and pipe B into the steam pipe C; it then becomes greasy steam, passes to all the valves and cylinder of every stroke of the engine; glass tube I indicates amount used per hour. Packing on rods and stems lasts longer, and the rings on the piston will not corrode. One pint of oil will last from three to six days, according to speed and size of engine; I, sliding gauge; K, valve to shut off when engine stops; H, F, valves to shut off in case of frost; steam does not enter the cup; it is always cool; warranted to give satisfaction. Patented February 14, 1871. Manufactured by California Brass Works, 125 First street, S. F. 24v23tf

PUBLISHERS please say advertised in Scientific Press.

PACIFIC BRIDGE COMPANY.

WORKS NEAR SOUTH POINT MILL, BERRY STREET, SAN FRANCISCO, CAL.

Are Prepared, with Superior Machinery, to Manufacture and Build all kinds of Bridges on Smith's, Howe's, and other Improved Plans. Framing of all kinds done by Machinery.

The Smith Bridges have been thoroughly tested in the East for Three Years, and wherever tried have proved superior to any other Bridge in the following points:
Being built of wood entirely, they are not affected by change of temperature.
The timber used is placed so directly in the line of strain, that less material is required to support the same load.
It is not perceptibly affected by shrinkage. It is the most Economical Bridge built. It is adapted to any practicable LENGTH OF SPAN.
Plans, Specifications and Terms will be sent to any County, Township or Person wishing to build a Bridge, and no charge made unless the Plan is used. For all Public Bridges the Plan will always be open to competition.
Smith's celebrated CAST IRON PIER, economical, and adapted to heavy currents, built at low rates.

C. H. GORRILL, Secretary.

W. H. GORRILL, President

BROWN'S PATENT LAMP.

One of these Lamps, when placed at a distance of 200
feet from the bank, will light up a bank surface 250 feet
in length and 150 feet high, and to a much better ad-
vantage than any other light heretofore tried, and at an
expense not to exceed five cents per hour. Lamps
furnished at short notice.

Letter of Recommendation.
Mr. O. B. BROWN-Sir: Your Patent Lamp for light-
ing hydraulic mines, which you sold to me in December
last, has given entire satisfaction, and far exceeds my
expectations, and I think it the best and cheapest light
ever used to light mining claims by night, and am sat-
isfied that I have saved three hundred dollars by the
use of it in the last mining season over pitch or any
other light of the same brilliancy; and I will also say
that if I could not get another lamp, five hundred dol-
lars would not buy it. Yours,
W. D. APLIN.

Little York, Nov. 5, 1872.
For further particulars, address,
fe22-4f C. B. BROWN, Placerville, Cal.

P. J. PHILLIPS & CO., No. 608 Clay street, near
Montgomery, San Francisco, are agents for Brown's
Lamp, where it may be seen.

The California Powder Works

No. 314 CALIFORNIA STREET,
SAN FRANCISCO.
Manufacturers and have constantly on hand
SPORTING,
MINING,
And BLASTING
POWDER,
OF SUPERIOR QUALITY, FRESH FROM THE
MILLS. It being constantly received and transported
into the interior, is delivered to the consumer within a
few days of the time of its manufacture, and is in every
way superior to any other Powder in Market.
We have been awarded successively
Three Gold Medals
By the MECHANICS' INSTITUTE and the STATE AG-
RICULTURAL SOCIETY for the superiority of our
products over all others.
We also call attention to our
HERCULES POWDER.
Which combines all the force of other strong explosive
now in use, and the lifting force of the BEST BLASTING
POWDER, thus making it vastly superior to any other
compound now in use.
A circular containing a full description of this Pow-
der can be obtained on application to our Office.

Agents for MILES' ALARM MONEY DRAWERS, a
sure protection against till thieves. 16v26-cowbp6m

Polishing and Fluting Iron.

This new invention takes the place of two articles
needed in nearly every house. As a POLISHING IRON
it has no superior. The part used for Fluting is made
of brass, and highly polished. A Receipt for making
FRENCH GLOSSING STARCH, that gives a superior polish,
goes with each iron. The Polishing Iron and Fluter,
being in one, are both heated at the same time. We are
now prepared to furnish them in quantities to suit.
Price, \$3.

BURLEIGH
ROCK DRILLS
—AND—
Air Compressors.

The Burleigh Rock Drills, which have stood the test
of five years' constant use at the Hoosac Tunnel, and
which are now in use in nearly every State in the Union,
as well as in Europe and South America, are unequalled
in efficiency and economy by any other Drilling Ma-
chine. They are of various sizes, and equally well
adapted to Tunneling, Shifting, Open Cut or Quarry-
ing, and will drill six to ten inches per minute in gran-
ite. They are driven by steam above ground. The Bur-
leigh Air Compressor is the best engine yet devised for
furnishing the "air motor" for the many purposes to
which it is now being used.
They are to be used on the St. Gothard Tunnel, Swit-
zerland; Tunnel 13 miles long. We refer to the follow-
ing gentlemen and works:
Gen. Newton, U. S. A.....Hell Gate Tunnel, L. I.
Mess. Shanley.....Hoosac Tunnel, Mass.
J. Dutton Steele.....Nesquehoning Tunnel, Pa.
Sidney Dillon.....Fourth Avenue Work, N. Y.
Col. Roehling.....East River Bridge Company, N. Y.

Leather Market Report.

[Reported for the Press by Dolliver & Bro.]

SAN FRANCISCO, Wednesday, June 18, 1873.

The demand for Domestic Skins and Sole Leather continues light at old prices. The same may be said in reference to French Skins, except that they have an upward tendency.

MINING AND SCIENTIFIC PRESS

An Illustrated Journal of Mining, Popular Science and Progressive Industry.

BY DEWEY & CO.,
Patent Solicitors.

SAN FRANCISCO, SATURDAY, JUNE 28, 1873.

VOLUME XXVI.
Number 26.

A Convenient Implement for Hydranlic Miners.

The accompanying illustration is a representation of a recent California invention for collecting the precious metals in mining sluices, and is also a safety pocket and guiding rifle. It is intended as an attachment for sluices, which in combination with a peculiar arrangement of the rifles in the bottom of the sluice will provide a means of arresting and drawing off from the sluice all particles of gold which may reach the bottom before passing the rifles. It is applicable to all classes of sluice mining but its chief value will be found in hydraulic mines. As most of our readers probably know, in that class of mining it is customary to continue the operation of washing for several months before "cleaning up." Meantime little money is obtained, you can't tell whether the ground pays well or not, and a watchman has to be employed to look out for the sluices to prevent them being robbed at night. This invention is intended to arrest some of the gold which would otherwise be caught in the bottom of the sluices and convey it to a receptacle which is under lock and key, and which is attached to the sluice at some convenient point, from which the proper person can in a short time remove the gold caught without interfering with the sluicing operation.

A represents the section of a sluice through which the dirt, gravel, or tailings is carried by the water. The upper part of the sluice through which the dirt first passes, should have a bottom of smooth boulders or cobbles laid closely together and the interstices packed or puddled with clay so as to form a smooth bottom to prevent the lodgment of the gold, while the projecting ends of the cobbles assist in pulverizing the lumps of dirt. Rails can be laid longitudinally to protect the rifles from boulders as now laid in ordinary sluices. At a convenient point the section, A, is placed, the bottom of which is as smooth as possible. One or more rifle bars, B, are laid diagonally across the sluice forming a sort of "track." These rifle bars may be varied in form and be laid in different directions, but the inventor prefers laying them as shown. They consist of a thin narrow plate as a base, extending diagonally from side to side, which has a ridge across its lower edge about 1 inch in height—more or less—which does not cover the base plate at the angles. This track may be amalgamated if desired, but in order to clean it the water would then have to be shut off as in other sluices. The use of the track is to arrest the heavier particles of metal and guide them to a cavity, G, at some point in its length. The cavity, G, connects with the reservoir shown as being attached to the side of the sluice in Figure 1.

A circular plate or disk, C, is attached to the side of the sluice and the pipe which forms the cavity, G, passes at an angle through the side of the sluice and through the plate, C, as shown. A box, D, is secured against the plate, C, by a bolt which passes through its center so that it can be revolved by hand when desired. The inner face of the box, D, has a hole through it in the proper place to allow the pipe which forms the cavity, G, to communicate with it when the box, D, is in a certain position as shown in Fig. 1; but when the box, D, is revolved in either direction as shown in Fig. 2, communication between the two holes is cut off. A hole is made in the upper rim of the box, D, through which the box can be

charged with mercury or its contents emptied, and a shield, F, is fixed to the side of the sluice to cover this hole when the pipe, G, and the box, D, communicate. When in the latter position the box can be fixed in place by securing it to the side of the sluice with a padlock or other suitable means.

The operation is as follows: The box, D, is charged with mercury until the mercury rises in the tube which forms the recess, G, and stands almost level with the surface of the zig zag plate, B, inside the sluice. The dirt now being passed through the sluice, all the particles of gold which find the bottom before passing the rifles, will be caught on the track and be directed back and forth by the raised edge of the rifle, B, until they arrive at the cavity, G, where the gold sinks by specific gravity, through the mercury into the box, D, while the dirt and debris will float over the mercury and be carried away. In this manner gold accumulates in the box, D, and can be removed

Hydrostatic Weighing Machine.

We saw this week at Linforth, Kellogg & Co.'s, No. 5 Front street, one of Duckham's Patent Hydrostatic Weighing Machines and Dynamometers, an English invention of great utility. The machine is very simple in appearance and construction, though of great power. It is intended to weigh heavy articles during the operation of loading and unloading, but may also be used as a dynamometer, rope or chain tester. It is simply a square iron box, above and below which are heavy iron rings, for attaching to the materials to be weighed and to the crane. A dial plate is on the front of this iron box which indicates the weight from 100 [pounds up to] 100 tons, according to the size of the machine. The external dimensions of a 30 ton machine are only 28 inches x 18 inches x 13 inches. Inside of the iron case, which is filled with oil, is a simple valve, and when the weight is attached to the lower ring

GOLD CATCHING ATTACHMENT FOR SLUICES.

when desired by turning the box, D, upside down so as to empty out the amalgam and quicksilver. This operation does not interrupt the sluicing operation, as the quicksilver on the cavity, G, will remain undisturbed, while the box is being emptied. After straining, the quicksilver can again be replaced. In order to prevent the loss of quicksilver that will be displaced by the accumulation of metal in the box, D, a partition, E, can be used upon one side of which the mercury is held. This partition is of proper height to allow the quicksilver to flow over into the next compartment before it overflows into the sluice. Dr. J. B. Beers, No. 230 Kearny street, who patented this invention through the SCIENTIFIC PRESS Patent Agency, says that the device can also be used to advantage in the beds of streams, and the particles of gold that are annually washed down the river or creeks be caught and saved.

ANTIMONY.—The Silver State says operations have been resumed on the antimony mine, in Bloody Cañon, on which work was suspended a year ago in consequence of some misunderstanding with those to whom the ore was consigned in San Francisco. Joseph Organ & Co., who own and work the mine, shipped a carload of ore to parties in San Francisco, with whom arrangements have been made for the purchase of the ore.

it forces the oil through the small pipe in proportion to the weight, so that the oil presses the index finger in the dial to the proper point.

Machines of this sort will be found very useful in many places. Small sized ones can be used for weighing ore at mills, where there are no scales. The weighing can all be done in one operation, while loading or unloading. They are also valuable to railway companies, merchants, shippers, iron founders, etc. The weight of metal can be ascertained even during manufacture. Cargo and stores for ships can be weighed while hoisting on board. Everybody who deals in merchandise by weight, or is interested in knowing the strength of material or machinery, can by this contrivance ascertain these particulars.

As soon as the goods are lifted, they are weighed, and the operation of weighing is costless. Several sizes are made for different uses. When attached to the chain of a crane the process of raising the material weighs it accurately. A peculiar merit is its lightness, an 84-lb. machine being capable of weighing ten tons. It is one of the most recent and useful adaptations of the principles of hydraulics, and is like a common spring-balance on a large scale. "Land-lubbers" will readily understand about "weighing the anchor," after seeing this machine, for the operation would be as simple as weighing a pound of sugar, if it were necessary.

The Canadian Pacific Railroad Survey.

We had the pleasure of a call, a few days since, from Mr. Marcus Smith, the engineer in charge of the Western Division of the Canadian Pacific Railroad, extending from Fort Edmonton, near the Eastern base of the Rocky Mountains, to its terminus on Puget Sound—about one thousand miles in extent, and comprising all the difficult engineering points on the line of the road.

Mr. Smith was returning to his field of labor, after having visited the Canadian Capital, to make a report of the progress thus far upon the work. In addition to the main trunk, the survey embraces two branches,—one to the north, 120 miles to Bute Inlet; the other, to the south, by way of Fraser River to Burrard's Inlet. The engineering difficulties over the Rocky mountains, are much lighter than was apprehended. The highest elevation is found in the Yellow Head Pass, 3,800 feet above the sea level, which is reached by a grade of 300 miles, the maximum of which is 52 feet per mile, and that not covering more than one-tenth of the distance. Three or four short tunnels will be required, but a little over a mile in length, altogether.

The work over the Cascade Range is heavier and more difficult. The best line yet found requires about fourteen miles of grade, 100 to the mile, including much rock cutting and some four miles of tunnel. Mr. Smith will look for a better route over the Cascades. Less difficulty is anticipated from snow than is met with on the Union Pacific. We are assured that there is no truth in the reports heretofore circulated with regard to the letting of contracts for grading, etc.; but it is the intention to commence active operations this season.

There seems to be a very erroneous idea abroad with regard to the agricultural capacities of the country to be traversed by this road, East of the Rocky Mountains. Instead of its being a barren, desolate region, it is, if anything, superior to the great plains near the same meridian traversed by the Union Pacific, and contains as large if not a larger area of cultivable land, with a climate in no way inferior. We are assured that the region traversed by this road is capable of sustaining fully twenty-five millions of population.

SERIOUS MINING ACCIDENT.—Two miners named John George and George Dobbs were precipitated 224 feet down a shaft in the Eureka Consolidated mine this week. George was killed, and Dobbs, who had both legs and arms broken, will not recover. They got on the cage and the brake gave way letting the whole thing fall. We do not know whether there was any safety catch on this cage or not—probably not—but with all the safety appliances for preventing such accidents there are in use, it is a piece of gross carelessness to put up a cage and run it without them. It was only a few weeks since that the rope broke which hoisted the cage in another mine, in Nevada, but the safety catch held it in place, thereby saving the lives of three men who were at the bottom of the incline. If superintendents will run cages without safety catches the miners ought to protest against them.

TWENTY CONCENTRATORS.—The Keystone Mill, in Amador, in which two of Joshua Hendy's ore concentrators have been in use for two years, will hereafter run twenty new machines; sixteen for the batteries and four for concentrating, following the settlers. The blanket process will now be given up in this mill.

We are without our usual Virginia City letter this week, owing to illness of our correspondent.

CORRESPONDENCE.

Notes of Travel in Tuolumne and Calaveras Counties.

[By our Traveling Correspondent.]

THE GOLDEN GATE QUARTZ M. Co.'s
Works are located about 1 1/4 miles southeast of Sonora. This mine was the original location of W. G. Long, Esq., now owned by J. Hatch, M. L. Thomson, L. A. Rider and Messrs. Brown and McKay, all of Benicia, Cal., and W. G. Long of Sonora and J. H. Holt of San Francisco. This company claim a ledge 2,650 feet in length, running nearly northeast and southwest. It is being rapidly developed by both a tunnel and shaft, the latter is in 250 feet, and the former down 60 feet.

THE WIDTH OF THE LEDGE

At the bottom of the shaft is not really known, but at this writing they have a width of 7 feet of ore in the shaft, and are only on the foot wall, all of which contains more or less gold, and some of it fabulously rich. A prospect of some 5 pounds of rock, taken from different parts of this ledge, prospected \$375 per ton in free gold, obtained by crushing in an ordinary mortar. This company's ledge runs from 15 to 50 feet thick, and a prospect is obtainable from any part of it. This mine is favorably located for fall and drainage. A contract is now let to put up

A TEN-STAMP MILL

With capacity for 40 stamps; the mill is expected to be completed within 90 days, by which time they will have at least 1,000 tons of ore out ready for crushing. W. G. Long is the Superintendent, now working 6 men.

CASSINELLA MILL.

This flouing mill is located on Mormon Creek, one mile south of Springfield, Tuolumne county and about four miles from Sonora—the county seat. It is owned by Messrs. Paddison & Cassinella. This mill is run by water-power, one run of burrs, and a capacity of making thirty-five barrels of flour every twenty-four hours.

GOLD SPRING COTTAGE

Is a way-side inn kept by L. A. Stevens, and located midway between Jamestown and Sonora, teamsters' headquarters.

THE STICKLE QUARTZ MINING COMPANY,
Is an incorporation with a capital stock of \$100,000 in 10,000 shares. E. J. Wilson is President, E. Wheaton, Secretary, and H. Shipman, Superintendent. This company's works and mine are located within the town limits of Angel's Camp, Calaveras county, this State. Their improvements consist of a

TWENTY-STAMP MILL,

Ruphy steam, there are also fine hoisting works erected over their principal shaft, which is in close proximity to the mill. The mill of this company is very complete, from rock-breakers to concentrators. The ledge of this mine runs northeast by southwest, and is 400 feet in length, the ledge stands nearly vertical, is developed to a depth of 330 feet, by a shaft with three compartments and still sinking. The walls are about 20 feet apart, both of which are composed of elate. The ore body is found in kidney shaped masses between the walls, and has paid as high as \$6.00 or \$7.00 per ton; it is low grade but easily extracted, and readily reduced, so much so that \$4.00-rock would pay a profit. This mill is at present idle, while the mine is being prospected to a greater depth; working 16 men.

LOYD GRAVEL MINE,

Located in the town of San Andreas, Calaveras county, is owned by the Lloyd Bros., merchants of San Andreas. This claim is an ancient channel, and is being mined by drifting. The Lloyd Bros. claim a little over 3,000 feet of this channel, which runs from 100 to 400 feet wide and averages 150 feet. The pay streak is a cemented gravel and from two to four feet thick. A little over two-fifths of this claim has been drifted out. This claim is being worked by hoisting works run by water, through a shaft 44 feet deep, working an average of ten men. They own a 5-stamp battery run by the same power working their hoisting works—by which for a time all their gravel was crushed; they now run their cement through an arastra as a more economical way of working their pay gravel. The stamps in the mean time are used to crush custom rock. This company are extracting about 12 tons of gravel per day, with the above mentioned force employed. It pays about \$3.50 per ton.

PIONEER CHIEF QUARTZ MINE,

Located about two miles in a westerly direction from the town of San Andreas. It consists of a ledge 3,000 ft. in length, covered by a U. S. Patent, and is the property of A. G. and Benjamin Thorn of San Andreas. The ledge runs nearly north and south, and pitches easterly at an angle of 72°. It is of the character of the great gouge belt of this and adjoining counties, and undoubtedly on the

MORMON LONE

Of the State. The character of the rock of this mine is similar in ever respect to the Hayward mine of Amador County. This claim is being developed by three shafts, down from 45 to 300 feet deep and pierce the lode and

follow the same at intervals of 266 feet. The ore body of this mine is about 4 feet thick and the vein matter between the walls fully 8 feet. The foot wall is a kind of green stone, and the hanging wall of a black slate. This mine has been worked to its present depth by an ordinary whim, but cannot be driven deeper without

HOISTING WORKS,

Which the Messrs. Thorn anticipate erecting including a 10 or 12 stamp mill, if capital expected comes to their aid. The ore of this mine prospects from \$7.50 to \$15 per ton, about 500 tons of which rock is now on the dumps. There is plenty of timber in close proximity to the mine, and water can be had as a motive power, from Treat & Co.'s ditch; the showing of the partially developed mines I visited in this county indicate to me that capital would find a good investment and its presence he attended with beneficial results.

THE NEW YORK MINE

Is about two miles west of San Andreas, Calaveras county, and about one mile south of the Hudson mine, on the south fork of the San Antonio creek. This mine is the property of Peter Davis, Esq., of San Andreas, and consists of an original location 2,000 feet in length running north and south, and pitching to the east. This location has been prospected the entire length of it, which crops out all the way.

It has been developed by a vertical shaft to a depth of 30 feet, the ledge at this point, and in fact all the way down, is between slate walls and shows a ledge of four feet in thickness, and prospects from \$7 to \$15 per ton.

There is about 60 tons of this class of ore now on the dump. This location is as fine as one could wish for, wood, water and fall. One and one-half miles of ditch would bring a plenty of free water to run a 10-stamp mill the year round, and an abundance for 20 stamps at least half the year. Should Mr. Davis succeed in soliciting capital to his aid, my opinion is he has a fortune in this mine.

WORTH'S HILL HYDRAULIC M. Co.

Is an incorporation with a capital stock of \$300,000. S. L. Prindle is President and J. V. Martin, Secretary. The works of this company are located on Chile Gulch, one mile below Chile Gulch Junction, and about six miles south of Mokelumne Hill, Calaveras Co. This corporation own 43 acres of an ancient channel or river bed. Mr. J. V. Martin, Esq., is the general Supt. Some years since its former owners drifted a large portion of this ground out, but only took the richest spots. The present corporation have run a bed-rock flume under the same some 700 feet in length, entering the claim 14 feet below the bed-rock, and some 104 feet from the surface. This company have in connection with their claim 1,400 feet of bed-rock flume. Since opening this mine as a hydraulic claim no general clean up has been made; only cleaning up the closest rifles, enough is known to prove it a splendid paying enterprise. Working regularly 7 men. This company are using one of Hoskin's

LITTLE GIANT NOZZLES.

The water is brought in 3,100 feet of 11-inch pipe, using 200 inches of water under a 220-foot pressure. The grade of this companies flume is 9 inches to every 12 foot box.

LONE STAR MINE

Is on the North Fork of the Mokelumne River in West Point District and distant 3 miles North West from the town of West Point, in Calaveras County, is owned by Messrs Reed & Mauley, of West Point. This is an original location 2,000 feet in length, running nearly North and South, and pitching to the Westward, and the ledge runs from 1 to 8 feet thick.

This mine is very favorably located for working, being on a steep hillside; it is being developed by

THREE TUNNELS,

Number 1 of which is in 200 feet, No. 2, is in 180 and No. 3, is in 250 feet, showing average vein of over 2 feet in thickness; 2 shafts have been sunk upon the same and now sinking another; 33 tons of rock crushed from this mine, taken from tunnel No. 3, averaged \$36 per ton, taking the rock as it comes out. Selected rock from the same mine, has run as high as \$92 per ton.

THE REED & HILLARY MINE,

Is only 150 feet distant from the Lone Star, and is a parallel ledge. The location is 1,000 feet in extent, and is owned by the same parties as in the above mentioned mine. The Reed & Hillary is developed by two tunnels, No. 1 of which is in 150 feet, and No. 2 is in 260 feet, with a shaft sunk to No. 2, 112 feet in depth. The ore body of the mine is similar to the above mentioned, except that the ledge is larger and highly sulphuretted, which is not the case in the other. The ore of this mine will pay as well as the Lone Star, but not by the ordinary process. All of the ore of the above mentioned mines that is reduced, has to be packed on mules about a half mile up a steep hill, and then hauled two miles to mill, costing an average of \$10 per ton to haul and mill it. The water power obtainable here is a prominent feature, having all the water that a dozen mills would need at one time, and perfectly free. So much water passes down this stream in the winter, and confined to so narrow a gorge that the strongest dams are often washed away.

THE WOLVERINE M. & M. Co.

Is an incorporation of \$2,000,000 capital stock, in 20,000 shares, Wm. H. Taylor, President; S.

O. Putnam, Secretary, and H. H. Sheldon, Superintendent. The works and mine are located about three miles northwest from Railroad Flat, in Calaveras County, and twelve miles east of Mokelumne Hill. This company, by purchase and location, own a series of ledges 2,200 feet in extent. This mine at present writing is being developed by one principal incline shaft, now down 300 feet on the incline of the ledge, at which point the ledge averages three and a half feet thick. Above the 200-foot level it is about two and a half feet thick, and at some points below that level it runs to six feet in thickness.

The previous development of this mine was by another incline shaft, sunk to a depth of ninety feet, and a tunnel that was run in on the ledge, 208 feet, cutting what is known in this mine as their south chimney. This company run their

HOISTING WORKS

By a thirty-five horse-power steam engine; the same engine also runs their mill, which is of ten stamps, and has a capacity of 16 tons every twenty-four hours. The rock now being extracted is from between the 200 and 300 foot levels, the pay of which averages about \$20 per ton, running from \$18 to \$27 per ton. Last month this company crushed 228 tons of ore, which yielded \$5,080, netting a dividend of about \$2,000 to the corporation. They employ in all departments some forty men.

Capitalists and tourists wishing to visit any of the above mentioned mines in Calaveras county will find the shortest and most pleasant route by the Mokelumne daily stage line. Stages leave Mokelumne station, on the arrival of the 1:30 p. m., train of the Western Pacific Railroad, every day (Sundays excepted), passing through the following towns: Lockford, Camanche, Campo Seco, Poland House, Lancha Plana, Gwin Mine and Mokelumne Hill. They leave Mokelumne Hill at 6 a. m., connecting with the cars of the Western Pacific Railroad for Stockton, Sacramento and San Francisco. Passengers leaving San Francisco on the Western Pacific 8 a. m. train, arrive at Mokelumne Hill at 7:15 p. m.

L. P. MC.

Discovery of Yosemite Valley.

[Written for the PRESS.]

Now that the fame of Yosemite Valley has become world wide, incidents connected with its discovery and early exploration have a general, if not a special interest. A narrative, however, penned so long after the occurrence, lacks that freshness essential in rendering it readable. It is offered more as a matter of history concerning the valley; as such, will claim to the fullest extent the charitable consideration of its readers. The writer regrets his inability to recall the names of a number composing the party spoken of. Should this come under the eye of any one able to furnish the information they will confer a favor by directing a line to the address of the writer.

Early in August, 1855, when the fervid heat of summer and parching rays of old Sol had dried up the waters in the gulches, baked and hardened the ground so that mining was neither pleasant or profitable, a proposition was made to have a season's hunting, and at the same time determine the truth of the Indian's story of the existence of a wonderful place, *muncho leguas*, (many miles or leagues) back in the mountains where there was "mucho oro," (much gold) and *matos indios*, (bad Indians). The party that started from the head of Sherlock's Creek was composed of ten as fearless spirits and noble hearted fellows as ever shouldered a rifle, or gathered around a campfire. As it was to be a hunting and exploring trip, we limited our supplies to what could be packed upon two animals in addition to our blankets and cooking utensils, with but one pan, pick and shovel. Each member of the party carrying a gun, pistol or knife, with ammunition enough for meeting all contingencies. Our first camp was made near a small stream some twenty miles from Mariposa. It was early, in order that our hunters should have time for providing a deer for supper. No sooner had the fires been started and kettle on to boil than an Aborigine put in his appearance, followed soon after by others; all having little willow bowls or baskets containing something which those of our party were of scent and taste, discovered to be a most delicious beverage, resembling the richest cider from mixed tart and sweet apples. An immediate demand for the article sprang up; and, to supply it, the Indians hurried away, returning soon, however, reinforced in numbers and with liberal supplies of the now famous liquid, which was soon exhausted by our thirsty company.

After a number of hearty draughts, the writer and another member of the party shouldered their guns and started forth in quest of game. In our circuit we came upon the ranchero or camp of our cider merchants, where, squatted around a pile of manzanita berries, were some fifteen or twenty old cronies with eight or ten naked peepoese rolling on end in the heap, their jaws and hands working away for deer life, as fast as their mouths could be filled with berries, chewed and emptied into the large water-tight baskets beside them and from which the juice was dipped out into the small baskets and hurried to market. Shades of imbibers! Could it be possible that this is the delectable drink over which we had smoked our lips so short a time before? Was there a chance for a doubt? Not a word for our eyes and ears, by living their cautious and inactive operation. Bute cider making fully demonstrated. Returning to our camp, some time after, a lively trade was still in progress—the little willow bowls were being emptied by our yet thirsty crowd as fast as brought—the gloom of night finally ending the traffic.

The ignorance oftentimes is bias, was proven here by the perfect satisfaction manifested by those who had partaken most freely, and were filled to repletion. That the peridy of man should lead him to destroy these pleasing illusions is scarcely to be credited. It had been agreed upon by the initiated that *muncho* was to be the word—nothing said about the discovery until the victims not only satisfied their present appetites, but provided for future indulgence, by filling their cautious es had been suggested. The thing, however, was too good to keep long. Pipes had no sooner been lighted and all gathered around the camp fire after our supper of flapjacks and bacon than the revelation of what we knew of Indian cider was made. That group—what splendid subjects for the pencil of a Hogarth, or pen of a Dickens—like quivering waters lashed to foam, by the swirl of a sudden wind came the knowledge. Ineffable dis-

gust seized upon them, and that portion of the system credited with receiving ailment for sustaining it proved recreant; hurried exit were made into the surrounding shades, and the blue vault of the summer sky echoing to a Neptune chorus—"Oh, ah, ugh, hue, hue, hue, hoine, hoine, oo, hul, hul—*shall die*."

Bright and early next morning our Indian merchants appeared in full force, well supplied and ready for business. That noble Dame who, the night before had smiled upon them, now turned her back. Their hopes of fortune in sugar and tobacco were dashed to earth. In fact, had not wise council prevailed, they would have made a departure, not only from our camp, but the scene that had known them through many a season of elder making.

Our second day's journey carried us over a high ridge that divides the south fork of the Merced from the waters running into and forming the Fresno and Chowchilla. After descending the mountain to the south fork, we crossed, following it down on the right hand bank until we came to a favorable place, we camped, intending to have some sport at fishing, the stream being alive with the finest speckled trout. Strange to say, they would not take the hook—we were as wary and shy as if the stream had been whipped by a thousand augers. The result of the afternoon's fishing was most unsatisfactory for hungry men. And, although our minds had been made up for a bountiful supper, we were forced to content ourselves on a square meal of anticipation and a small fish for each. The opinion expressed by one of the party, (a Kentuckian), "that he allowed we didn't understand 'em," was concurred in without dissenting voice.

The third day we continued down the stream some distance from our camping ground where the trail turned to the right and led out of the valley, up the side of the mountain, south of the main Merced. It was a terrible path for each animal, crossing deep and precipitous ravines on fallen trees, and around ledges where there was scarce foothold for a goat. Indian trails are made oftener with reference to direction rather than ease and convenience for traveling. We were continually reminded of this in the day's journey. Circling around and crossing the numerous gulches that furrow the side of the slope below the summit of the main ridge and hence into the great canon below, we were obliged, fatiguing in the extreme. We were obliged to follow the trail, not knowing the country, and fearing if we left it we would lose the animals that carried the supplies and bedding. The Aborigine is generally regarded as superior to his white brother in selecting the most feasible routes and easiest passes, but experience proves the contrary. The miner or mountaineer et once improves upon trails traveled by the Indians, as one and all will testify who clambered long through a black-neck path of early days, and now gallop over the road into the Yosemite.

About the middle of the afternoon we came to the point where the trail led over the brink and commenced its downward course to the valley. Here, as if by common consent, a halt was made, and long and earnestly we gazed, leaning our eyes upon the beautiful scenery before, below and around us, until a wild "Eureka!" rang forth from ten lusty throats upon the still air of that mountain top. An inspiration filled each breast—a grand rejoicing that we were there, and for what was yet in store.

Far, far, down through the hazy ether the sheen of the silver thread of water that wound through and around the narrow strip of emerald could be seen, the whole scene wider than one's palm. The glistening granite walls and towering battlements, the tiny rivers whose waters, leaping from the cliffs, were caught by each passing breeze and wafted in dewdrops to the valley below.

Sliding, rolling, tumbling, on we went, until it seemed as if there was no bottom. At last we reached and crossed the river to its left hand bank, flowing it up until, nearly at the foot of what is now known as the Yosemite Falls, we camped; the location offering fine grazing for our tired mules, as well as wood and water for our own convenience. Early next day we were on the *qui vive* for explorations and sight seeing. Two of the party most fatigued were detailed to guard camp, while the others were making explorations and came to the other side of the mountain at its left hand corner of the valley. Those going up the left hand fork came upon Mirror Lake, Iron Spring, etc. Pushing on, up the canon some distance, the writer, among others, took the right hand main fork, following it to Vernal Fall, where the perpendicular walls barred farther progress. Returning to near the mouth of a creek coming down from the south side of the valley, we were the survey of the situation, and concluded that there was a possibility of going farther up the canon, along the side of the mountain we could reach the top of the cliff. After a hazardous scramble over and under jagged and broken masses of rock, we succeeded, coming out upon the ledge where there was a clump of small pines, and a few feet above where the smoother granite ran down to the water's edge, as it leaped into the abyss. That first view of the mountain side, as it burst upon us, as we raised our heads above the ruins of rock can not be described, and can never be forgotten. It was so entirely unexpected—so utterly different from what we had looked for, that we were spell-bound—completely overwhelmed with awe. We there stood motionless and mute. The first of civilized men to view nature's wildest wood modeled by the Creator's hand from rugged mountain sides.

Above the fall we amused ourselves in drifting wood into the rapid current to see it carried over, endeavored to throw stones beyond the influence of the draft caused by the falling waters, leaned against the stony bulwark on the edge of the precipice and gazed into the depths, where the boiling surging waters sent up clouds of spray, whom we outlined the brightest arches of heaven. The wavering, humid grass plat at the caldron's side, all were enjoyed.

Before returning to camp, a rough outline was sketched of the prominent features of the landscape, which sketch is now most highly prized by the writer, as the first ever made of any portion of this now so much pictured scenery. At camp, where all the company had arrived before us, and where a general review of the day's doings were entered into, much was learned. Upon the declaration that a way around Vernal Fall had been found, that still another valley and falls, even higher than the Vernal existed, the anxiety to see them was such that, although it had been determined to start homeward on the morrow, it was put off for another day. We would gladly have postponed our return to camp, but our provisions were so low, and our hunting and fishing had not been successful. We were on rations of one small jack and a cup of coffee per meal. That the stomach has ruled from Adam's day to the present hour can not be denied, or that poetry dwells not with famine, mentality can not overcome the physical requirements of a mountain trip, though surrounded by the grandeur of Yosemite.

With the writer as guide, the starting point started next day soon after dawn for the upper valley, passing above the Vernal Falls, where we entered into the same amusements as the day before, of throwing stones, driving logs over the falls, carving our names in the rocks, etc. We then extended our explorations farther up the stream, following its bank or edge for some distance on the left side, and then on the right side, passing through a rough and woody canon, at the base of Liberty Cap. We came out above the Nevada or Apron Falls, as we named them. Above these falls, upon a bench of smoother granite, we found a number of large boulders which we rolled over the brink. A huge one was started by a few blows of a pick at its lower side, as the mass sprang over the precipice and went crashing and thundering into the valley, cutting its way through the for-

est trees, as if they had been straws, a sense of fear came upon us, for might there not be hundreds of such rocks ready to start on their journey of destruction? That our experience might be complete, clouds gathered around the mountain tops and poured out floods of rain. Vivid lightnings sprang from peak to peak, peals of thunder shook the earth and rang from cliff and battlement in continuous echoes.

The note of return was sounded on the following morning, but before leaving the valley, the bark was cut from the side of an immense pitch pine, standing at the lower or west end, near the trail, as it rose over the brow of hill after crossing the river; upon the white trunk we wrote our declaration of claiming the valley, signing our names, which, as recollected, were the three brothers, Mann, of Kentucky, Dickerman, of Chicago, the writer, and five whose names are not remembered.

South Vallejo, May 10, 1873.

G. L. PEARSON.

SCIENTIFIC PROGRESS.

Action, Reaction and Contact.

The expression "action and reaction are equal," is one quite commonly used, and we believe that most who use it very imperfectly comprehend its meaning. It is stated in some works on physics, that this follows as a necessary consequence of the inertia of matter, but we have shown, in a former article, that the term inertia had its origin in erroneous ideas; and the terms "action and reaction" are also old, and were determined from equally false conceptions of the true nature of moving matter.

It once supposed when one body approached another that contact was possible between the two. Molecular physics, however, teaches us that actual contact of two bodies can never take place. Ultimate particles, if there be ultimate particles, never touch each other. The compressibility of matter proves this, and it is now admitted, by those who believe in the molecular state of masses, that the molecules of matter exist in a state of vibration or motion, the exact nature of which has never been determined. If, by external pressure, any of the particles be made to change their position, relatively to other particles of the mass, the other particles make, as it were, an effort to restore the normal relation of position. The same is true when one body approaches another. As soon as the particles of one mass have reached a certain limit of distance from the particles of the other mass, the passage of this limit is a signal, so to speak, for the nearest particles of the second to recede. In so doing they approach nearer the adjacent particles, which, in their turn, recede, and so on, until all recede, and the mass moves, as a mass, away from the other body.

So far as the direct perception of the sense can discover, these masses collide, and one appears to strike the other, but to accept this as the true explanation of impact, would be to deny the only inference that can be drawn from the compressibility of matter in masses, and from other considerations. The attraction of gravitation is held to act upon bodies of matter inversely as the squares of the distance between their centers. It is evident, therefore, that if two molecules should ever come into actual contact, they would be held together by a bond of infinite strength, so that they could not be separated by anything less than infinite power. One body cannot, therefore, be said to act upon another, in the original sense in which the term was employed. If we accept the doctrine of an invisible, imponderable, and highly elastic ether, as the medium through which motion is imparted (and this theory is now maintained by the most eminent scientists), then it is absolutely certain that the bodies at their nearest approach to each other must be separated by a film of this ether. If we do not accept this theory, all that we can say is, that when one body approaches another body sufficiently close, the second body coincidentally recedes, and whether we call this phenomenon by the name of repulsion, or by any other name, there certainly is no direct action or reaction. Neither have we any warrant for saying there is indirect action. We know nothing but that it is the universal law of nature that the phenomenon should occur under the condition stated.

Suppose it were a law of nature that, if one body moved away from another, the second should itself move away as far as the first moved, so that the recession of one body one foot would cause the separation of the bodies two feet, no one would ever think of applying the terms action and reaction to such a phenomenon as this. Yet they would have as much reason to suppose that the bodies act and react upon each other, as we have under our hypothesis of the molecular state of matter. It appears to us, therefore, much more philosophical and logical, to say that bodies act, under certain conditions, rather than to assert that they act and react upon each other. *American Artizan.*

REFLEX ACTION.—Mr. Darwin, in his new work, relates the following in connection with the subject of reflex action: The conscious wish to perform a reflex action sometimes stops or interrupts its performance, though the proper sensory nerves may be stimulated. For instance, many years ago I laid a small wager with a dozen young men that they would not sneeze if they took snuff, although they all declared they invariably did so. Accordingly they all took a pinch, but from winking much to succeed, not one sneezed, though their eyes watered; and all without exception had to pay

me my wager. Sir H. Holland remarks that attention paid to the act of swallowing interferes with the proper movements; from which it probably follows, at least in part, that some persons find it difficult to swallow a pill.

To Europe in a Balloon.

It is well known to most of our readers that Prof. Wise, the famous aeronaut, has long contemplated a voyage to Europe, in a balloon. The object is not a mere foolhardy attempt to do what no one else has done; but the voyage is taken purely in the aid of science. The Professor expects by the trip to prove the correctness of a long held theory of his, that the entire equatorial atmosphere of the earth moves constantly eastward with the earth's revolution, and at a rate considerably faster than the earth, just as water is thrown forward from a rapidly revolving grindstone. He thinks that a centrifugal force is that generated by which the air current moves forward at the rate of 100 miles an hour, and he proposes to ascend into this current, and be carried along with it. He thinks he can thus cross the ocean in from 60 to 70 hours.

It is stated that Prof. Henry and other distinguished scientists, fully agree with Prof. Wise, and have faith in the result of the proposed voyage, both because it is reasonable, and because in almost in all cases when balloons have reached any considerable altitude they have invariably moved rapidly East. Prof. Wise has made 446 ascensions, and has been swept rapidly to the eastward in fully 96 out of 100 ascents, during which he has reached any considerable altitude.

It is proposed to construct a balloon with a capacity for carrying five tons. The Professor will take with him three other scientific gentlemen—a very large number being anxious to share the honor, and from whom he can take his choice. The "car" will consist of a closed room with glass windows on all sides, and will contain a lime stove capable of furnishing all the warmth with which to make the party comfortable. An excellent apparatus will also furnish light. If the balloon threatens to fall into the water, the aeronauts will descend into a Francis metallic life-boat, which will be carried beneath the car, well provisioned and supplied with oars, and so constructed that it can neither sink or founder. It can be readily cut loose as soon as the drag, which will in such emergency be thrown from the balloon, has sufficiently checked the speed of the air ship to make such a movement safe.

It was expected that the balloon would leave Boston Commons an important feature of the city celebration for the Fourth of July next; but the recent fire there and further loss of two millions of property, has induced a spasm of economy in the city government, which has delayed the trip for the present. It is confidently believed, however, that the money needed—\$3,000—will soon be forthcoming to enable the anxious scientists to start upon their novel and adventurous voyage.

The Motion of Camphor in Water.

Prof. W. Kingdon Clifford, in the *Science Monthly*, presents the following interesting explanation of a well-known phenomenon: "If small pieces of camphor are dropped into water, they will begin to spin round and swim about in a marvelous way. Mr. Tomlinson gave, I believe, the explanation of this. We must observe to begin with, that every liquid has a skin which holds it; you can see that to be true in case of a drop, which looks as if it were held in a bag. But the tension of this skin is greater in some liquids than in others; and it is greater in camphor and water than in pure water. When the camphor is dropped into water, it begins to dissolve and gets surrounded with camphor and water, instead of water. If the fragment of camphor were exactly symmetrical nothing more would happen; the tension would be greater in its immediate neighborhood, but no motion would follow. The camphor, however, is irregular in shape; it dissolves more on one side than the other, and consequently gets pulled about, because the tension of the skin is greater where the camphor is most dissolved. Now, it is probable that this is not nearly so satisfactory an explanation to you as it was to me when I was first told of it; and for this reason: By that time I was already perfectly familiar with the motion of a skin upon the surface of liquids, and I have been taught by means of it to work out problems in capillarity. The explanation was, therefore, a description of the unknown phenomenon which I did not know how to deal with. But to many of you possibly the liquid skin may seem quite as strange and unaccountable as the motion of camphor in water.

HOW WARM SNOW IS.—Last fall, Mr. Spencer, who has a farm near Elk Rapids, Mich., filled a pit in his field with potatoes, covering them only with boards and potato tops. During the night snow fell, and he was unable to cover them with earth, and they remained in this condition till last week, when the covering of snow, potato tops and boards were removed, and the potatoes found to be entirely untouched by the frost. Perhaps the most remarkable fact connected with this is that a coffee-pot half full of water, which was left standing on the ground beside the potato pit, and was covered only with snow to the depth of about one foot, was found to be as free from ice as when placed there last fall.

Intra-Mercurial Planets.

There is just now much speculation as to the existence of one or more planets moving in orbits between Mercury and the sun, and facts bearing on the subject are fast being accumulated. Prof. Kirkwood, of Bloomington, Indiana, in April last sent a communication to the *Chicago Tribune*, in which he endeavored to show that certain recent observations of spots passing over the sun's disk pointed to the existence of a small intra-mercurial planet, having a revolution around the sun of about thirty-five days.

More recently he writes in the same journal that there are other observations which cannot be referred to the same body, and supposes another planet with a revolution of between sixteen and seventeen days.

Observations recorded by experienced observers are quite too numerous to be attributed to any optical deceptions, and seem in fact to indicate the existence of a zone of minor planets, or asteroids within the orbit of Mercury, similar to that known to exist between the orbits of Mars and Jupiter.

As a farther evidence of the existence of one or more bodies as indicated is a disturbing influence in the motion of Mercury, which can only be explained by the existence of such a body or bodies. At a recent meeting of the Manchester, (Eng.) Philosophical Society, a member, Mr. Sidobotham, also a Fellow of the Royal Astronomical Society, referred to certain observations of his own, as long ago as 1849, which point to the same facts. Observations of a similar character have been noted by others in 1802, 1819 and 1847. The increased interest just now manifested, in astronomical research will probably lead to an early and definite solution of this interesting problem.

MECHANICAL PROGRESS.

The Influence of Acid and Zinc on Iron and Steel.

Mr. M. H. Johnson has written a very interesting paper on the effect of acids on the breaking strain and elongation of iron, from which we condense as follows:

The effect of immersion in acid on the breaking strain and elongation of iron wire naturally suggested itself as an interesting subject for inquiry. Accordingly a number of pieces of iron were immersed in hydrochloric acid for one or more hours, and then carefully tested for elongation and breaking strain. The pieces were then heated on a hot plate for several hours, and again tested, with the following general results:

1. That immersion in acid diminishes the breaking strain of iron wire from $\frac{1}{2}$ to 3 per cent., and of steel wire about 4.76 per cent.
2. That immersion in acid appears in some cases to diminish, in others slightly to augment, the elongation of iron wire; and to augment the elongation of steel wire about 30 per cent.

The effect of pyroligneous acid on iron and steel appears to be exactly similar to that of hydrochloric and sulphuric acids, causing it to become more brittle, etc., though the effects are, perhaps, somewhat less intense. As in their case, heat restores the iron to its original toughness.

A piece of galvanized iron of good quality, which, when cold, several times resisted bending to and fro at right angles to itself, was raised to a red heat with such rapidity that only a small portion of the coating of zinc was vaporized. On then attempting to bend it, it broke off sharp, the fracture being sharp and crystalline. When cold, this piece broke with all its former toughness the fracture showing a long fibre. The same piece was then heated till all the coating of zinc was driven off; it was then found impossible to break it. This clearly shows that the iron was not "red short," except when rendered so by the zinc. The same experiments were tried with iron coated with lead and tinned iron, but without the above results. Some kinds of iron do not appear to be rendered "red short" by the zinc.

Possibly the above phenomenon may have some connection with the fact that zinc forms an alloy with iron at a red heat, containing from 2 per cent. to 6 per cent. of iron, and having a melting point which is higher as the proportion of iron is greater, while lead and tin do not alloy with iron at this temperature. But still the iron appears to absorb the liquid zinc in a similar way to that in which it appears to take up acid on the immersion in it, and with similar results.

NARROW-GAUGE PASSENGER CARS, as generally constructed, stand thirteen inches nearer the rail, and have about fifteen inches less overhang at the side; hence the center of gravity is considerably lower than on the standard gauge, making the carrievary steady, and with less oscillating motion than is usually observable upon the wide gauge. The seats, thirty-six to a car, are arranged double on one side and single on the other, with the order reversed midway of the car, to distribute the weight equally.

IMPROVEMENTS IN IRON MANUFACTURE.—Since the improvements made by Siemens, Bessemer, Heaton, Danks and others, in the methods of purification of iron and the manufacture of steel, much ingenuity has been expended in perfecting the various processes, and among others engaged in such experiments is Mr. Parkes, an account of whose investigation appears in the *London Athenaeum*. The peculiar feature of the process devised by this inventor is the purification of iron from sulphur and phosphorus by injecting into it, when melted, compounds of chlorine or fluorine. By melting the wrought iron with carbon, together with some chlorides and alkalis, it is converted into steel. A more recent, and it would appear, more important improvement in the process of steel manufacture, is that which has been brought forward by some French chemists, and which is based on the partial decarbonization of the iron, under the influence of a rich oxide of the metal. This is a method which, it is stated, has been known for some time, but has not been put in practice on account of the deterioration caused by it in the side of the crucible. In the process as now improved, the iron and mineral are placed in metallic molds, and brought to a red heat in special furnaces. The reaction is produced and the melting does not take place until after the transformation. Ingots are thus obtained, melted in the crucibles or in a reverberating furnace.

SUPPOSED EVIDENCE OF MAN IN THE MIOCENE.—Mr. Frank Calvert, an eminent archaeologist communicates an interesting discovery, which he has recently made in beds regarded as Miocene Territory, bones of animals having etching upon them of the figures of other animals. If there is no mistake about the character of the deposit, this discovery would carry back the existence of men upon the earth, to a period immensely more remote than has yet been ascertained by scientific research—to a much earlier date, even, than can be ascribed to the human remains reported to have been found in the deep gravel mines of California—under Table Mountain, etc. The earliest reference of the latter are only to the Pliocene, and it is considered doubtful if they can be referred back even as far as that. The evidence of geological investigation seems to establish the fact that man has existed on the earth for a period infinitely longer than has generally been assigned to him in past centuries.

AMERICAN LOCOMOTIVES are becoming quite popular in Russia, as they are the only locomotives in the world adapted for burning anthracite coal, of which Russia possesses large deposits. Work in the coal mines in Catherine-slaw, in the province of Don, continues very active, and the mines are being worked with much success. The coal which is there produced supplies several lines of railroad in various parts of the empire. Since the completion of the Voronez-Rostov railroad line, they are occupied in transforming the machinery in order to use anthracite for fuel. It is said that Europe does not manufacture locomotives suited for this kind of fuel; they are only made in America.

NEW MATERIAL FOR GAS MANUFACTURE.—Mr. John Sellars, a manufacturing chemist, of Birkenhead (Eng.), has a novel composition of matter for use in the place of coal, cannel, etc., in the manufacture of illuminating gas. The composition consists of a mixture of seaweed, sea-grass, sea-rack, or the like, with coal-tar, pitch, bitumen, mineral, oils, etc., either with or without peat, charcoal, or other carbonaceous matter, which mixed matter is subjected to destructive distillation in retorts. The advantages claimed are more effective separation of the light hydro-carbons; second, increased yield of carburetted hydrogen, and the production of coke particularly valuable in the manufacture of metal-foundries' blacking.

THE HARDENING OF SWORDS in Solingen is done in the following manner. The swords are placed in a coke fire, with tynes below, and are heated to a uniform cherry red. Before cooling the edges are drawn through wet coal dust, whereupon the whole sword, the strong end first, is dipped into water and quickly withdrawn. When five swords have thus been treated, another man anneals them until they appear blue, testing them also in a clamp for their elasticity. Finally they are annealed gray. The interior thus remains soft, while the exterior becomes hard.

IRON VESSELS, for the transport of spirits, are found to be free from many of the defects of wooden ones, especially such as canse loss. They are made of sheets less than one-tenth of an inch thick, of cylindrical form, about forty-seven inches long and thirty-two inches in diameter, with ends slightly convex. The bung is closed by rubber disks, and protected by wooden hoops on each side; there are thin iron hoops around each end, and the interior is protected from rusting by a coating of gum or dextrine.

DECARBONIZATION OF IRON.—Fenner's process has recently received encomiums from high authorities. Plates of cast-iron, varying from one-half to three-quarters of an inch in thickness are packed in sand, enclosed in chests, and heated for the space of several weeks to a red heat, arrangements being made to ensure a free circulation of air; a fusible slag is formed from the impurities, and is removed without difficulty.

Our Weekly Stock Review.

THURSDAY EVE, June 26, 1873.

Stocks have not been very lively this week and but little business has been done. The advances and declines have been small, and the sales light. The San Francisco Stock Board will celebrate our National Anniversary by a week's holiday, which would not be done if business was lively. The Board will adjourn next Wednesday until the following Tuesday morning.

The Comstock mines are panning out as usual. Both Belcher and Crown Point are turning out ore and their mills are turning out silver and gold with astonishing rapidity. Our regular weekly letter from Virginia did not come to hand in time for publication in this issue.

Dividends for the past six months from mining companies foot up the handsome sum of \$7,419,181 against the sum of \$4,026,300 during the same period last year, exclusive of coal mining companies. They were as follows:

Belcher	\$3,434,000
Black Bear	15,000
Black Diamond Coal	25,000
Cedarburg	24,000
Cons. Amador	120,000
Crown Point	3,100,000
Diana	1,181
Eureka	50,000
Eureka Con.	50,000
Eastport, Coos Bay Coal	10,000
K. K. Cons.	12,500
La Grange	12,500
Meadow Valley	120,000
Monitor Belmont	50,000
Raymond & Ely	300,000
	\$7,451,451

This includes the two dividend paying coal mines, the dividends without them, being \$7,419,181. This showing for the end of the first six months of the year, augurs well for mining interests for the remainder of the year. Dividends, however, have little effect on the stock market.

On Friday the Stock Market was quite active and strong, but on Saturday it was quite weak without any activity in prices or sale. At close Belcher was \$1 higher. Chollar-Potosi \$1 and Eureka Consolidated 50c.

On Monday the market was strong again especially for Belcher. The American Flat mines all improved a little. Belcher rose \$5, and \$96 was bid after the Board. Crown Point rose \$2; Baltimore Con., \$2; Eureka Con., 25 cents; Ophir, 2; Cverman, \$6; Savage, \$3. Other prices were firm.

Tuesday's market was pretty good, and fair business was done at firm prices. On Wednesday, although prices were firm, the market was not as active as on the previous day.

To-day the market was weak and prices irregular, the fluctuations being of little interest.

The following items of interest from prominent mines are collated from letters or telegrams from superintendents on file at the offices of the respective companies in this city.

Arizona and Utah.

Letter of the 23d says we have resumed sinking the shaft. No water to interfere with work. Rock in bottom working very favorably. We are also going down with incline on east ledge. No material change in quality of rock. We came across some bunches of ore that is good, and will pay well for milling, but the bunches that will not pay predominate. Think we will get ore in milling quantities when in 100 feet.

Belcher.

Dispatch of the 24th says the east crosscut is now in 34 feet in splendid ore. South drift, 1300-foot level, in good ore. No change in crosscut on oil floor or fourth floor. Stopes look well. Car samples, \$107 per ton.

Dispatch of the 25th says the south crosscut, 1200-foot level is in 37 feet. South drift, 1300-foot level, in 269 feet, in splendid ore. No change. Stopes look well. Car samples, \$126.

Crown Point.

Dispatch of the 24th says they are running a drill on the 1400-foot level crosscut, and are now in twelve feet, with but little water. The incline engine is running again, but we will not be able to run more than two cages before four o'clock. No change since last report in other parts of the mine.

Superintendent's letter of the 22d says: "From the first of the month to the 20th, inclusive, we have extracted from the mine, and shipped to the mills, 5,776 tons 1,500 pounds of ore, which, estimated at 65 percent of the assay value, will yield \$300,512.81. The general average per ton, \$50.61. Since the breaking of the spur wheel of the incline engine, which occurred about two weeks since, we have been extracting quite a large amount of ore from the 1000 and 1200-foot levels, and from the fact that ore from the two levels mentioned not being of near so high a grade as the 1300-level is a principal reason that the ore does not run so high as when taken exclusively from the 1300-foot level. The breasts and floors of the 1300-foot level are looking fine and show no symptoms of weakening. The sill floor crosscut from the 1300-foot level and immediately in the fifth floor crosscut was run east a distance of 66 feet, through barren quartz and porphyry. Rich ore was struck and continued for a distance of 14 feet, in ore that will assay from \$150 to \$200 per ton. We have continued this drift 15 feet east of this 14 feet mentioned, and for that distance it has been in porphyry and quartz that shows light assay, and feel confident that we will strike a rich body of ore lying next to the east wall the same as we struck in fifth floor crosscut above. The crosscut from the 1400-foot level south is in 58 feet, in hard, firm quartz, showing small assay, not being in far enough to tap the main ore body."

Dispatch of the 25th says the drill is 15 feet ahead of the crosscut on the 1400-foot level. We are now following it up with the drift. The water has not increased much. No change since the last report elsewhere in the mine. The machinery is running all right.

Raymond & Ely.

Dispatch of the 25th says: "Shipped to-day, \$33,423. Previous shipments in June, \$139,150, making the total for the month, so far, \$172,573."

Imperial.

Letter of the 23d says nothing of importance has occurred in the mine since Saturday. The appearance of the various drifts is unchanged.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned:

California.

ALPINE COUNTY.

TANISH.—Alpine "Miner," June 21: Some quartz taken from this mine on the 18th inst. and assayed by Mr. Hunter, yielded in silver about \$125 per ton, and gold enough to make the value of a ton \$150. Work, which was suspended for a few days, has been resumed in this mine.

GLOBE.—We learn from Gen. Winchester that the difficulty of late surrounding this company in N. Y. has been settled, the company winning every point. It is hoped work will soon be resumed on the mine, and the bright prospects last encountered followed up vigorously.

MONITOR & N. W.—In the main tunnel some fine-looking quartz veins have been struck. Silver Glance shows good ore in the 100-ft. level, but the water increases as the drift penetrates the mountain. As the company expects to put up steam-hoisting works very soon, the work is now crowded at present.

TUE EXCHANGUE MILL will start up on Monday next, and with fine prospect of a successful run. Competent men have been employed as amalgamators, who promise to extract the metal by the wet process, if it can be done, and much interest is felt in the result of the trial.

AMADOR COUNTY.

THE GOVERN QUARTZ MINE.—Weekly Ledger, June 21: The Governor Company worked on their mine in April, 1872, and sank a shaft 200 ft., where they drifted east 70 ft. through heavy quartz boulders and struck a gouge about 4 ft., and a beautiful ribbon rock upwards of 12 ft. wide. They then returned and continued sinking on the main shaft 200 ft. farther. From this point they went with well defined foot and hanging walls. The rock taken from this ledge assays over \$90 per ton. They then ran 70 ft. north and found a vein about 4 ft. wide which prospects well. They then ran 40 ft. to the south, found a fine ledge about 3 ft. wide. At the first 200-ft. level a large reservoir was built and empties abundant water above by the use of one of Hooker's best California steam pumps. At the 400-ft. level there is another of these pumps which drains the mine and keeps the reservoir above well filled. From the 40-ft. drift south, they are but 130 ft. from the Fremont mine. The Governor is owned by Messrs. Wilson, Ashby, and other San Francisco men, and is under the able superintendence of Mr. John Trelogan. From what we have learned we feel assured that the Governor has very favorable chances of becoming one of the richest mines in the county. It is situated about one mile north-east from the famous Keystone mine at Amador, and has a good location for mill and working purposes. The Co. have a U. S. Patent for their mine, and are taking steps to secure one for the Fremont.

EL DORADO COUNTY.

STANLEY.—Republican, June 19: A correspondent informs us that another strike has been made in Kelsey District. The Cincinnati mine, lying within three-quarters of a mile of the St. Lawrence, in a north-westerly direction, have struck a very rich body of ore; the ledge is from 7 to 8 feet in width, and prospects from 10 to 50 cents to the lb. This mine is owned and worked by a San Francisco Co., and under the superintendence of Geo. A. Gates, they are pushing the work along rapidly.

We are informed that great activity is manifested in developing quartz mines in Big Canon Mining District, Mud Springs Township. The mine has recently been sold to Baldwin & Cavalieri, of S. F., who will erect hoisting works and mill. The ledge is said to look exceedingly fine, having been sunk 100 ft., average width being 17 ft. Two locations have been made to the north, both of which are being vigorously prospected. Location of the southerly extension have also been made, extending into Amador County, the first shot of Baldwin & Cavalieri being located by T. J. Hunter, the next by Day & Wake, and the next, which takes it to the Amador line, by Frank Swift, all of which are being developed.

INYO COUNTY.

YGNACIA.—Inyo "Independent," June 21: Work has been carried on in developing this mine and taking out ore for several months past. They have on the dump quite a large quantity of ore which would readily command \$250 per ton, and the mine has improved to such an extent that the owners value it at least six times its original cost. It belongs to the Diaz Bros., of Corro Gordo, and another San Francisco party, who, some two years since, sold it for \$10,000 but subsequently took it back. The claim is 950 feet in length, and from all accounts the Ygnacia is valuable property.

KERN COUNTY.

HAYLASH Miner, June 21: At the Pinte, everything moves along like clockwork. We might also say the same of the St. John at Sage-land. Two manual number of men are employed and the work progresses smoothly.

At the Jos Walker the fight against water is progressing with prospects of success soon.

NEVADA COUNTY.

GOLD TUNNEL MINE.—"Transcript," June 25: The frame and water wheel for the new mill at the Gold Tunnel mine is almost completed, and the batteries are being cast. The Co. is putting up a first-class mill, and there will be plenty of first-class rock on the dump for it to crush when completed.

G. V. "Union," June 25th, says: The working for copper is being prosecuted at Mineral Hill, Nevada. The ore is said to assay 65 percent of copper, and is being shipped.

PLUMAS COUNTY.

National, June 21: The hoisting-works of the Dutch Hill Co. were started up last week. The water is raised 325 ft., and will be used on some very rich ground. We expect to hear of some big pay in this claim, before long.

TUOLUMNE COUNTY.

Independent, June 21: The miners in the Garibaldi, two miles below Robinson's Ferry, on the Stanislaus river, have got through the vein with their tunnel, showing a ledge 13 ft. in thickness and free gold—the rock prospecting well throughout.

Nevada.

REES RIVER REVELLE, June 21: All the mines are ending up their rich ores and both stamp mills are grinding away. The water is raised, and the machinery all set, and it is expected to commence hoisting ore by the middle of July. The El Dorado mine never looked as well as at present. The body of sulphuretted ore in the 1,400-ft. level north, now measures 22 ft. from the level of the shaft. This mass of ore averages \$100 per ton. The stream of steel cables has been opened on the lower level, showing some of the finest ore we ever saw. Boulders weighing 100 pounds and upward being broken off are found to be nearly pure metal. This ore assays \$2,500 to \$3,000 per ton. The large steam pump will be lowered in the mine next week. A double track is now being put in, and when the present improvements are completed, there will be no estimate of the amount of ore that can be hoisted from this mine.

BELMONT.

REES RIVER REVELLE, June 21: All the mines are ending up their rich ores and both stamp mills are grinding away. The water is raised, and the machinery all set, and it is expected to commence hoisting ore by the middle of July. The El Dorado mine never looked as well as at present. The body of sulphuretted ore in the 1,400-ft. level north, now measures 22 ft. from the level of the shaft. This mass of ore averages \$100 per ton. The stream of steel cables has been opened on the lower level, showing some of the finest ore we ever saw. Boulders weighing 100 pounds and upward being broken off are found to be nearly pure metal. This ore assays \$2,500 to \$3,000 per ton. The large steam pump will be lowered in the mine next week. A double track is now being put in, and when the present improvements are completed, there will be no estimate of the amount of ore that can be hoisted from this mine.

BELMONT BULLION.

\$2,332 53, belonging to the El Dorado South Co., passed through on the stage last evening.

MANHATTAN BULLION.—Thirteen bars of bullion, weighing 1,361 pounds and valued at \$319,024 61 was shipped by the Manhattan Co. yesterday.

BOLIVIA DISTRICT.—"Silver State," June 21, says: The reports from the rich copper district continue favorable. In the Tidal wave a streak of ore 2 ft. wide, averaging 75 percent metal, has been developed. Andrew Davidson discovered a ledge last week which shows fully as well near the surface as any claim in the district. It has been named the Bouita. Kallogg & Elliot are working vigorously on the wagon road, and are making assay grade over the mountains. There is considerable excitement in the district, and everybody is working with a will. There are no idle men in Bolivia.

BELMONT BULLION SHIPMENT.—Reese River Revelle, June 18: On Monday night Wells, Fargo & Co. shipped four bars of bullion from the El Dorado South mine, Belmont, valued at \$3,091.63, and four bars from the Belmont Company valued at \$6,902.17, and last night was shipped by the same firm from the El Dorado South, Belmont, three bars valued at \$2,180.49, and four bars from the Manhattan Company of this city, valued at \$20,328.39.

MOUNTAIN VIEW MINES.—Sentinel, June 22: We gather the following in relation to the mines of the Mountain View Consolidated Mining Company, situated on the east side of Prospect Mountain, from W. MacDonald the Superintendent: The company own a number of locations, the most important of which are the Anna mine. This mine has an incline run in a distance of 25 ft., which taps a body of ore 6 ft. wide, and increasing in proportions as it is developed. The ore is plumbiferous to a considerable extent and consequently suitable for smelting. No furnace test has yet been made to show what the practical yield would be, but from assays got from fair samples, the owners are confident they will get good prices for the ore. Next in order from the Anna comes the Mountain View claim. On this an incline has been run in 90 ft., and discloses a sort of vein, or elongated deposit, which measures something like two feet latitudinally. Work will be resumed in this incline in a few days. Two shafts have been put down on the Masepepe claim, and a fine showing made as a result. These excavations are respectively 20 and 30 ft. in perpendicular extent.

WASHOE.

ARIZONA AND UTAH.—Gold Hill News, June 21: The main east drift on the 250-ft. level, is in 155-ft., the face still in ledge matter. This drift cut the ledge at a distance of 115 ft. east of the shaft, showing it to be large, well defined, and to contain bunches and spots of good milling ore. Work in the face of the drift has been stopped for the present, and a winze started 120 ft. east of the shaft in the foot-wall of the ledge, and rich developments may soon be looked for.

BALTIMORE CON.—The breaking of one of the hoisting reels on Monday last, almost entirely stopped the work in the mine during the week. The reel was repaired, however, and work resumed last evening with a full force of men on both the 225 and 450-ft. levels.

BELCHER.—Daily yield 500 tons from the four ore-producing ledges. The 1300-ft. level shows finely, and the face of the south crosscut is in splendid ore. The incline is down to the 1400-ft. level and the station being opened. Our sources of information relative to this mine are demoralized to-day.

BUCKETT.—Daily yield about 20 tons. The ore sections are holding out well. The main east drift is in 350 ft., and from the stringers of good quartz, assaying well in gold, coming in at the face of the drift, it is thought that the ledge must be very near at hand.

CALEDONIA.—Extracting the usual amount of milling ore from the 400-ft. level. The prospecting drifts, both north and south, on the 500-ft. level, are still driven energetically ahead, with no new developments to report.

CHOLLAR POTOSI.—Daily yield 100 tons of \$30 rock. The water in the mine has been reduced in quantity to such an extent that the pump is kept on duty only three hours per day. The ore-breasts are looking fully as well as at any time during the past thirty days.

CROWN POINT.—Daily yield 320 tons. Owing to the repairs to the machinery not being completed, the yield is below the average and will be until the latter part of next week, when the new spur wheel will be put in and the difficulty obviated. The ore-breasts of the 1300-ft. level are looking finely and prospecting developments show improvement. The crosscut east of the 1400-ft. level is not in far enough to reach the ledge yet, and no increase of water is tapped indicating close proximity.

CONS. VIRGINIA.—Sinking the shaft is making excellent progress, the rock in the bottom working finely. It is now down 1,045 ft. The main north drift on the 1167-ft. level from the old and Curry shaft, has made out slow progress during the week, on account of the terrible swelling of the ground through which the drift is running. The tremendous force of the swelling was such as to completely close up the working end of the drift, crushing in and smashing the heavy timbers like pipe stems, and although all the men that can be profitably used are employed there, the work has not been reached by several feet the extent attained last week. The heavy stone foundation for the new engine is completed, and the engine will be ready to place in position as soon as the masonry is sufficiently dried.

EMPIRE.—Prospecting at the 1600 and 1700-ft levels being vigorously prosecuted with excellent assays occasionally. At the 1600-ft. a narrow streak of pay ore found in a raise assays over \$50 to the ton.

GOULD & CURRY.—The work of taking the old pumping machinery out of the mine and replacing with new and more powerful, will be completed by the close of next week. The main northeast drift on the 1500-ft. level is still driven ahead, the face being in quartz and porphyry. The main south drift on the 1600-ft. level will make the connection with the north drift on the same level from the Savage to-day. This is an important and much to be desired connection between the two main drifts, and will result in cooling off the different levels, facilitating the work, and affording a means of escape from one mine to the other in case of fire or other contingency. Prospecting at the second station still continues, developing large quantities of low grade ore, but which at the present cost of reduction will hardly pay for extraction.

GLOBE.—Progress in the raise from the main tunnel is very slow and difficult, owing to the great heat, and it is doubted whether the connection can be made with the upper raise without hoisting apparatus being arranged to supply the requisite ventilation.

HALE & NORRIS.—Daily yield 70 tons of ore. Prospecting the 1700-ft. level still continues with unabating energy and no new developments of importance to the mine. The north winze from the 1700-ft. level is down 65 ft. Nothing new to report of the other levels.

IMPERIAL.—About 100 tons per day are being hoisted from between the 1600 and 1700-ft levels, where several good bunches of ore exist. Better deposits are expected when the next level below is opened.

JULIA.—The water is nearly drained from the south crosscut on the 1000-ft. level, and the drift is in 100 ft. so that it is the expectation that work in that portion of the mine can be resumed in a very few days, when some valuable developments are looked for.

JUXTON.—Daily yield 20 tons, from the south mine. Drifting to connect with the 400-ft. level. Nothing new.

KNOCKENBROCK.—The west drift is now in 690 ft., with the face in highly favorable vein matter.

NEW YORK CONS.—The new pump is in and working splendidly. It keeps the water out of the shaft with very little trouble, allowing a fine progress being made in sinking. The shaft is 247 ft. deep and is in a well chosen locality for good ore development.

OSGEO.—Situated in a highly favorable position at both lower and upper levels, and making good progress sinking shaft below the 1465-ft. level. No good developments as yet.

REES RIVER REVELLE.—The west drift is now in 690 ft., with the face in highly favorable vein matter.

REES RIVER REVELLE.—The west drift is now in 690 ft., with the face in highly favorable vein matter.

REES RIVER REVELLE.—The west drift is now in 690 ft., with the face in highly favorable vein matter.

REES RIVER REVELLE.—The west drift is now in 690 ft., with the face in highly favorable vein matter.

REES RIVER REVELLE.—The west drift is now in 690 ft., with the face in highly favorable vein matter.

REES RIVER REVELLE.—The west drift is now in 690 ft., with the face in highly favorable vein matter.

REES RIVER REVELLE.—The west drift is now in 690 ft., with the face in highly favorable vein matter.

OCCIDENTAL.—Daily yield 35 tons of ore. The assay of which is from \$30 to \$50 per ton. This ore is taken from 3 cross-cuts in the ledge from the main north tunnel 250 ft. apart, which proves the ore body to be of magnificent extent. It is expected that the ore yield will be greatly increased as soon as the ore-breasts are sufficiently opened, to admit of the employment of more miners.

SAYAGE.—Connection is completed with the Gould & Curry, at the 1600-ft. level, giving much desired and needed ventilation. The lower level conundrum still remains unsolved to the public.

SILVER HILL.—Daily yield about 60 tons. The ore-breasts both north and south at the first station, still continue to improve in yield and quality of ore. The main north drift at the second station is energetically driven ahead and the Bacon mill is kept running on ore from the mine.

SIERRA NEVADA.—The mine shows about the same as at our last report, and this mill is kept running steadily.

SENATOR.—Total depth of shaft 354 ft., having sunk 10 ft. during the week. The vein matter now being panned through is the most rich vein of ore yet encountered, being clay and porphyry, with stringers of quartz, indicating close proximity to the vein.

UTAH.—This mine, after lying idle for several months, was started up last Wednesday, under the superintendence of Sam Owens, one of the most competent and efficient miners on the Comstock. The shaft is 210 ft. in depth and the water has risen within 23 ft. of the surface. The engine and other machinery were started up, worked to perfection, and bailing out the water was immediately commenced. Notwithstanding a strong and steady influx, the water has been lowered over 100 ft., and it is expected that sinking the shaft and prospecting the ledge will be resumed in a very few days.

WAGNER JACKET.—Nothing new since last report. Drifting north and east on the 1500-ft. level, and about the same thing at the 1400.

BELCHER.—Enterprise, June 24: The rich deposit of ore on the 1300-foot level of this mine has now been opened upon to a distance of 261 feet south from the Crown Point line, and it still holds as rich as ever. There were yesterday received at the Bank of California sixteen bars of Belcher bullion, worth \$32,000.

WHITE PINE.

TRENCH MINE.—White Pine News, June 21: V. Butch, of the Trench mine, on White Pine mountain, presented us with a rich specimen of silver-bearing rock. His mine is looking better than ever before. The strike made by his miners has resulted in the discovery of a remarkably well defined and rich vein of ore. It appears that as depth was attained the course of the vein changed gradually to the northwest, pitching at an angle of 35 deg. into the hill, and at a depth of 200 ft. The vein is found of a thickness of 2 1/2 ft., and a width of 12 to 18 in., between two well defined walls. The assays made show the following results: First quality, \$703.75; second, \$518.38; third, \$161.80—all silver, with no trace of gold or other minerals.

We have been shown a specimen from the Caroline mine, worked by Mr. Elles, at Swanscote; it weighs 50 lbs., and valued at \$2 per lb.

ENGAR MINE.—This mine still continues to produce good rock—35 tons daily shipped to the Manhattan mill. With about 30 men employed, it shows well for a mine to produce over a ton to a man of high-grade ore.

ROBINSON DISTRICT.—This district is slowly making its immense mineral wealth known to the world, and it is only a question of time when it will take rank among the richest mining sections. The Brooks mine is showing splendidly, having a shaft down 60 ft. in a continuous body of milling ore of high grade. Being but a short distance from the Hayes mine, the present appearance proves its ultimate worth. Many men are engaged developing their various properties, and all are working with an abiding faith in the future of the country. One great detriment to the prosperity of the camp is the present want of facilities for reduction purposes, there being only one small furnace there, which has never yet succeeded in producing a ton of metal.

What the Cubans are Fighting for.

The struggle in Cuba has now been actively carried on over five years, and notwithstanding the "Patriots," as they term themselves, have never, within that time, met with anything like a serious reverse; but on the contrary have been constantly, though slowly, gaining ground, it is certainly a little singular that with the exception of a single nationality in South America, which has, itself, been for even a longer time, in a sort of quasi war with Spain, not a government on the globe has officially extended a hand of sympathy toward the party striving to obtain a redress of grievances. Even our own government has stood quietly by, all these long years, looking on as coolly and indifferently as though we had never known what it was to find ourselves engaged in a war under similar, but less provoking circumstances. All the Cubans ask is the common courtesy of belligerent rights almost always, heretofore, extended to any considerable body of people, who have made any positive and continuous stand for the redress of real or even imaginary grievances. All will recollect the readiness with which the nations of Europe extended this customary courtesy in the case of our own late "unpleasantness," even when there was never the slightest official demonstration of any grievance set forth as a justification for a resort to arms.

That the Cubans are not without just cause for a resort to arms—for more than ever existed between our own and the mother country—is well known to all who have been attentive to the history of this conflict. It is so long, however, since these grievances have been set before the world that most people have, no doubt, forgotten them, and perhaps we may be conferring a favor on some of our readers, at least in reproducing them in this connection, in the following condensed form:

The Cubans have stated officially and from mouth to mouth, that they are fighting for Representation, Severance of Church and State, and General Emancipation.

Every one of these are principles traditionally dear to the American people, and ends which we have been taught to believe just causes of war.

Cuba has no representation in the Spanish Cortes, and never had. She has no voice in determining the amount or the method of collection of taxes which she must raise. These taxes, again, are not spent for her benefit, nor has she any power of any kind over them.

The consequences of this disability are:

A burdensome standing army, which weighs down and impoverishes the island.

The rule of the Captain General is absolute and arbitrary.

The exercise of the right of petition has been followed by expatriation and imprisonment.

Corporate associations of the people, for the purposes of science, art or commerce, has been discontinued and impeded. The ports of the island have been closed to foreign ships, for the purpose of creating a monopoly for Spanish bottoms.

For one cause alone—taxation without representation—we went to war, and deemed the step well and prudently taken. No civilized people on the globe ever had better cause of war than have the Liberals of Cuba.

WAGES IN COLORADO.—From a long article on the Briggs mine in the Colorado Register we glean the following item concerning wages: Twenty-five men are employed on the mine at \$3 per day. Bucket fillers, who work 12 hours, get \$3.50. In the mill are two feeders, each working 12 hours, who get \$3.50; three engineers, \$3.50; blacksmith, \$4 per day.

BULLION FREIGHTING.—M. W. Belshaw is fitting up a fast-freight line of eighty teams for the transportation of bullion, to be run on the Los Angeles road for "the Inyo trade."

UTAH INVESTMENTS.—It is said that San Francisco capitalists are negotiating for a mining property in Salt Lake, for \$500,000. The matter has not yet been fully arranged.

THE DARDANELLES Mining Company has increased its capital stock from \$2,400,000 to \$6,000,000.

OVER \$300,000 in treasure left this city last week by rail, \$229,023 was in silver bars.

ORE SHIPMENTS from mines on the Comstock are about 95 car loads per day.

THE manufacture of bricks has been commenced in Truckee.

IRON ORE of good quality has been found in City Creek, Utah.

WAGES at Missoula, Montana, are from \$4.50 to \$5 per day.

QUICKSILVER is quoted at £14 per hottle in Liverpool.

A PLANING MILL is to be erected at Santa Barbara.

The Banana.

In pursuing our descriptions and illustrations of the indigenous fruits of our country, we come now to speak of the Banana. The genus *Musa* of the Musad family, is one of the most important found in tropical countries, and the principal food of vast numbers of the inhabitants of hot climates. It is in many places the chief support of a family, as an extent of ground which sown in wheat could only maintain two persons, will yield in bananas sufficient sustenance for a family of fifty.

Numerous varieties are produced from seeds and in some of these varieties it seems indigenous to almost all hot countries. Besides its utility as an article of food, a strong fibre is obtained from the leaves and stems, of remarkable fineness. An intoxicating drink is also made from the fermented fruit, which the In-

parts of California where the more tropical varieties might not succeed as well.

In Figs. 3, 4, 5 and 6 we present full size illustrations of different varieties of Dwarf Cherries (*Prunus pumila*) found in many parts of the country, both east and west of the Rocky Mountains. It seems more properly a species of plum; grows upon a hush from two to six feet high; fruit larger than a damson, sweet, and in color from a light pink to a deep crimson, and from a light to a deep yellow. The shrub thrives in sandy places and the fruit is sometimes gathered in large quantities by the Indians, wherever obtainable and dried for future use, plum gathering being one of their festival seasons. The tree has been domesticated in California and the fruit makes excellent preserves.

MEN AND MEMORIES OF THE SPRING OF '50.—Hurrah for the forty-niners! This spicy and well prepared narrative, strikes at once a sympathetic cord in the hearts—not only of every man of them who was "pars magna fui," but

NATIVE FRUITS.

dians or natives are not slow to avail themselves of, and this remark is equally true of nearly all sweet fruits in any country.

Besides the Banana and Plantain with their slightly varied varieties, common to the West Indies and Central America, we illustrate in Fig. 1 and Fig. 2 varieties found growing further north than the more tropical varieties, common to Northern Mexico, Arizona, and Southern Utah. The plant is there known as the Spanish Bayonet (*yucca baccata*). The fruit is produced upon a stem a little longer than the leaves, with several laterals. They vary in shape, some of them resembling the West India banana and nearly equal to them in flavor.

This fruit is of a greenish-yellow color, of a soft pulpy nature, very sweet and palatable and differing from their prototypes of more tropical climes in having large black seeds, and being produced only every other year from the same plant. The natives of the countries where grown, dry large quantities of the fruit for winter use. Even the unripe fruit is roasted in hot ashes and eaten with avidity, while the young flower buds when about to expand are also roasted, being a highly-prized article of diet.

The leaves of this species of *Yucca* yield a long and strong fibre, somewhat coarse but very durable. The plant will grow on the poorest kind of dry soil and could be grown in many

of all who have lived in, and loved California.

Who, among the Argonauts of those noted times, especially those advanced in years, does not delight to dwell on "auld lang syne," or the early days of our State's history? Messrs. Barry & Patten have shown themselves, as was expected of them when the book was announced for publication, admirably well qualified to illustrate in thrilling language and fit terms those stirring and remarkable times when people rushed here in search of the "Golden Fleece." This is indeed San Francisco—most graphically depicted—in the spring of '50. The work, no doubt, will be most extensively sought for and read not only on the whole Pacific Slope but far away Eastward. It is full of lively, quaint and humorous anecdotes. It is truly a characteristic picture of the peculiarities,—funny, and pathetic too, of this unique era in the history of our race and country. A. L. Bancroft & Co. are the publishers.

The earnings of the Central Pacific Railroad for the last month, are said to be the largest since the completion of the road, aggregating more than a million and a quarter of dollars.

From the Borax Fields.

A correspondent of the *Bulletin* writes as follows from Columbus, Nev.: No doubt you have heard of this place as the center of the great borax district, but if you were here to-day you would say it was the center of Old Boreas' regions, where he held undisputed sway. For the last twenty-four hours he has kept up the most dismal howling and such fierce charges round the corners, with such clouds of dust, old tin cans, boxes, bits of paper and other debris flying through the air, as to render it almost unsafe to venture out. And this day is no exceptional day. I have seen at least a dozen such in the last month. Take one of San Francisco's worst windy days and multiply it by five and you have this day. The wonder is that the wind does so little damage, but there is little to be affected by it on this barren plain unless to change the base of the dust. The bones are all one-story and mostly built of concrete, which is very hard and firm, and there is little surplus wood or lumber lying round loose at the sport of the winds, both being too scarce and too expensive. Wood is \$20 per cord and lumber of very poor quality \$125 per thousand. All the wood is brought twenty miles by teams, and the lumber is brought from Wadsworth, (150 miles,) and there is little to be had at any price owing to the scarcity of teams and high prices of freight.

The Climate—A Barren Region.

We had quite a heavy shower of hail yesterday, which lasted fifteen minutes, making it quite wintry for a while. There are no snow or rain storms here winter or summer, only a little hail or rain showers, like yesterday, for a few moments. The winters are not cold, the thermometer rarely falling below 20 degrees above zero; but the summers are very hot when they begin. It is like living on a sand heap with a glass case over you. There is not a blade of grass or tree or shrub, except some very scant bunches of grease wood, to be seen on this whole plain ten miles in extent. It is perfectly level, and covered for the most part with a white saline deposit, which will kill any plant put into it. I had to send twenty-five miles to get a box of soil to plant some flower seeds in, and now I have quite a fine display of nasturtiums and sweet peas in my window, the admiration of all passers. To-day a poor deluded horse looked in and tried to thrust his nose into the window to get a bit of the tempting green morsel. I felt real sympathy for the poor brute, and thought what a feast it would be to my eyes to see the beautiful gardens and orchards around Oakland and vicinity and get a taste of the delicious fruits and vegetables you are reveling in now, and which we must be denied all the year round. But, thanks to canned fruit and vegetables, we are very well compensated at very round prices. Teams bring all merchandise from Wadsworth, the nearest point of shipment, by railroad. They are one month making the round trip. The route is destitute of grass or water the most of the way, and teamsters have to take a supply for their animals both ways. The new road, by way of Carson, which will be open about the first of July, will be through a more fertile region, and though the route will not be much shorter, it will have this advantage—plenty of water and cheap feed for the animals.

Borax Mines.

There are very extensive deposits of borate of lime and borate of soda in this place and vicinity. The Pacific Borax Company's works here are making about fifty tons per month of borax; and the works at Seel's Marsh and Fish Lake are making about as much more; but, owing to the decline in the price of the article, there will not be so much interest in this branch of business.

Gold and Silver Mines.

There are several rich silver mines worked here, one owned by A. G. Holmes & Co. has a fine showing of ore at present, a well defined ledge, at a depth of 400 feet, with a large amount of rich ore in eight. Messrs. Sweet, Apple and Harseltine, have a mine, two miles from town, which is yielding well. They are running a quartz mill day and night. The Columbus Mill and Mining Company, under the superintendence of Colonel Jeremiah Milles, are running a ten stamp mill night and day, also.

THE PAUL PROCESS.—We yesterday had the pleasure of again meeting Cole Sanders, Esq., of Montana, who has just returned from a visit to the Paul Mill at Springville, and from him learn the following particulars: That it is the best constructed automatic mill he ever saw, and does fully all that is claimed for it in the way of crushing ores. The amalgamating barrel and settler work beautifully, and four men in twenty-four hours do the work of ten men by the ordinary stamp mill. Mr. Saunders states that the proprietors, however, disclaim to give results of their working, as they claim they are not using at this time all the chemicals that Mr. Paul desires should be used, yet they say they are well satisfied with the results already obtained, and have ordered another set of machinery. If Mr. Saunders can be convinced or guaranteed results such as Mr. Paul claims, he will without delay erect his machinery in Montana in place of the ordinary stamp mill, as contemplated, so pleased is he with the other operations of the Paul Mill.—*Salt Lake Journal*.

USEFUL INFORMATION.

Blacksmiths and Machinists.

Every one had an opportunity to employ different kinds of workmen to assist him in the construction of novel machinery, will agree with us that he always had the least trouble with the blacksmiths. As a class of workmen they generally possess the best judgment, and will not misunderstand the directions given which is so often the case with other workmen, and they have the special faculties of possessing a good eye for symmetry of form. They will judge by the eye alone, quite correctly, if an angle is right, a circle round, etc. This latter faculty is a result of their training. While the carpenter lays his square on the work, and marks it off beforehand, the blacksmith more ordinarily makes his right angles by sight, and can only resort to the square to see if he was correct.

In regard to utility for social progress, the business of the blacksmith also stands foremost. What would the most useful of all producers, the farmer he, even in his most primitive state, without the blacksmith. It has been noticed that at the present day few young men care to learn that trade; the cause is that it requires so much hard, muscular labor. Thousands prefer, therefore, to become machinists, and then they have all sorts of mechanical tools to shape their work, without the hard labor with nimble hammer and sledge, and also that as machinists they can, in this thriving country, find always more ready employment than in the blacksmith's trade.

In fact, the occupation of machinists is at the present day the foundation of almost all other trades, as we owe to it the invention of many tools which facilitate labor of all kinds. Without the appliances invented by the machinists of the present day, we should indeed have no steamboats, railroads or steam power; the ingenuity of inventors, in attempting to supply the present race of men, has in fact, created the machinist's trade; and this by inventing the forge hammer driven by steam, and other similar inventions, which have succeeded in shaping masses which no sledge hammer could manage. It was thus demonstrated what bold conception could practically be realized, and this in turn stimulated inventors and capitalists to expand their ideas, and go on in conceiving and supporting the most gigantic projects, which our forefathers would have considered impossible of execution, but which our mechanical engineers have practically realized, and in persisting to do so, continually surpass their own former efforts.

Also in small, but not less useful matters, the inventive genius of the machinist is eminently active at the present day, not only in regard to the saving of labor and time, but also in saving expenses for divers pieces of machinery, by contriving a machine to do the work of two or more distinct ones.—*Bulletin.*

PROPOSER BRILLIANT ILLUMINATION.—A Mr. P. A. Vickers proposes to the people of Oregon to illuminate the top of Mount Hood on the night of the Fourth of July, in such a manner that the light will be witnessed by thousands in that State, as well as in Washington Territory. For this magnificent display he asks only a slight remuneration, "to be paid upon the accomplishment of his grand design." A writer in the *Portland Bulletin* recommends Mr. Vickers and Scheme. "If he fail," says the correspondent, nothing will be lost to the community. If he succeeds, Oregon or rather, Portland, will have been instrumental in making the most signal and gigantic pyrotechnic display the world has, perhaps, ever seen on such an occasion; and the investment by the committee will never be regretted. The conditions are certainly moderate, and Mr. Vickers will probably be told to go ahead with his grand illumination.

TALE OF THE WHITE AND BLACK.—A correspondent of the *Country Gentleman* says: Every spotted dog has the end of his tail white, and every spotted cat the end of the tail black. Of the fact there can be no doubt. I have examined dogs and cats without number in France, in England, and America, and always noticed the same result. The dog affair is not original with me, but the cat is. Our former minister to Japan, Mr. Harris, first mentioned the fact concerning the dog in a letter to the *New York Times*, published some years since. I have looked at many paintings of dogs in the galleries of Paris, and elsewhere, in regard to this, and found even there the dogs spotted, always "in order," proving to me that the artists had invariably copied after nature.

THE INK OF THE ANCIENTS.—In a letter from Mr. Joseph Ellis, of Brighton, addressed to the *Society of Arts Journal*, he states that by making a solution of shellac with borax in water, and adding a suitable proportion of pure lamp black, an ink is produced which is indestructible by time or chemical agents, and which, on drying, will present a polished surface, as with the ink found on Egyptian papyrus. He made ink in the way described, and proved, if not its identity with that of ancient Egypt, yet the correctness of the formula, which was given him by the late Mr. Charles Hackett, F. R. S.

DURABILITY OF CYPRESS WOOD.—It is said that the ancient gates of Constantinople, which endured the attacks of decay for more than 1100 years, were made of cypress wood.

WHY IT IS CALLED ROSEWOOD.—Did any of our readers ever wonder why the dark wood so highly valued for furniture should be called rosewood? Its color certainly does not look much like that of a rose, so we must look for some other reason. We are told that when the tree is first cut, the fresh wood possesses a very strong rose-like fragrance, hence the name. There are half a dozen or more distinct kinds of rosewood-tree. The varieties are found in South America and in the East Indies and neighboring islands. Sometimes the trees grow so large that planks four feet broad and ten in length can be cut from one of them. These broad planks are principally used to make the tops of piano-fortes. When growing in the forest, the rosewood-tree is remarkable for its beauty, but such is its value in manufactures as an ornamental wood that some of the forests where it once grew abundantly, have now scarcely a single specimen. In Madras, the government has prudently had great plantations of this tree set out in order to keep up the supply.

HOW THE DIAMOND CUTS GLASS.—Dr. Wallaston ascertained that the parts of the glass to which the diamond is applied are forced asunder, as by a wedge, to a most minute distance, without being removed; so that a superficial continuous crack is made from one end of the intended cut to the other. After this, any small force applied to one extremity is sufficient to extend this crack through all the whole substance and across the glass; for since the strain at each instant in the progress of the crack is confined nearly to a mathematical point at the bottom of the fissure, the effort necessary for carrying it through is proportionally small. Dr. Wallaston found by trial that the cut caused by the mere passage of the diamond need not penetrate so much as the two-hundredth part of an inch. He found also that other mineral bodies, recently ground into the same form, are capable of cutting glass; but they can not long retain that power, from want of the requisite hardness.

GOOD HEALTH.

Good Nature Can be Cultivated.

Good nature is a sign of health and sweetness, and is cultivated by cultivating these conditions, especially the first. When digestion is good, the blood is abundant and rich and all the organs of the body and mind are well fed, when if the sleep is abundant, and cares not too many, good nature comes of itself.

It is a favorite notion among the scientists that the coal we dig from the mine, with which to warm our houses and drive our machinery is but the sunshine of former ages, stored up for future use; and the comparison is very apt. And so we may say that a good-natured, jolly, wholesome man consists mainly in an unusual amount of sunshine turned into light and life.

Mr. Beecher in one of his pointed *Ledger* letters says: "There is so much care in life, so many that are victims of low spirits, so much of sorrow, so many that are languid through sickness or grief, or watching, or want, that any one who can throw a ray of light upon their spirits is a benefactor indeed. Good nature is the most practical of all kinds of benevolence. It gives itself forth without measure. It shines, like the sun, into all places, high and low alike. It chooses nothing, but blesses all, without discrimination. It allays strifes, pours oil upon friction, lightens the tasks of life, and diffuses a cheer and glow which wine cannot give; and all this, too, while the cause of all this blessing is himself, blessed above all."

Some men are good-natured in spots, some are good-natured when they have their own way, or have fallen upon some good luck; some are good-natured when at ease, but cross when burdened; some are good-natured in company, and cross at home—all smiles and geniality in the store and among customers, but lowering and mooping at home. Now and then we find a real son of light—a hero of the luminous heart! One who beams forth like summer upon all, everywhere; whom all men bless when he comes, and all miss when he goes! Such men ought to wear crowns. They do. Grateful thoughts, love and joy form the crown. They wear it unconsciously, but a hundred hearts place it upon their heads, and they go crowned with light all their days!"

DYSPEPSIA.—Dyspepsia is the most multitudinous disease extant. No two dyspeptics are precisely alike, while each may have more morbid feelings and variable sensations than he could relate in a week, as they are forever changing. In general terms, a dyspeptic should eat plain, simple food, at regular hours, masticate thoroughly, drink little or nothing while eating, take frequent and regular exercise, but always short of fatigue, sleep all that is possible, and bathe twice a week.

WARTS.—Apply to the wart with the end of a knitting needle a little fuming nitric acid, to be had of the apothecaries. Repeat the application once or twice, and in two or three days the excrescence will come off without leaving any mark.

Summer Drinks.

No beers, or wines, or brandies—nothing alcoholic! They are carbonaceous, and increase the heat and fever of the system; they clog up instead of lightening; they debilitate instead of giving strength. The tendency of the system in all lands, in summer, is to biliousness—to bilious diseases; we call them fevers. This is because we eat more than we wear out by exercise or labor; hence, the body becomes too full.

The great scavenger or emptier of the body is the liver; it is like the pump in a sinking vessel; you must keep it at work, or all is lost. As warm weather renders us incapable of doing as much work in summer as in winter, and as work was intended, in part, to work out the wastes of the system, some substitute must be provided, some compensating power. That power is the liver. It must be made to do more work in summer, and a beneficial Providence has made provision for this in sending us the berries and fruits of warm weather, which contain an ingredient (the acid) which, after six thousand years, the French found out, has its efficacy towards cooling off the body by acting on the liver—having an effect upon it to make it work more actively, and thus more promptly remove the bile, which is the waste matter of the system, from the blood.

Everybody knew that fruits and berries were cooling—were "healthy;" but how they were, was not definitely known until within a few years. The wisdom and benevolence of our Maker in this thing, surely, will command our affections, in that He has provided these fruits and berries in such generous profusion, and combined a necessary quality with such a delicious taste, that every soul of man is perfectly ravenous for them, and we can eat them without harm, to our utmost fill, if ripe, raw, and perfect, and taken alone.

In the absence of fruits and berries, we may obtain the needed natural acid from the lemon, diluted with water; but the most universally available acid drink for summer as a natural aid to the liver is buttermilk, not an ounce of which should ever be wasted, to be taken at meal times, or between meals when thirsty.

For the harvest-field, buttermilk is the safest, most healthful and cooling of summer drinks, to be taken at the temperature of the air. If a mouthful is swallowed at a time with a distinct interval, the thirst will be better satisfied with a quarter of a pint, than if a whole cupful is taken without being removed from the lips.

A palatable and safe summer drink for outdoor workers is water, of the natural temperature, sweetened with molasses. All root beers are pernicious.—*Hall's Journal of Health.*

Nourishment for Food.

The wholesome or unwholesome character of any aliment depends, in a great measure, on the state of the digestive organs, in any given case. Sometimes, a particular kind of food is called wholesome because it produces a beneficial effect of a particular character on the system of an individual. In this case, however, it is to be considered as a medicine, and can be called wholesome only for those whose system are in the same condition. Very often a simple aliment is made indigestible by artificial cookery. Aliments abundant in fat are unwholesome, because fat resists the operation of the gastric juice. The addition of two much spice makes many an innocent aliment injurious, because spices resist the action of the digestive organs, and produce an irritation of particular parts of the system.

In any given case, the digestive power of the individual is to be considered, in order to determine whether a particular aliment is wholesome or not. In general, we can only say, that aliment is healthy which is easily soluble, and is suited to the power of digestion of the individual; and, in order to render the aliment perfect, the nutritious parts must be mixed up with a certain quantity of innocent substance affording no nourishment, to fill the stomach; because there is no doubt that many persons injure their health by taking too much nutritious food. In this case, the nutritious parts, which can not be dissolved, act precisely like food which is, in itself, indigestible.

It is a very mistaken idea that the nourishment in food is according to the quantity; a person may eat a great deal of some article, and receive very little nourishment from them. The quantity of nourishment depends greatly on the aromatic flavor contained in food; and whatever is insipid to the taste is of little service to the stomach. Now, the difference between good cookery and bad cookery lies principally in the development of the flavor of our food; articles properly cooked yield the whole of it; by good cookery we make the most of everything—hy had cookery, the least.

ANTIDOTE TO PHOSPHORUS POISON.—On good authority it is promulgated that two drops of turpentine oil in a little milk is a complete antidote to phosphorus poison. Children not unfrequently bite off the charged end of phosphoric matches and swallow them. It is stated that a girl was recently saved in England by this newly discovered remedy, who had actually eight match ends in her stomach.

THE PHILOSOPHY OF THE CHILL FROM WET CLOTHES.—Few persons understand fully the reason why wet clothes exert such a chilling influence. It is simply this: Water, when it evaporates, carries off an enormous amount of heat, in what is called the latent form. One pound of water in vapor contains as much heat as nine or ten pounds of liquid water, and all this heat must, of course, be taken from this body. If our clothes are moistened with three pounds of water, that is, if, by wetting, they are rendered three pounds heavier, these three pounds will, in drying, carry off as much heat as would raise three gallons of ice-cold water to the boiling point. Is it any wonder then that damp clothes chill us?

BUTTERMILK is an important aid to the digestion of any food taken with it; and by many hygienists is regarded as an excellent substitute for fruit in winter, and a prevention of spring sickness. It is especially recommended to invalids who suffer from indigestion—drink it at meal times.

DOES BREATHING COLD AIR COOL THE LUNGS? Breathing cold air does not reduce the temperature of these organs to any appreciable extent. It is probable that oxygenation goes on more rapidly in the lungs than elsewhere, thus keeping up the supply of heat, lost by introducing cold air into them.

DOMESTIC ECONOMY.

Cooking Eggs.

Eggs bear a relation to other animal food similar to that which seeds bear to other vegetable food. They are the depositories of vitality, stored up to form a new link in the continuation of the species. They are probably the purest form of animal food, though they compare unfavorably with seeds in several respects. They lose their vitality sooner, and they parts more or less of whatever impurities may have belonged to the animal that produced them. They are not so nutritious as some of the seeds, and they require more care in cooking.

Like seeds, one of their principal ingredients is albumen, which is nearly pure in the white; but, unlike vegetable albumen, it coagulates with heat. If the heat is great, it becomes so hard as to be extremely difficult of digestion. Hence eggs are more easily digested raw than cooked, and hence also the objection to hard-boiling. Dr. Beaumont found bits of hard-boiled egg-white, no larger than a pea, sometimes remained in the stomach after everything else had yielded to the action of the gastric juice. Such logic is unanswerable. He deduced from it the importance of careful mastication. We women can go a step further, and find in it an intelligent reason for so cooking the eggs, that they will not require this extra care. Fried eggs are still worse than those which are boiled, both because subjected to a greater degree of heat, and because of cooking fat into them.

Even in the common method of boiling them rapidly, "three and a half minutes," the albumen next the shell is quite too hard. It should be uniform and custard-like, and this is secured by the method, now becoming quite common, of merely letting the eggs stand from seven to ten minutes in hot water. This should be boiling hot at first, but the cool eggs reduce its temperature somewhat. The exact time required will vary with the relative proportions of egg and water, with the size of the eggs, with the heat and thickness of the utensil used, with the warmth of the place where it stands, and with the weather also; a little more time being required in dull weather. The cook will soon learn what allowance to make for her utensils; and for the rest, she must use her judgment every time. They are not so easily spoiled, however, as in boiling. If left in a little too long, they can be plunged into cold water for a minute or two. If even kept hot until the yolks stiffen, the whites will not be hard. The yolk should be cooked just enough not to break rapidly when turned out. These are, properly speaking, not "boiled eggs," but "curled eggs."

These curled eggs make an admirable dressing for many breakfast dishes—boiled camp, oatmeal mush, cracked wheat, and especially for small hominy. The gentle method of cooking eggs may also be observed in making egg-toast. Have the milk almost boiling in a fit dish, and brook in the eggs one by one, cooking a few at a time, and being careful not to let them run together. Sprinkle in a little salt, and let them stand hot and covered, until firm enough to take up without breaking. Then have ready some split butter-biscuits (gems), softened in hot milk and laid on a platter, and when the eggs are done, dish them one on each half of a biscuit, and serve warm. This is a handsome dish, and though not quite so digestible as hominy dressed with eggs curdled in the shell, it is still far better than the fried potatoes and griddle-cake that form the staple of so many breakfasts.—*Science of Health.*

COOKING BEETS.—The true way to cook a beet is to bake, not boil it. Thus treated and sliced either in vinegar or butter it is exceedingly palatable and nutritious. Boiling extracts the most valuable part of this vegetable,

Volume XXVI.

With this number of the MINING AND SCIENTIFIC PRESS, we close volume XXVI, and celebrate the Thirtieth Anniversary of its existence. We have, during the past six months, had most convincing proofs of the increasing interest taken in our work by our readers, and of the assistance we have been able to render them, in their every-day occupations. The mining community on this coast, who are our chief patrons, have increased in numbers as facilities of transportation, improved processes and the number of mines has increased. Mechanical appliances and interests, have not, been by any means neglected, and we number many subscribers among the mechanics, foundry-men, etc., on the coast.

We devote our time and space mainly to these interests. No new device or process in any country escapes our notice, and whatever will benefit the mining community in the slightest degree, receives our fullest attention. We can refer with pleasure to the number of mining illustrations and the amount of matter with relation to the mining interests, we have published during the past six months. We have given in full all the State Mining Laws under the New Code; the Mining Laws of May 10th, 1872, with complete instructions from the Secretary of the Land Office; the Coal Land Law; all the decisions and instructions of the Government Department in any way referring to the mining interests, which, together with a complete and general Mining Summary, comprising items of interest from all parts of the country, makes a large amount of such news.

In addition to this it has been our aim in the editorial columns to give such subjects as would interest and benefit the miners of the Coast,

full attention, without devoting any space to wrangling with our brethren of the press, or to political or other issues, as is too often the case. Our Stock Reports have been remodelled, the tables extended so as to be more comprehensive, the style of type reduced to afford more room, and that particular department of our paper is now more valuable than ever before. We have regular correspondents in the more prominent mining localities and travelling correspondents who periodically visit every mining section of importance in order to keep our readers posted as far as possible with the march of development. The voluminous index on the last page of this issue, which covers only half a year and is, moreover, very much condensed, is of itself sufficient guarantee of the quality and amount of reading we have furnished. We will endeavor in the future, as in the past, to merit the patronage and esteem of our readers by conscientiously looking out for their interests to the best of our ability.

Since the beginning of the year we have added a new cylinder press, enlarged our office and otherwise extended our facilities for carrying on business. This has, of course, been attended with considerable expense, but our increasing circulation, and steady and extending advertising patronage has warranted the outlay. Recent developments and the extension of the mining field on this coast, has brought us many additional patrons and enables us to furnish a better paper than in years gone by. The special field of journalism in which we labor is no longer, by any means, a limited one, and is increasing year by year. Extensive patronage is essential to newspaper success, and while we have no complaints to offer on that score, at the same time we would suggest that the close of the volume is a good time for our readers to renew their subscriptions and invite others to patronize our paper, if it is believed that by so doing they will be pleased and profited.

Ore Feeder for Quartz Mills.

The cut shown herewith is a representation of Cochran's Ore Feeder, an invention recently patented through the agency connected with this office, and of which we spoke in our last issue. The main feature of the device is its adaptability to feeding wet ores, a great desideratum in self-feeders. Its construction will be seen by reference to the cut. A hopper is supported on a frame, situated close to the machinery, into which it is intended to feed the ore.

On the lower side the frame timbers extend out from one side to the proper distance to support a roller above where it is desired to drop the ore. Another roller is supported inside of the frame, parallel with the outside roller. A broad endless band, or apron, passes around these two rollers so that its upper surface will travel just below the lower or feed-opening of the hopper. A ratchet wheel is secured to one end of the outside roller and is operated by a strong bar from the tappet on the stamp stem or some other part of the machinery, causing the roller to revolve, and thus move the endless band. The bar which strikes the ratchet wheel is supported on the end of a projecting timber, and a spring serves to lift it after each drop of the stamp. A turn-buckle is inserted in the length of this rod so as to permit of the lengthening or shortening of the rod for regulating the amount of feed. The upper end of this bar rests beneath the tappet as shown and consequently it will be supported in an incline position in order that its lower end may engage with the ratchet.

The machine operates as follows: The ore is placed in the hopper and passes through the lower opening which is regulated according to the quantity it is desired to feed; after passing through it is received on the horizontal endless band. As the stamp falls the tappet operates the bar and causes the roller to revolve, feeding the ore forward by moving the belt, thus automatically supplying the stamps with the proper quantity to be fed, as when a sufficient quantity is beneath the stamp it will not drop so far and will not operate the feeding device, but when the ore diminishes the drop is greater and the feeding increased. This arrangement is quite simple and possesses the advantage of being able to feed very wet ore without trouble. The device was patented by T. A. Cochran, of Jamestown, Tuolumne county, Cal.

COCHRAN'S ORE FEEDER.

This manner of mining for asbestos being necessary, a small deposit of, say, 18 inches in width would be valueless, since so much waste ground would have to be removed. Where a good sized ledge is found it could be blasted or quarried out easily, and nothing but the substance itself be removed. The fibrous asbestos seems, in the mine mentioned, to be even more plentiful in the center but runs more or less all through. Some have been taken out which was of the texture of silk, and softness of satin, but was at the same time quite tough in fiber. The crystals or long fibers sometimes occur all over the vein, and again are confined to the middle of it; it occurs in the common gray stone of our mountains.

Asbestos was well known to the ancients, and it is said that they manufactured from it incombustible wicks and when these became encrusted with oil, they were plunged into a burning furnace to purify them. The fibers possess very little cohesive power, and resemble very much the filamentous products of the vegetable kingdom. This peculiar texture deceived the ancients, and Pliny writes that "this linen" grows in the deserts of India—arid and scorching—thus the climate that produces it, accustoms it to the action of fire. The ancients spun it into sheets, napkins, head-dresses, etc., which were thrown into the fire when soiled, coming out white, the foreign matter being destroyed by the fire without altering the texture. What a jolly thing, if some enterprising inventor were to turn his attention this way, and manufacture shirts from it. It would be a good thing in the mining camps where wives and washerwomen are scarce, and might help to solve the Chinese question in California, by taking away the occupation of the cheap Chinese laundry man. Another use to which the ancients put it, was to enclose the bodies of their dead in a sheet made of asbestos, and then the body was burned on the funeral pyre; the ashes were easily gathered for preservation.

The great difficulty with the mineral as far as weaving it into cloth is concerned is the difficulty of finding it in fibres of sufficient length. In most cases the fibres are short, but in certain localities it can be taken out in great lengths. In making it into cloth it is woven,

Asbestos.

This peculiar mineral, which has been found in various localities on the Pacific Coast, is rather an unfamiliar substance, concerning which little is generally known. We have of late received numerous inquiries concerning the uses to which it may be put, and have also had several specimens sent to us for examination. Some of these specimens are very handsome, with long delicate fibres of silky hue and flexibility; others again looking more like soapstone than asbestos. Some of our readers will probably be interested in learning something of the method of mining this substance and the uses to which it is put.

As far as we know, only one company has been formed on this coast for the purpose of mining for this material, and very little has been accomplished by them as yet. The company we allude to was formed in April of this year, but so far not even a working capital has been raised. The mine is in this State, in a favorable locality for transportation of material; but there is only a limited demand at a price of \$60 per ton. There is a regularly defined vein of the substance, varying in width from six to ten feet. It crops out on the surface in different places some 4,000 feet. From an old tunnel in the hill where the ledge occurs, it was ascertained that it had a depth of 400 feet from the croppings; how much further it runs down is undetermined. The vein is between two wall rocks the same as a regular quartz vein; on the outside edge of the vein the material looks like a whitish green soapstone, and is compact in form, but the fibrous substance runs all through it; some fibers are taken out five feet in length. The people who have worked this claim, state that it is a very difficult substance to mine, except, in one way. Blasting has little effect; it is like blasting in cotton; it has to be regularly quarried out. The fibers run up and down, and a "breast" is made so that the miner may pick it down easily. After sinking along the vein in this way, a new breast can be made of sufficient height to enable a man to work easily, and reach the top. It is almost impossible to dig across the deposit, and we understand that the parties who crossed the vein we refer to, in running the old tunnel spoken of above, state that it cost them \$500 to get across the asbestos ledge; they did not at that time know what the substance was.

Asbestos has been found in many places in the Atlantic States, in Virginia, New York, and elsewhere. As long ago as 1860 a lead of this substance was found near Russian river, in Sonoma County, in this State. It was also found near Auburn on the line of the Central Pacific Railroad. The latter vein was, however, only about six inches in width, which accounts, probably, for its not being worked now. Australia contains it and the island of Corsica is noted for the quality and abundance of this mineral. Quite a number of other deposits or veins of small size are said to exist in the locality of the mine spoken of at the beginning of this article; but if the large one will not pay, or there is a very limited demand for the substance, it is scarcely worth while to work the small one. If, however, we have on this coast a superior article as would appear, and the roofing and boiler covering men are successful in introducing their manufactures, a steady demand for the product will doubtless spring up and the mine will pay to work. It is said also that a good fire-proof paint can be made of it as well as fire-bricks for furnaces. If either of these ideas were carried out practically to any extent, it would cause a large consumption of asbestos to the manifest advantage of our mine owners. It would then be worth prospecting, and it doubtless exists in many localities this side of the mountains and especially in California. Besides the localities spoken of above, it is found in Savoy, Piedmont, Tyrol, Hungary, Cape of Good Hope and Scotland.

There are numerous varieties which were enumerated some time since by a French journal. *Luberiform Asbestos* or *Asbestos terri*, of Haüy, is softer than the others—it absorbs water more readily; its ordinary colors are a dirty gray and a yellowish white. Sometimes it is in thick and spongy pieces, and is then called vulgarly "mountain flesh," sometimes nearly the texture of cork, and then called "mountain cork;" again, it is hard and membranous and very flexible, when it is termed "mountain paper." The *Ligniform Asbestos* or "mountain wood," of Brochant, is of a reddish or brownish color, and resembles splinters of wood. The asbestos of Savoy is silky and fine as linen. Asbestos is composed of several metallic oxides, lime, magnesia, and alumina, united to silicic acid. Chevreul gives the following analysis:

Silica..... 59
Magnesia..... 25
Lime..... 9
Alumina..... 3
Water, iron, loss, etc..... 4

Total..... 100
The different analyses made by Thompson, Berthier, Schmidt, Delesse, and others, have given almost the same result.

PETROLEUM, of superior quality, has been found at Los Gatos.

easily when mixed with woolen or hemp. When taken from the loom the cloth is thrown into the fire to burn the vegetable fibers, the asbestos coming out unchanged. This process however makes a material of very coarse texture. In Siberia, they in some places manufacture purses, gloves, etc., of this substance. The Italians have manufactured cloth, paste-board and even a sort of lace from it. According to Sage they manufacture in China, sheets of paper six metres long and entire webs of cloth. A very valuable variety of it is found in Italy the threads of which are of a shining whiteness and have the peculiarity of seeming to be wound up in the mineral mass they form as the silk in the cocoon from which it is drawn. If one of the ends of these mineral fibers is seized it can be drawn out to a length eight or ten times the size of the piece from which it comes. The cloth made from it however presents little solidity. It is stated that an entire work was once printed on paper made from asbestos, and presented to the Institute of France by Madame Perpete.

The finer qualities of asbestos have been formed into gloves, neckties, etc., which can easily be cleaned by putting them in the fire. It has been highly recommended for firemen's hats, gloves, coats, etc. The uses to which it is put to any extent at present, are for lining fire proof safes, making roofing material and boiler filling, steam packing, making crucibles, fire bricks, filters, etc. The parties owning the mine spoken of above could only find a limited sale for the product to the manufacturers of safes. Mixed with tar it forms a cheap roofing material, which is so flexible that it is said not to shrink or be subject to fracture. In connection with oily materials it is said to form a valuable cement for leaky joints around windows, doors and chimneys. In steam boilers its non-radiating and non-conductive properties are utilized for the purpose of covering the boilers and pipes. As it is quite refractory and durable it will not decompose like felt and canvas. It is put on in a plastic form which soon solidifies and adheres to the iron with great tenacity. The coating is generally 1½ inches thick. A New York company is now using asbestos for this purpose, and have already four factories producing the material. If asbestos accomplishes all that is claimed for it in that line, which it probably will, it will no doubt be more generally in demand. The manufacturers referred to use a glutinous material to keep the asbestos together, the composition of which is kept secret. As a roofing material, no doubt more attention will be turned to it, since the large fires of the past few years.

As a packing, asbestos seems to be gaining in favor. A late exchange says that this packing in ocean-going steamers, put in more than sixteen months since, is still apparently as perfect as ever. The *Anglia*, one of the Anchor Line Trans-Atlantic passenger steamers made 14 trips to America and back, from England, having steamed in the same packing over 98,000 miles.

Asbestos has been found in many places in the Atlantic States, in Virginia, New York, and elsewhere. As long ago as 1860 a lead of this substance was found near Russian river, in Sonoma County, in this State. It was also found near Auburn on the line of the Central Pacific Railroad. The latter vein was, however, only about six inches in width, which accounts, probably, for its not being worked now. Australia contains it and the island of Corsica is noted for the quality and abundance of this mineral. Quite a number of other deposits or veins of small size are said to exist in the locality of the mine spoken of at the beginning of this article; but if the large one will not pay, or there is a very limited demand for the substance, it is scarcely worth while to work the small one. If, however, we have on this coast a superior article as would appear, and the roofing and boiler covering men are successful in introducing their manufactures, a steady demand for the product will doubtless spring up and the mine will pay to work. It is said also that a good fire-proof paint can be made of it as well as fire-bricks for furnaces. If either of these ideas were carried out practically to any extent, it would cause a large consumption of asbestos to the manifest advantage of our mine owners. It would then be worth prospecting, and it doubtless exists in many localities this side of the mountains and especially in California. Besides the localities spoken of above, it is found in Savoy, Piedmont, Tyrol, Hungary, Cape of Good Hope and Scotland.

There are numerous varieties which were enumerated some time since by a French journal. *Luberiform Asbestos* or *Asbestos terri*, of Haüy, is softer than the others—it absorbs water more readily; its ordinary colors are a dirty gray and a yellowish white. American Inventive Genius.

There seems to be a peculiar disposition manifested among American mechanics and inventors to accomplish everything possible by automatic machinery. An observer in an American machine-shop or factory will see many things done by machinery here, which in other and older countries is done by hand. This fact is becoming very marked; but whether to the healthful advantage of mechanical progress or not, is not yet altogether clear.

This desire to carry machinery to the utmost limits of mechanical possibility, in the way of automatic action, not infrequently leads to complication in our machinery, a desire or necessity for building it too light—to crowd in the greatest number of movements and largest amount of efficiency, with the least weight of metal. This practice is made more urgent by reason of the higher price of labor here. Our inventive faculties are seeking to make us independent of cheap labor.

A California Invention—Hyde's Water-Power Attachment.

The little engraving, shown herewith, represents a machine which although simple in appearance and operation, is one which is rapidly effecting a great change in domestic circles. It is Hyde's Water power attachment for sewing machines. The evils attendant on the constant operation of the sewing machine by the treadle movement, are too well known to need comment by us. Physicians have agreed that the method usually employed is injurious to the health of females, and should be remedied. This little water power attachment is, as can be seen by the cut, quite simple. It can be attached to the table of the machine in such a manner as to offer no obstruction to the operator and in fact is rather ornamental than otherwise.

It consists of a neat iron water-case, about one foot in diameter which is attached to the side of the table. Within the case is a water wheel, modeled after the wheel ordinarily used in manufactories, and measuring eleven inches in diameter; two pipes connect with the case, one running from a point in the floor to the front side of the case and almost on a line with the center; and the other a waste pipe, leading from the rear end of the case to, and through, the floor. The volume of water, involving of course, the motive power of the machine, is controlled by the operator, who simply presses his foot on the iron sandal that is substituted for the treadle. The stream of water running upon the wheel is no larger than a darning needle, but it performs its work admirably, furnishing all the power required; the water passes a few inches in the bucket on the wheel and is then thrown off by centrifugal force; and passes down the waste pipe. An ordinary tank pressure of 20 feet, or the pressure of the city water pipes will move the machine at a high rate of speed, causing it to run 300 yards of cloth, while the ordinary operator would run 150 yards. The little water wheel only weighs six ounces.

The machine is operated as follows: The operator starts it by pressing upon the iron sandal with the front part of the foot. If a higher rate of speed is desired, increase the pressure, and so on until the required speed is reached. The speed is lessened by depressing the heel, and the machine can be started at full speed at once, or stopped immediately at will. The attachment is compact, the water is never seen, and the ease of working the machine with it is almost no work at all. In applying the attachment the wheel is fastened to the table of the sewing machine by wood screws or bolts. The foot-valve is placed beneath the table and screwed fast to the floor, and occupies the same position as an ordinary treadle. The pipes are connected with rubber or leather washers placed between the joints or couplings, and screwed tight. The waste water pipe connecting with the outlet of the machine must have sufficient fall to secure free drainage, otherwise the wheel will cease to operate. On cabinet machines the wheel can be placed under the table and connected by a belt. The attachments can be made with either rubber or lead pipe; if with rubber, the machine can be moved to any part of the room, according to the length of hose. The foot-valve must in that case be put upon a board,

with the sewing machine table resting upon it.

Messrs. Sawyer & Whedon, No. 633 Washington street, agents for this machine, inform us that they have lately applied it to other uses than driving sewing machines, and that it answers the purpose required admirably. One use to which it will probably be applied extensively, is in driving a dental tool known as Morrison's "Burring Engine," which is used for boring out cavities in teeth. This machine has usually been run by a treadle but an irregular movement was the consequence. Recently however, this little "attachment" has been applied in this city to run the "Burring Engine" with very satisfactory results. Boring teeth by water power may seem a strange idea, but it has nevertheless been put in practice successfully. The drilling and polishing is done as well as the excavating, and as quickly. By this means the dentist is able to move about in any direction, and to point the "hurr" to any particular place without any irregularity of movement in the instrument.

The agents are now applying it to small printing presses, jewelers and dentists, lathes, etc. In one jeweler's in this city a 1-16 inch nozzle entirely dispenses with two treadles, drives a polishing lathe 1,500 revolutions a minute and works at the same time a lapetone six feet distant. It is also used on a lathe at a prominent optician's and works beautifully for light turning, polishing and grinding. This little thing is a California invention, having

been patented through the agency connected with this office recently. For small manufacturing purposes where little power is required it is invaluable, and when once used can scarcely be dispensed with. It is being introduced quite extensively in this State, and will no doubt before long find its way to the East. The machine will materially lessen the doctors' bills in families, and be of great benefit to many ailing persons of the gentle sex. Its simplicity is apparent to the most casual observer.

The New Coal Land Law and Regulations Thereunder.

We give below the text of the bill in relation to the location of Coal Lands in the United States, which was passed at the last session of Congress, together with the full and complete rules and regulations by the Commissioner of the General Land Office for carrying the provisions of the law into effect.

[GENERAL NATURE—No. 107.]

AN ACT to provide for the sale of lands of the United States containing coal.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That any person above the age of twenty-one years, who is a citizen of the United States or who has declared his intention to become such, or any association of persons severally qualified as above, shall, upon application to the register of the proper land-office, have the right to enter, by legal subdivisions, any quantity of vacant coal lands of the United States not otherwise appropriated or reserved by competent authority, not exceeding one hundred and sixty acres to such individual person, or three hundred and twenty acres to such association, upon payment to the receiver of not less than ten dollars per acre for such lands, when the same shall be situated more than fifteen miles from any completed railroad, and not less than twenty dollars per acre for such lands as shall be within fifteen miles of such road.

Sec. 2. That any person or association of persons severally qualified as above, who have opened and improved, or shall hereafter open and improve, any coal mine or mines upon the public lands, and shall be in actual possession of the same, shall be entitled to a preference right of entry, under the foregoing provisions, of the mines so opened and improved: *Provided*, That when any association of not less than four persons, severally qualified as in section one of this act, shall have expended not less than five thousand dollars in working and improving any such mine or mines, such association may enter not less than one hundred and forty acres, including such mining improvements.

Sec. 3. That all claims under section two of this act must be presented to the register of the proper land district within sixty days after the date of actual possession and the commencement of improvements on the land, by the filing of a declaratory statement therefor: *Provided*, That the date of actual possession shall be the date of such improvement, filing must be made within sixty days from the receipt of such plat at the district office: *And Provided Further*, That where the improvements shall have been made prior to the expiration of three months from the passage of this act, sixty days from the expiration of said three months shall be allowed for the filing of a declaratory statement, and no sale under the provisions of this act shall be allowed until the expiration of six months from the date hereof.

Sec. 4. That this act shall be held to authorize only one entry by the same person or association of persons under its provisions; and no association of persons any member of which shall have taken the benefit of this act either as an individual or as a member of any other association, shall enter or hold any other lands under the provisions of this act; and no member of any association which shall have taken the benefit of this act shall enter or hold any other lands under its provisions, and

all persons claiming under section two hereof shall be required to prove their respective rights and claims for the lands filed upon and within one year from the time prescribed for filing their respective claims; and upon failure to file the proper notice, or to pay for the land within the required period, the same shall be subject to entry by any other qualified applicant.

Sec. 5. That in case of conflicting claims upon lands where the improvements shall hereafter be commenced, priority of possession and improvement, followed by proper filing and continued good faith, shall determine the preference right to purchase. And also where improvements have already been made at the date of the passage of this act, division of the land claimed may be made by legal subdivisions, to include, as near as may be, the valuable improvements of the respective parties. The Commissioner of the General Land-Office shall be, and is hereby authorized to issue all needful rules and regulations for carrying into effect the provisions of this act.

Sec. 6. That nothing in this act shall be construed to destroy or impair any rights which may have attached prior to its passage, or to authorize the sale of lands valuable for mines of gold, silver, or copper.

Approved, March 3, 1873.

Regulations Under the Law.

Your attention is called to the following points:

1. The sale of coal-lands is provided for—
1st. By giving priority of entry under section one.
2d. By granting a preference right of purchase based on priority of possession and improvement under section two.

2. The land entered under either section must be by legal subdivisions, as made by the regular United States survey; entry is confined to surveyed lands; to such as are vacant, not otherwise appropriated, reserved by competent authority, or containing valuable minerals other than coal.

3. Individuals and associations may purchase; if an individual, he must be twenty-one years of age and a citizen of the United States, or have declared his intention to become such citizen.

4. If an association of persons, each must be qualified as above.

5. A person is not disqualified by the ownership of any quantity of other land, nor by having removed from his own land in the same State or Territory.

6. Any individual may enter by legal subdivisions as aforesaid any area not exceeding one hundred and sixty acres.

Any association may enter not to exceed three hundred and twenty acres.

8. Any association of not less than four persons duly qualified, who shall have expended not less than \$5,000 in working and improving any coal mine or mines, may enter under section two not exceeding six hundred and forty acres, including such mining improvements.

9. The price per acre is \$10 where the land is situated more than fifteen miles from any completed railroad; and \$20 per acre where the land is within fifteen miles of such road.

10. Where the land lies partly within fifteen miles of such road, and in part outside such limit, the maximum price must be paid for all legal subdivisions, the greater part of which lies within fifteen miles of such road.

11. The term "completed railroad" is held to mean one which is actually constructed on the face of the earth; and lands within fifteen miles of any point of a railroad so constructed will be held and disposed of at \$20 per acre.

12. Any duly qualified person or association must be preferred as purchasers of those public lands on which they have opened and improved, or shall open and improve, any coal mine or mines, and which they shall have in actual possession.

13. Possession by agent is recognized as the possession of the principal. The clearest proof on the point of agency must, however, be required in every case, and a clearly defined possession must be established.

14. The opening and improving of a coal mine, in order to entitle a purchaser to purchase, must be considered as a more matter of fact; the labor expended and improvements made must be such as to clearly indicate the good faith of the claimant.

15. These lands are intended to be sold where there are adverse claimants therefor to the party who by substantial improvements, actual possession and a reasonable industry, has established his claim; and his development of the mines in preference to those who would purchase for speculative purposes only. With this view, you will require such proof of compliance with the law, when lands are applied for under section two, by adverse claimants as the circumstances of each case may justify.

16. In conflicting claims, where improvement has been made prior to March 3, 1873, you will, if each party make subsequent compliance with the law award the land by legal subdivisions as to secure to each as far as possible, his valuable improvements; there being no provision in the act allowing a joint entry by parties claiming separate portions of the same legal subdivision.

17. In conflicts when improvements, etc., have been commenced subsequent to March 3, 1873, or shall be hereafter commenced, priority of possession and improvement shall govern the award when the law has been fully complied with by each party. A mere possession, however, without satisfactory improvements, will not secure the tract to the first occupant when a subsequent claimant shows his full compliance with the law.

18. After an entry has been allowed to one party, you will make no investigation concerning it at the instance of any person, except on instructions from this Office. You will, however, receive all affidavits concerning such case, and forward the same to this Office, accompanied by a statement of the facts as shown by your records.

19. Prior to entry it is competent for you to order an investigation, on sufficient grounds set forth under oath of a party in interest, and substantiated by the affidavits of disinterested and credible witnesses.

20. Notice of contest, in every case where the same is practicable, must be made by reading it to the party to be cited and by leaving a copy of this notice in the hands of the proper land-office and be signed by the register or receiver. Where such personal service cannot be made by reason of the absence of the party, and because his whereabouts are unknown, a copy may be left at his residence, or if this is unknown, by posting a copy in a conspicuous place on the tract in controversy, and by publication in a weekly newspaper having the largest general circulation in the vicinity of the land, (where no newspaper shall be specified by this Office,) for five consecutive insertions, covering a period of four weeks next prior to the trial; and in each case requiring such notice, a copy must be forwarded with the returns of this Office, accompanied with proof of service by affidavit indorsed thereon.

21. In case of contest, all papers in the same must be forwarded to this Office for review before an entry is allowed to either party.

22. Thirty days from your decision will be allowed by you to enable any party to take an appeal, or file argument to be forwarded to this Office.

23. No appeal will be entertained unless the same shall be forwarded to the district land-office.

24. The party may still further appeal from the decision of the Commissioner of the General Land-Office to the Secretary of the Interior. This appeal must be taken within sixty days after service of notice on the party. This may be filed with the district land-office and by them forwarded, or it may be filed with the Commissioner, and must recite the points of exception.

25. If not appealed, the decision is by law made final. (See section 10, act June 12, 1858, United States Statutes, volume 11, page 326.) After appeal, thirty days are usually allowed for filing arguments, and the case is then sent to the Secretary, whose decision is final and conclusive.

26. Manner of obtaining title: First, by private entry. The party will present the following application to the register, and will make oath to the same:

I, _____, hereby apply under the provisions of the

act approved March 3, 1873, entitled "An act to provide for the sale of the lands of the United States containing coal," to purchase the _____ quarter of section _____, in township _____ of range _____, in the district of lands subject to sale at the land-office at _____, and containing _____ acres, and I solemnly swear that no portion of said tract is in the possession of any other party; that I am twenty-one years of age, a citizen of the United States, (or have declared my intention to become a citizen of the United States), and I have never held nor purchased lands under said act, either as an individual or as a member of an association; and I do further swear that I am well acquainted with the character of said described land, and with each and every legal subdivision thereof, having frequently passed over the same; that my knowledge of said land is such as to enable me to testify understandingly with regard thereto; that there is not to my knowledge within the limits thereof any vein or lode of gold or silver, or copper, and that there is not within the limits of said land to my knowledge any valuable mineral deposit other than coal. So help me God.

To this affidavit the register will append the usual jurat.

27. Thereupon the register, if the tract is vacant, will so certify to the receiver, stating the price, and the applicant must then pay the amount of this purchase-money.

28. The receiver will then issue to the purchaser a duplicate receipt, and at the close of the month the register and receiver will make returns of the sale to the General Land-Office, from whence, when the proceedings are found regular, a patent or complete title will be issued; and on surrender of the duplicate receipt such patent will be delivered, at the option of the purchaser, either by the Commissioner at Washington, or by the register at the district land-office.

29. This disposition at private entry will be subject to any valid prior adverse right which may have attached to the same land, and which is protected by section 2.

30. Second. When the application to purchase is based on a priority of possession, &c., as provided for in section 2, the claimant must, when the township plat is on file in your office, file his declaratory statement for the tract claimed within sixty days from and after the first day of his actual possession and improvement. Sixty days, exclusive of the first day of possession, &c., must be allowed.

31. The declaratory statement must be substantially as follows, to wit:

I, _____, being _____ years of age, and a citizen of the United States, (or having declared my intention to become a citizen of the United States), and never having, either as an individual or as a member of an association, purchased or obtained title to any land under said act, approved March 3, 1873, entitled "An act to provide for the sale of the lands of the United States containing coal," do hereby declare my intention to purchase, under the provisions of said act, a quarter of section _____, of township _____, of range _____, of lands subject to sale at the district land-office at _____, and that I came into possession of said tract on the _____ day of _____, A. D. _____, and have ever since been in actual possession, and have expended in labor and improvements on said mine the sum of _____ dollars, the labor and improvements being as follows: (here describe the nature of the improvements, and I do furthermore solemnly swear that I am well acquainted with the character of said described land, and with each and every legal subdivision thereof, having frequently passed over the same; that my knowledge of said land is such as to enable me to testify understandingly with regard thereto; that there is not to my knowledge within the limits thereof any vein or lode of gold or silver, or copper, and that there is not within the limits of said land, to my knowledge, any valuable mineral deposit other than coal.)

32. When the township plat is not on file at the date of claimant's first possession, the declaratory statement must be filed within sixty days from the filing of such plat in your office.

33. When improvements shall have been made prior to June 4, 1873, the declaratory statement must be filed within sixty days from that date.

34. No sale under this act will be allowed by you prior to September 4, 1873. One year from and after the expiration of the period allowed for filing the declaratory statement is given to the claimant to make proof and payment, but you will allow no party to make such proof and payment, except on notice as aforesaid to all others who appear on your records as claimants to the same tracts.

35. A party who otherwise complies with the law may enter after the expiration of said year, provided no valid adverse right shall have intervened. He postpones his entry beyond said year at his own risk, and the Government cannot thereafter protect him against any person who complies with the law, and the value of his improvements can have no weight in his favor.

36. One person can have the benefit of one entry or filing only. He is disqualified by having made such entry or filing alone, or as a member of an association. No entry can be allowed an association which has in it a single person thus disqualified, as the law prohibits the entry or holding of more than one claim, whether by an individual or an association. You are to allow no entry under this act of lands containing other valuable minerals. You will determine the character of the land under the present rules relative to agricultural and mineral lands. Those that are sufficiently valuable for other minerals to prevent their entry as agricultural lands, cannot be entered under this act.

37. Assignments of the right to purchase under this act will be recognized when properly executed. Proof and payment must be made, however, within the prescribed period, which dates from the first day of the possession of the assignor who initiated the claim.

38. You will so construe this act in its application as not to destroy or impair any rights which may have attached prior to March 3, 1873. Those persons who may have initiated a valid claim under any prior law relating to coal-lands will be permitted to complete their entries under the same.

39. You will report at the close of each month as "sales of coal-lands" all filings and entries under this act in separate abstracts, commencing with number one, and thereafter proceeding consecutively in the order of their reception. Where a series of numbers has already been commenced by sale of coal-lands, you will continue the same without change. The affidavit required from each claimant under Sec. 2, at the time of actual purchase will be as follows, to wit:

I, _____, claiming the right of purchase under the act of Congress entitled "An act to provide for the sale of the lands of the United States containing coal," approved March 3, 1873, to the _____ quarter of section _____, in township _____ of range _____, subject to sale at _____, do solemnly swear that I have never had the right of purchase under said act, either as an individual or as a member of an association; and that I have never held any other lands under its provisions; I further swear that I have expended in developing coal-mines on said tract in labor and improvements the sum of _____ dollars, the nature of such improvements being as follows: (that I am now in the actual possession of said mines, and make the entry for my own use and benefit, and not directly or indirectly for the use and benefit of any other party; and I do furthermore swear that I am well acquainted with the character of said described land, and with each and every legal subdivision thereof, having frequently passed over the same; that my knowledge of said lands is such as to enable me to testify understandingly with regard thereto; that there is not to my knowledge within the limits thereof any vein or lode of gold or silver, or copper, and that there is not within the limits of said land, to my knowledge, any valuable mineral deposit other than coal. So help me God.)

40. Of the land-office at _____, do hereby certify that the above affidavit was sworn and subscribed to before me this _____ day of _____, A. D. 18____.

41. In case the purchaser shows by an affidavit that he is not personally acquainted with the character of the land, and that he has not obtained any such knowledge as may be required by the law as to its character; but whether this affidavit is made by principal or agent, it must be corroborated by the affidavits of two disinterested and credible witnesses having knowledge of its character.

WILLIS DRUMMOND, Commissioner.
To Registers and Receivers,

The Lignites of Ione Valley and Lancha Plana—Combustion.

[Written for the Press.]

While in Amador county on two recent occasions, the writer of this, noticed at quartz mills, the attempt to burn the above fuels, but the mill-men did not express satisfaction at their use—quite otherwise. To have explained to them satisfactorily why, involved such an acquaintance with the chemistry of combustion and mechanical arrangements of the furnace and boiler setting that I forbore on that occasion. In that county fuel is scarce and high—\$6 for wood—and so if this fuel can be availed of profitably, it will be a source of profit and commerce to all parties.

What is combustion? This question involves another—what is fuel or carbon and its relation to heat? Carbon is deemed an element, and the plant, through its living organization, gathers it from the earth and the air and stores it up as growth or woody fibre. But with it, as evidently a part of the Divine economy, is also stored up heat. Now if we want that heat we apply active flame to woody fibre, and the operation is, first, to add to the volatile part of the dry wood—the hydro-carbon—oxygen, and if it be furnished in sufficient quantity, then the hydro-carbon is decomposed, the hydrogen, from its greater affinity for oxygen than for its associate carbon, unites with oxygen from the atmosphere, and forms water—a cord of wood yielding it is estimated, half a ton of water—and the carbon unites with oxygen, if it be furnished in sufficient quantities and proper time and opportunity be afforded it, forming firstly, carbonic oxide and secondly carbonic acid.

Now it must be borne in mind that all the heat is not liberated until carbonic acid is formed, which acid is the result of the full and complete union of carbon and oxygen.

In other words, then, combustion may be considered to be the distillation of heat from carbon, which heat cannot be so liberated except under proper chemical conditions.

Now the fuels in question consist of hydro-carbon, fixed carbon, silica, alumina and water.

In order to effect the combustion, economically, of these soft coals—especially these lignites—Mt. Diablo, Coarse Bay, Rocky Mountain and other like soft coals, our boilers must be set in accordance with the principles of sound mechanics and chemistry, otherwise great loss must inevitably result therefrom.

While at Virginia City and Gold Hill, recently, this matter struck me forcibly as I stood before the furnaces at various mines and mills and observed construction of boilers, setting, etc.

On looking into the furnaces I found that without one single exception they were so set as to unavoidably lose 20 to 33 percent. of fuel, but mere words would not clearly explain the matter, so I forbore.

For locomotives on railroads much loss must necessarily and unavoidably be endured; but on the land it is entirely unnecessary, and therefore unpardonable. I may pursue this matter in another communication hereafter.

ENGINEER.

San Francisco, June 14, 1873.

PERUVIAN MINES.—In an interview with Mr. Evans, of Peru, a New York *Sun* reporter elicited the following with regard to mines and expenses in that country: The people there are accustomed to pay well for accommodations. I have given \$3 there for watering my horse. I dined once in Peru with some gentlemen who owned mines. I said, "I don't see how you can afford to work your mines at so much expense." "Expense," they replied, "don't amount to much, when you find things like that laying around," and they showed me several lumps of silver.

With regard to the value of the guano yet remaining, Mr. Evans declined to give any opinion. He also refused to say anything as to the way in which the Peruvian Government is carried on. Of the prosperity of Peru, he said: "Too much prosperity will hurt a people as much as adversity. Gold and silver will ruin a people quicker than anything in the world. My belief is that there is eternal wealth in Peru. When I was building the Tanga road, an Indian used to come down from the mountains once a year with a lump of gold worth \$5,000. He would sell it, buy goods for his village and depart. Attempts to discover where he obtained the gold were vain. In another instance an Indian lady was found wrapped in a shawl of beaten gold. There are mines of silver and gold in Peru only waiting for Yankee ingenuity and Yankee pluck to work them.

A NEW INDUSTRY AT ALASKA.—A correspondent of the New York *World*, writing from Sitka, states that a new enterprise—that of ship building—has sprung into existence there, which promises to be of some importance in the future. Two small vessels have been constructed for local use, and larger ones are on the stocks for the San Francisco coasting trade. It is also claimed that the timber of Alaska is admirably suited for ship-building purposes. So far the vessels constructed have been the work of Russian mechanics, who have remained at Sitka, but the field is widening so that American artisans may hereafter find employment.

Borax Fields in Esmeralda County.

From W. J. Westersfield, Freight Agent at this point for the Virginia and Truckee Railroad Company, a thoroughly reliable gentleman, who recently paid a flying visit to the borax fields of Esmeralda county, we learn the following interesting facts in regard to the new wagon road from Carson to Columbus, and touching the wealth of the new borax fields opened up in the southern portion of Esmeralda county:

The road from Carson to Aurora, a distance, so called, of 110 miles, runs a little east of south, and is one of the best wagon roads in the State, well supplied with wood and water. An abundance of hay is cut and put up in the valleys adjacent to the road, and is sold at very reasonable rates. The town of Aurora presents a dilapidated appearance at present. No mines are being worked and hence none of the mills are in operation. The town contains two grocery stores, a drug store, livery stable, one saloon, a butcher shop and a hotel. The major portion of the merchandise shipped to the vicinity is teamed from Reno, simply because there is no forwarding house at Carson to attend to business for the southern country. Bishop Creek, 60 miles south of Aurora, also demands the establishment of a forwarding house at Carson, and we believe D. W. Earl will open one in a few days.

About eight miles north of Aurora, or 100 miles from Carson, is the junction of the Aurora and the proposed new toll road to Columbus, the distance from the junction to the last named town and district being estimated at from 50 to 55 miles. The road bears a little south of east. From this junction to first water is seven miles; next water, seven miles—to which point, over a nearly level table land country, the new road is completed. Here the first range of mountains, about eight miles across, presents the first barrier and greatest obstacle on the route. The mountains are of granite formation, high and rugged, the cañons through which the road must pass on both sides of the summit being deep and rough. Angus McLeod, Superintendent of construction, estimates the cost of building the road across this range at from \$7,000 to \$8,000, while others think the cost will reach \$12,000. From the eastern base of this first range, or the mouth of Whisky Cañon, the road passes six miles over a level plain to the mouth of a cañon leading to the summit of the second range, over which is a comparatively easy grade and an almost natural grade, so much so that light vehicles now pass over in safety. Ten or twelve miles across this range of mountains brings us to Teal's marsh, which is said to be the best and richest borax deposit in the country, a description of which will be given hereafter. From Teal's marsh to Columbus, the distance by the present traveled route is 20 miles, over a good road, (excepting a 3-mile stretch of sand, which will hereafter be avoided), but this will be shortened to 16 miles. The people of Columbus purpose building a good road to the mouth of Whisky Cañon, at a cost of about \$3,000, and are now at work upon it. This road is being built for the purpose of turning the tide of freight to Carson instead of Wadsworth, and to shorten and improve the road over which the constantly increasing borax yield and general supplies must pass.

This road, when completed, will possess many advantages over the one now in use between Wadsworth and Columbus, and can reasonably be expected to turn the trade of the southern country into Carson. The distance from Wadsworth to Columbus is 150 miles, over a very sandy and desert country, with a great scarcity of water and feed for stock. Water has to be hauled from station to station, one drive along being forty miles over heavy sand. Across this desert water must be hauled, and a fourteen-mule team will consume 3,000 pounds of water while crossing, and merchandise freight over the whole distance from the railroad to Columbus, must give place to this necessary but unpaid-for freight. Twenty-six to thirty days is required to make the round trip over the Wadsworth route, and hay is \$80 per ton. Freight charges from Wadsworth to Columbus on merchandise and all material, is four cents per pound; returning, freight on borax, by contract, three and a half cents per pound, otherwise four cents. Between thirty and thirty-five teams are now on the road, and this number is not able to do the amount of work required.

Teal's Marsh

Contains 1,000 acres of borax land by actual survey. The estimated amount of crude borax on this survey is 300,000 tons, or 75,000 tons of net borax. One set of works in full operation on this marsh has a boiler 12x15, two feet deep, and 13 tanks in which borax is manufactured; and these turn out two tons of concentrated borax daily, or sixty tons per month. These works are owned by J. Mosshimer & Co. Smith & Co. are erecting works capable of concentrating eighty tons per month, and these will be in operation in July. Nadeau & Co. have bought 500 tons of the material on this marsh, most of which is already sacked and will be shipped in its natural state. Other works are to be erected at an early day. All the borax from this marsh will come over the new road to Carson, as it is twenty miles

further from Teal's to Wadsworth than to Carson, to say nothing of the other disadvantages of the former route. The upper end of this marsh contains one of the finest deposits of salt known to exist anywhere, and it is believed that this marsh alone will ship at least 200 tons of borax per month.

Columbus Borax Marsh

Is situated about 150 miles south of Carson, and about the same distance from Wadsworth. Four manufacturing companies are at work upon the marsh. The Pacific Company is making fifty tons of borax per month. Hearn's steam works started up on the 10th of last month. Capacity, 140 tons per month. This company will require twenty-five hands, and employ 150 animals daily to do their hauling.

Columbus

Has a population of 500, in 125 houses, most of concrete or adobe; three grocery stores, six saloons, two livery stables, one hay yard, two blacksmith shops, one butcher shop, one stationary store and news depot, and two quartz mills. Columbus is also the distributing point for Alida Valley, Gold Mountain, Death Valley and other districts south. One quartz mill is now running at Gold Mountain and another is being erected, while extensive deposits of borax have recently been found and located at two or three different points in Death Valley, about 70 miles south of Gold Mountain. All freight forwarded to or from these districts, for over 100 miles south of Columbus, will pass over the new Carson road when completed.

Borax Yield.

Below will be found an estimate of the amount of borax that will be shipped from these southern districts, monthly:

From Columbus Marsh, 220 tons.
From Fish Lake Valley, 120 tons.
From Rhoad's Marsh, 300 tons.
From Teal's Marsh, 240 tons.

By this statement it will be seen that the estimated monthly shipment of borax alone will be 880 tons, to say nothing of the large prospective increase in the production of this material and the general supplies necessary to carry on operations. These facts indicate unmistakably that our southern neighbors have a "big thing," and we should not be surprised to hear at any time that they were to be connected with Carson by rail.—*Virginia Chronicle*.

White Pine Mines.

The editor of the White Pine *News* was treated to a buggy ride by Morris Ballenberg, the other day, and visited Eberhardt, Treasure City and Shermantown. At Eberhardt the Stanford mill is in constant operation, and the sound of its stamps can be heard for a considerable distance. It is now being run by Dr. Goodfellow on ores from the Eberhardt & Aurora Company's mines. Workmen are engaged in clearing away the debris at the International mill site, and making preparations for the reception of the new structure. The people in town are confident of good times when the work of construction shall commence. Proceeding around the foot of Treasure Hill we arrived at Shermantown, passing on the way the deserted remains of the Little Giant, Kohler and Metropolitan mills, the sound of whose stamps once gladdened the ears of the numerous residents then in the vicinity. Shermantown presents a spectacle of gloomy desolation equalled only by the description given by Goldsmith of the "deserted village." Only one source of industry now remains for the residents, some six in number, and that is the small mill used by J. B. Osborne to run through the immense quantity of tailings left from the former workings of the Oasis and Eberhardt mills. We are informed this latter enterprise has not been successful thus far, from the fact of want of appliances to run through sufficient quantities of tailings during the twenty-four hours. However, the works are to be reconstructed and placed in thorough running order, when another start will be made.

On the way to Treasure Hill we pass more ruined structures, which were once the scenes of busy industry in smelting and mining. Our thoughts naturally recur to the times when money was plentiful and everybody was prospectively wealthy, and we cannot but think the day will yet come when the mountains surrounding the present waste will yield up the treasure hidden within their rugged sides. Treasure Hill, however, dispels much of the gloom which the view at Shermantown has left upon us, and we are again reassured by the signs of labor and life. The mines of the Ward Beecher Consolidated, Hidden Treasure and the English Company are all looking well and daily producing large quantities of mineral. The Peerless chamber, particularly, still keeps up its ore-producing reputation, and continues to supply the Stauford mill with sufficient to keep it running. Many other localities are being worked on the Hill and vicinity, mostly by private individuals and miners owning their own claims. We had not time to visit any of them, but are told the owners are confident of making a good thing the present season. Taken altogether we can see nothing discouraging in the appearance of White Pine District as it stands to-day. True there are mills standing idle, but men are at work extracting ore which must soon be crushed; then we have had a hard and long siege of dullness, and it will take some time to recover entirely from the effects of the black eye received in days gone by.

Utah Investments.

Whatever may be said of mining property as an investment, this one proposition cannot be denied, that to a very great extent, every investment in land, railroads, manufacturing and general business, depends upon the success of mining. The present limited development of mining as a legitimate business, has increased already to a wonderful extent the value of every kind of real and personal property in the Territory. Among the substantial men in the Eastern States, mining has always been and is now considered as a wild speculation. The frauds that have been connected with mining operations, the enormous outlays of money on valueless property, and the misrepresentations of unprincipled men in times past, makes it today, almost an impossibility to get an investor who has never before invested. Iron and lead mining in Pennsylvania, has become as legitimate as any business carried on in the State, and these interests, have no doubt, done more for the State's welfare than all the other interests combined. Of course the business is now thoroughly understood, and undertakings of every kind connected therewith, are gone into with as much confidence as any other branch of commerce or industry. The condition of things a few years ago, favored the sharper who desired to fleece the unsuspecting; traveling facilities were comparatively limited, and the men of business or large means in the East, could not spend the necessary time to visit and inspect the property for himself, and were in consequence dependent upon the representations made, or the judgment of experts in the interests of the seller. Oftentimes, enterprises of great magnitude were undertaken with too small a capital, and after struggling awhile, been abandoned or neglected, until they have actually passed out of the hands of the original owners, and some of this kind of property is of great value, and would have proved remunerative if it had been properly prosecuted.

Nevada became a prosperous mining Territory under the greatest disadvantages. The district of Pioche suffered in a large increase of cost of every article necessary for a mining camp; labor was scarce and commanded an exorbitant price. At Virginia City, flour has been as high as one hundred and twenty dollars per barrel, almost everything in different states of the market have been equally as high. While there is a risk in all kinds of business, we think the state of things now existing in Utah, makes mining investments made with caution and with good practical judgment, as safe as any investment that can be made. We have an agricultural country already well developed, water in abundance, timber plentiful, and we have a community of business men that are determined to frown and discountenance any attempt at fraud; labor is to be had at all times, at fair living wages, transportation is gradually growing cheaper, manufacturing are being rapidly established, good prospects are to be purchased at low figures, and we cannot see any good reason why these investments should not be sought after and made extensively profitable.

Our Wheat Product

The Sacramento *Record* in estimating the product of the coming harvest gives the following table, the figures for which are mainly made up from circulars sent to prominent men in the different counties named:

COUNTY.	1872-3.		1873-4.	
	Acres.	Yield Centsals.	Acres.	Estimated Yield.
Alameda....	58,000	407,000	58,000	408,000

SINGULAR DISCOVERY OF A RICH LEDGE.—The *Silver State*, Humboldt county, publishes the following account of a singular discovery of a rich ledge: A few days since a horse used at the hoisting works at the Butte mine, while being led by a Chinaman, fell in an incline shaft and broke his neck. For sanitary reasons and a sensitiveness of the olfactory nerve, they concluded to bury the carcass. In digging a hole for that purpose, a rich ledge was discovered, and the horse found a grave elsewhere. There is now an active demand for Chinamen to drive horses at the Rye Patch,

Valuable Premiums and Subscriptions.

A Sewing Machine
of Real Value
(Beckwith's)
given for \$40
worth of Sub-
scriptions.

The AMERICAN AGRICULTURIST, in speaking of this Machine, says:

We are prepared to endorse the Beckwith Sewing Machine as one worthy of being at once acquired by all who cannot purchase the expensive machine.
1st. It is well and strongly made.
2d. It is easily attached to any table or stand having a leaf or edge projecting an inch or so, and can thus be used in any part of the house, near a window, etc.
3d. It makes the elastic loop stitch (the same as the Willcox & Gibbs and some other good machines), which with a little care in making the close and tight stitches, will give for nearly all kinds of sewing, and less liable to break in washing and wearing, owing to its elasticity.

WE WILL GIVE

For \$12, a Machine and the Illustrated Press, 1 year.
For \$12, a Machine and the Mining & Scientific Press, 6 mos.
For \$12, a Machine and the Pacific Rural Press, 6 mos.
For \$13.50, a Machine and the Mining & Scientific Press, 1 yr.
For \$13.50, a Machine and the Pacific Rural Press, 1 year.

For \$40, we will give a Machine and \$40 worth of subscriptions to either paper, or all jointly at regular rates. Send for Circular.

Express charges must be paid by the purchaser. Address, for further particulars, the PUBLISHERS OF THIS JOURNAL.

W. T. GARRATT & CO.
CITY

Brass and Bell Founder,

Corner Natoma and Fremont Streets,
MANUFACTURERS OF
Brass, Zinc and Anti-Friction or Babbet Metal
CASTINGS,
Church and Steamboat Bells,
TAVERN AND AND BELLS, GONGS,
FIRE ENGINES, FORCE AND LIFT PUMPS.

Steam, Liquor, Soda, Oil, Water and Flange Cocks, and Valves of all descriptions, made and repaired.
Hose and all other Joints, Solder and Copper Rivets, etc. Gauge Cocks, Cylinder Cocks, Oil Cocks, Steam Whistles, HYDRAULIC PIPES AND NOZZLES for mining purposes. Iron Steam Pipe furnished with Fittings, etc. Coupling Joints of all sizes. Particular attention paid to Distillery Work. Manufacturer of "Garratt's Patent Improved Journal Metal."
Highest Market Prices paid for OLD BELLS, COPPER AND BRASS.

W. T. GARRATT, JAMES HILLMAN, W. T. LITTLE.

HALLIDIE'S
Patent Endless Wire Ropeway.
Covered by Numerous U. S. Patents.

IMPORTANT TO

Mining Companies, Civil Engineers, Contractors, Etc.

The system of transporting material, such as Ores, from the mine to the mill, Earthen embankments, Rock from quarries, etc., by means of steel wire rope, has been well tested and found more economical, advantageous and reliable than any other method of transportation; and to the annexed certificates in connection therewith I beg to call the attention of those interested to:

EUKEKA, Nevada, July 10, 1872.
T. M. MARTIN—My dear sir: On your leaving for San Francisco, it gives me great pleasure to hand you my written acceptance of the HALLIDIE TRAMWAY put up by you upon our mine in Freiberg.

It is a perfect success, discharging ten tons of ore per hour with two men's labor. It is perfectly simple in construction, and, as far as I can judge, there is nothing about it to ever get out of order—nothing to wear out. While ours requires but about two thousand five hundred feet of wire rope, I can see no reason why the line could not be extended almost indefinitely with equally happy results. Again, the carrying capacity might be doubled or quadrupled if desired. After several weeks trial upon our mine, the unanimous verdict of all who have seen it is a complete, unquestioned success. If this can be of any service to you, use it in any way you think proper. Very respectfully, C. O. GOODWIN.

EMMA HILL CONSOLIDATED MINING CO.,
Little Cottonwood, Utah.
Superintendent's Office, Sept. 23, 1872.
T. M. MARTIN, Esq., San Francisco.
The HALLIDIE'S PATENT Ropeway for the Emma Hill Consolidated Mining Company, has been built in a most substantial and workmanlike manner, and is at this time in splendid working condition. I most cheerfully accept the work for the company, and recommend it to others wishing a safe and speedy transit for ores over places impracticable for wagon roads, etc. Respectfully,
L. W. COLBATH, Superintendent.

"The Vallejo works smoothly with the elevated wire tramway, which carries its load of ore as quietly and easily as if there was no winter or snow in the world."
Whatever the objections to wire tramways may be on account of the cost, I have seen nothing yet that even approaches them in the facilities they afford for moving ore at all seasons of the year. —Correspondent Utah Mining Journal, Alta, Jan. 8, 1873.

The Vallejo Ropeway.

The Vallejo Tunnel Company's Tramway in Little Cottonwood, built on the HALLIDIE PATENT PLAN, is a complete success. It is between 2,300 and 2,400 feet in length, and is supported by thirteen stations. The fall in this distance is about 600 feet, and the wire rope, which is three-fourths of an inch in diameter, will safely and easily deliver one hundred tons in six hours. The machine is automatic, loading and unloading the sacks or buckets. About one ton and a half can be sent down at one time. The stations are about two hundred feet apart, and the entire apparatus is strong and safe. As the wire rope is elevated about forty feet above the surface of the hill, the Tramway can be worked all winter long, without the slightest trouble. —Utah Mining Journal, Salt Lake, Sept. 23, 1872.

Mining Companies and others desiring to negotiate for the erection of this system of Ropeway, can communicate with me personally, or through Postoffice Box 943.

A. S. HALLIDIE, Patentee,
112 and 114 California Street, San Francisco.

For hoisting from mines, transmitting power, ship rigging, etc., of all kinds and sizes, on hand and made to order.
Wire of all kinds and descriptions, furnished at lowest rates.
A. S. HALLIDIE, 112 and 114 California St.

GIANT POWDER.

Patented May 20, 1868.

THE ONLY SAFE BLASTING POWDER IN USE.

GIANT POWDER, NO. 1.

For hard and wet Rock, Iron, Copper, etc., and Submarine Blasting.

GIANT POWDER, NO. 2.

For medium and seamy Rock, Lime, Marble, Sulphur, Coal, Pipe Clay and Gravel Bank Blasting, Wood, etc.
Its EXCLUSIVE use saves from 30 to 60 per cent. in expenses, besides doing the work in half the time required for black powder.

The only Blasting Powder used in Europe and the Eastern States.

BANDMANN, NIELSEN & CO.,

General Agents, No. 210 Front Street.

N. W. SPAULDING,
Saw Smithing and Repairing
ESTABLISHMENT.

No. 17 and 19 Fremont Street, near Market.

MANUFACTURER OF

SPAULDING'S

Patent Tooth Circular Saws.

They have proved to be the most durable and economical Saws in the World.

Each Saw is Warranted in every respect.

Particular attention paid to construction of
Portable & Stationary Saw Mills.

MILLS FURNISHED AT SHORT NOTICE
At the lowest Market Price.

Ashcroft's Patent Steam
Gauges,

(Original—with Bourdon Spring).

Steam Gauges,

Vacuum Gauges,

Registering Gauges,

Test Gauges.

Low Water Alarms, Gauge Cocks, Glass Water Gauges, Cylinder Cups, Self-Oilers, Boiler Felting, Seldens, Tucks, Kemp and Soapstone Packing, Stocks, Taps and Dies, Twist Drills, Drill, Lathe and Planer Chucks, Emery Wheels, Etc.

Every description of Engineers' and Machinists' supplies, for sale by

TREADWELL & CO., San Francisco.

PURCHASERS please see advertised in Scientific Press.

A CARD.

The subscriber offers his services to the public for the examination of mines and mining properties. This State abounds in quartz mining properties, which are present failures from the want of knowledge in their development or management. Witness Nevada, El Dorado, Tuolumne and Mariposa counties; witness also Amador county with its Potomac, Hazard, Plymouth, El Dorado, Original Amador, Herbetville, Union, Mahoney, Summit and other gold mining properties, all of which are intrinsically first-class mines, yet all of the above and others in that county are present failures.

But their successful development depends upon Geology, Oology, Topography, a knowledge of "the Chemistry of Rocks and their relations to mines and mining," an apprehension of Nature's great plan of their development. In short, the mathematics of mining. In the above respect, the subscriber believes himself thoroughly master of the situation. Consultation free. Office, 543 Sacramento street, one door east of Montgomery.

O. W. EASTON,

Geologist and Mining Engineer, ju21-4t

Diamond Drill Co.

The undersigned, owners of LESCHOT'S PATENT for DIAMOND POINTED DRILLS, now brought to the highest state of perfection, are prepared to fill orders for the IMPROVED PROSPECTING and TUNNELING DRILLS, with or without power, at short notice, and at reduced prices. Abundant testimony furnished of the great economy and successful working of numerous machines in operation in the quartz and gravel mines on this coast. Circulars forwarded, and full information given upon application.

A. J. SEVERANCE & CO.

Office, No. 315 California street, Rooms 16 and 17.

PATENTS & INVENTIONS.

Telegraphic List of U. S. Patents Issued to Pacific Coast Inventors.

FROM OFFICIAL REPORTS FOR THE MINING AND SCIENTIFIC PRESS, DEWEY & CO., PUBLISHERS AND U. S. AND FOREIGN PATENT AGENTS.]

By Special Dispatch, Dated Washington, D. C. June 24th, 1873.

FOR WEEK ENDING JUNE 10th, 1873.

ELECTROLYTIC GAS LIGHTING APPARATUS.—John Vansant, S. F., Cal.

COOKING RANGE.—James H. Mitchell, S. F., Cal.

EXPLOSIVE COMPOUND.—Thomas Varney, assignor to the Giant Powder Company and the Atlantic Giant Powder Company, S. F., Cal.

The patents are not ready for delivery by the Patent Office until some 14 days after the date of issue. NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO., at the lowest rates. All patent business for Pacific coast inventors transacted with greater security and in much less time than by any other agency.

Old Tuolumne.

The annual reunion of the Tuolumne Reunion Association, composed of residents and ex-residents of Tuolumne county, was held in Brooklyn, Alameda county, on the 17th inst. As usual, the picnic passed off pleasantly to all concerned. These annual gatherings of old friends and acquaintances are much enjoyed by the participants, and they propose to keep them up indefinitely. A great register is kept of all the old residents of the county, in which are as many original signatures as can be obtained. Placer county is the only other one that has as yet followed the example of Tuolumne in this matter, two "Placer Reunions" having been held. It is pleasant to see men who have "roughed it" together in early days, join together with those who have come in later years to keep up old associations and remembrances in an annual reunion. We give below the officers elected by the Association for the ensuing year:

President L. P. McCarty (of the MINING AND SCIENTIFIC PRESS), San Francisco. Vice-President, C. B. Rutherford, Oakland. Secretary, Thornton Westley, San Francisco. Treasurer, W. G. Dinmore, Oakland. Executive Committee, James L. Homer, H. M. Rose, L. Jacob, Hon. Stephen Wing, all of San Francisco.

Committee at Large, (San Francisco), John Sedgwick, J. H. Scammon, Alden Kingman, O. Becker, P. R. Woodman, Wm. H. Culver, A. Sharp, John S. Cannon, Oakland.—E. G. Jones, Samuel Boynton, P. Emon, Stockton.—J. B. Douglass, R. C. Patten, Le Rose Phelps, Hon. Geo. S. Evans, Colonel Wm. Sabine.

Visalia.—James Spear. Vallejo.—Hon. Paul K. Hubbs. San Jose.—Nep. S. derer, Walter Hollenbeck. Salinas City.—Henry Harter, George A. Tolman. Columbia.—Hon. P. B. Bacon. Sonoma.—D. M. Kenfield, J. B. Bacon. Martinez.—W. H. Ford.

Antioch.—Wm. Stewart. San Diego.—Joseph A. Smith. Marysville.—F. W. A. Aaron. Petaluma.—B. Harter. Carson, Nevada.—D. C. Turner. Virginia City, Nevada.—Joseph Smith. San Luis Obispo.—Walter Murray.

Lone Pine.—Tim Lewis. Hamilton, Nevada.—Dan Patterson. San Andreas.—Hon. Wm. T. Lewis. Helena.—Wm. A. Chesman. Los Angeles.—B. F. Ryder. Santa Cruz.—Judge Wellington. Eureka.—John H. Fordham. Confidence Mine, Tuolumne County.—L. Gileon. Gold Springs.—J. B. Robbins.

Big Oak Flat.—Wm. Ulrich. Obispo Camp.—M. Bacon, Judge Oallinridge. Napa.—John F. Zollner. Montezuma.—D. J. Edgar. Mount Springs.—W. J. Flack. Pioche.—Barney Mullen. Jacksonville.—Dan Munn. Silver City.—Mike Maxwell.

New Incorporation.

The following companies have filed certificates of incorporation in the County Clerk's Office, S. F.:

QUINTERO M. Co., June 23. Location: Sonora, Mexico. Capital stock, \$5,000,000, in shares of \$100 each. Trustees—J. D. Fry, Thomas Findley, G. D. Roberts, S. Haydenfeldt, and John F. Boyle.

MONO M. Co., June 25. Utah Territory. Trustees—David D. Colton, Jesse Holladay, Chauncey B. Land, John W. Galloway, John D. Fry. Capital stock, \$5,000,000 in shares of \$100 each, all of which has been subscribed.

CALIFORNIA SAVINGS AND LOAN SOCIETY, June 25. Object: accumulating savings and loaning the funds of members, stockholders and depositors. The place of business is in this city and county. Trustees—John Bell, Charles Lux, A. O. Corbett, James K. Kelly, Frederick July, Julius C. Reis, Adolph Wecker, Alexander G. Able, Alexander Austin, Robert Ewing. Capital stock, \$300,000, in 300 shares of \$1,000 each, all of which has been subscribed.

Meetings and Elections.

IMPERIAL S. M. Co., June 24. Trustees: A. K. P. Harmon, J. D. Fry, H. O. Kibbe, H. O. Dickinson, William Norris, Alpheus Bull and Thomas Bell, W. E. Dean, Secretary; O. C. Batterman, Superintendent.

INCREASE OF CAPITAL STOCK.—A certificate of the increase of capital stock of the Cherokee Flat Blue Gravel Mining Company, from \$65,000 to \$3,120,000, has been filed in the County Clerk's office. The certificate states that the amount of capital stock actually paid in is \$83,200, and that the liabilities of the Company are about \$500 for current expenses.

OUR "TRAVELLING CORRESPONDENT," Mr. L. P. McCarty leaves town on a trip this week and will within the next 90 days visit the following places in the State of Nevada: Battle Mountain, Galena, Palisade, Mineral Hill, Eureka, Hamilton Treasure City, Eberhardt, Mineral city, Schellhornne, Pioche, Anstin, Belmont, Reno, Virginia City, Gold Hill, Sutro, Carson, Silver City, Dayton, etc. He will also probably visit some of the prominent mining camps of Utah during his tour of observation. We hope our brethren of the press, as well as mining superintendents and others, will give Mr. McCarty a hearty welcome in their respective localities and assist him in obtaining the information he desires to publish. He will receive subscriptions for this journal during his trip and send us regular letters in relation to mining matters in the localities he visits. Mining Superintendents will oblige us and the mining community greatly, by affording him such facilities as are in their power.

MINING SALES.—We see by the Tribune, that during the month of May, several large sales of mining property were made in Salt Lake. Half of the "Emporia" mine, in Dry Cañon, Ophir District was sold by Godbe & Co., to Mr. B. Brady. The Northern Light, Fairview and Grizzly mines in Bingham Cañon, were sold to Michigan capitalists, for \$80,000 cash by B. F. Oliver, B. McManamin, J. E. Hutchings and Bell & Bateman. The Lottie, Hidden Treasure and Silver Hill mines, in the same locality, were also sold to Michigan capitalists, for \$50,000.

THE Pacific Wire Manufacturing Co., A. S. Hallidie, Agent, have recently removed from their quarters on California street to Nos. 113 and 115 Pine street, as will be seen by advertisement in another column.

Leather Market Report.

[Reported for the Press by Dolliver & Bro.]

SAN FRANCISCO, Wednesday, June 25, 1873. Trade in all kinds of stock has been exceedingly quiet and prices are the same, as a general rule. Money continues scarce, but an improvement is hoped for on the incoming harvest.

Mineral Land Office.

The undersigned make the business of obtaining U. S. Patents for Mining Claims and Coal Land a specialty. We take cases in any part of the mineral region west of the Rocky Mountains, and in the Department of Washington. Special attention paid to contested cases. Mr. McKee has been for years Chief Clerk of the Mining Claims Division of the General Land Office at Washington, and has thorough knowledge of all the proceedings under the Mining Laws.

Bunker Hill Quartz Mining Company—Location of works, Amador County, California. Principal place of business, San Francisco, Cal. Notice is hereby given, that at a meeting of the Board of Directors, held on the 5th day of June, 1873, an assessment (No. 10) of Ten Dollars per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at his office, No. 19 First street, San Francisco, California. Any stock upon which this assessment shall remain unpaid on Monday, the 11th day of July, 1873, will be delinquent and advertised for sale at public auction, and unless payment is made before, will be sold on Monday, the 25th day of July, 1873, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Directors.

SPECIAL NOTICE.—At a meeting of the Board of Directors of the Bunker Hill Quartz Mining Company, held this day, the assessment (No. 9) levied December 30, 1872, for Ten Dollars per share, was levied. Any stock upon which said assessment has been paid will be credited with the amount paid, upon Assessment No. 10.

CHARLES H. KNOX, Secretary pro tem.
San Francisco, June 5, 1873.

Lady Esten Tunnel and Mining Company. Principal place of business, No. 35 New Merchants' Exchange, San Francisco, California. Location of works, Little Cottonwood District, Utah Territory. Notice is hereby given, that at a meeting of the Board of Directors, held on the 11th day of June, 1873, an assessment (No. 3) of five cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, No. 35 New Merchants' Exchange, San Francisco, Cal. Any stock upon which this assessment shall remain unpaid on the 15th day of July, 1873, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Wednesday, the 10th day of August, 1873, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

CHAS. S. HEALY, Secretary.
Office, 35 New Merchants' Exchange, California street, San Francisco, California.

4v25-3m **E. G. DENISTON, Proprietor.**

Varney's Patent Amalgamator.
These Machines Stand Unrivaled.

For rapidity pulverizing and amalgamating ores, they
have no equal. No effort has been, or will be spared
to have them constructed in the most perfect manner
and of the great number now in operation, not one has
ever required repairs. The constant and increasing de-
mand for them is sufficient evidence of their merits.
They are constructed so as to apply steam directly
into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:
The pan being filled, the motion of the miller forces
the pulp to the center, where it is drawn down through
the aperture and between the grinding surfaces.—
Thence it is thrown to the periphery into the quicksilver.
The curved plates again draw it to the center, where it
passes down, and to the circumference as before. Thus
it is constantly passing a regular flow between the grind-
ing surfaces and into the quicksilver, until the ore is
reduced to an impalpable powder, and the metal amal-
gamated.

Sellers made on the same principle excel all others
They bring the pulp so constantly and perfectly in con-
tact with quicksilver, that the particles are rapidly and
completely absorbed.

Mill-men are invited to examine these pans and settlers
for themselves, at the office, 229 Fremont Street,
San Francisco

BROWN'S PATENT LAMP.

One of these Lamps, when placed at a distance of 200
feet from the bank, will light up a bank surface 250 feet
in length and 150 feet high, and to a much better ad-
vantage than any other light heretofore tried, and at an
expense not to exceed five cents per hour. Lamps
furnished at short notice.

Letter of Recommendation.

Mr. C. B. BROWN—Sir: Your Patent Lamp for light-
ing hydraulic mines, which you sold to me in December
last, has given entire satisfaction, and far exceeds my
expectations, and I think it the best and cheapest light
ever used to light mining claims by night, and am sat-
isfied that I have saved three hundred dollars by the
use of it in the last mining season over pitch or any
other light of the same brilliancy; and I will also say
that if I could not get another lamp, five hundred dol-
lars would not buy it. Yours,
W. D. APLIN.

Little Rock, Nov. 5, 1872.

For further particulars, address,

RICULTURAL SOCIETY for the superiority of our
products over all others.

We also call attention to our

HERCULES POWDER.

Which combines all the force of other strong explosive
now in use, and the lifting force of the BEST BLASTING
POWDER, thus making it vastly superior to any other
powder now in use.

A circular containing a full description of this Pow-
der can be obtained on application to our Office.

16v20-3m **JOHN F. LOHSE, Secretary.**

PROCESSES please say advertised in Scientific Press.

San Francisco Boiler Works,

123 and 125 Beale Street.....SAN FRANCISCO

F. I. CURRY,

(Late Foreman of the Vulcan Iron Works,) Proprietor.

High and Low Pressure Boilers of all
Descriptions.

SOLE MANUFACTURERS OF THE CELEBRATED
SPIRAL BOILER.

SHEET IRON WORK of every description done
at the Shortest Notice.

All kinds of **JOBING** and **REPAIRING** promptly
attended to. 17v25-3m

McAFEE, SPIERS & CO.,

BOILER MAKERS

AND GENERAL MACHINISTS,

Howard st., between Fremont and Beale, San Francisco.

SHEET IRON PIPE.

THE

Risdon Iron and Locomotive Works

Corner Howard and Beale Streets,

Are prepared to make **SHEET IRON** and **ASPHALTUM**
PIPE of any size and for any pressure, and contract to
lay the same where wanted, guaranteeing a perfect
working pipe with the least amount of material.

Standard sizes of railroad Car Wheels, with special
patterns for Mining Cars. These small wheels are made
of the best Car Wheel Iron, properly chilled, and can be
fitted up with the improved axle and box—introduced by
this company, and guaranteed to outlast any other
wheels made in this State.

All kinds of Machinery made and repaired.
24v23-3m **JOSEPH MOORE, Superintendent.**

BLACK DIAMOND FILE WORKS.

G. & H. BARNETT,

Manufacturers of Files of every Description,

Nos. 33, 41 and 43 Richmond street,

Philadelphia, Pa.

MILL SAW FILES A SPECIALTY.

BURLEIGH ROCK DRILLS

—AND—

Air Compressors.

The Burleigh Rock Drills, which have stood the test
of five years' constant use at the Hoosac Tunnel, and
which are now in use in nearly every State in the Union,
as well as in Europe and South America, are unequalled
in efficiency and economy by any other Drilling Ma-
chine. They are of various sizes, and equally well
adapted to Tunneling, Shafting, Open Cut or Quarry-
ing, and will drill six to ten inches per minute in gran-
ite. They are driven by steam above ground. The Bur-
leigh Air Compressor is the best engine yet devised for
furnishing the "air motor" for the many purposes to
which it is now being used.

They are to be used on the St. Gothard Tunnel, Swit-
zerland; Tunnel 15 miles long. We refer to the follow-
ing gentlemen and works:

Gen. Newton, U. S. A. Hell Gate Tunnel, L. I.
Mess. Shanley Hoosac Tunnel, Mass.
J. Dutton Steele Nesquehoning Tunnel, Pa.
Sidney Dillon Fourth Avenue Work, N. Y.
Col. Roehling East River Bridge Company, N. Y.

For further information, etc., address

L. C. PARKE,

VIRGINIA CITY, NEVADA.

AGENT FOR THE PACIFIC COAST. 115

NELSON & DOBLE,

AGENTS FOR

Thomas Firth & Sons' Cast Steel.
